Centennial Exhibition, a World's Fair held in Philadelphia, Pa., from 10 May 1876, to 10 November of the same year. To celebrate the 100th anniversary of American independence, an association of Philadelphians in 1870 proposed an international exhibition of arts, manufactures, and agricultural products, to be held in the city where independence was declared. Congress passed an act 3 March 1871, authorizing the exhibition and also appointed a commission of one member and an alternate from each State and Territory, nominated by the governors, to report on dates of opening and closing, plans for buildings, method of receiving and classifying articles, custom-house regulations. The commission was organized 4 March 1872, with Joseph R. Hawley of Connecticut as president; and on 12 May chose as director-general of the exhibition Alfred T. Goshorn. On 1 June Congress appointed a centennial board of finance, to raise funds for the exhibition. This board was to solicit subscription to $10,000,000 of stock, and the corporators and subscribers were to elect 25 directors, who should apply the funds on the plans of the commission. Of 227,940 of individual subscriptions, Pennsylvania gave $1,749,468. The city of Philadelphia added $1,500,000; the State of Pennsylvania $1,000,000 more. Then Congress appropriated $1,500,000, besides $500,000 for a government building. Fairmount Park was selected as the site, 236 acres being used for the purposes of the exhibition. The buildings of the exhibition proper consisted of the main building (for manufactured products, mines and metallurgy, the public works of all nations, and a conspectus of science and education), built of iron and glass with masonry foundations, 70 feet high, 1,880 x 464 feet, with central transept of 416 feet and two end transepts of 216; Machinery Hall, 1,402 x 360, of wood and glass on masonry foundations, occupying with an annex nearly 13 acres; Agricultural Hall, 820 x 540, of wood and glass; Horticultural Hall, built by the city of Philadelphia, a permanent structure of iron and glass in Moorish 12th-century style; Memorial Hall, intended as a permanent art gallery, of granite, glass, and iron, in Renaissance style, 365 x 210 and 59 feet high, with a central tower 150 feet high, surmounted by a colossal statue; the United States Government Building, 504 x 306; the Women's Pavilion, an acre in extent, not only for the convenience of women, but for the collection and exhibition of their work; the Shoe and Leather Building, and the Carriage Building, besides annexes. Moreover, 26 States erected buildings of their own, costing over $400,000; and a number of foreign countries, out of 49 which took part in the proceedings by invitation, erected their own buildings. There were over 200 separate buildings in all. The admission fee was 50 cents; 7,250,620 paid it in full, 753,654 paid a special 25-cent rate, and 1,906,692 went in free, making 9,910,966 admissions in all.

By the system of awards adopted the exhibits — to the number of over 50,000 — were divided into 36 groups, and these subdivided again and again into small sections. Each of the last was assigned to a special jury of awards, who had to make a statement in writing of the special merits they found in the articles which they esteemed best, and the uses for which each was best fitted, and to sign their names to the award: this left no room for carelessness or irresponsibility, and gave the maker the benefit of names of known weight. These judges included many of the ablest and most famous men of science and the professions and other great experts in the Western World; and the awards have been a source of just pride.

The exhibition was a most important landmark in the industrial history of the country, and other countries. Not only did it make later ones possible and successful here, but it diffused inventions, broke down stolid self-conceit, and immeasurably advanced the knowledge of all the nations which took part in it. For instance, the Bell telephone was first exhibited there, and gained immediate celebrity from Sir William Thomson's enthusiastic praise; and the American bicycle manufacture sprang from Col. Pope's inspection of English cycles there. It showed European countries with new clearness the marvels of American machinery-making, especially the immense development of mechanism with interchangeable parts, from watches to steam boilers and artillery. It made the first collection ever attempted of women's work on a large scale. It first made the beauty and grace of Japanese decoration and patterns popularly known. It shed new light on art principles in general. It illuminated educational systems with light from foreign sources. No public or private money was ever better invested than that devoted to creating and profiting by this collection. The official account of the exhibition was published by the government in 1880.

Centen'nial State, a popular name given to the State of Colorado on account of its admission to the Union in 1876, the 100th year of American independence.

Centeno, Diego, dē-ā'gō thān-tā'nō, Spanish soldier: b. Cindad-Real, Spain, 1504; d. La Plata, upper Peru, 1549. Going to South America he accompanied Alvarado to Peru and soon became famous as a skilful fighter.

Center. See CENTRE.

Centerville, Iowa, city in Appanoose County; on the Rock Island, the C. B. & Q., the I. & St. L. and the Iowa Central R.R.'s, 70 miles south of Des Moines. The town was settled in 1832 and was incorporated as a city in 1846. It is the centre of a coal mining, agricultural and stock-raising region. It has four banks, 15 churches, and an excellent public school system. Pop. (1900) 5,256.

Cen'terville, Va., a village of Fairfax County, 27 miles west of Washington. It is memorable for the series of battles fought in its vicinity on the last days of August 1862, in which the Federal army, under Gen. Pope, suffered heavy loss and a severe repulse.

Centesimo, sĕn-tĕs'ĭ-mō, a coin of Italy, Peru, etc., equivalent to a centime (q.v.).

Centiare, sĕn'tĭ-ār, or sŏñ-tyär, a measure of surface of the metric system, the hundredth part of an are (q.v.) or one square metre, equivalent to 10.764 square feet.

Centigrade Scale. See THERMOMETER.

Cen'tigram, or **Cen'tigramme,** a weight of the metric system, the hundredth part of a gram (q.v.), equivalent to 0.15432 grain troy.

Centiliter, or **Centilitre,** sĕn'tĭ-lē-tėr, a measure of capacity of the metric system, the hundredth part of a litre (q.v.), equivalent to a little more than three fifths of a cubic inch.

Centime, säñ-tēm, a French coin, in value one hundredth of a franc or about one fifth of a United States cent.

Cen'timeter, or **Cen'timetre,** a measure of length of the metric system, the hundredth part of a metre (q.v.), equivalent to 0.3937 inch. Its abbreviation is *cm.*

Centimeter-Gramme-Second System. See UNITS.

Cen'tipede, or **Centiped,** one of those myriapods (*Chilopoda*) with long, many-jointed, flattened bodies, each segment bearing only a single pair of legs. The mouth-parts, besides a pair of jaws (mandibles), consist of two pairs of maxillæ, those of each pair being fused together in the middle. The first pair of legs are fused at their base, and form the poison-fangs, the poison-gland being situated in the base, and the poison oozing out of an orifice at the end of the leg. The single oviduct and corresponding male duct open at the end of the body in the penultimate segment. The centipedes (*Scolopendra*) are mostly confined to the tropics, a small species extending as far north as North Carolina. Those of the West Indies and the tropics in general are eight to nine inches in length, one species, however, attaining the length of 18 inches. Their bite is dangerous, quite as much so as the sting of the scorpion. They are ferocious when attacked or seized, biting energetically. In the northern States the centipedes are represented by the species of *Lithobius* (*L. americanus*), which are wrongly called "earwigs," and live under stones, under the bark of fallen trees, etc. They prey on insects and worms. They have been observed to attack earthworms, grappling with them for several hours and, after killing them, sucking their blood. Very long, slender forms are *Geophilus* and its allies. The body is composed of from 30 to nearly 200 segments, each bearing a pair of legs. They are eyeless, and live buried in the sand, coming to the surface under stones.

The centipedes are hatched with numerous segments, and corresponding legs. Wood states that the female of a centipede (*Scolopocryptops sexspinosa*) guards her young by lying on her side, and then coiling her body, passes them along by a quick action of her feet, thus arranging them satisfactorily to herself. He also describes the manner of molting in this species.

The chilopods are more nearly related to the insects than are the millipedes (q.v.). They are a less ancient group. No true *Chilopoda* are known to exist in rocks older than the middle Tertiary period, species of *Cermatia, Scolopendra, Lithobius,* and *Geophilus,* having been detected in amber and the gypsum beds of Aix, Provence, France, of Oligocene age. (See CHILOPODA.) Consult: Wood, 'The Myriapoda of North America' ('Transactions,' Amer. Phil. Soc., Philadelphia 1865); also the writings of Meinert.

Centlivre, säñt-lēvr, **Susanna Freeman,** English actress and dramatist: b. Ireland about 1667; d. London 1 Dec. 1723. When very young she married a nephew of Sir Stephen Fox. Becoming a widow within a year she took for a second husband an officer of the army of the name of Carrol, who was killed in a duel the second year of their wedlock. This event in her singular career reduced her to considerable distress, and led her to attempt dramatic composition. Her first production was a tragedy entitled the 'Perjured Husband,' performed in 1700. This was followed by several comedies, chiefly translations from the French, which exhibited the vivacity that distinguishes her literary character, and met with some temporary success. She also tried the stage as an actress on the provincial boards, and by that means attracted the attention of her third and last husband, Mr. Centlivre, Queen Ann's head cook, whom she married in 1706. She still continued writing for the stage, and produced several more comedies. Some of these remain stock pieces, of which number are 'The Busy Body'; 'The Wonder'; and 'A Bold Stroke for a Wife.' They are diverting from the variety of incident and the liveliness of the characters, but want the accompaniments of adequate language and forcible delineation. They partook of the license of the age. Mrs. Centlivre enjoyed the friendship of Steele, Farquhar, Rowe, and other wits of the day. Having, however, offended Pope, she obtained a place in the Dunciad, but is introduced by no means characteristically. An edition of her works with a biography appended appeared in 1872.

Cent'ner, a German weight, in common use on the continent of Europe, which is nearly the equivalent of the British hundredweight. It formerly varied in the different German states, but since the introduction of the metric system of weights and measures into the German empire, 1 Jan. 1872, the value of the centner has been fixed at 50 kilograms, or 100 German pounds, equivalent to 110.23 pounds avoirdupois. In Austria it is equal to 110½ pounds, and in Sweden to 112.06 pounds.

Cento, chĕn'tō, Italy, a city 13 miles north of Bologna, on the eastern bank of the canal of Cento, and near the river Reno. It is surrounded by a rampart and ditch, and contains several churches, convents, and a cathedral. The celebrated painter, G. F. Barbieri, commonly called Guercino, was born here about 1590. Pop. 5,000.

Cento, sĕn'tō (Latin, "patchwork"), originally a cloak made of patches; hence, as Lessing observes, the dress of Harlequin is called in Apuleius *mimi centuculus.* The term has been transferred to such poems as have been formed out of verses taken from other poems. It was a particular art to combine passages of different authors on different subjects in this manner so as to form a regular whole. Thus there were in early times Vergilian centos (*centones vergiliani*), in which most of the verses

were taken from Virgil; for instance, the 'Cento Nuptialis' of Ausonius, and centos from the verses of Homer (*Homero-centones*).

Cen'tral Africa Protectorate. See BRITISH CENTRAL AFRICA PROTECTORATE.

Central America is a continent of distinct geologic formation, with east and west mountain-folds, at right angles to those of North and South America. Though on the map it appears to be a mere isthmus extending in a southeasterly direction from Mexico to Colombia, between the Caribbean Sea and the Pacific Ocean, it is in fact structurally much more nearly related to the West Indies, including the Gulf of Mexico and the Caribbean Sea, and to the northern coast of South America, than to the main bodies of the larger continents. Probably in the Tertiary period Central America and the Antilles together formed a great island or archipelago lying between North and South America. (Compare Robert T. Hill's 'Cuba and Porto Rico,' etc.). This subject will be referred to below, in connection with "volcanoes and soil."

Politically, the name groups together Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica: five republics which are characterized in the treaty of peace signed at Corinto, Nicaragua, 20 Jan. 1902, as "the Central American family." Moreover, the Isthmus of Panamá at the commencement of its history under the Spanish régime was associated not less intimately with the settlements in the region north and west of it than with those of South America; British Honduras (Belize) also, an English colony, lying between Guatemala and the Caribbean Sea, has been connected about equally with the history of the Central American states and with that of Yucatan (Mexico). We shall therefore mention both Panamá, a department of Colombia, and British Honduras in the following historical sketch.

History.—Rodrigo de Bastidas, a notary of Triana, was the first Spaniard to explore the Caribbean coast of Central America. He embarked at Cádiz in October 1500; and, after reaching the mainland of South America near the present Venezuelan boundary, coasted westward and made observations of the isthmus from a point below Darien to Nombre de Dios. Columbus, on his fourth voyage to America, sailing from Cádiz 9 May 1502, and stopping at Santo Domingo on the way, arrived off the shore of Honduras July 30. There he heard reports of the wealth of Mexico, but decided to continue the voyage southward, searching for a strait that should lead across terra firma to India. Thus they passed a cape to which they gave the name Gracias á Dios, and on 25 September reached the river San Juan de Nicaragua, and heard stories from the natives which made them believe they were within a nine-days' journey of a splendid land, such as Marco Polo had described in his veracious account of travels in Asia, and that the river Ganges lay only a little beyond. On 7 October they came to the beautiful Laguna de Chiriqui, and on the adjoining Veragua coast they obtained a large amount of gold by trading with the natives.

Columbus lingered in the immediate neighborhood of the Chagre (now called Chagres) River and Colon — at Porto Bello from 2 to 9 November, and at other points within a few miles for three weeks and five days. Thus during more than a month the great discoverer hovered voluntarily about the spot where the strait he dreamed of was to be cut after four centuries should have elapsed. And when he thought to return by the way he had come, abandoning the search, stress of weather held his vessels back, so that it was not until 6 Jan. 1503, that they anchored in a little river just west of Colon. He wished to plant a colony on the coast between Veragua and Cerebaro, but, hostilities breaking out between the Spaniards and the natives, the former were obliged to abandon their attempt, and once more Columbus passed the place of the future canal, clinging to the shore before setting a straight course for Jamaica.

First Spanish Colonies.— In 1506 Juan Diaz de Solis and Vicente Pinzon sailed along the coast of Honduras westward, exploring the Gulf of Honduras, in search of a passage by water to the Far East — India and Cathay. Several years passed before the Spanish king, Ferdinand, authorized Alonzo de Ojeda and Diego de Nicuesa to colonize and govern in his name the northern coast of South and Central America. The river Darien or Atrato was made the dividing line between their dominions. The eastern or South American portion was called Nueva Andalucia, and of this Ojeda was made governor; the western division was named "Golden Castile," *Castilla del Oro,* and the command given to Nicuesa. The latter secured the larger number of followers; the former, however, attracted to his standard Martin de Enciso, afterward governor, Balboa, discoverer of the Southern Sea, and Francisco Pizarro, conqueror of Peru. The forces of both governors suffered extreme hardships. Nicuesa's capital was at Nombre de Dios, Ojeda's at San Sebastian — so named because the Indians afflicted them as that saint was tortured. Ojeda returning to Española, where he died, Euciso, Balboa and Pizarro removed the capital of Nueva Andalucia to Antigua del Darien — that is, a point within Nicuesa's dominions; but the natives of Darien did not poison their arrows. In the contest for supremacy that ensued, Nicuesa was the loser. Balboa assumed command, and Antigua became the centre of Spanish enterprise in that part of America. On 25 Sept. 1513, Balboa discovered the Southern Sea, and four days later took possession of it, with all its lands and ports and islands in the name of the king and queen of Spain. Before news of this discovery reached the Spanish court, a successor to Balboa had been appointed in the person of Pedrarias (also called Dávila). In 1517 Balboa was falsely charged with treason, and executed. Pedrarias Dávila, being superseded in command, migrated to the south coast and founded the city of Panamá, 15 Aug. 1519.

A voyage into the unknown northwest from Panamá was made in 1522 by Gil Gonzales, who explored the Dulce and Nicoya gulfs indenting Costa Rica's southern shore. Thence northward 50 leagues he went, to the domain of a chief whose name was Nicaragua, and who dwelt near the principal lake of that region. Gonzales learned that this lake, though lying near the Southern Sea, had an outlet to the Caribbean. In his narrative he says that the discovery is important, inasmuch as only "two or three leagues of very level road separate the two

seas." The expedition returned to Panamá in 1523, after baptizing thousands of natives and securing 112,000 *pesos* of gold. On 15 Sept. 1521, Panamá was made a city with royal privileges; the episcopal see was transferred to it; from this base expeditions were sent out toward Peru as well as into the northwest. Pedrarias, in 1524, dispatched Francisco Hernandez de Cordova with Hernando de Soto and other captains to Lake Nicaragua. Gil Gonzales, continuing his discoveries in Honduras and Nicaragua, came into collision with de Soto; and only a little later one of the captains of Hernan Cortez, the Spanish conqueror of Mexico, appeared as a claimant for the territory of Honduras.

In the latter part of October 1524 Cortez set out from Mexico, marching to Honduras with an army of about 100 horsemen, 40 archers and arquebusiers, and 3,000 native warriors and servants. After making himself governor of the country, he returned in triumph to Mexico City in May 1526. Pedrarias went to Nicaragua about the same time: there were rival Spanish governors even then in Nicaragua and Honduras. Guatemala and Salvador were overrun by Pedro de Alvarado, second in command to Cortez: the former country, in which a great empire had existed at the beginning of the Christian era, was inspected by Alvarado in 1522, and conquered with a small force of Spaniards and native allies before two years had passed.

Veragua.— In 1535 an unsuccessful attempt to colonize Veragua was made in the interest of the descendants of Columbus (on whom the titles, "Duke of Veragua," etc., had been conferred), and a still more calamitous enterprise was that of Diego Gutierrez, a citizen of Madrid who led an expedition to Costa Rica north of Veragua in 1540. Francis Drake, English privateersman, attacked Nombre de Dios in 1572. Again, in 1595, Drake (now Sir Francis, knighted for his feat of sailing round the world), Sir John Hawkins and others took Nombre de Dios; but an English force of 750 men sent to attack Panamá was defeated by the Spaniards when half-way across the isthmus. Drake, dying on 28 Jan. 1596, was buried off Porto Bello. The conquest of Costa Rica was undertaken by Nicaraguan Spaniards in 1560. Partial success rewarded the efforts of the soldiers; meanwhile, however, great progress had been made in the pacification of that province by the efforts of Franciscan friars.

Buccaneers in the 17th Century.— Captain William Parker, sailing from Plymouth in November 1601, captured Porto Bello. In December 1616 the king of Spain informed the governor of Castilla del Oro that he and the commercial world believed that communication might be easily established between the oceans by constructing a canal. This was the century of English depredations and of Spanish idle dreaming — Spain's centuries of vigorous expansion having passed. In 1668 the Welsh buccaneer Morgan plundered Porto Bello, his foul cruelty rivaling any Spanish misdeed in this blood-stained region. Three years later, having at his disposal a fleet of 37 ships and a force of 2,000 fighting men, he captured Panamá (January 1671). The inhabitants set fire to their homes, and built a new city of the same name at a little distance in a locality less exposed to attack. Granada, in Nicaragua, was sacked by French and English pirates in 1686.

Scotch Colony on the Isthmus.— A number of influential Scotchmen, chief of whom was the founder of the Bank of England, William Paterson, were authorized by the Scottish parliament in 1695 to found colonies in savage lands; afterward obtaining letters patent from William III. of England. Paterson chose Darien, believing the control of the traffic of the isthmus to be essential to the prosperity of England; he certainly was not, as is incorrectly and commonly stated, merely anxious to make money for his company, and reckless of consequences to the colonists. See Bannister's 'Life'; Rodriguez's 'Anexion de Cuba'; etc. The largest and most costly expedition that had yet been fitted out for colonization in America sailed from Leith, 26 July 1698, and founded "New St. Andrew." Subsequently recruits were sent out to them; but the project came to a miserable end. More than 2,000 lives and several millions of money had been lost, when the survivors were starved into surrender by the Spaniards.

A British squadron commanded by Admiral Edward Vernon (21 Nov. 1739), took Porto Bello, but was defeated at Cartagena. Meanwhile English settlements of a very peculiar character had been begun in Mosquitia and at Belize.

Mosquito Coast.— The Misskito tribe, called by the Spanish and English "Sambos" or "Mosquitos," a hybrid people, descendants of fugitive slaves, "Cimarrones," and natives, ruled by an hereditary king, dwelt on the eastern coast of Honduras and Nicaragua in the 17th century. Unoccupied by the Spanish, this coast was frequented by buccaneers, who made Cape Gracias á Dios, on the dividing line between the colonies just mentioned, their rendezvous. Small settlements of English adventurers existed in this region; by the treaty of Madrid (1670) certain rights were conceded to Great Britain; the British claim was asserted (1744) by sending troops and building forts, but withdrawn (1786) when an agreement was reached as to the cession by Spain of the territory on the north coast of the Gulf of Honduras to which we shall now refer.

The English Colony.— The foundation of Belize, on the coast east of Guatemala and south of Yucatan, by the Scotch buccaneer Peter Wallace, has been described in the article "Belize." The ex-freebooters of Belize, reinforced by other white adventurers, Mosquito Indians, etc., were able to exploit the rich forests and hold their own, or more, in the contest for the possession of this territory waged at intervals between the authorities of Yucatan and the wood-cutters (regarded as interlopers) from 1733 until the end of the 18th century. The treaty of Versailles (1783) defined the limits of Belize; such limits were more precisely stated in the treaty signed at London, 14 July 1786; but the boundaries were subsequently extended by encroachments of the wood-cutters. Thus England, retaining the region now known as the colony of British Honduras, abandoned possession of the Mosquito coast, though her claim to exercise a certain degree of influence in the latter territory (from which the Spaniards were expelled by the Sambos in 1796) was not expressly and absolutely surrendered until 1850 or 1860. (See treaties mentioned below.) Before that deter-

mination, several reverses were sustained in Nicaragua. An English force was repulsed at Fort San Carlos in 1769. A few years later the design to sunder the Spanish provinces of Central America, and at the same time to capture a route for an interoceanic canal, by taking possession of Lake Nicaragua and the cities of Granada and Leon (see Bancroft's 'Central America'), proved infeasible. An English force of about 1,800 men, including a party of marines under Horatio Nelson, was forced by the deadly fevers to abandon the attempt.

Spain in Possession.— Except Belize, Mosquitia, and large tracts in which the Indians remained nearly undisturbed, Spain now held the land, but no longer had energy or opportunity to develop its natural resources. The natives, more docile and serviceable than in other parts of America, seldom increased the difficulties of the situation by uprisings; there was, however, little incentive to accumulate property in a land menaced constantly for a hundred years by English, Dutch, and French pirates, and the mother country had grown too poor to take the lead in industrial enterprises. The several divisions of an apathetic population were easily drawn together for administrative purposes: the captain-general of Guatemala by the middle of the 18th century controlled the provinces of Costa Rica, Honduras, Nicaragua, and Salvador, beside others now within Mexican boundaries. Revolt against Spain was the form in which the spirit of the people, awakened from this lethargy, naturally expressed itself. Unfortunately armed revolt has ever since been too closely identified with progress in the popular conception. The first weak blow for Central American freedom was struck in San Salvador, 5 Nov. 1811. A sequel to this attempt (in Leon, Nicaragua, 13 Dec. 1811) duplicated this Salvadoran effort, in result as in motive. A third failure was recorded when the Colombian insurgents (1820) fitted out a combined sea and land expedition to operate against the towns of Omoa and Trujillo. The Isthmus of Panama cast in its lot with South America, rather than with Central America, by voluntary annexation to the republic of Colombia on 28 Nov. 1821. (For its subsequent history see COLOMBIA and PANAMA.) The declaration of independence at the city of Gautemala, 15 Sept. 1821, was little more than an echo of the triumphant cry of other Spanish-American colonies in revolt; it was soon followed (5 Jan. 1822), by a decree of the *junta directiva* annexing Central America to Mexico. Salvador refusing to join in this surrender, a war with Guatemala ensued. Before 18 months had passed the Central American provinces resolved to form a union and constitute a single nation. On 1 July 1823 a national constituent assembly expressed this purpose, the name chosen for the nation being *Provincias Unidas del Centro de America.*

Slavery Abolished.— Though laggards in the race to win freedom, the Central Americans were prompt in bestowing it. The laws of 31 Dec. 1823, and 17 and 24 April 1824, emancipated their slaves and declared that slaves of other countries on coming to Central America should be freed. When dissensions and civil war broke up their confederacy, they had at least taken one step forward, in advance of their neighbors. The congressional decree of 30 May 1838, granting to the states the privilege of unrestrained action in most important matters practically dissolved the union, though Salvador tried to maintain or renew it long after the other confederates withdrew. Nicaragua, on recovering her autonomy, became involved in a dispute with Great Britain, the latter upholding the claim of the Mosquito king to all the territory lying between Cape Gracias á Dios and the mouth of the San Juan River, and sending (January 1848) two warships to occupy the port of San Juan. Nicaragua yielded provisionally to superior force. At this point the intervention of the United States was felt. The Clayton-Bulwer treaty, concluded at Washington 19 April 1850, between the United States and Great Britain, provided that neither power should occupy, fortify, colonize, or exercise dominion over any portion of Central American territory (except Belize), or make use of a protectorate in any form. In regard to this treaty the statements have been made: (1) That it guarantees Central American independence; (2) That it encourages the maintenance of English influence. Both statements are correct. The English influence was considered beneficial within certain limits (see BELIZE.) By the Zeledon Wyke treaty of 28 Jan. 1860, England ceded to Nicaragua absolutely the protectorate over the Mosquito coast.

Walker's Campaign.— While the diplomacy of the government of the United States was in the main considerate and helpful at this time, the conduct of some of her individual citizens left much to be desired. San Juan del Norte, or Greytown, was bombarded by the United States sloop-of-war Cyane, and burned to the ground by a landing party from that vessel, on 13 July 1854, the excuse offered for this violence being an alleged insult to the United States minister to Nicaragua. William Walker, a native of Nashville, Tenn., of Scotch descent, sailed from San Francisco, Cal., 4 May 1855, on the brig Vesta, with 58 men, to take part in the little wars of political factions in Nicaragua. Before long he found himself at the head of a considerable force composed of Americans, European adventurers, and natives, with whose aid he became master of the situation, forced the people to elect him to the presidency, and was inducted into office 12 July 1856. Attacked by the combined forces of Salvador, Costa Rica, Guatemala, and Honduras, he was obliged to capitulate. Returning in 1860 with another filibustering expedition (this time landing at Trujillo on the coast of Honduras), he was captured, tried by court-martial, sentenced to death, and executed.

Renewal of the efforts to achieve Central American unity was due in a measure to President Barrios of Guatemala (1873–85). For the further development of this design; the attempt (1895–8) to unite Honduras, Nicaragua, and Salvador; the treaty of 20 Jan. 1902, mentioned above, and events of the years 1885 to 1903, we refer our readers to separate articles on each of the five republics.

Mountain System.— The mountains described as extending directly at right angles to the cordilleras of North and South America are part of a great Antillean system. East and west mountain ranges of this type occur in the Isthmus of Panamá, Costa Rica, and the eastern parts of Nicaragua, Honduras, Guatemala, and the adjoining provinces of Mexico; also along the Colombian and Venezuelan coast of South

America, and in Cuba, Haiti, and the other islands of the Greater Antilles. Two submarine ridges stretching across the Caribbean Sea, between Honduras and the Sierra Maestra range in Cuba, and from Cape Gracias á Dios to Jamaica, are regarded as being genetically a part of the same system. The interesting suggestion is made by Mr. Robert T. Hill that the Caribbean lands before the close of the Tertiary period were much more extensive than now. «Geological surveys,» he says, «have proved that during this time of expanding Antillean lands, the Gulf Stream flowed out from the American Mediterranean as now, but through a passage across the northern half of Florida. . . . The great banks of the western Caribbean Sea were at that time projections of land probably connecting Central America with Jamaica and possibly Cuba.» Therefore Florida, the Bahamas, the Antilles, and at least the eastern part of Central America, totally severed from North and South America, together formed either one great island, or, more probably, a group of several large islands, with volcanic chains on the east and west (see CARIBBEAN SEA), and with characteristic rocks, calcareous and igneous, which have weathered into soils of unsurpassed fertility (see CUBA).

Volcanoes.— A Central American group of volcanoes, with 31 active craters crossing the western ends of the Antillean folds, occurs on the Pacific side of the republics, from Costa Rica to Guatemala. The central and eastern region is shown by the observations of Mr. P. W. Chamberlain, member of the American Society of Civil Engineers, to be well watered, with comparatively low mountains, very rich soil, and a good climate — except the Caribbean coast which, from Trujillo downward, including the Mosquito territory, is hot and insalubrious. Lack of communication and means of transportation has led to the abandonment of the intermediate lands, the most attractive and extensive part of the country, nearly or quite beyond the influence of the volcanic area. The easily approachable volcanic strip (in Nicaragua, for example, between the lakes and the Pacific) has been preferred hitherto as a place of residence. Thus one who visits only the principal cities in the centre of population, seeing nothing of the naturally richer and better districts, receives the impression that this is the most volcanic region of the globe. The largest volcanoes are in the north — for example, the Acatenango, 14,000 feet elevation, in Guatemala, and in the south — for example, the Irazú and Turealba, of 12,000 feet, in Costa Rica. In Nicaragua the highest, El Viejo, is only 5,800 feet above sea-level. In Guatemala we find the volcanoes, Fuego, Cerro Quemado, El Chato, etc.; in Salvador, Ilopango, San Salvador, and others. Earthquake shocks in the republics last mentioned, and also in Costa Rica, have been, as a rule, very severe, while those of Nicaragua are comparatively mild in force and extend over limited areas. The recorded seismic disturbances that have affected the whole country are those of 1538, 1648, 1651, 1844, and 1865. Central Nicaragua, east of the lakes, Nicaragua and Managua (the largest bodies of fresh water in Central America) is regarded as nearly immune from such disturbances. Nicaragua's centre of volcanic activity is a ridge, the Sierra de los Morabios, between the Cosigüina (whose outburst on 2 Jan. 1835 was considered the grandest on record before the eruption of Krakato in 1883), and the Momotombo. In this ridge are 10 vents, two of which, the Telica and Momotombo, are active, and none can be properly called extinct. Southeast from the Morabios ridge is the isolated active volcano Masaya. The Orosé is in Costa Rican territory. The island of Ometepe in Lake Nicaragua has two volcanoes, one dormant, the other extinct. Comparatively few members of the Central American chain of volcanoes are of the type with which fierce eruptions are commonly associated; moreover, the fertility of the soil on their flanks, due to the high percentage of soda and potash contained in volcanic dust, tempts agriculturists to remain in this neighborhood. It will be noted with interest, also, that the proposed line of the intercontinental railway keeps near to the Pacific coast. It is probable, therefore, that for many years yet to come the best part of Central America — the central districts — will receive only secondary consideration, remaining comparatively undeveloped.

Intercontinental Railway and Isthmian Canal.— Two subjects of great importance to this region are: (1) The plan to connect the railway systems of North and South America at the Isthmus of Panamá, so that the political and commercial capitals of all, or nearly all, American republics may be closely united by land routes. (2) The proposed shortening of the highways of the sea between the same nations by the construction of a ship canal (see ISTHMIAN CANALS). An all-rail route from New York to Buenos Ayres would be approximately 10,471 miles in length, of which about 5,000 miles remain (1903) to be constructed. The first International American Conference (1889–90) recommended the construction of the railroad necessary to join existing lines and give through rail communication; President Harrison approved the project (in a message, 19 May 1890); engineers were put in the field to make surveys, which were completed in 1895; in March 1903, a commissioner from the United States was sent to the Central and South American countries to ascertain the condition of lines in operation and the prospect for the completion of the undertaking. As shown by surveys published in 1902, the line will join an extension of the Mexican railway system on the northwestern frontier of Guatemala; it will have 230 miles in Guatemala, 220 in Salvador, 70 in Honduras, 224 in Nicaragua, and 363 in Costa Rica; in South America it will follow the curvature of the Pacific coast, though not closely, to Cuzco, Peru; and, in combination with the extensive systems of Argentina and Chile, will connect the Sierra of Bolivia with the southern capitals, Santiago and Buenos Ayres, with extensions to Rio de Janeiro and Asuncion. At present the principal railway lines in Costa Rica, Guatemala, and Honduras run from the interior to the ports. Guatemala leads, with 342 miles of railroad, Costa Rica has 222, Nicaragua 176 miles, Salvador 132 miles, and Honduras 50 miles. Such is the lack of transportation facilities between the countries of Spanish-America, a letter or express package from one of the Central American states, or even North America, intended for some of the South American republics, is sent first to Europe, to be forwarded to its destination; but the region now so isolated will lie at

the crossroads of two great routes of traffic in the future.

Races.— Mr. H. H. Bancroft is authority for the statement that the most numerous class of the population in Central America, next to the pure Indians, are the *ladinos,* most of whom are half-breeds, including mestizos (the offspring of white and Indian), mulattoes, quadroons, octoroons, and zambos (or sambos — the offspring of Indian and negro). "The *ladino* class furnishes the domestic servants, muleteers, small farmers and tenants, herdsmen, and not a few beggars and robbers. . . . A considerable number of *ladinos,* however, become mechanics and traders, and many have attained high positions in the Church and the state, and become distinguished for their talents and abilities. The zambos and other mixtures of the negro race reside in the coast districts," doing the heaviest work. The Caribs, who have increased greatly in numbers since they were transported from St. Vincent by the British, are more active and industrious than the sambos. Salvadoran society, according to the same authority, has a small proportion of whites, while the mass of the population is Indian, *ladino,* and zambo; in Guatemala he found (1883) that the Indians numbered 750,000, *ladinos* or mestizos 430,000, white persons 10,000, negroes 8,000, and foreigners 2,000; in Honduras that "the amalgamation of races has almost obliterated the line distinguishing whites from blacks." In Costa Rica, on the other hand, the inhabitants are mainly white, and to a large extent descendants of Spaniards from Galicia, the Indians being distinct from the civilized race, and the negroes living almost exclusively on the coast.

Comparative Statement of Area, Population, Commerce, Imports, and Exports, etc.— The following comparative statement of the commerce, imports and exports, and interior developments of the five republics is based upon the latest complete statistics, equally representing all of the countries, that are now available — those for the year 1901:

1. Costa Rica: Area 22,000 square miles, population 310,000. Imports during 1901 were valued at $4,410,422.45, while the exports rose to $5,583,197.91, giving an excess of exports over imports of $1,172,775.46. Coffee exports reached a total value of $2,823,291.32, and bananas were shipped valued at $1,532,581.78 (nearly 4,000,000 bunches). Gold coin and bullion exported aggregated $682,409.23. Importations from the United States amounted to $1,946,726, while exports to that country for the same period aggregated $2,990,550. In the trade for 1900 and 1901 the United States shared to the extent of about 50 per cent in the import lists of the republic, as against 43 per cent in 1899, Germany's trade having fallen off one and a half points, while that of Great Britain advanced from 19.6 per cent to 22.6. Two issues of bonds were authorized during the year, the proceeds to be used in developing the railway interests of the country. On the other hand, Costa Rican bonds to the value of 642,300 *colones* (a *colon* equals $0.465 in United States gold or silver) were incinerated, having been issued in 1897 and 1899, and subsequently redeemed. A commercial treaty with France, providing for the reciprocal exchange of tropical products between Costa Rica, the French colonial possessions, and France, at the lowest rate of customs duties, was signed by representatives of the two countries interested on 7 June 1901, at San José. Trade conditions being reported as unfavorably affected by the decline in the price of coffee in foreign markets, a law abolishing the export duty on that article became operative on 1 Sept. 1901. According to a governmental decree, import duties on foreign goods brought into the republic were raised 50 per cent after 28 April 1901. A rapid development in the tobacco industry was noted. The net earnings of the Costa Rica Railway Company were sufficient to meet the interest on the capital invested, and to increase the reserve fund. In March the circulation of 30,000 *colones* was authorized by presidential decree. These gold coins were made at the United States mint in Philadelphia.

2. Guatemala: During 1901 Guatemala exported to the United States products valued at $3,512,445, as compared with $2,402,978 in 1900. The imports from the United States were worth $1,424,814, while in the previous year they were worth only $785,462. The tariff schedule of 1900 continued in force during the first six months of 1901. Certain exemptions were, however, made in favor of imports from the neighboring republics of Salvador, Honduras, Nicaragua, and Costa Rica. A reduction of 30 per cent, provisionally granted in the customs tariff to merchandise imported from Europe and the United States, was extended for another period of six months. On 12 Aug. 1901 a decree was issued by the government providing that the duty of six *pesos* (Guatemalan *peso* equals $0.361) per quintal on coffee exported from the republic should remain in force until 30 June 1902. The crop of 1901 was estimated at 480,000 quintals. A decree in January 1901 authorized the appointment of four teachers, two men and two women, who should be sent to the United States at the government's expense for the purpose of studying the methods of instruction in that country. With a view to the proper exploitation of the forest lands, special regulations were enacted. The president of the republic, in his annual message to the national Legislative Assembly at the opening of its regular session in 1901, noted the improvement in public highways, the development of agriculture, and in general the moral and material advancement of the country. In January definite steps were taken for the completion of the Northern Railway, which will be of great benefit in the development of Guatemala's latent resources, and to this end a contract was made with the Central American Company. The government of Guatemala proposed, as a guaranty for the cost of construction, an issue of 6 per cent gold-bearing bonds to the amount of $4,000,000, redeemable within 10 years, the road and rolling-stock to become eventually the property of the government. A contract was entered into (April 29) between the government and the Guatemala Central Railroad Company for the extension of the Patulul branch of that road, to connect the Guatemala Central and the Occidental Railroad, thus placing the capital in direct communication with the northern and western provinces. A tramway between Guatemala city and Guarda Viejo was authorized, the concession including the free importation of the necessary cars. To prevent mining monopolies, the national Legislative Assembly prohibited the holding of more than one mine by one individual in his own name, or of more

than three mines by any corporation of three or more members. The area of Guatemala is 47,810 square miles; its population in 1897 was 1,501,145.

3. Honduras (British): Area 8,000 square miles; has about 32,000 inhabitants. See BELIZE; HONDURAS (*British*).

Honduras (Republic of) has an area of 46,400 square miles. Population 543,741. In the fiscal year 1901 the exports of Honduran products to the United States were valued at $1,258,317, as compared with $988,606 in the preceding year, while the imports from the United States in the same years were valued at $1,115,009, and $1,181,453, respectively. Other countries furnishing imports were: Germany, to the value of $486,373, England $471,650, France $101,855, British Honduras $152,800, other Central American states, $107,402. Leading exports: Precious metals, $2,279,115.50; fruits, $1,945,388; cattle, $557,316; coffee, $275,193; cabinet woods, $274,255; tobacco, $213,423; hides and skins, $182,345; indigo, $107,365; sundries (hats, wheat, salt, etc.), $177,503. Seventy per cent of the exports were taken by the United States, Germany and the Central American republics dividing the balance. Exports exceeded imports by $2,014,000. Net government receipts from all sources, $3,017,273.40; expenditures, $2,840,397.21. Payments on the national debt during the year, $805,144.73, leaving the total indebtedness of the republic at the beginning of 1902, $1,285,207.75. The coinage of 1901 exceeded that of 1900 by $3,948.52. During the year 2,999 ships (total capacity, 491,199 tons) entered the ports. These vessels brought 5,168 passengers, and carried away on their outward voyages 3,928 passengers. Exports of ores from the mines amounted to $470,293.50 more than in 1900. The quantity of mail handled by the post-office service was greater than in the previous year. The telegraph system was extended by 120 miles of additional wires, making the total length of the telegraph lines 3,166 miles. During 1901 the number of messages sent was 543,599, or 31,045 more than in 1900. A report of the secretary of war presented to the national congress showed the total strength of the army to be 40,079 men. Subjects of national importance were: the canalization of the Patuca River, the systematic culture of rubber, and the construction of a line of railway from Omoa to the Bay of Trujillo — the concessionaires in the matter of the railway being citizens of the United States.

4. Nicaragua: Area, 40,000 square miles, population, 360,000. Exports to the United States in 1901 were of the value of $2,035,636, as compared with $1,520,266 in 1900. Imports from the United States were of the value of $1,482,194 and $1,817,869 in 1901 and 1900 respectively. Total foreign commerce of the republic in the year 1900: imports, $2,487,952; exports, $2,836,557. In 1901 Managua was made headquarters of the German consul-general, who exercises control over German consulates in Salvador, Honduras, and Costa Rica. At the close of 1900 the total debt of the republic was approximately $4.000,000, of which $2,666,000 represented internal indebtedness, and about $1.334,000 the foreign debt. During the year the government floated a loan of $451,000, the bonds being purchased by local merchants and business men. A treaty of reciprocity between Nicaragua and Chile provided for the free admission of certain articles at the ports of those countries. With a view to developing trade relations with Spain, a special exhibition of Spanish products was established at Managua in the National Museum. The work of connecting the eastern and western railway systems was continued; a syndicate of citizens of the United States undertook to build cart-roads to certain mines, and purchased the exclusive rights of navigating the largest river in Nicaragua, the Segovia; a concession for a railway from Matagalpa to the head of navigation was granted to a citzen of the United States; a concession was granted to a company for the establishment of a line of steamships, to run between the Caribbean ports, and carry the mails between Bluefields (formerly written Blewfields) and New Orleans; a dock to cost $150,000 and to be built at Corinto was contracted for, and the government also granted a concession for the establishment of a thread and cloth mill. Increased attention was given to the cultivation of the rubber-tree, the only important agricultural industry of the Caribbean coast country having been until recent years the growing of fruits, principally bananas. There was but one large manufactory of sugar.

5. Salvador: In order to improve the interstate relations of the republics of Central America, a session of delegates from the various countries was held in the city of Salvador in February 1901, at which it was agreed that the products of the states there represented should enjoy reciprocal free entry. The exports in 1901 included 326,588 sacks of coffee, worth $8,308,466 in silver. Other products exported were of the value of $2,647,579, silver. Imports during the same period were valued at $2,615,150.64, gold, which, with exchange at 150 per cent, equals $6,537,876.60 silver. Exports to the United States in 1901 were worth $1,037,715, as compared with $738,674 in 1900. Imports by Salvador from the United States in 1901 were valued at $738,722; in 1900 they were $679,440. At the beginning of the year 1901 the republic of Salvador was reported to be entirely free of foreign debt, bonds covering such indebtedness having been redeemed and destroyed in November 1900. Receipts from taxation in 1901 were: Customs duties, $4,168,564.59; tax on liquors, $1,814,761.99; sundry taxes, $315,283.14; telegraphs, post-offices, etc., $258,111.84; total, $6,556,721.56. To this sum there must be added $1,133,958.17 (from deposits, licenses, etc.), which, added to the balance on hand at the beginning of the year, makes the total receipts $7,825,764.40. Disbursements in 1901 were: Legislative, executive, and judicial branches of government, $4,378,948.31; payment of different credits, $3,197,956.09; return of deposits and other expenditures, $63,986.77; balance 31 Dec. 1901, $184,873.23; total $7,825,764.40. The public debt on 31 Dec. 1901 was $8,325,904.43. Salvador's area is 7,255 square miles; its population, according to the census of 1901, was 1,106,848.

MARRION WILCOX,
Authority on Latin-America.

Cen'tral City, Colo., a city and county-seat of Gilpin County, situated on the Union P. R.R., 20 miles southwest of Boulder. It lies in a gold-mining district of the Rocky Mountains and its industries are chiefly connected with the development of the mines, which have been worked for about half a century. Pop. (1900) 3,114.

Central College, a coeducational institution in Fayette, Mo., organized in 1857, under the auspices of the Methodist Episcopal Church South; reported at the end of 1902: professors and instructors, 10; students, 201; volumes in the library, 6,500; value of all property, $320,000; acting president, T. Berry Smith, A.M.

Central Falls, R. I., a town in Providence County, situated on the Blackstone River, and the New York, N. H. & H. R.R., 4½ miles north of Providence. It has a number of large manufacturing establishments, with an aggregate capital of $3,389,000, including cotton, woolen, silk, and leather factories. The river supplies excellent power. There are several churches, newspapers, and a national bank. Pop. (1900) 18,167.

Central Force, a force which constantly urges the body upon which it acts toward the same fixed point or "centre." Central forces are specially important in physics and mechanics, because systems in which the forces are all of this character are "conservative." See DYNAMICS; ENERGY, CONSERVATION OF.

Central India Agency, the official British term for a collection of states in Hindustan, consisting of four groups or agencies, namely, Bundelkhand, Bhaghelkhand, Gwalior, and Nimar and Malwa, covering an area of 77,808 square miles, under the ultimate charge of the governor-general's agent at Indore. The largest individual states are Gwalior, Indore, and Bhopal. Pop. (1901) 8,501,883.

Central Park, the most noted park in New York city. It contains 840 acres and extends from 59th Street to 110th Street, and from Fifth Avenue to Eighth Avenue. In 1856, the year of its purchase by the city, the land now constituting Central Park was occupied by shanties, bone-boiling establishments, piggeries, and pools of offensive stagnant water which rendered the neighborhood anything but park-like. The first full year's report of the men who were given the work of turning this ground into a park, contains the following description of its condition:

"It was already a straggling suburb, when purchased by the city, and a suburb more filthy, squalid and disgusting can hardly be imagined. A considerable number of its inhabitants were engaged in occupations which are nuisances in the eyes of the law and forbidden to be carried on so near the city. They were accordingly followed at night in wretched hovels half hidden among the rocks.

"During the autumn of 1857, 300 dwellings were removed or demolished by the commissioners, together with several factories and numerous 'swill milk and hog-feeding establishments.' Ten thousand loads of stone were also taken off the land and used to build a rough enclosing wall."

This description helps one to appreciate the vast amount of work, and artistic planning which has been necessary to bring the park to its present state of beauty and attractiveness, and it is interesting to see how fully the prophecy of a park commissioner, who wrote in 1868, has been fulfilled:

"But we who are in the middle of life," he says, "can never know all its beauty. That is reserved for those for whom we have planted these shrubs and trees, and spread these level lawns. These trees will arch over many happy generations, and thousands who are not yet born will enjoy the sweet green of the grass; and it will ever habitually serve to keep the memory of its founders green."

The central site was finally selected despite its unpromising topography, in preference to the one first proposed at 66th Street on the East River — the Jones' Wood site — because it was central and spacious. It was also thought that the great expense of turning it into building lots — the extensive filling of low, swampy ground, and blasting away of ledges — would enable the city to purchase the land at a low figure. Including a number of acres of water surface, comprising the two reservoirs belonging to the Water Department, the cost was about $7,500 an acre. The total acreage, including the subsequent extension to 110th Street, was 843, and the price paid $6,348,959.90.

There has been spent in bringing the park to its present condition somewhere between $25,000,000 and $30,000,000.

The special committee appointed by the Board of Aldermen to select the most desirable park site pronounced emphatically in favor of "the Central Park," stating their opinion that "it could be made to compare favorably with

the most celebrated public grounds of the chief cities of Europe, not excepting Hyde Park of London, the Champs Elysées of Paris, the Prater of Vienna, the Cascine of Florence, the Corso of Rome, the Prado of Madrid, or even on the American continent, with the spacious plazas of Havana or the lovely botanical gardens of Rio de Janeiro."

It was freely predicted by the opponents of the park that it would prove a white elephant on the hands of the city; that it could never be made into a decent-looking park, and was an unnecessary extravagance which the city did not need and could not afford.

The largest settlement of the park seems to have been along the Eighth Avenue side. Mount St. Vincent was included within the park borders, situated just west of Fifth Avenue at 105th Street, on the old Boston post road, which ran diagonally through the park. The land and buildings (now the headquarters of Commissioner Wilcox) forming the State arsenal, were subsequently purchased by the city and added to the park in 1867, the price paid being $275,000.

Owing to the lack of funds no work was done in improving the land until 1857. In April of this year the legislature authorized the issuance of bonds and in the following June a tentative beginning was made on the park. Preliminary surveys had been carried out by Egbert L. Viele, the first engineer to the commissioners, but they soon decided that it would be desirable to offer a series of prizes to outside architects for designs for the formal laying out of the land. In 1857 such an announcement was made and on April 1, 1858, 30 designs were submitted. That of Messrs. Olmsted & Vaux was chosen, and they were awarded the first premium of $2,000. In 1857 Mr. Olmsted had been appointed superintendent to the board; George E. Waring, agricultural engineer; Samuel I. Gustin, nurseryman, and several other landscape offices had been created and filled.

In 1858 Mr. Olmsted was promoted to architect-in-chief at a salary of $2,500 a year, and the other offices abolished or subordinated to his.

The work of putting the successful design into execution was begun by Mr. Olmsted, Calvert Vaux, and J. W. Mould in June 1858. The original plan has been pretty closely adhered to, during the 40 odd years of the park's existence, although there have been times when strong efforts were made to alter it, and even to remodel some of the previous work. In 1871 when the Central Park commissioners were legislated out of office, and a board of public parks for the whole city instituted, such an attempt was made, one of its features being an extensive thinning of the trees.

Until 1871 the history of the park was an uneventful one. Most of the commissioners had served on the board since its first year, and except for family squabbles over the details of management and construction, the improvements were carried on without interruption practically in the entire charge of Mr. Olmsted. The difficulties which began to interfere with the efficiency of the department after its political organization in 1871 are indicated by the following extract from a pamphlet by Mr. Olmsted, who was subsequently made a commissioner and president of the board shortly prior to his dismissal:

"As superintendent of the park," he says, "I once received in six days more than 7,000 letters of advice as to appointments, nearly all from men in office." Delegations from various political organizations came to find out "what share of his patronage they could expect," and in order to make him as little trouble as possible in its parceling out "they took the liberty to suggest that there could be no more convenient way than that you should send us our due quota of tickets, if you please, sir, in this form, leaving us to fill in the name." Here a pack of printed tickets was produced, which proved to be blank appointments, bearing the signature of Mr. Tweed. "That," continued the spokesman of the delegation, "was the way we arranged it last year, and we don't think there can be anything better."

There seems to have been some misconception, during the early years of the park, as to its real purpose, and considerable jealousy of its regulations. In April 1864, for instance, one of the regiments of the first division of the National Guard, despite the vehement opposition of the park keepers, marched through one of the gates and proceeded to drill upon the green. Another regiment subsequently attempted to do the same thing.

An interesting item in the report for 1863 is the announcement that 14 European sparrows, "*moineau* of France," were let loose in the park in the spring of that year. This original 14, apparently the pilgrim fathers of the present local settlement, must now be represented by several million.

The paving of Fifth Avenue up to the park was completed in 1863. Previous to this, especially in wet weather, the approaches had been extremely bad, and the completion of the Fifth Avenue paving led to an immediate increase in the use of the park for driving. In its early days guards were stationed at each of the park gates, and a part of their duty was to count the number of persons passing in. In 1861 the result of the count was 1,863,263 pedestrians, 73,547 equestrians, and 456,849 carriages, the total number of visitors being estimated at 2,404,659.

"For the purpose of ascertaining the nature of the existing vegetation," says the first annual report (1857-8), "a botanical survey of the park has been made. First, to learn how far it can be made available in the projected improvements and to ascertain what plants will prove most flourishing if transplanted to this ground, and second to discover what alterations the soil will require in order to admit of an increased variety."

This report details about 70 species of trees, shrubs, and vines. Among the trees were included maples, beech, dogwood, chestnut, catalpa, red birch, persimmon, ash, locust, black walnut, red cedar, sweet gum, sycamore, poplar, American aspen, oak, and elm. All told, there were about 150,000 trees and shrubs.

Regarding the present vegetation there seems to be no available data, no continuous record of the planting having been kept nor any detailed botanical study of it made during recent years.

The soil of the park was never good in quality, nor abundant enough to support the veg-

egation of a park. For this reason the public had to be excluded from the meadows and lawns, as a single day's trampling of the grass nearly destroyed it. In 1903 a systematic renovation of the soil was undertaken, and continued until nearly the whole planted area was covered with loam, carted from Long Island, at an expense of upward of $2,000,000.

Central Provinces, a part of British India, presidency of Bengal, occupying a position about the middle of the peninsula. Their total area is computed to be 115,936 square miles, of which 86,617 square miles are British territory, and the rest the territory of native protected states, 15 in number. They contain much waste land and jungle and the cultivated area is small, little more than one fourth of the British territory being turned to account, and more than one half of the remainder being uncultivable. The district of Narbada is admirably adapted for the cultivation of the sugarcane, of cotton, and of wheat, and it contains coal and iron. Nagpur has extensive cotton fields, contains the celebrated cotton market Hinganghat, and the valley of the Wainganga, farther east, grows maize, wheat, and rice. The most important manufactures are weaving and working of iron ore. These provinces became a separate administration in 1861, and are under the authority of a chief commissioner. For administrative purposes they are divided into four commissionerships, Jabalpur (Jubbulpore), Nagpur, Narbada (Nerbudda), and Chhattisgarh (Chutteesgurh), and these contain 19 districts.

Central University, a co-educational institution in Pella, Iowa, organized in 1853, under the auspices of the Baptist Church; reported at the end of 1901: professors and instructors, 15; students, 83; volumes in the library, 5,000; grounds and buildings valued at $60,000; productive funds, $24,000; benefactions, $1,500; income, $5,350; president, Asa B. Bush, Ph.D.

Central University of Kentucky, a co-educational institution at Danville, Ky., under the auspices of the Presbyterian Church. It was given its present organization in June, 1901, by the consolidation of the Centre College of Danville (founded 1822) and the Central University of Richmond (founded 1874). Number of instructors reported, 107; number of students, 1,205; volumes in the library, 25,000; total value of property, $1,500,000; president, W. C. Roberts, D.D.

Central Wesleyan College, a co-educational institution in Warrenton, Mo., organized in 1864, under the auspices of the Methodist Episcopal Church; reported at the end of 1902; professors and instructors, 18; students, 294; volumes in the library, 7,000; grounds and buildings valued at $100,000; productive funds, $70,000; income, $10,300; president, George B. Addicks, A.M.

Centra'lia, Ill., a city of Marion County, situated on the Illinois Cent. R.R., and several other railroads, 105 miles north of Cairo. It is in a fruit-raising and mining region and is largely occupied in iron and steel workings. The city has several parks and a public library. Pop. (1900) 6,721.

Centraliza'tion, the placing in the hands of a central government jurisdiction over matters which might be under the management of local authorities. The term is used to denote the increase of power of a central authority already established, or the closer union under a central power of a confederation of partially independent States. The adoption of the Constitution of the United States was centralization in the latter sense. The question of centralization in the first sense has been an important one in United States history, forming the point of dispute between the first two political parties, and being a frequent subject of discussion at all times. The question as applied to the United States is whether to interpret the Constitution liberally, and give the national government power in doubtful cases; or whether to put a close construction on the Constitution and give the States the benefit of the doubt.

Centrarchidæ, sĕn-trär'kĭ-dē, a family of fresh-water percoid fishes, confined to North America. The body is generally short, deep, and compressed, with an equal curvature above and below, and covered with rather large, strongly ctenoid scales. The mouth is terminal, variable in size, with the premaxillary protractile, and numerous fine, close teeth on all of its bounding bones. Both dorsal and anal fins are long, with 6 to 13 strong, sharp spines in the anterior part of the former, and 3 to 8 in the latter. All are active, pugnacious, carnivorous fishes, many of which build nests. They are important game and food fishes of small or moderate size, of which about 12 genera and 30 species are known, almost all of which are confined to the Mississippi valley and the eastern United States, where they are almost the most characteristic fishes. The most important are the grass bass, black bass, rock bass, warmouth, and sunfishes (qq.v.).

Centre, a point equidistant from the circumference of a circle or from the superficies of a sphere; also the middle point of any superficies or solid.

Centre-board, a contrivance used in a yacht or shallow, keelless, or flat-bottomed vessel, to counteract the tendency to make leeway and to enable the craft to stand up under press of sail. It consists generally of a quadrangular wooden or iron plate which is bolted or hinged by its lower forward corner into a trunk or casing which fits, water-tight, over a fore-and-aft slot in the vessel's bottom, about midway of her length. When running before the wind or in shallow waters the centre-board is hauled up inside the trunk. When on a wind, or with the wind abeam, the centre-board is lowered, presenting a broad surface to the water on the same principle as a lee-board (q.v.). The term centre-board is essentially American; elsewhere the contrivance is known as a sliding-keel. See YACHT AND YACHTING.

Centre of Buoyancy. The pressures which act on every point of a surface immersed in a fluid can be resolved into horizontal and vertical components. The former balance each other. The resultant pressure must therefore be vertical; and, as the pressure increases with the depth, it is clear that the upward pressures must be greater than the downward. Hence the resultant pressure on an immersed body must be a force acting vertically upward. It is easily shown that the magnitude of this pressure is equal to the weight of the fluid displaced. The

point in the displaced fluid at which the resultant vertical pressure may be supposed to act is called the centre of buoyancy, or centre of displacement. Hence, we see that when a body floats in a fluid it is kept at rest by two forces, the weight of the body acting downward through its centre of gravity, and the weight of the fluid acting vertically upward through its centre ot gravity or centre of buoyancy. The relative positions of the centre of gravity and the centre of buoyancy have an important bearing on the safety of ships at sea. If the centre of buoyancy be above the centre of gravity, the equilibrium is stable; in other words, if the ship is displaced, it will tend to return to its original position. If, on the other hand, the centre of buoyancy be below the centre of gravity, the equilibrium will generally be unstable, although a body may float in stable equilibrium even if the centre of buoyancy be below the centre of gravity.

Centre College, Danville, Ky. See CENTRAL UNIVERSITY OF KENTUCKY.

Centre of Gravity, or **Centre of Inertia,** a point in a body, or in a system of bodies, which in modern works on mechanics is usually and preferably called the "centre of mass." See MASS.

Centre of Gyration. See PENDULUM.

Centre of Inertia. See CENTRE OF GRAVITY.

Centre of Oscillation. See PENDULUM.

Centre of Percussion. See PENDULUM.

Centre of Population, the centre of gravity of the population of a country, each individual being assumed to have the same weight. The centre of population in the United States has clung to the parallel of 39° lat. and has moved in a westward direction during the last 110 years. The following table shows the movement of the centre of population since 1790:

Years Census	North Latitude	West Longitude
1790	39° 16.5′	76° 11.2′
1800	39 16.1	76 56.5
1810	39 11.5	77 37.2
1820	39 5.7	78 33.0
1830	38 57.9	79 16.9
1840	39 2.0	80 18.0
1850	38 59.0	81 19.0
1860	39 0.4	82 48.8
1870	39 12.0	83 35.7
1880	39 4.1	84 39.7
1890	39 11.9	85 32.9
1900	39 9′36″	85 48′54″

Centre of Pressure. See HYDROSTATICS.

Centreing, or **Centering,** the framing of timber by which the arch of a bridge or other arched structure is supported during its erection. See BRIDGE.

Centrifugal Force, a force which continually tends to fly from a given fixed point or centre; opposed to centripetal force (q.v.).

Centrifugal Machines, machines used for various purposes, in which centrifugal force produced by rapid revolution is utilized. Such a machine may be used for drying clothes or other goods, the articles being placed inside a hollow cylinder made of wire-gauze or with numerous perforations in its circumference, which, being driven at a high speed, the moisture is caused to fly off by centrifugal action. Sugar is now often separated from the molasses by a centrifugal machine, the product being commonly known by the trade name of "centrifugal sugar." The cylinder in which the sugar is contained is placed within a larger cylinder in which the molasses is received. Liquids such as beer, can also be clarified and cleared of foreign substances by means of centrifugal action, the extraneous matters being made to collect at the circumference of the vessel through the high rate of speed at which it is driven, while the clear liquid can be drawn off by an outlet at the centre. Cream is now commonly separated from milk in large dairies by the same method. See BUTTER.

Centripetal Force, a force which tends continually toward a given fixed point, or centre; a "central" force. See DYNAMICS; ENERGY, CONSERVATION OF.

Centumviri, judges of ancient Rome, three from each tribe, who determined ordinary causes. The extent of their jurisdiction is uncertain. Hollweg would confine it to civil cases; it seems probable that they at first handled questions relating to quiritarian ownership, which determined the status of the citizens.

Centuries of Magdeburg, a history of the early Christian Church, so called because it was divided into centuries, each of the 13 volumes containing a hundred years, and was first written at Magdeburg. Matthias Flacius formed the plan of it in 1552, but the last volume did not appear until 1574. It is the first comprehensive work of the Protestants on Church history; its main purpose was to prove the agreement of the Lutheran doctrine with that of the primitive Christians, and the difference between the latter and that of the Roman Catholics.

Centu'rion, a Roman army officer who commanded a century, or body of 100 men. The rank of a centurion corresponded very nearly to that of a captain in modern armies. See LEGION.

Centuripe, chĕn-too-rē'pā, Sicily, a town in the province of Catania, situated on a height above the valley of the Simeto, 20 miles northwest of Catania. It is situated in a district yielding soda, sulphur, and marble. The ancient city (Centuripa), considerable ruins of which exist, was at one time among the important cities of Sicily. Pop. 11,000.

Cen'tury, in chronology, a period of 100 years. Modern chronology of Christian nations centres at the birth of Christ, and the centuries are numbered according to their order either before or after that event, for example, the 20th century A.D., the 4th century B.C.

In Roman times, (1) a division of 100 men in the army, corresponding to the modern company, 60 of which formed a legion; (2) a division of the six classes of the people, introduced by Servius Tullius, for the purposes of taxation and voting.

Century-plant, a popular name of the *Agave americana,* or American aloe. See AGAVE.

Ceo, Violante do, vē-ō-lān'tā dō thā'ō. Portuguese poet: b. Lisbon 1601; d. 1693. She was styled "the tenth Muse." Her 'Portuguese

Parnassus' and miscellaneous poems are greatly admired.

Ceorl, chĕrl. See CHURL.

Ceos, sē'ŏs, or **Kea,** kā'ä (sometimes called by the Italianized name of *Zea* or *Tzia*), an island in the group of the Cyclades, in the Ægean Sea, 13 miles off the coast of Attica. It is 13 miles long, 8 broad and 39 square miles in area. The central and culminating point is Mount Elias, 1,863 feet high. It is fairly fertile, raising fruit, wine, honey, and valonia. In ancient times Ceos was noted as the birthplace of the poets Simonides and Bacchylides, and the physician Erasistratus; and the Cean laws were famous for their excellence. The capital is Ceos.

Cephaelis, sĕf-ą-ē'lĭs, a genus of plants belonging to the order *Rubiaceæ,* natives of tropical America. The roots of *C. ipecacuanha* furnish the commercial drug of that name. See IPECAC.

Cephalaspis, sĕf-ąl-ăs'pĭs, a genus of ostracoderms (q.v.) of the Devonian Period, characterized by a semicircular or semioval head-shield, with spines at the angles. It has a curious superficial resemblance to the head-shields of certain trilobites.

Cephalization, sĕf-a-lī-zā'shŭn, a principle advanced by Dana, who claims that cephalization is simply domination of the head — cephalic domination — in an animal, as manifested in the structure; and any degree of it depends on the grade or power of the cephalic centre and the degree of subordination to it in the structure. He agrees that since animals have a head as their grand characteristic feature, and a brain as the fundamental element of the head and the prime centre of force in the organism, exaltation and concentration anteriorly of the life-forces mark a high grade of cephalization. Their concentration of parts anteriorly, with exaltation of the cephalic end of the body, is manifested not merely in the transfer of members to the cephalic series, but also in the form and structure of the head, of the sense-organs, the mouth-appendages, the legs and abdominal appendages.

The principle is most clearly shown by the increased size and specialization of the head of the crab and the corresponding reduction of the abdomen as compared with the elongated abdomen of the lobster and shrimps, as well as the relations of the head to the thoracic and abdominal regions in the amphipod and isopod *Crustacea.* It should be observed that in arthropods in general, at the beginning of embryonic life, development begins with the head, thus in *Limulus, Arachnida, Crustacea,* and insects, the head is the first to become developed; its segments and appendages arise before those of the hind body. It is so in the vertebrates, the head at first forming the bulk of the body. This is the case with annelid worms, etc., in their larva, the trochosphere (q.v.), the bulk of the body is formed by the head. It is not improbable that the cause of the large size of the head in the embryos of all the higher animals is in some way connected with the fact that development begins at the anterior end. On the other hand the new segments later in embryonic life in worms and arthropods arise at the growing-zone, which is situated at the end of the hind body, between the penultimate and terminal segments of the body.

A. S. PACKARD,
Brown University.

Cephalochorda, sĕf"ą-lō-kôr'dą, a group of *Chordata* (q.v.) represented by the lancelet or Amphioxus (q.v.). Other names for the young group are *Leptocardii* and *Acrania.* The *Cephalochorda* are fish-like in shape, and have a notochord extending the length of the body, beginning in the head; hence the name *Cephalochorda.* The notochord is situated between the nervous system and the digestive canal. The central nervous system lies entirely on one side of the digestive canal, while numerous gill-slits extend from the pharynx to the exterior.

Cephalodiscus, sĕf-ą-lō-dĭs'kŭs, a very puzzling animal now placed in the subphylum *Enteropneusta* (*Hemichordia*), along with *Balanoglossus* (q.v.). It is a deep-sea form, and at first was mistaken for a large polyzoan, which it strikingly resembles. It is like *Balanoglossus* in being divided into three regions, that is, a proboscis, a collar, and the main trunk, which is very short; but it is not worm-like in general appearance. Its place among the chordates is due to the presence of a structure resembling a notochord, with the same relations to the nervous system as in *Balanoglossus.* It differs however, from the latter animal in the possessing tentacles arising from the collar, and in the digestive canal being bent on itself as in the *Polyzoa,* so that the vent is situated near the mouth; and it has only a single pair of openings supposed to represent the gill-slits. These creatures occur in colonies, secreting a common branching case somewhat like that of *Polyzoa,* and it multiplies by budding.

Cephalonia, sĕf-ą-lō'nĭ-ą, or **Kephallenia,** an island of Greece, the largest of the Ionian islands, northwest of the Morea, at the entrance of the Gulf of Patras, about 31 miles in length, and from 5 to 12 in breadth; area, 302 square miles. The coastline is very irregular and deeply marked with indentations, and the surface is rugged and mountainous, rising in Monte Negro, the ancient Ænos, to a height of 5,380 feet. There is rather a deficiency of water on the island. The principal towns are Argostoli, the capital, and Lixuri. The chief exports are currants, oil, and grain; wine, cheese, etc., are also exported. The manufactures are inconsiderable, consisting of some cottons, carpets of mixed wool and goats'-hair, with some potteries and distilleries of liqueurs. The island is subject to frequent earthquakes. One of the most destructive was that of the year 1867. The greater part of the population are of the Greek Church; the others belong to the Catholic Church. By Homer the island was called Same or Samos, though he speaks of the inhabitants as Cephallenes. The island adhered to Athens during the Peloponnesian war. In 189 B.C. it came under the Roman dominion and after the division of the empire, it became subject to the Byzantines. In the 12th century it was taken by the Normans, and afterward fell successively into the hands of the Venetians and Turks, and then again into the hands of the Venetians, who retained possession of it until 1797, when the French seized it. From 1815 it belonged to the Republic of the United Ionian Islands, and in

1864 was united with the other islands to the kingdom of Greece. With Ithaca and a few other adjacent islands it forms a nomos or province of the kingdom of Greece. Pop. of nomos 83,363; of the island about 72,800.

Cephalop'oda, a class of mollusks represented by the squid, cuttle-fish, octopus, nautilus, argonauts, etc. In these mollusks the head-lobe bears arms or tentacles, as the animal has no "foot" or creeping-disk like that of other mollusks, though its homologue is found in the siphon and tentacles. They have an unpaired muscular mantle, which forms the walls or outside, so that as in the squids, where there is no outer shell, the body is naked. The nervous system is much concentrated, for not only are the cerebral ganglia, pedal, and visceral ganglia in the head, but also the ears and osphradia, or olfactory organs. The large complicated brain, thus composed of the three primary pairs of ganglia with some accessory ones, are enclosed in a cephalic cartilage which suggests a comparison with the cartilaginous skull of the lamprey and sharks. In the body behind are the sympathetic and stellate ganglia. The eyes as a rule are highly developed, with a retina, choroid, iris, cornea, vitreous body, and lens. The gills are well developed, either as one or two pairs situated within the mantle-cavity. The water is forced from the mantle-cavity, which is open behind the head, through the siphon. There are two kinds of hearts. The systematic heart consists of two or four (nautilus) auricles receiving the blood from the gills, and a median ventricle from which arise the anterior and posterior aortæ. There is also, at the base of each gill, a branchial heart, which receives the blood from the vena cava and pumps it into the gill. These branchial hearts are not known to exist in other mollusks, and no other mollusks possess an ink-sac. The armature of the mouth, however, as in gastropods, consists of two horny teeth, enormous in most cephalopods, and an odontophore with its lingual ribbon for cutting flesh, etc. The eggs in developing undergo a superficial or discoidal development; and the young undergo no metamorphosis. The shell of cephalopods is either chambered, as in orthoceratites, nautiloids, and ammonoids, or, as in argonauts, forms a simple deep basin. In the squids and cuttle-fish the body is supported by an internal pen or "bone."

The cephalopods are divided into two orders, according to the number of their gills.

Order 1. *Tetrabranchiata.*—This group, in which the gills are four in number, is represented by the nautilus, the sole living representative of a number of fossil forms, such as *Orthoceras, Goniatites* and *Ammonites. Nautilus pompilius* and *Nautilus umbilicatulus* are the only survivors of about 1,500 extinct species of the order. See NAUTILUS.

Order 2. *Dibranchiata.*—The dibranchiates are so called from possessing but two gills, while the tetrabranchiates had, as in *Nautilus,* numerous unarmed tentacles; these are now represented by 10 (*Decapoda*) or 8 (*Octopoda*) arms, provided with numerous suckers. To the 10-armed forms belong *Spirula,* a diminutive cuttle with an internal coiled shell. The shells of *Spirula peronii* are rarely thrown ashore on Nantucket; it lives upon the high seas. The extinct Belemnites had, like the recent *Moroteuthis,* a straight conical shell, the "thunderbolt" fossil. Allied to *Loligo* and *Ommastrephes* are gigantic cuttle-fishes which live in mid-ocean, but whose remains have been found at sea or cast ashore on Newfoundland and the Danish coast. Their jaws also occur in the stomachs of sperm whales.

Fossil Cephalopods.—The greater proportion of cephalopod mollusks are fossil. They began to exist in the Cambrian Period, and, as nautiloids and ammonoids, flourished in great profusion in the Palæozoic and Mesozoic eras, the ammonites (q.v.) of the Jurassic and Cretaceous beds numbering about 5,000 species.

Cephalula, sĕf-ạ-loo'la, the name applied by Packard to the stage of the embryos of mollusks and of worms immediately succeeding the gastrula (also the trochosphere) when the larva is still a surface-swimmer and the head is beginning to be formed. Consult Packard 'Life-Histories of Animals,' p. 94.

Cephalus, sĕf'ạ-lŭs, the son of Creusa; according to some the son of Deion, king of Phocis, and of Diomede. He was the husband of Procris, or Procene. Shortly after his marriage Eōs (Aurora) carried off the beautiful youth while he was hunting on Mount Hymettus. He refused the love of the goddess, who induced him to put the virtue of his wife to a trial which it could not withstand. Procris, in return, tempted him likewise, and he yielded also. Learning their mutual weakness, they became reconciled. But Procris subsequently became jealous of her husband, and concealed herself in a wood to watch him. He mistook her among the leaves for a wild animal, and killed her with a javelin.

Cephas, sē'fạs, a surname given by Christ to Simon. In the Greek it is *πέτρος* ("a rock"), in Latin *Petrus,* and in English Peter.

Cepheus, sē'fūs, a king of Ethiopia and husband of Cassiopeia; his name was given to a constellation of stars in the northern hemisphere, surrounded by Cassiopeia, Ursa Major, Draco, and Cygnus.

Cephis'sus, the name of three rivers of Greece. (1) A river which waters the Athenian plain. It rises on the west slope of Mount Pentelicus and the south side of Mount Parnes, and flows past Athens on the west into the Saronic Gulf near Phalerum. (2) A river of Attica emptying into the Gulf of Eleusis. (3) A river flowing through eastern Phocis and northern Bœotia and emptying into Lake Copais (Topolias).

Ceracchi, Giuseppe, joo-sĕp'pĕ chā-rä'kē, Corsican sculptor: b. on the island of Corsica, 4 July 1751, or, according to others, about 1760; d. Paris 29 Jan. 1801. In 1798 he took part in establishing the republic at Rome, of which he was among the warmest partisans. On the re-establishment of the papal authority he was obliged to leave Rome, and went to Paris, where he was employed in making a bust of the First Consul. Nevertheless, he joined the young French artists whom he had known at Rome, and whose ardent republican opinions coincided with his own, in a conspiracy against Bonaparte, in whom he saw only the oppressor of his country. On 9 Nov. 1800, he was arrested at the opera, with Arena, Damerville, and Topino Lebrun. Before the tribunal he answered only in

monosyllables to the questions put to him. He was sentenced to death, together with his accomplices, and ascended the scaffold with great firmness. The death of this disciple, and almost rival, of Canova, was a great loss to sculpture.

Ceram, sĕ-răm′, or **Ceiram,** called by the natives Zeram or Serang, an island of the Moluccas, the second of the group in size, lying west of New Guinea; in the Indian Archipelago; area about 7,000 square miles. Its interior is very imperfectly known, but it is understood to be traversed by mountain ranges from 6,000 to 8,000 feet high, and culminating in Noosaheli, which is 9,250 feet. The vegetation is luxuriant and gigantic, some of the sago-palms growing 100 feet high. Sago forms the chief food of the inhabitants and is an article of trade. The inhabitants of the coast are of Malay origin, and have extensive fisheries. The interior is peopled by Alfoories or Alfuros, long known for their barbarous custom of using human skulls for public and private ornament, and the still more barbarous atrocity of committing murder in order to procure them. They are said to have become more civilized, and many of their rajahs have adopted the European dress and manners. They are divided into various independent tribes. Christianity has been introduced into several villages on the south coast, but not with any great success, though it is said that in some of the villages a considerable number of those professing Christianity can now read and write. The island belongs to the Dutch, who have established several stations there under the charge of an official residing at Wahai on the north coast. Pop. estimated at 195,000.

Cerambycidæ, sĕ-răm-bis′ĭ-dē, a family of beetles of great extent, readily known by their very long antennæ, which give its members the name of "longicorns." The family already numbers some 12,000 or 13,000 species, though probably not over half of the existing forms are known. It comprises some of the largest, most showy, as well as the most destructive insects of the sub-order. They are readily recognized by their oblong, often cylindrical bodies, the remarkably long, filiform, recurved antennæ, and the powerful incurved mandibles. Their eggs are introduced into cracks in the bark of plants by the long, fleshy, extensile tip of the abdomen. The larvæ are long, flattened, cylindrical, fleshy, often footless, whitish grubs, with very convex rings, the prothoracic segment being much larger and broader than the succeeding, while the head is small and armed with strong, sharp mandibles adapted for boring like an auger in the hardest woods. These borers live from one to three years before transforming, at the end of which time they construct a cocoon of chips at the end of their burrows, the head of the pupa lying next to the thin portion of bark left to conceal the hole.

The species of the American genus *Oncideres* are called girdlers, because the parent beetle, after laying an egg in a small branch, girdles this round with a deep incision, so that the portion containing the larva sooner or later falls to the ground. The growth of a longicorn larva frequently takes more than a year, and under certain circumstances it may be enormously prolonged. *Monohammus confusus* has been known to issue from wooden furniture which was 15 years old. Individuals of another longicorn have issued from the wood of a table 20 and even 28 years after the felling of the tree from which it was made. Watson has related a case from which it appears probable that the life of a longicorn beetle dwelling in household furniture extended over at least 45 years. It is generally assumed that the prolongation of life in these cases is due to the beetle resting quiescent long after it has completed the metamorphosis; but more probably it is the larval life that is prolonged; the larva continuing to feed, but gaining little or no nutriment from the dry wood in these unnatural conditions. A large number of longicorns stridulate loudly by rubbing a ridge inside the pronotum on a striate surface at the base of the scutellum. A few produce noise by rubbing the hind femora against the edges of the elytra, somewhat after the fashion of grasshoppers; and some possess highly developed stridulating surfaces on the hind and middle coxæ.

Ceramics. The operations of the clay worker rank among the most ancient of those undertaken by man and are, with the single exception of agriculture, the most widely spread. The origin of the art is lost, but it is quite certain that in prehistoric times the plasticity of clay had been remarked and made use of. The first clay work probably consisted of brick, and these were at first sun dried. (See BRICK.) Of sun-dried pottery but few examples remain, and the fact that such wares could not be employed to hold liquid prevented a very extensive use of unburned pieces. The knowledge that clay could be hardened and made impervious by burning must be ranked as a discovery distinct from that of shaping the plastic clay. It is not unlikely that the funeral pyre revealed the secret. Vases and jars have been found in the British barrows or tumuli which have apparently been burned only in the fire by which the body was consumed.

Clay work was originally formed by hand alone, the method followed being similar to that still practised by certain tribes of Indians. A plastic clay was worked and kneaded to render it homogeneous and was then rolled into long thin strips. These were coiled in a spiral form and the joints made good by pressure until the desired size and shape was reached. The invention of the potters' wheel marks an epoch in the history of the art and wherever the wheel became known it entirely superseded the older method. Some peoples, however, never learned of the wheel, but brought their own craft to great perfection. The wheel is of very ancient date. Dr. Birch ('Ancient Pottery') states that the Egyptians attributed it to the power of the gods. Num, the creator, used it for the formation of the human race. (See POTTERS' WHEEL.)

In modern times the wheel has given way to the mold as a means of giving shape. (See POTTERY.)

Among early workers natural clay was used and their wares are colored, the single exception being Chinese porcelain. (See PORCELAIN.) The first traces of pottery are found in Egyptian hieroglyphics, where vases, evidently wheel-made, are depicted in the writing. The vases themselves of various dates are to be found in museums and the recent excavations by Dr. Flinders Petrie have added much to our know-

ledge of Egyptian work. In Babylonia and Assyria the main interest lies in the fact that clay was used as a means of writing. Clay tablets and cylinders were prepared and with angular punches the cuneiform characters were impressed. The tablet being fired the writing became indelible. Vast stores of these clay records have been discovered and are being deciphered.

In Greece the fictile art was developed in a remarkable degree. A high standard of criticism prevailed and the arts reached great perfection. Greek pottery ranges from 700 to 200 B.C. The early work was crude, almost barbaric. The clay was of a pale salmon tint deepening to a warm brown. Upon the polished surface decorative patterns were traced in black. Geometric designs occupied the attention of one section, others attempted a more florid treatment developing into silhouettes of birds and animals. The human figure eventually prevailed and scenes from mythology and local history appeared. The great change came when, instead of black figures on a red background, the figures were outlined and the background painted in black. This enabled details of feature and drapery to be executed with rare fidelity, and the culminating point of Greek pottery was reached. There are some 15,000 Greek vases in existence and the larger number of them are of superior workmanship.

The pottery of the Romans exists in great abundance, but few pieces are remarkable for excellence of workmanship. The Romans possessed an abundance of glass and the rude pottery of the household was displaced at the table of the patrician. Roman pottery is remarkable for its wide distribution. Their armies seem to have been regularly accompanied by potters. Germany, France, and Great Britain are covered with fragments of Roman wares made for the most part from local clay. A remarkable variety of pottery is that known as Samian, or more correctly, as Aretine ware. This is made of clay of a brilliant red color, and as molds and waste pieces have been found in England and France the presumption is that the clay as well as the workman was imported. No such clay is known to exist now and the wares are all made of the same material. The Roman «slip painted» or Castor ware was the ancestor, though after a long interval, of the English clay decorated pieces which gave the potter's art so firm a hold on the English people and eventually brought the knowledge of clay working to the American colonists.

In the far East a different line was being wrought out. The pottery of India and Persia was the descendant of Egyptian blue-glazed ware. The characteristic which distinguishes these wares from the productions of Greece and Rome is the glaze. Very early in the history of the art it was found necessary to use some impervious coating before the pottery could be extensively used, but in the East a covering of glaze was used for its decorative effect. This fact led to an important development. A glaze upon brown or red clay is not always pleasing, and therefore the expedient was adopted of coating the clay with a light-colored slip or engobe. Thus Oriental engobe ware has become a recognized type of ceramic production. Each Eastern nation in turn worked on similar lines. India affected colored glazes well known in the rich blue roofing tiles of Multan. Persia adopted a delicate fanciful tracery of floral motif, the outlines being filled in with light blue and gray. A beautiful pottery, almost porcelain, was made in Persia and exported from the port of Gombron, hence known as Gombroon ware. The characteristic feature was a series of fine perforations which were filled with glaze, producing a transparent pattern upon a slightly translucent ground.

Damascus produced many fine pieces of engobe ware, the treatment being more forceful than that of Persia. In the island of Rhodes and in certain neighboring localities variety was given by the adoption of red in the decoration. This red consisted of a natural earth. The development of the peculiar colors found on this ware is due to the absence of lead oxide from the glaze. (See GLAZE.) The Arabians and Moors carried the knowledge of pottery along the north coast of Africa, and when, in the 8th century, the former people invaded Spain they brought the art with them. It was not, however, until the Moorish invasion in the 12th century, and the building of the Alhambra palace, that any great progress was made. A notable change took place in the introduction of tin oxide as a glaze constituent. The knowledge of this substance existed farther east, but in Spain both tin and lead were found in abundance. The consequence was that the intermediate coating or engobe was discarded and the glaze itself rendered opaque by tin oxide. This of course involved a different treatment of color and as the art spread from Spain to Italy the great schools of Italian Majolica grew up. (See MAJOLICA.) In France some variations took place and in Germany the main product was stoneware (q.v.).

In England the ceramic art had never been forgotten. The departure of the Romans had caused a relapse and neither Anglo-Saxon nor Norman pottery was of any importance. About the Tudor period, however, a revival took place. The potters had foregathered in Staffordshire, where there was an abundance of clay, and there they produced the slip decorated, the combed, marbled, and tortoise-shell wares which are so characteristic of the time. A great stimulus was given by the arrival of two Dutchmen named Glers. These brothers were skilful potters and speedily influenced the quality of the claywares manufactured. They, in fact, prepared the way for Josiah Wedgwood, who established the English factory system and made it possible for skilled men to combine their efforts in the production of fine pottery. See WEDGWOOD.

In America the history of the ceramic art may be conveniently, if somewhat arbitrarily, divided into four epochs. (1) The work of the aborigines. (2) From Colonial times until 1840. (3) From 1840 to 1880. (4) The present day.

The work of the natives was varied and interesting. The wheel seems never to have been used; but, on the other hand, the process of building pottery by means of coils of clay was brought to great perfection. Barber ('Pottery and Porcelain of United States') divides pre-Columbian pottery into three groups, (1) the crude work of the eastern coast; (2) the better wares of the mound builders, and (3) the superior productions of the more civilized tribes of the west.

The eastern tribes were scarcely more than savages, even in the day of the Pilgrims. The pottery was rude in the extreme and scarcely burned. So fragile indeed that but few examples remain. The Wyoming Historical and Geological Society of Wilkesbarre, Wyoming County, Pa., have given attention to the preservation of these records, and they possess some unique specimens. Clay pipes were in common use among the Indians, and, in fact, were put in circulation as a kind of currency. Some of the Indian women even now in their reservations indulge in the pastime of pottery-making, but the manufacture has almost died out.

The pottery of the mound-builders forms an extensive study in itself. In addition to the building of plain forms considerable skill in modeling was developed. Not only were animal and bird forms produced, with more or less fidelity, but the human face, in some cases full of expression, was constantly used as a relief embellishment. Students distinguish between painted and unpainted wares, but there is divided opinion as to whether these classes were contemporaneous or divided.

Through the States of Colorado and Utah, and in the great valleys of the San Juan, the Colorado and the Rio Grande, are found numerous relics of the work of the house-building tribes. This pottery is far in advance of either of the other types. In some cases the structure of the soils is boldly asserted as a decoration, sometimes alone and often in conjunction with painting. Skill in modeling was well developed, but the work is archaic in type. Drawings of birds and beasts are frequently used in decoration and natural clays find frequent employment as colors. There is no doubt that the principles of decoration by which the contemporary basket work was embellished inspired much of the clay treatment.

Even the earliest settlers engaged more or less in clay work. Brick and tile were, naturally, their first products. See BRICK; ROOFING TILE.

The first pottery for white or cream wares was built at Burlington, N. J., about the year 1684. The abundant clays of New Jersey attracted the attention of many who had been concerned with pottery in the old country, and for nearly two hundred years the work was in close imitation of that manufactured in England. Nearly all the distinctive styles of the period were attempted. Slip painting, sgraffito, stoneware, and queensware were all pursued with more or less success, both English and German potters being at work. In some parts of the country, notably in eastern Ohio, pottery-making became a home industry. Many a barn held a "kick" wheel, and a small kiln served to finish the work. Farmers divided their time between clay and soil; and, building rough flat-boats, would float their wares down the river for sale in the large towns.

The third epoch may be described as that of the factory. The large pottery centres, East Liverpool, Ohio, and Trenton, N. J., were established about the beginning of the period. It may also be characterized as the era of bad quality. The potters were new to the local materials. Clays were carelessly mined and badly prepared, and in many cases the men who attempted to make pottery were ignorant of anything but the processes of manipulation. It is not strange, therefore, to find that the work of this period was very inferior, nor to learn that those who made it were inordinately vain of their productions. Every now and then some enterprising manufacturer would attempt an important piece of work, but the results were uniformly disastrous. There is almost nothing to show for the work of these years but a series of misdirected efforts.

The cause of the renaissance which, happily for the country, at length dawned, was the Centennial Exhibition of 1876. There, for the first time, non-traveling Americans were brought face to face with the productions of Europe, and the contrast with American work was very marked. The effect of the lesson was not immediate. Some manufacturers declined to be aroused, they were making money under a high protective tariff and were content to produce inferior wares. Those upon whom the influence was strongest were private individuals, painters, sculptors, and amateurs. A company of women got together and eventually established the Rookwood Pottery. (See ROOKWOOD.) On somewhat similar lines several small manufactories of glazed pottery have since been opened, among which are the Grueby faience, Boston; the Merrimac pottery, Newburyport, Mass.; Lonhuda ware, Steubenville, Ohio; Lonelsa ware, Zanesville, Ohio. During this period a number of English decorators sought employment in this country. They were somewhat stereotyped in style and secured short engagements in factory after factory. A few pieces were produced at each, and for some reason the output ceased. A number of similar works are therefore extant. They have been made in many places of differently composed wares, but all are decorated by the same band of artists. The identification of such wares becomes very difficult therefore, but they remain as an evidence of a desire on the part of the manufacturers for a higher grade of work.

The pottery centres of East Liverpool, Ohio, and Trenton, N. J., have grown into large and prosperous communities. A number of English workmen have settled in each place, and the English accent and English sports flourish. In each city there are upward of 40 establishments directly engaged in producing ceramic wares and the accessories thereto.

The types of ware included in the term pottery range themselves according to color, structure, use, and locality. Thus Rockingham, yellow ware, and cream color, abbreviated to C. C., are definitions arising from color. Granite, ironstone, opaque china, and hotel china, are judged by structure, a fine vitreous body; the term "use" defines sanitary and railroad ware, mortars and chemical stoneware, while locality gives names to Belleek, Rookwood, and other fancy wares.

C. C. ware is the lineal descendant of English earthenware; the materials used are similar (see POTTERY), but a higher temperature is uniformly employed in America. The term is no longer accurate. The cream color was due to the natural tint of the clays of which even the best contain a small percentage of iron, but the exigencies of trade have forced the potters to neutralize this by the addition of a blue stain. C. C. therefore can no longer be distinguished by its color.

Rockingham and yellow wares are virtually the same wherever made. Common buff-burning clays are used, and in the former ware the glaze is stained dark-brown by the use of manganese; in the latter a cheap lead glaze over the yellowish clay intensifies the color. Jet ware is usually made from a red clay covered with a blue glaze.

In the production of sanitary ware America holds the field. Great demands have been made upon the potters on account of increased domestic comforts and the elaboration of railroad fittings. The earthenware necessaries of kitchen and bathroom have been brought to great perfection, both in composition of body and glaze and in methods of manufacture. See ENAMELED POTTERY.

No factory of any repute is without a complete plumber's apparatus by which every piece is tested for its action with water before being shipped.

Hotel china has also been brought to a highly satisfactory point. The demand of hotels and restaurants for a tough ware led a number of manufacturers into the experimental field. Costly as was the process, one after another has come forth successful. The conclusion to which all have arrived is that high temperature is the secret of success. The mixture of materials must of course be adjusted to suit the extreme heat, and there is no doubt that tons of pottery have been destroyed before the correct proportions were found. This ware is a distinctive American product. It can be matched against any pottery in the world of its own class without risk of failure. It has little or no pretence to artistic merit, for the decorations are, for the most part, inexpensive, but for withstanding the knocks of a strenuous life there is nothing so good. The principal factories making this ware are the Greenwood Pottery, the Lamberton Works, and the Crescent Pottery, of Trenton; the Knowles, Taylor & Knowles Company, of East Liverpool, Ohio; and the Onondaga Pottery, of Syracuse, N. Y.

Belleek ware had its origin in the town of that name in Fermanagh, Ireland, and the first ware made in America of this type was compounded by men who had worked in the old country, and was avowedly an imitation of the Irish product. It, however, speedily assumed a character of its own and was pursued on entirely different lines. The ware belongs to the class of soft porcelain. It is light, translucent and of a pale creamy color. The body is largely composed of feldspar, which is mined in Maine and Connecticut in great abundance. The glaze is a fusible compound in which lead oxide is largely present. This porcelain is greatly in demand for over-glaze painting. The soft glaze enables almost any ceramic color to be melted to a brilliant surface in any of the ordinary studio kilns. The best Belleek is made by the Ceramic Art Company and the Willetts Manufacturing Company, of Trenton, N. J.

An account of American ceramics would not be complete without a word on the enthusiasm for china-painting and clay-working which has possessed American women for the last two decades. The movement took serious shape soon after the Centennial Exposition, and may be said to have reached its height in 1893. In that year at the World's Fair a great quantity of so-called "amateur painting" was exhibited, and some of it was severely criticised. The criticism was taken to heart and from that time the work greatly improved. Study-clubs were formed and more serious work undertaken, culminating, in a number of instances, in women undertaking to produce their wares from the clay, instead of being content to paint upon purchased pieces. This movement is yet in its infancy and must eventually exercise a large influence upon the quality of American clay-work.

CHARLES F. BINNS,
New York State School of Ceramics.

Ceramic (sẹ- or kẹ-răm'ĭk) **Society, The American,** a body of scientific clay-workers organized in 1899. The 'Transactions' of the Society already form the most complete record of progress in ceramic knowledge published in the English language.

Cerar'gyrite, native chloride of silver, AgCl. It crystallizes in the isometric system, and is cubical in general habit. It has a specific gravity of 5.55, and is quite soft, with a grayish color and a resinous lustre. Upon exposure to light its color changes to a violet-brown. It occurs in Mexico, in western South America, in Norway, and in the Ural Mountains. In the United States it is found in Idaho, Utah, Colorado, Nevada, and Arizona. When found in quantity it is valuable as an ore of silver.

Cerastes, a genus of African vipers, remarkable for their fatal venom, and for two little horns formed by the scales above the eyes. Hence they have received the name of horned vipers. The tail is very distinct from the body. *C. cornutus* is the horned viper of northern Africa, a species known to the ancients. There are several other species.

Cerasus, a genus of trees, the cherries, of the order *Rosaceæ,* now always regarded as a section of the genus *Prunus,* distinguished from the other sections by the smooth, bloomless fruit, conduplicate vernation, and other characters. See CHERRY.

Cerates, official preparations of the United States Pharmacopœia. They are unctous substances, consisting of oil or lard mixed with wax, spermaceti, or resin, to which various medicines may be added. In consistency they are harder than ointments and softer than plasters, and should be capable of being spread at ordinary temperatures on cloth, and should not melt at the temperature of the human body.

Ceratodus, sĕr'ạ-tō-dŭs, a genus of fishes belonging to the *Dipnoi* or lung-fishes. It is the barramunda or native salmon of the Australian rivers, measures from three to six feet in length, and forms an interesting connecting link between the oldest surviving group of fishes and the lowest air-breathing animals. It is said to leave the water and go on the flats after vegetable food, but its traveling powers cannot be great.

Cerato'sa, certain sponges in which the skeleton or solid support is horny. Another name is *Ceratospongiæ.* The skeleton consists of spongin, which differs chemically from the substance of true horn (keratin). The spongin is deposited in long fibres by peculiar cells (spongioblasts). The fibres interlace, branch, and unite into the supporting framework of the sponge. Examples of the horny or fibrous sponges are the bath-sponges, such as *Euspongia officinalis,* varieties of which occur in the Medi-

terranean and about the West Indies, Florida, etc. See SPONGE.

Ceratosaurus, sĕ-ra-tō-sôr'ŭs, a carnivorous dinosaur (see DINOSAURIA) resembling Allosaurus (q.v.), but of smaller size and with small horns over the eyes and on the nasal bones. It is found in the Como formation of Wyoming (Upper Jurassic Period).

Ceraunian (sē-râ'nĭ-an) **Mountains,** in classical geography, (1) a mountain range in the southeastern part of the Caucasus Mountains, the exact position of which is not known; (2) a chain of mountains in Epirus, northern Greece, extending to the Adriatic and forming the peninsula Acroceraunium (q.v.). The mountains themselves are also called Acroceraunia.

Cerberus, sĕr'bĕ-rŭs, in Greek myths, a three-headed dog, with snakes for hair. Hesiod describes him as fifty-headed, and states him to have been the offspring of Echidna by Typhon, the most terrible of the giants that attempted to storm heaven; but later writers give him only three heads. At his bark hell trembled, and when loosed from his hundred chains, even the Furies could not tame him. He watched the entrance of Tartarus, or the regions of the dead, and fawned on those who entered, but seized and devoured those who attempted to return. He was subdued by Heracles (Hercules).

Cercaria, sĕr-kā'rĭ-a, the so-called "nurse" of the fluke-worm (q.v.) and other trematode parasites. The body is tadpole-like in shape, with an anterior and posterior sucker, a mouth and pharynx, and a forked intestine. The *Cercariæ* are developed in the body of the parent-nurse (*redia*). Escaping from the redia, the cercaria, swimming about in pools or ponds, forces its way into the body of some snail, which forms its first host. Then, losing the tail, it becomes encysted, attached to blades of grass or herbage. The transference of the larval fluke to its final host, the sheep, is effected if the latter swallow the grass on which the cercaria has become encysted. The young fluke then escapes from the cyst, and forces its way up the bile-ducts to the liver, in which it rapidly grows, and developing reproductive organs, attains the adult condition. See TREMATODA.

Cercelée, sĕr-sē-lā, or **Recercelée,** in heraldry, applied to a cross, the ends of which are curled or twisted, like a ram's horn.

Cercis, sĕr'sĭs, a genus of plants of the order *Leguminosæ*. *C. canadensis,* redbud, or Judas-tree, is a small ornamental tree, often cultivated, but growing wild from New York south to Florida and west to Minnesota, Kansas, and Louisiana. *C. siliquastrum,* a native of the south of Europe, and of several countries in Asia, is a handsome, low tree with a spreading head. The leaves are remarkable for their unusual shape; they are of a pale, bluish-green color on the upper side, and sea-green on the under. The flowers, which have an agreeable acid taste, are often mixed in salads, and the flower-buds are pickled. The genus received the name of the Judas-tree from the tradition that it was upon a specimen of it, near Jerusalem, that Judas hanged himself.

Cercopithecidæ, sĕr-kō-pĭ-thē'sĭ-dē, a family of primates, including all the Old World monkeys, except the anthropoid apes. The various groups and species may be found described under their names. See also MONKEY.

Cer'cyon, a famous robber, killed by Theseus.

Cerdic, kĕr'dĭk, king of the West Saxons: d. 534. He was a Saxon earldorman who invaded England in 495, and after gradually fighting his way and extending his conquests, established the kingdom of Wessex about 519. He won a great battle at Charford in 519, but suffered a severe defeat from the Britons in 520 at Mount Badon, or Badbury, in Dorsetshire. In 530 he conquered the Isle of Wight. At his death his kingdom extended over the present counties of Berkshire, Wiltshire, Dorsetshire, and Hampshire (including the Isle of Wight).

Cerdo'nians, an ancient sect, whose belief, half philosophical, half religious, was a confused mixture of Christian dogmas with Oriental dualism and Gnostic ideas. Their founder, Cerdo, was a Syrian, who came to Rome about the year 139 under the pontificate of Hyginus. He maintained the existence of the Zoroastrian two principles, one of good and the other of evil. The latter, according to him, was the creator of the world and the God and lawgiver of the Jews. The former was the creator of Jesus Christ, whose incarnation, sufferings, and death were only sensible appearances, and not vital facts. His disciples became confounded with those of Marcion, who some years later propagated similar opinions.

Céré, Jean Nicolas, zhŏn nĭk-ō-lä sā-rā, French botanist: b. Isle of France 1737; d. there 2 May 1810. Under the direction of the French government he greatly extended the culture of spices in the Isle of France (now Mauritius), when that island was a French dependency. The agricultural society of Paris published his essay on the culture of rice, and awarded him a medal; and Napoleon confirmed him in his position as director of the botanical garden of the Isle of France, and conferred on him a pension of $120. A tree of the island has been called after him, Cerea.

Cere, sēr, the naked skin or fleshy sheath that covers the base of the upper mandible in some birds, through which it is supposed that a tactile sense is exercised.

Cerealia, sē-rē-ā'lĭ-a (from Ceres, the goddess of the fields and of fruits) signified the productions of agriculture, also the festivals of Ceres, celebrated at Rome. The time at which they were celebrated is not known. According to some it was the ides (13th) of April; according to others the 7th of the same month.

Ce'reals, a term derived from Ceres, the goddess of corn. Though sometimes extended to leguminous plants, as beans, lentils, etc., it is more usually and properly confined to the *Gramineæ,* as wheat, barley, rye, and oats, which are used as human food. In agriculture they are usually considered as exhausting crops, partly on account of their trailing roots; their mode of nutrition, which is effected more by the roots than by the leaves; their slender stems, which allow weeds to grow up and rob the soil; and from the necessity of allowing them to attain full maturity before they are reaped.

Accordingly it is considered one of the rules of good husbandry not to take two cereal or white crops in succession, but to make them alternate with root crops, which, growing in rows at some distance apart from each other, have the additional advantage of allowing weeds to be destroyed by means of repeated hoeings.

Cereals, or **Cereal Plants,** the grasses cultivated for their seeds which are used as food by man and animals. Sometimes also called bread-plants and, in Europe, corn-plants. The principal ones are treated in separate articles. See BARLEY; MAIZE; MILLET; OATS; RICE; RYE; SORGHUM; WHEAT.

Cerebellum, sĕr-e-bĕl'ŭm ("the little brain") that portion of the brain situated behind and beneath the cerebrum. It is connected with the main brain mass by means of two feet or stems, the cerebellar peduncles, and is separated from the main brain mass in the cranial cavity by a thick layer of connective tissue, the tentorium cerebelli. It is also connected with the pons by a pair of middle peduncles, and with the medulla oblongata by the inferior peduncles. It thus forms a very integral portion of the brain mass. In general the form of the cerebellum in human beings is a flattened ovoid measuring from eight to ten centimeters from side to side, five to six centimeters from before backward, and five centimeters vertically. Its average weight is about 140 grams, which is one eighth of the weight of the whole cerebro-spinal axis. It is larger and heavier in the male than in the female, and is relatively larger in the adult than in the child. Like the brain, it is divided up into a number of lobes, of which three are most prominent, the middle portion, or vermis, and the two lateral lobes. The minute structure of the cerebellum is somewhat similar to that of the cerebrum, but there are certainly very marked differences, particularly in the development of a layer of very characteristic cells, the Purkinje cells. The interior of the cerebellum contains masses of gray matter, or nuclei. These are the dentate nucleus, the nucleus emboliformis, nucleus globosus, and the nucleus fastigii in the vermis. Through the inferior, middle, and superior peduncles fibres pass to and from the cerebrum, pons, medulla, and spinal cord, thus bringing the cerebellum into organic union with the rest of the nervous system. The functions of the cerebellum are not yet completely known, but it is certain that the cerebellum has a number of important functions, chief among which are those connected with locomotion and the act of balancing. Affections of the cerebellum often result in a peculiar form of staggering, known as cerebellar ataxia. See BRAIN.

Cer'ebral Hemorrhage. See BRAIN, DISEASES OF.

Cerebra'tion, an old term, much used in the early physiologies, designating an automatic reflex series of brain actions taking place below the threshhold of consciousness. See CONSCIOUSNESS.

Cer'ebrin, sĕr'e-brĭn, a name that has been applied, at different times and by different chemists, to various substances that are obtainable from the brain and other parts of the nervous system by extraction with alcohol. It is now usually applied to a white, crystalline, nitrogenous powder that is obtained by heating ox-brain with baryta, washing, drying, and finally extracting with alcohol. The cholesterin that is also present in the product so obtained may be removed by the action of ether, in which cerebrin is insoluble. Cerebrin does not combine with acids or bases, but by prolonged boiling with hydrochloric acid it is converted into a substance that can reduce Fehling's solution.

Cer'ebro-spi'nal, pertaining to the brain and spinal cord together, looked on as forming one nerve mass.

Cerebro-spinal Fluid. See BRAIN.

Cerebro-spinal Meningitis. See MENINGITIS.

Cerebrum. See BRAIN.

Ceremo'nial of the European Powers, certain forms of international etiquette or usage, which have arisen in Europe during modern times. No independent state can actually have precedence of another; but as the weaker seek the protection and friendship of the more powerful, there arises a priority of rank. This has occasioned the gradual establishment of dignities, rank, and acts of respect to states, their rulers, and representatives, by which means (in contradistinction to the internal etiquette of a state) an international ceremonial has been formed, which has been the source of confusion and war, and to the observance of which far more consideration is often paid than to the fulfilment of the most sacred contracts. Louis XIV. carried this folly further, perhaps, than any one before or after him. To this international ceremonial belong:

1. Titles of rulers. Accident made the imperial and regal titles the highest, and thus conferred advantages apart from the power of the princes. After Charlemagne, the emperors of the Romans were considered as the sovereigns of Christendom, maintained the highest rank, and even asserted the dependence of the kings on themselves. For this reason several kings in the Middle Ages, to demonstrate their independence, likewise gave their crowns the title of "imperial." England, for example, in all its public acts, is still styled the "imperial crown." The kings of France received from the Turks and Africans a title equivalent to emperor of France. In progress of time the kings were less willing to concede to the imperial title, of itself, superiority to the royal.

2. Acknowledgment of the titles and rank of rulers. Formerly the Popes and emperors arrogated the right of granting these dignities; but the principle was afterward established, that every people could grant to its rulers at pleasure a title, the recognition of which rests on the pleasure of other powers, and on treaties. Some titles were therefore never recognized, or not till after the lapse of considerable time. This was the case with the royal title of Prussia, the imperial title of Russia, the new titles of German princes, etc.

3. Marks of respect conformable to the rank and titles of sovereigns. To the "royal" prerogatives, so called (conceded, however, to various states which were neither kingdoms nor empires, such as Venice, the Netherlands, Switzerland, and the electorates), pertained the right of sending ambassadors of the first class, etc. In connection with this there is a much contested

point, namely, that of precedence or priority of rank, that is of the right of assuming the more honorable station on any occasion, either personally, at meetings of the princes themselves, or of their ambassadors, at formal assemblies, etc., or by writing, as in the form and signature of state papers. There is never a want of grounds for supporting a claim to precedence.

As the councils in the Middle Ages afforded the most frequent occasion of such controversies, the Popes often intervened. Of the several arrangements of the rank of the European powers which emanated from the Popes, the principal is the one promulgated in 1504 by Julius II., through his master of ceremonies, in which the European nations followed in this order: (1) the emperor of the Romans (emperor of Germany); (2) the king of Rome; (3) the king of France; (4) the king of Spain; (5) of Aragon; (6) of Portugal; (7) of England; (8) of Sicily; (9) of Scotland; (10) of Hungary; (11) of Navarre; (12) of Cyprus; (13) of Bohemia; (14) of Poland; (15) of Denmark; (16) Republic of Venice; (17) Duke of Bretagne; (18) Duke of Burgundy; (19) Elector of Bavaria; (20) of Saxony; (21) of Brandenburg; (22) Archduke of Austria; (23) Duke of Savoy; (24) Grand-Duke of Florence; (25) Duke of Milan; (26) Duke of Bavaria; (27) of Lorraine. This order of rank was not, indeed, universally received, but it contained a fruitful germ of future quarrels; some states, which were benefited by the arrangement, insisting upon its adoption, and others, from opposite reasons, refusing to acknowledge it. To support their claims for precedence the candidates sometimes relied on the length of time which had elapsed since their families became independent, or since the introduction of Christianity into their dominions; sometimes on the form of government, the number of crowns, the titles, achievements, extent of possessions, etc., pertaining to each. But no definite rules have been established by which states are designated as being of the first, second, third, fourth, etc., rank. Rulers of equal dignity, when they make visits, concede to each other the precedence at home; in other cases, where the precedence is not settled, they or their ambassadors take turns till a compromise is effected in some way. In Great Britain and France far less ceremonial is observed, in the official style, than in Germany, where forms and titles are carried to an absurd extent, and the ceremonial words, which extend even to the pronouns by which the princes are designated, it is not possible to translate. Emperors and kings mutually style each other "brother," while they call princes of less degree "cousin." The German emperors formerly used the term "thou" in addressing other princes. The "we," by which monarchs style themselves, is used either from an assumption of state or from a feeling of modesty, on the supposition that "I" would sound despotical, while "we" seems to include the whole administration, etc.

Cereopsis, sē-rē-ŏp'sĭs, the pigeon-goose, an Australian genus of the *Anatidæ* or duck family, and the subfamily *Anserinæ,* or geese. *C. novæ hollandiæ* is abundant on the south coast of Australia and the adjacent islands.

Ceres, sē'rēz, the name given by the Romans to the Greek goddess of agriculture, Demeter, when her worship was introduced into Rome. The origin of the name cannot be explained with certainty. It is not Latin; but some think that it was Etruscan, among whom, according to Servius, Ceres was one of the Penates. Others think that Ceres may be the same with the Greek Cora, or Core (that is, "maiden"), another name for Persephone, the daughter of Demeter, with whom Demeter herself was often confounded. The worship of Demeter, or Ceres, was introduced into Rome from Sicily at the beginning of the 5th century B.C., and the first temple to her was vowed by the dictator, A. Postumius Albinus, 496 B.C. Her worship soon acquired a considerable degree of political importance. As usual when the Romans introduced the worship of a foreign divinity into their own city, they adopted all the legends connected with that divinity, adapting them to their own mythology. Thus, since Demeter was said by the Greeks to be the daughter of Kronos and Rhea, and accordingly sister of Hera, Aïdes (or Hades), Poseidōn, Zeus, and Hestia, so Ceres was regarded by the Romans as the daughter of Saturn and Ops, and sister of Juno, Pluto, Neptune, Jupiter, and Vesta; and so also the Persephone of the Greeks became the Proserpine of the Romans. See DEMETER.

Ceres, the name of the first asteroid discovered. It was discovered by Piazzi 1 Jan. 1801. Having observed it at Palermo, in Sicily, he called it Ceres, after the old tutelary divinity of that island. Under favorable circumstances it has been seen by the naked eye as a star of the seventh magnitude, but more generally it looks like one of the eighth magnitude, only the light has a red tinge, and a haze surrounds the planet as if it had a dense atmosphere.

Cereus, sē'rē-us, a genus of plants of the order *Cactaceæ,* remarkable for their singularity of form and the beauty of the flowers. *C. giganteus,* the Suwarrow or Saguaro of the Mexicans, is the largest and most striking of the genus. It rises to the height of 50 or 60 feet, and looks more like a candelabrum than a tree of the normal type. Other notable species are *C. senilis,* the long gray bristles of which give it the appearance of the head of an old gray-haired man. *C. grandiflorus* is the night-flowering cereus, but there are others which also flower at night. *C. speciosissimus,* an erect plant, commonly cultivated in greenhouses, is a native of Mexico. *C. flagelliformis,* a creeper, is not unfrequently met with in gardens. The members of the genus are generally useful as cardiac agents and antipyretics,—particularly the Mexican fever-few, *C. Bonplandi.*

Cerignola, chā-rēn-yō'lä, Italy, a town in the province of Foggia, and 24 miles southeast from the city of Foggia. It has a college, several convents, and a hospital. The inhabitants manufacture linen; and the district produces large quantities of almonds and cotton. In 1503 the Spaniards, under Gonzales, Duke of Cordova, here defeated the French, when the Duke de Nemours, who commanded the latter, was slain. Pop. 34,000.

Cerigo, chā'rē gō (ancient CYTHERA), an island in the Mediterranean, separated from the southern coast of the Morea by a narrow strait. It formerly belonged to the Ionian Republic of the Seven Islands, but since 1864 has been part

of the kingdom of Greece; area about 106 square miles. Cerigo, with the neighboring islands, now forms one of the eparchies belonging to the province or nome of Argolis and Korinthia. It is rather rocky and mountainous. Grain, wine, olives, and other fruits are raised. Sheep and goats constitute the chief live stock. The people are of Greek origin, and are all of the Greek Church. At an early period a Phœnician colony was founded here. Later it was successively under the control of Argos, Sparta, and Athens, and finally fell into the hands of the Romans. After submitting to Venice and then to Turkey, in 1718, it was once more assigned to Venice. It was annexed to France in 1807; two years later it was occupied by the English; and since 1815 it has shared the fate of the Ionian Islands. It was anciently sacred to Aphrodite (Venus), who was also called Cytherœa. Pop. 12,306.

Cerin'thus, one of the first heresiarchs who, according to St. Irenæus in his work, 'Against Heresies,' was contemporary with the evangelist St. John; but Tertullian and Epiphanius refer him to the time of Hadrian. In Irenæus' work, as also in the 'Philosophumena,' attributed variously to Origen and Hippolytus, bishop of Ostia, Cerinthus is represented as an alumnus of the pagan philosophical schools of Alexandria; but he broached his heretical doctrines in Asia Minor, and there had a numerous following. The universe, he taught, is not the work of the First God, but was created by some angelic power far inferior to the supreme power. Jesus he held to be the son of Joseph and Mary, born as other men are born, but excelling all in righteousness, wisdom, and understanding. Cerinthus taught also that upon Jesus, after his baptism by John, descended the Christos from the power which is supreme over all, in the form of a dove, and that when Jesus proclaimed the unknown Father and wrought miracles; but that at the end of the passion the Christos flew away out of Jesus, and Jesus suffered, but that the Christos remained impassible, being the spirit (or breath) of God. Angels play a conspicuous part in the system of Cerinthus. Thus it was an angel, he says, that gave the law to Moses; and the Jahve of Israel was an angel. Cerinthus and his followers entertained a special animosity against St. Paul and St. John, and the heresiarch is credited with writing an apocalyptic book in rivalry with St. John. He is said to have been a believer in the millennial reign of the Christ upon the earth.

Ce'rite, sē'rīt, a mineral occurring only at Riddarhyttan, in Sweden, and containing the rare element cerium, and others of the cerium group. Its formula is not certainly known, but the mineral may be described as a silicate of the metals of the cerium group, combined with small quantites of calcium and iron. It is mostly massive or granular, but crystals belonging to the orthorhombic system are sometimes found. Cerite has a hardness of about 5.5, and a specific gravity of about 4.9. It has a peculiar and characteristic color, intermediate between clove-brown and cherry-red, shading off to a gray.

Cerito, Francesca, frän-chĕs'kä chā-rē'tō, commonly called FANNY, Italian danseuse: b. Naples 1823. She was the daughter of an officer who served in the Neapolitan army under Murat, and made her début at the San Carlo theatre in 1836, and, although only 13, was received with great enthusiasm. At Milan, in 1838, and for two years at the Kärntherthortheatre in Vienna, and afterward in Paris and London, everywhere the same storm of applause greeted her appearance, especially in London. She excelled most in lively, gentle, arch, and delicate gestures and attitudes, and less in heroic or classical parts. In 1850 she separated from her husband, Mr. St. Leon, who was well known in Paris and London as dancer and violinist.

Ce'rium, sē'rĭ-ŭm, a metallic element the oxide of which was discovered and recognized as a new substance in 1803 by Klaproth, and, independently, by Berzelius and Hisinger. It was named for the minor planet Ceres, which was also discovered at about the same time. The principal source of cerium is the mineral monazite (q.v.), which is a silicate of cerium and certain other allied elements. Cerium forms a basic nitrate that is insoluble in water, and this fact affords a ready means of separating the metal from the other elements with which it is almost invariably associated. Metallic cerium may be obtained by electrolysis of the anhydrous chloride, or by melting the anhydrous chloride with metallic sodium. Thus perepared, cerium is a steel-gray metal, ductile and malleable, and melting at a temperature probably not far from the melting-point of silver. Its chemical symbol is Ce, and its atomic weight is 140 if O = 16, and 139 if H = 1. It has a specific gravity of from 6.6 to 6.75, and a specific heat of about 0.0448. It does not change in dry air, but in moist air it oxidizes superficially. It decomposes cold water slowly, and hot water quickly. Two oxides of the metal certainly exist, one having the formula Ce_2O_3, and the other the formula CeO_2. Three other oxides have also been described, with the formulæ CeO_3, Ce_2O_5, and Ce_4O_9; of these the first probably exists, but the other two still need confirmation. Oxide of cerium is also used in the manufacture of the better grades of incandescent gas-mantles. A fabric of cotton is woven of the desired form, and this is impregnated by repeated dipping in a solution of the nitrates of cerium and thorium. On ignition the cotton burns away, and the nitrates are converted into oxides, which give the intense luminosity desired. A mixture of 99 per cent of thorium oxide to 1 of cerium oxide gives the best results.

In medicine the insoluble salts of cerium are used, cerium oxalate alone being officinal. It resembles the insoluble bismuth compounds in its action, being a sedative to mucous membranes, and it is much used as an antemetic, particularly in the nausea of pregnancy. The soluble salts of cerium are poisons, their action being similar to the soluble salts of bismuth.

Cernuschi, Enrico, ĕn-rē'kō chĕr-noos'kē, Italian economist: b. Milan, Italy, 1821; d. Mentone 12 May 1896. He was graduated at Pavia in 1842, fought for liberty in the insurrection of 1848, and was obliged to flee from Italy, owing to political proscription. He acquired a large fortune in Paris as a banker, but owing to the hostility of the communists left France in 1871 and traveled extensively in Egypt, China, Japan, England, and the United States, visiting the last-named in 1877. He was an ardent bimetallist, and published 'Mecanique de

l'É'change' (1865); 'Illusions des Sociétiés coöperatives' (1886); 'Discours' (1871); 'Silver Vindicated' (1876); 'Le Bi-métallism à quinze et demi' (1881); 'Anatomie de la Monnaie' (1886); etc.

Cero, sē'rō, a large, edible fish (*Scomberomorus regale*) of the western Atlantic, and similar to the Spanish mackerel. Another species (*S. caballa*), also called "sierra" or "king-cero" is found in the southern Atlantic, and reaches double the weight of the former, often attaining 100 pounds.

Ceroxylon, a genus of South American palms. See WAX-PALM.

Cerquozzi, Michelangelo, mē'kĕl än'jā-lō chär-kwôt'zē, Roman painter: b. Rome 1602; d. 1660. He received the surname *delle battaglie* (battle-painter), and at a later period that of *delle bambocciate,* because, in imitation of Peter Laar, he painted ludicrous scenes taken from low life, such as that to be seen at fairs and markets, and among the Lazzaroni. In his later years he painted flowers and fruit.

Cerretti, Luigi, loo-ē'jē chĕr-rĕt'tē, Italian poet and rhetorician; b. Modena 1 Nov. 1738; d. Pavia 5 March 1808. The purity and elegance of his diction made him, at an early age, the most distinguished professor of rhetoric and oratory in Italy. His 'Poems and Select Prose,' collected into a posthumous volume, were instantly successful, and have retained their rank ever since.

Cerro Blanco, the highest mountain in New Mexico; summit, 14,269 feet.

Cerro Gordo, thĕr rō gôr'dō, or sĕr'rō gôr'dō ("Big Hill"), a famous mountain pass in Mexico, the scene on 18 April 1847, of one of the sharpest battles of the Mexican war. After the capture of Vera Cruz on the coast, Gen. Scott moved northwest toward the City of Mexico, along the National Road. Some 50 miles from Vera Cruz this leaves the steaming lowlands and climbs a steep rocky plateau, an eastern spur of the great mountain range, seamed with ravines and thick with chaparral, and pierced by the defile of the little Rio del Plan. To this defile the road after crossing it and leaving it by a loop to the north among the mountains, returns at a ravine separating a sharp rocky ridge called Atalaya from a conical eminence termed Telegraph Hill. West of this again is the small hamlet called Cerro Gordo, which gives its name to the pass. On 9 April Santa Anna began fortifying Telegraph Hill, and from the 12th pushed on the work with all his force; accumulating about 12,000 men, the bulk at Cerro Gordo, but neglecting to occupy Atalaya. On the 11th, Scott's vanguard under Twiggs and Harney came up to Rio del Plan at the foot of the plateau, where the road crosses the river, drove away a few Mexican lancers, established a camp, and began reconnaissances. Santa Anna, in place of attacking the scattered detachments, confided in his strong position, and the lowland fevers which must force the Americans to fight him, and waited. By the 17th most of Scott's forces had come up; and he pushed Twiggs forward within easy striking distance. The latter, finding Atalaya undefended occupied it just as a Mexican detachment advanced to do so, routed them, and chased them in headlong flight half way up Telegraph Hill. The whole American army, about 8,500, being now at hand, Scott issued orders for a general advance next day. Santa Anna's line extended from Telegraph Hill to a road at the ravine, and eastward for a mile along the heights overlooking the National Road, which end in a precipitous rocky bluff 100 feet high; then back over three ridges terminating in rocky knolls, to the river defile. In front of the batteries and infantry, the chaparral had been cut down and piled into an abattis for several hundred feet. The Americans, on the other hand, planted powerful batteries on Atalaya, and enfiladed the Mexican right with a howitzer across the river. Scott's plan was simple, but brilliantly effective, though the impassable ground made it fall short of the full intention. Since the Mexicans expected the chief attack on their right, he resolved to make only a feint there and assuming that they expected him to move forward along the road resolved not to do so. In the meantime he ordered the roads cleared around the hills to the north in order that by making a circuit to the National Road in the rear of the Mexicans he might cut off their retreat. On the morning of the 18th Pillow assailed the right; the artillery on Atalaya rained shot and shell with terrific effect on Telegraph Hill, the road batteries, Santa Anna's camp, and even his reserves, and the howitzer over the river added its discharge. Twiggs, Shields, and Worth, with Riley, then moved along the circuit till on the north flank of Telegraph Hill, at first out of sight, then in full range of the Mexican fire. Santa Anna detached part of the forces on Telegraph Hill to drive them back; then Harney from Atalaya swept over the crest and down the side, up Telegraph Hill till within 200 feet of the batteries and below their range. There he reformed and in one final charge utterly routed the Mexicans, at the same time turning the forces on the hill against the main body of Mexicans at Cerro Gordo. The entire right, its retreat cut off, threw down its arms and surrendered. The main body broke up in a panic as the fugitives from Telegraph Hill rushed among them and the guns from that quarter cut them down and fled wildly down the craggy slopes and to the defile, and westward along the road. The Mexicans lost 1,000 or 1,200 in killed and wounded; about 3,000 prisoners, including five generals, and 299 other officers; 43 guns, and 3,500 small arms. The Americans lost 63 killed and 368 wounded. The victory laid open the road nearly to the Mexican capital.

Cerro de Pasco, sĕr'rō dā päs'kō, Peru, capital city of the department of Junin, at the northern extremity of the plateau of Bourbon, 14,275 feet above the level of the sea. The town came into existence in 1630, in consequence of the discovery of veins of silver there by an Indian. The streets are narrow and crooked, and the houses small and without windows or balconies. The inhabitants are a mixture of all races and nations, who make their living by the produce of the mines. From October to July hail-storms, mists, and snow-falls make the place almost intolerable, and in summer with the exception of a few clear days the climate is little better. On account of the extreme rarity of the air the difference in temperature

ir the sun and in the shade is great. Cerro de Pasco still contains the most productive mines in all Peru, although they no longer yield the almost fabulous wealth that the Spaniards are said to have derived from them. Many of the shafts leading down to the veins of silver are in the town itself, and have their openings either in little huts or in the dwellings of the owners of the mines. According to the greater or smaller depth of the diggings they are called *minas* or *cortes*. The silver is found partly pure, and partly in ores containing from 25 to 80 per cent of the precious metal. Pop. (very variable) about 7,000.

Cerro Gordo de Potosi, da pō-tō-sē', a mountain in the Andes of Bolivia; southwest of Potosi, 16,150 feet high. It is remarkable for its deposits of silver.

Cerro Largo, sĕr'rō lär'gō, a department in the northeast of Uruguay, well watered, with large savannahs and forests. Area, 5,729 square miles. Capital, Cerro Largo or Melo. The inhabitants are chiefly engaged in cattle-raising. Pop. 36,000.

Cerros, or **Cedros Island,** an island belonging to Mexico, in the Pacific Ocean, off the west coast of Lower California. It is for the most part mountainous and barren, but is thought to possess mineral wealth. Area, 12 square miles.

Certaldo, Italy, a town of Tuscany, partly on a conical height, and partly on a flat along the right bank of the Elsa, 15 miles southwest from Florence. It is the birthplace, was long the home, and now contains the ashes of Boccaccio. His house is still shown, and in one of its rooms are collected numerous relics of tho author of the 'Decameron,' and a large fresco painting of him by Benvenuti of Florence.

Certiorari, sėr-tē-ō-rā-rī, or sėr-shē-ō-rār'ī, in law, a writ, the purport of which is to remove convictions, orders, or proceedings before magistrates, indictments, and records in civil actions before judgment, from inferior courts into the courts above, with a view that the party may have justice done to him, or that the superior court may see whether the justices or court below, before which the proceedings have taken place previously to the certiorari being obtained, have kept within the limits of their jurisdiction. This writ, from the moment of its delivery to the judges of the court below, or magistrate, suspends their power, and any subsequent proceedings by them are void and *coram non judice*. Although the writ of certiorari removes the record from the inferior court into the court above, yet the court above does not take up the cause where the proceedings stopped, but begins *de novo*. Procedure by appeal has largely superseded that by certiorari.

Ceruleum, a blue pigment, consisting of stannate of protoxide of cobalt mixed with stannic acid and sulphate of lime.

Ceru'minous Glands, the glands of the ear which secrete the cerumen or wax which lubricates the passage to the tympanum and prevents the entrance of foreign matter.

Cerussite, the native lead carbonate, $PbCO_3$. It is common in orthorhombic crystals, very frequently stellately twinned. It also abounds in massive, earthy and stalactitic forms. It is very brittle, has a hardness of 3. to 3.5 and the high specific gravity of 6.5. It is usually translucent and of an adamantine or pearly lustre. Its color is white or gray, though green and yellow tints are not uncommon. It is one of the most abundant and valuable ores of lead, and often carries silver. It is formed from galena by the action of solutions of calcium bicarbonate. Among its many important localities are Broken Hill in New South Wales, Ems in Germany, and Phœnixville, Pa.

Cerutti, Giuseppe Antonio Gioachimo, joo-sĕp'pĕ än-tō'nē-ō jō-ä-kē'mō chä-roo'tē, Italian Jesuit theologian: b. Turin 13 June 1738; d. Paris, February 1792. He was one of the most eminent professors in the Jesuit College at Lyons and his 'Apology for the Jesuits' attracted much attention. He had already published two discourses upon the means of preventing duels, and on the reasons why modern republics have not reached the splendor of the ancient. The last received the prize of the Academy of Dijon. He was at Paris when the Revolution broke out in 1789. Abandoning his former principles he became one of the most zealous supporters of the new order of things. He was intimately connected with Mirabeau, and labored much for him. He also published several pamphlets, among which was a 'Mémoire sur la Nécessité des Contributions Patriotiques.' In 1791 he was a member of the legislative assembly. Some time after he delivered, in the Church of St. Eustache, a funeral discourse upon Mirabeau. The city of Paris called a street after his name.

Cervantes Saavedra, Miguel de, mē-gĕl' dā thär-bän'tēs sä-ä-bā drä, Spanish poet and novelist, one of the great writers of modern times: b. Alcala de Henares 9 Oct. 1547; d. Madrid 23 April 1616. His parents removed to Madrid when he was about seven years old. Their limited means made it desirable that he should fix on some professional study, but he followed his irresistible inclination to poetry, which his teacher, Juan Lopez, encouraged. Elegies, ballads, sonnets, and a pastoral, Filena, were the first productions of his poetical genius. Poverty compelled him to quit his country at the age of 22, to seek maintenance elsewhere; he went to Italy, where he became page to the Cardinal Giulio Acquaviva, in Rome. In 1570 he served under the papal commander, Marco Antonio Colonna, in the war against the Turks and African corsairs, with distinguished courage. In the battle of Lepanto, in 1571, he lost his left hand. After this he joined the troops at Naples, in the service of the Spanish king. In 1575, while returning to his country, he was taken by the corsair Arnaut Mami, and sold in Algiers as a slave. He remained in slavery for seven years, but servitude, far from subduing his mind, served to strengthen his faculties. Vincente de los Rios and M. F. Navarrete, his chief biographers, relate the bold but unsuccessful plans which he formed to obtain his freedom. In 1580 his friends and relations at length ransomed him. At the beginning of the following year he arrived in Spain, and from this time lived in seclusion, entirely devoted to the muses. It was natural to expect something uncommon from a man who, with inexhaustible invention, great richness of imagination, keen wit, and

a happy humor, united a mature, penetrating, and clear intellect, and great knowledge of real life and mankind in general. But it rarely happens that expectation is so much surpassed as was the case with Cervantes. He began his new poetical career with the pastoral novel 'Galatea' (1584), in which he celebrated his mistress. Soon after the publication of this he married. Being thus obliged to look out for more lucrative labor he employed his poetical genius for the stage; and in the course of 10 years furnished about 30 dramas, among which his tragedy called 'Numancia' is particularly valued. He was not so successful in another kind of drama particularly favored by the Spaniards, a tangled mixture of intrigues and adventures; and this was doubtless the cause of his being supplanted by Lope de Vega, who was particularly qualified for this kind of composition. He consequently gave up the theatre, but it seems not without regret. From 1588 to 1599 he lived retired at Seville, where he held a small office. He did not appear again as an author till 1605, when he produced the first portion of that work which has immortalized his name,— 'Don Quixote.' Cervantes had in view by this work to reform the taste and opinions of his countrymen. He wished to ridicule that adventurous heroism with all its evil consequences, the source of which was the innumerable novels on knight-errantry. The beginning of the work was at first coldly received, but soon met with the greatest applause, in which, at a later period, the whole of Europe joined. Cervantes' true poetical genius was nowhere so powerfully displayed as in his 'Don Quixote,' which, notwithstanding its prosaic purpose and it satirical aim, is full of genuine poetry. While it struggles against the prevailing false romance of the time, it displays the most truly romantic spirit. The extraordinary good fortune of the work did not extend to the author. All his attempts to better his condition were unsuccessful, and he lived contented with his genius and his poverty, and a modest though proud estimation of his merits. After an interval of some years, he again appeared before the public in 1613, with 'Twelve Novels' (which may be placed by the side of Boccaccio's), and in 1614 his 'Journey to Parnassus' — an attempt to improve the taste of his nation. In 1615 he published eight new dramas, with intermezzos, which, however, were indifferently received. Envy and ill-will, in the meantime, assailed him, and endeavored to deprive the neglected author of his literary fame; for which the delay of the continuation of 'Don Quixote' afforded the pretext. An unknown writer published, under the name of Alonzo Fernandez de Avellaneda, a continuation of this work, full of abuse of Cervantes. He felt the malice of the act painfully, but revenged himself in a noble manner by producing the continuation of his 'Don Quixote' (1615), the last of his works which appeared during his lifetime; for his novel 'Persiles and Sigismunda' was published after his death. He found a faithful friend in the Count of Lenos, but poverty, his constant companion through life, remained true to him till his last moments. He died on the same day as Shakespeare, in Madrid, where he had resided during the last years of his life. He was buried without any ceremony, and not even a common tombstone marks the spot where he rests. In addition to his celebrity as an author, he left the reputation of a man of a firm and noble character, clear-sighted to his own faults and those of others. Among the best editions of 'Don Quixote' are the one published at Madrid by Joaquin Ibarra, in 1780, considered a masterpiece of typography; that of Pellicer (Madrid 1798), and that of D. Diego Clemencin, with an excellent commentary (Madrid 1833–9). Many of his works are translated; 'Don Quixote' into all the languages of Europe. Among the English translations may be mentioned those of Motteux (1719); Jarvis (1742); and Smollett (1755). Several noteworthy English translations have been made in recent years: by Duffield (1881); Ormsby (1885); and Watts, (1888–9), containing life of the author, notes, bibliography, etc.

Cervantes, Philippines, capital of the province of Lepanto, situated near the centre of the province in the northwestern part of the island of Luzon, 3 miles from Cayán, the former capital. It is on a road connecting it with Benguet, and is 78 miles from Dagupan, which is the nearest point on the railroad. Pop. 16,000.

Cervantite, or **Antimony Ocher,** is native antimony tetroxide, Sb_2O_4. It usually occurs in crusting stibnite and other antimony ores. It has a pale yellow color and greasy lustre.

Cervera y Topete, Pascual, päs'kwäl thār-bā'rä ē tō-pā'tā, Spanish naval officer: b. province of Jerez 18 Feb. 1833. He was of noble birth, his mother being a daughter of Count Topete y Valle. He was graduated at the Naval Academy of San Fernando; entered on active service in 1851; and was made first lieutenant in 1859; captain in 1868; and admiral subsequently. He was a prominent factor in the 10-years' war in Cuba, when he succeeded in blockading the ports and preventing the landing of filibusters; was sent to London as a representative of Spain to take part with other nations in a conference bearing on naval questions of international importance; and commanded the fleet sent against the American squadron operating in Cuban waters after the declaration of war in 1898. He took refuge in the inner harbor of Santiago de Cuba, and when, on 3 July, he attempted to escape, under imperative orders from his superiors, his entire fleet was destroyed by the squadron under the official command of Rear-Admiral Sampson and the actual command (in the temporary absence of that officer) of Rear-Admiral Schley. Admiral Cervera and his surviving officers were sent to Annapolis, Md., as prisoners of war, and soon afterward were released and allowed to return to Spain. He is a man of cultured and genial manners, of a kindly disposition and a gallant officer, for whom his captors felt the greatest admiration and sympathy.

Cervidæ, sėr'vĭ-dē, the deer family, a group of ruminant ungulates, including, besides the typical deer, the reindeer, the musk-deer, and others. The most noticeable characteristic of the entire group is the presence, in the males, or "bucks," of branched appendages to the skull, called antlers. These are, however, lacking in certain species, which, despite this fact, are very evidently closely related to the antlered deer. The antlered animals shed these

ornaments annually and develop new ones. (For growth and reproduction of these, see ANTLERS.) All deer have a large unossified space in the fore part of the skull which prevents the lachrymal bone from coming in contact with the nasal bone, as in the ox family. In the deer without antlers the upper canine teeth are especially well developed for defensive purposes; but they are generally present in all species; and, with the exception of the musk-deer, the *Cervidæ* have no gall-bladders. Though not nearly so numerous as such families as that of the ox, the deer family includes a variety of genera and numerous species, widely distributed, so that we find representatives throughout the Old World, except in Australia and southern Africa, and in both continents of the New World. Deer are generally found in forests or grass-lands, and never in deserts. They are, historically considered, older than the other families of ruminants, dating back to the Lower Miocene Period, when they were very small and without antlers. With the gradual change in other directions, such as the variation in dentition and the increased size, the antlers have been produced and amplified, so that the deer of the present is a far larger and finer-looking animal than his fossil ancestor. In the matter of antlers the young stag typifies the evolution of the race; as a yearling, his antlers are merely one-pronged spikes; but each successive year they become more branched and forked until, at maturity they may have seven or even more branches.

All deer are supplied with a coat of short fur, dull in tone, for protection, ranging from reddish-brown to gray; and usually white below. Those that are marked bear such markings on the face and throat and on the tail. Only a few genera are spotted. In most genera only the young (the fawns) are spotted; and lose their spots when they are about one year old. Deer breed annually, the young, one or two at a birth, being produced in late spring. The fawns remain with their mothers until they are about a year old, when they are sufficiently mature to become independent. The grass-land deer, especially, are gregarious, and often gather in large herds at the approach of winter. These feed on the meadow herbage, whereas the forest deer eat the leaves, twigs, and buds of bushes. In all, about 60 species are known. They are included within the following genera: *Cervus,* the red deer; *Cervulus,* the Asiatic muntjacs; *Elaphodus,* the tufted deer; *Rangifer,* the reindeer; *Alces,* the elk; *Capreolus,* the roe-deer; *Hydropotes,* the water-deer; *Cariacus,* the American deer; *Pudua,* the Andean deer; and *Moschus,* the musk-deer. All these, except *Moschus,* form the sub-family *Cervinæ; Moschus,* by itself, forms the sub-family *Moschinæ.* See DEER, and the English names of the various species.

Cervin, Mont (German, *Matterhorn;* Italian *Monte Silvio*), a mountain, Switzerland, Pennine Alps, on the southern frontiers of canton Valais, about six miles west-southwest of Zermatt, from which a road leads to the Col St. Theodule, a pass over the mountain into Piedmont. It is one of the most magnificent objects in nature, being an almost inaccessible obelisk of rock starting up from an immense glacier, to a height scarcely 1,000 feet lower than that of Mont Blanc. The glacier, which differs from the lower glaciers in not being included between bold walls, but occupying a vast and desolate table-land, is nearly 10,000 feet above sea-level. The height of the peak is 14,837 feet. It is composed of felspar slate or gneiss. The peak was first ascended by a party of four English travelers and three guides in July 1865, but three of the party and a guide perished in the descent. (See Whymper's 'Scrambles Among the Alps'). On the summit of the pass, 11,096 feet, are the remains of a rude fortification, supposed to have been erected two or three centuries ago, to prevent incursions from the Valais.

Cervolle, or **Cervole, Armand de,** är-mäṅ dė sĕr-vŏl, French bandit chief, surnamed "The High Priest." He was taken prisoner with King John at the battle of Poitiers in 1356, and after being ransomed, plundered the south of France with a band of troopers (*routiers*), and exacted tribute from Innocent VI. at Avignon. He served for a time under the Dauphin; pillaged Burgundy, Champagne, Alsace, and Lorraine; was made Chamberlain to Charles V. in 1365; and was murdered in 1366.

Cesalpino, or **Cæsalpin, Andrea,** ān'drā-ā chā-zäl-pē'nō, Italian botanist and physiologist: b. Arezzo, Tuscany, 1519; d. Rome 23 Feb. 1603. He studied and taught medicine and botany at the University of Pisa, and was physician to Pope Clement VIII. He was the author of a valuable work 'On Plants,' in which he classified plants by their parts of fructification. To this work Linnæus, Jussieu, and other subsequent botanists were greatly indebted for their ideas of botanical classification. In his 'Peripatetic Investigations' he propounded the theory of the circulation of the blood, afterward adopted and demonstrated by Harvey.

Cesar Birotteau, sā-zär bē-rŏt-tō, **The Greatness and Decline of,** a novel by Honoré de Balzac. It portrays in a striking and accurate manner the bourgeois life of Paris at the time of the Restoration.

Cesares'co, Countess Martinengo. See MARTINENGO-CESARESCO, COUNTESS.

Cesari, Giuseppi, joo-sĕp'pē chā zā rē (sometimes called IL CAVALIERRE D'), Italian painter: b. Arpino about 1568; d. Rome 3 July 1640. He was greatly honored by no less than five Popes. His works — in fresco and oil — display lively imagination, and great tact in execution.

Cesarotti, Melchiore, mĕl-kē-ō'rē chā-zā-rōt'tē, Italian poet and scholar: b. Padua 15 May 1730; d. Solvaggiano 3 Nov. 1808. He devoted himself to the belles-lettres, and was soon chosen professor of rhetoric in the seminary in which he was educated. He translated three tragedies of Voltaire,—'Sémiramis,' 'La Mort de César,' and 'Mahomet.' In 1762 he went to Venice, where he translated Ossian into Italian, and was, in 1768, appointed professor of the Greek and Hebrew languages in the University of Padua. Here he published his translation of Demosthenes and of Homer, and his course of Greek literature. After the establishment of the republican government, in 1797, he was appointed by the existing authorities to write an 'Essay on Studies.' In this he made suggestions for the improvement of education. In

1807 appeared his poem called 'Pronea' (Providence), in praise of his benefactor, Napoleon, who made him the same year knight of the Iron Crown. In spite of his advanced age he subsequently occupied himself with an edition of all his works; but his death prevented the completion of this enterprise. The edition of his works that had been begun during his life was completed by his friend Giuseppe Barbieri (1805–13).

Cesena, chā-zā'nā, **Italy,** a city in the province of Forli, central Italy, on the right bank of the Savio. Among its buildings are a library founded in 1452 by Domenico Malatesta Novello, which possesses 4,000 precious manuscripts; a Capuchin church containing one of the best of Guercino's paintings, and a noble cathedral. Productive sulphur mines are in the neighborhood; and the region has been noted ever since Roman times for the excellence of its wine. Cesena was the birthplace of Popes Pius VI. and VII. In 1357, under Maria Ordelaffi, it made a famous defense against Albornoz; but in 1377 it was barbarously pillaged by Robert of Genf. On 30 March 1815, Murat gained a victory at this place over the Austrians. Pop. 12,000.

Cesium. See CÆSIUM.

Ce'sius, Bernar'dus, Italian philosopher: b. Modena about 1581; d. there 1630. He became a professor of philosophy and theology at Parma, and afterward at Modena, where he died of the plague. He is best known by his work entitled 'Mineralogia, sive Naturalis Philosophiæ Thesauri; Lugduni' (1636), in folio, which contains no important observations by the author himself, but is useful as being a laborious collection of everything relating to the mineralogy of the ancients, and as showing what minerals were familiarly known during the author's time.

Cesnola, Luigi Palma di, loo ē'jē päl mä dē chĕs-nō'lä, American archæologist: b. Piedmont, Italy, 29 June 1832. He served in the Italian war with Austria and came to the United States in 1860, serving in the Civil War, and attaining the rank of brigadier-general. He was United States consul at Cyprus (1865–77), where he made extensive archæological discoveries. In 1878 he became a trustee and director of the Metropolitan Museum of Art, in New York, a post he has since held. In 1897 he was awarded a Congressional medal of honor for conspicuous military service. He has written 'Cyprus: Its Cities, Tombs, and Temples,' and many monographs on art topics.

Céspedes, Pablo de, päb'lō dā thĕs'pā-dĕs, Spanish painter, sculptor, architect, and poet: b. Cordova 1538; d. there 26 July 1608. In 1556 he entered the University of Alcala de Henares, where he distinguished himself by his proficiency in the classics and Oriental languages. He also assiduously cultivated his genius for the fine arts. Having at last made these his principal pursuit, he proceeded to Rome, studied under Zucchero and Michael Angelo, and soon became renowned both for his frescoes and sculptures. In 1577 he obtained a prebend in the Cathedral of Cordova, and from that time resided alternately in his native town and in Seville. His best pictures are in Cordova, Seville, Madrid, and several towns of Andalusia; and are admired particularly for elegance and loftiness of design, complete knowledge of anatomy, the skilful employment of light and shade, warmth of coloring, accuracy of expression, and spirituality of composition. One of his most celebrated pictures is a 'Lord's Supper,' in Cordova Cathedral. He was the head of the then Andalusian school of painting, and numbered among his pupils some painters of distinction.

Céspedes y Borges, ē bôr'-gās, **Carlos Manuel de,** Cuban insurgent: b. Bayamo 18 April 1819; d. 22 March 1874. He studied at the University of Havana, and later at Barcelona, Spain. Implicated in Prim's conspiracy, he was banished from Spain (1843), and returned to Cuba to practise law. As leader of the revolt of 1868, he was chosen by the insurgents president of the newly proclaimed republic. He was killed in a skirmish with the Spaniards.

Cessart, Louis Alexandre de, loo'ē ä-lĕks-ändr dė cĕs-sär, French engineer: b. Paris 1719; d. 1806. He early entered the military service, and distinguished himself in the campaigns of 1743–6, during which he was present at the battles of Fontenoy and Rocoux. Bad health having obliged him to obtain his discharge, he entered the École des Ponts et Chaussées, where he displayed so much genius and industry, that in 1751 he was appointed general engineer of Tours. In 1775 he was removed to Rouen, and in 1781 proposed his plans for the construction of the harbor and works of Cherbourg. These have immortalized his name. He died while engaged in preparing a description of his most important labors. The work was published under the title of 'Description des Travaux Hydrauliques de L. A. Cessart' (1806–9).

Cessio Bonorum, sĕsh'ĭ-ō bō-nō'rŭm ("surrender of goods"), a process by which, according to the law of Scotland, a debtor against whom a warrant of imprisonment was issued after being charged to pay his debt, was entitled to be free from imprisonment, if innocent of fraud, on surrendering his whole estate to his creditors. Since the abolition of imprisonment for debt a debtor may be compelled to make *cessio bonorum* at the instance of a creditor.

Ces'tius, the name of a plebeian gens at Rome, of which two memorials have been preserved, one of them a bridge connecting the island of the Tiber with the right bank of that river, and the other a monumental pyramid standing at the gate San Paolo, partly within and partly without the walls of Aurelian. This pyramid stands upon a base of travertine. It is 125 feet high, and at the base 95 feet broad. It is built of bricks, encased in blocks of marble. In its interior there is a sepulchral vault 20 feet long, 13 feet broad, and 14 feet high. The walls of this vault were formerly decorated with paintings, but these are now faded, and only a few traces of them are still discernible. Two marble pillars which formerly supported the statue of the person whom the monument commemorates, stand in front of the pyramid. From the inscriptions still seen upon it, it has been inferred that the Cestius who caused this magnificent monument to be erected was a Roman knight of that name who lived in the

time of Cicero, and who, having enriched himself in Asia Minor, left part of his wealth for the purpose of perpetuating his memory in this way.

Cesto'da, a class of the phylum *Platyhelminthes,* represented by the tape-worms (q.v.). They are parasitic, usually ribbon-like worms, without any mouth or digestive canal, but with a slightly developed nervous system and an (excretory) water-vascular system. They are hermaphrodite, the joints as a rule numerous and containing male and female reproductive organs; the eggs are minute and very numerous. The mature worm is many-jointed, the joints budding out from near the head; in this form it is called a "strobila"; the terminal joints fall off, becoming independent (proglottis). The eggs, after fertilization, pass through a morula and gastrula stage, a circle of six hooks and suckers developing on the head and forming the *scolex,* or organ of attachment. They live as parasites in birds, beasts, and man, their earlier stages being passed in the bodies of a different host, as fishes, etc.

The Cestoda are divided into five families: (1) *Caryophyllæidæ;* (2) *Ligulidæ;* (3) *Tetrarhynchidæ;* (4) *Tetraphyllidæ;* (5) *Bothriocephalidæ;* (6) *Tæniadæ,* the last group being represented by the common tape-worm of man (*Tænia solium*). Consult: Leuckart, 'Die Menschlichen Parasiten,' two volumes; Braun, 'Die Tierischen Parasiten des Menschen; Linton, 'Notes on Entozoa of Marine Fishes of New England'; 'Reports of the United States Commission on Fish and Fisheries,' Parts I., II.; Stiles and Hassall, 'A Revision of the Adult Cestodes of Cattle, Sheep, and Allied Animals' (Bulletin 4 of the United States Department of Agriculture).

Cestracion, sĕs-trā'sĭ-ŏn, a genus of cartilaginous fishes allied to the sharks, of which the best known species is the Port Jackson shark of Australia (*C. philippi*). Four species are known, varying in length from four to five feet. They feed mainly on various kinds of mollusks. The family *Cestraciontidæ,* though now poorly represented, was very abundant in the earlier geological periods.

Ces'tus ("girdle"), a band or zone said to have been worn by Aphrodite or Venus, and endowed with the power of exciting love toward the wearer. The following is Pope's translation of Homer's description of it:

> In it was every art and every charm
> To win the wisest, and the coldest warm—
> Fond love, the gentle vow, the gay desire,
> The kind deceit, the still-reviving fire,
> Persuasive speech, and more persuasive sighs,
> Silence that spoke, and eloquence of eyes.

Cestus, or **Cæstus,** the boxing-glove of the Grecian and Roman pugilists. It consisted of thongs or bands of raw hide or leather, fastened to the hand, and reaching to the wrist. It was afterward enlarged so as to reach up to the elbow, and loaded with metal to increase the weight of the blow. The combat with the ordinary unloaded cestus was not more dangerous than a common modern boxing-match. Theocritus (Idyll. xxii.) has described one of these combats.

Cetacea, sē-tā'sē-ā, an order of mammals whose structure is so modified as to render them fit for an aquatic life. The whale-bone whales, the toothed whales, as the porpoise, narwhal, etc., and the extinct zeuglodon, represent the leading divisions of the group. The body is fishlike in form, the head passing gradually into the trunk which tapers posteriorly and ends in a bilobate caudal fin which is placed horizontally, not as in the fishes, vertically. The posterior limbs are wanting, and the anterior are converted into broad paddles or flippers, consisting of a continuous sheath of the thick integument, within which are present representatives of all the bones usually found in the fore limb of mammals, but they are not movably articulated, so that the paddle moves like a solid oar. The fish-like aspect is further increased by the presence of a dorsal fin; but this is a simple fold of integument, and does not contain, as in fishes, any bony spines. The vertebræ of the neck, seven in number, are united more or less to each other, so that in some they form a single solid piece. The right whale and its allies have no teeth in the adult state, their place being taken by the triangular plates of baleen or whalebone which are developed on transverse ridges of the palate. The frayed edges of these plates slope obliquely downward and outward from the middle of the roof of the mouth, so that when the mouth is shut there is a triangular space in the middle, the floor of which is formed by the enormous tongue. The water taken into the mouth is sifted by the frayed edges of the plates; it is driven out sideways between the plates and the tongue sweeps backward to the gullet any animals that have been caught in the fringes. But the fetal whales possess minute teeth, which are very soon lost. The porpoises, etc., when they possess teeth in one or both jaws, have them numerous and conical in form; they have no milk predecessors. The stomach is divided into several chambers, but these are not, as in ruminants, connected directly with the gullet; they are rather appendages of the pyloric portion of the organ.

The arrangement of the respiratory and circulatory systems, which enable the Cetacea to remain for some time under water, are interesting. The nostrils open directly upward on the top of the head, and are closed by valvular folds of integument which are under the control of the animal. When the animal comes to the surface to breathe it expels the air violently, and the vapor it contains becomes condensed into a cloud; if the expiration commences before the mouth of the spiracle or blow-hole is above the surface, a little water may be blown up like spray but no water from the mouth is thus discharged, for the soft palate firmly embraces during life the upper end of the larynx, so that the gullet is divided into two narrow passages, while the lungs have a continuous passage to the exterior. The blood vessels, especially those of the thorax and spinal canal, break up into extensive plexuses or networks, in which a large amount of oxygenated blood is delayed, and thus the animal is enabled to remain under water, the necessity for changing the air in the lungs being diminished.

Fossil Cetacea.— Bones of cetaceans, mostly allied to the living species, are found in the marine sediments of the Tertiary and Quaternary ages, and are occasionally dredged up from deep-sea deposits. The hard and heavy ear-

Mau

bones are especially apt to be preserved as fossils. The zeuglodons and squalodons of the Eocene epoch represent a peculiar primitive group of cetaceans with two-rooted teeth. Very little is known of the evolution of this order of mammals.

Classification of Cetacea.— The sub-orders of cetacea are as follows:

1. *Mystacoceti,* baleen-bearing whales. Its families are: *Balænopteridæ,* rorquals, and other great whalebone whales; *Balænidæ,* right whales and kogias.

2. *Odontoceti,* of which the families are: *Physeteridæ,* sperm-whales (*Physeterinæ*), and beaked whales (*Ziphiinæ*); *Delphinidæ,* dolphins, porpoises, white whales, killers and the like; *Platanistidæ,* river dolphins; and the extinct *Squalodontidæ.*

3. *Archæoceti,* containing the extinct family *Zeuglodontidæ.* The most recent and important work on this order is Beddard's 'Book of Whales' (London 1900). See WHALE, and the names of the various groups and species of cetaceans.

Cetewayo, sĕt-ĭ-wä'yō, Kaffir chief or king, son of Panda, king of the Zulus: d. Ekowe 8 Feb. 1884. Disturbances as to the succession having arisen in Zululand, Shepstone, the representative of the Natal government, secured the recognition of Cetewayo as king in 1873. The latter, however, in spite of the obligations into which he had entered, proved a tyrannical ruler, and maintained a large army. A dispute which had arisen regarding lands on the frontier was settled by arbitration in favor of the Zulus; but on the refusal of Cetewayo to comply with the conditions imposed, war was declared against him by the British, and the king made prisoner soon after the battle of Ulundi, July 1879. In 1882 he visited England and was conditionally restored to part of his dominions. In the following year he was driven from power by the chief Usibepu, and remained under the protection of the British until his death.

Cethe'gus, Cai'us Corne'lius, Roman conspirator, one of the associates of Catiline. He was put to death in prison by order of the senate, at the instigation of Cicero, 68 B.C.

Cetinje. See CETTIGNE.

Cetiosaurus, sĕt-ĭ-ō-sâ'rŭs, a genus of amphibious dinosaurs (see DINOSAURIA), of which fragmentary remains have been found in the Lower Cretaceous (Wealden) of Europe.

Cette, sĕt, France, a seaport town in the department of Hérault, built on a neck of land between the lagoon of Thau and the Mediterranean, 23 miles southwest of Montpellier. The space enclosed by the piers and breakwater forming the harbor can accommodate about 400 vessels; and the harbor is defended by forts St. Pierre and St. Louis. A broad, deep canal, lined with excellent quays, connects the port with the Lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to Cette an extensive inland traffic; and it has an active foreign commerce. The principal trade is in wine, brandy, salt, dried fruits, fish, dyestuffs, perfumery, and verdigris. Cette has shipyards, salt-works, glass-works, factories for the manufacture of syrups and grape sugar, etc., and carries on extensive fisheries. After Marseilles, it is the principal trading port in the south of France; and it is much resorted to as a watering place. Pop. (1901) 33,065.

Cettigne, Cetinje, chĕt tĕn'yā, Montenegro, the capital of the principality; situated in a lofty mountain valley, 19 miles east of Cattaro. It contains the palace of the ruler and the government buildings, a convent founded in 1478, a girls' institute and other schools, an arsenal, and a theatre. Turkish invaders sacked and burnt the town in 1683, 1714, and 1785. Many famous Montenegrin rulers lie buried here. Pop. about 3,500.

Ce'tus (Lat. whale), a large constellation lying on both sides of the equator, but mostly south of it, one of Ptolemy's original 48. It is surrounded by Pisces, Aries, Taurus, Eridanus, Fornax, Sculptor, and Aquarius. It contains the remarkable variable star Omicron Ceti, or Mira.

Cetyl, sē'tĭl, an alcoholic radical not yet thoroughly isolated, but supposed to exist in a series of compounds obtained from spermaceti.

Ceuta, thā'oo tä, Morocco, a strongly fortified place belonging to Spain, on the coast of Africa, opposite Gibraltar. The town occupies the site of the Roman colony of *Ad Septem Fratres,* so called from the seven hills rising here in a group, of which the most prominent are Montes Almina and Hacho; on the latter, the ancient Abyla (one of the Pillars of Hercules), is a strong fort, and on the former, among beautiful gardens, lies the New Town. Ceuta contains a cathedral, a hospital, and convents, but is chiefly of importance as a military and penal station. The place was a flourishing mart under the Arabs, and there the first paper manufactory in the Western world is said to have been established by an Arab who had brought the industry from China. In 1415 it was captured and annexed by the Portuguese, and fell to Spain in 1580. It has resisted several sieges by the Moors (1694-1720 and 1732), and is still the most important of the four African presidios. Pop. about 14,000.

Ceva, Tommaso, tōm-mä'sō chā'vä, Italian mathematician and poet: b. Milan 20 Dec. 1648; d. 3 Feb. 1736. He was admitted into the order of Jesuits in 1663, and spent his life as an instructor in various colleges. His more important mathematical works had reference to angles, for the trisection of which he invented a mechanical instrument. He wrote several biographies in Italian, and many poems in Latin and Italian, two of which, entitled 'Philosophia nova-antiqua'; and 'Puer Jesus', are still admired.

Cevallos, Pedro, pā'drō thā-väl'lōs, Spanish diplomatist: b. Santander, Biscay, 1761; d. Seville 29 May 1838. He studied at Valladolid, and entered on a diplomatic career. Having been appointed secretary to the embassy at Lisbon, he there married a niece of Manuel Godoy, Duke of Alcudia, the Prince of Peace, and became afterward minister of foreign affairs. In the disputes between Charles IV. and his son Ferdinand he adhered to the latter. Aware of the influence which Cevallos possessed over the Spanish people, Joseph Bonaparte was anxious to gain him over, and offered to take him into his service. Cevallos accepted with apparent willingness, but on arriving at Madrid

united with the Spanish junta against Joseph, and was sent by them on a mission to London, where in 1808 he published his celebrated work on Spanish affairs, referring more especially to the proceedings at Bayonne. After the Restoration he for some time maintained a great influence over Ferdinand, but on his opposing the marriage of the latter with a princess of Portugal he lost favor, was deprived of his office of secretary of state, and sent as ambassador to Naples and Vienna. On being recalled in 1820 he retired to private life.

Cevallos, Pedro Fermin, Ecuadorian lawyer and historian: b. Ambato about 1814. Besides holding several high professional positions he was a senator in 1867. His principal work is: 'Resumen de las historia del Ecuador,' in five volumes.

Cévennes, sā-vĕn, France, a southern district, which at one time formed the northern part of the government of Languedoc. During the wars against the Albigenses its mountains and valleys were the asylum of numerous persons who had renounced many of the beliefs of the Roman Catholic Church. It now forms part of departments Haute-Loire, Loire, Ardèche, Gard, and Aveyron.

Cévennes, sev-en' (ancient CEBENNA), the chief mountain range in the south of France. With its continuations and offsets, it forms the watershed between the river systems of the Rhone and the Loire and Garonne. Its general direction is from northeast to southwest, beginning at the southern extremity of the Lyonnais Mountains, and extending under different local names as far as the Canal du Midi, which divides it from the northern slopes of the Pyrenees. The Cévennes extend for over 150 miles, through or into nine departments, the central mass lying in Lozère and Ardèche, where Mount Lozère attains 5,584 feet, and Mount Mézen (the culminating point of the chain) 5,754 feet. The average height is from 3,000 to 4,000 feet. The mountains consist chiefly of Primary rocks, covered with Tertiary formations, which in many places are interrupted by volcanic rocks.

Ceylon (native SINGHALA, ancient TAPROBANE, an island possession and crown colony of Great Britain, in the Indian Ocean, about 60 miles southeast of the southern extremity of Hindustan, from which it is separated by the Gulf of Manaar and Palk Strait. It lies between lat. 5° 56′ and 9° 50′ N., and between lon. 80° and 82° E., having the shape of a pear, with the broad end south. Length, about 270 miles north to south; average breadth, 100 miles; area, 25,364 square miles. The northern and northwestern coasts are flat and monotonous, those on the south and east bold and rocky, presenting a highly picturesque appearance, which is further heightened by the exuberant vegetation, the noble palm forests, the luxuriant corn fields, and the verdant slopes of the mountains enameled with bright flowers, herbs, and creeping plants, whose delicious perfume spreads far and wide. Many parts of the coast, at its southern and northern extremities are studded with small, rocky, and verdant islands, some of them overgrown with palms, and presenting a singularly beautiful appearance. At Trincomalee, on the northeastern coast, there is one of the finest natural harbors in the world; at Galle on the southern coast there is also a harbor; while the harbor at Colombo, the capital, is capable of admitting the largest vessels, and is now the regular calling-station for mail steamers to and from Calcutta, China, and Australia. Between the islands of Manaar on the northwestern coast of Ceylon and the island of Ramiseram on the coast of India, is a ridge of sandbanks called Adam's Bridge, which nearly connects Ceylon with the continent, being intersected only by three narrow shallow passages, the remainder being covered with two or three feet of water at full tide. These channels admit only very small vessels, but ships of some size can get through between Ramiseram and the mainland; and schemes for the passage of larger vessels have been projected, as also for a railroad along Adam's Bridge.

Mountains.— The mountainous regions of Ceylon are confined to the centre of the south and broader part of the island. They gradually diminish to hills of moderate elevation as they recede from the central mass, and are succeeded on the western side by a flat tract extending to the coast. Their average elevation is somewhere about 2,000 feet, but there are several summits upward of 7,000 and 8,000 feet high. The highest summit is Pedrotallagalla (8,260), but Adam's Peak, reaching 7,420 feet, is the most remarkable from its conical form, the distance from which it is visible from the sea, and from the sacred associations with which it is connected, the summit being the point from which Buddha, according to his followers, ascended to heaven, a gigantic footprint bearing testimony to the fact. Other summits are Tolapella (7,720) and Kirrigalpota (7,810). The forms of the mountains of Ceylon are singularly varied. They most frequently occur connected in chains, and terminate in round or peaked summits. Their sides are always steep and occasionally precipitous and rocky. There is no proportional correspondence between the heights of the mountains and the depths of the adjoining valleys, and often the valleys are extremely narrow. The deepest are in the heart of the mountains. Some are between 3,000 and 4,000 feet deep, and not over half a mile wide.

Rivers and Lakes.— The rivers of Ceylon, though numerous, especially on the southern and southwestern sides, are small, being merely mountain streams, navigable only by canoes, and that but for a short distance from their mouths. The Mahaveli-ganga, which rises near Adam's Peak, and falls into the sea by a number of branches near Trincomalee, is by far the most important. It has a course of 134 miles, and drains upward of 4,000 square miles. Timber grows on its banks in great abundance, consisting of halmalille, ebony, satin-wood, etc., which is floated down to the harbor during the freshets. Of the remaining rivers the Kalaniganga, the Kala-ganga, and the Maha Oya reach the sea on the western coast; and the Gintota-ganga at Galle. All the rivers are liable to be surcharged with rain during the monsoon, and to inundate the level country, while the heat of the sun on drying the country produces malaria. There are numerous extensive lagoons or back-waters round the coasts, but no lakes in the island worth noticing, the largest being only four miles broad. There are rills and streamlets rushing along in every direction among the mountains,

so overhung with superabundant vegetation as to be frequently invisible.

Geology and Mineralogy.— Ceylon is mostly formed of ancient stratified rocks, but owing to the obliteration of fossil remains it is doubtful whether they have been deposited on the beds of seas or lakes. The mountains are composed of Primary and metamorphic rocks, the prevailing rock on the island being gneiss, though laterite (or «cabook») and a sort of dolomite also occur in considerable quantity. In the Nuwara-Eliya district and elsewhere there are large alluvial tracts. Basalt is found near Galle and Trincomalee, and at Pettigallakanda an ancient lava occurs. The soil is mostly formed from the disintegration of gneiss. The western coast of the island is believed to be rising. Plumbago is found in sufficient quantities to make it of commercial importance, anthracite is obtained, and among the metals occurring in the island are iron in fair quantity, manganese, gold, platinum, molybdenum, nickel, cobalt, copper, and tin. No coal has been found, but nitre and salt occur (the latter is also a somewhat important article of manufacture). Gems of many kinds are abundant, particularly near Ratnapura. They are found either embedded in the rock or washed down in the alluvium of river-beds, and include zircons, amethysts, cat's-eyes, topazes, moonstones, garnets, spinel, sapphires, rubies, cinnamon stones, etc. There are hot springs at Bintenna, Trincomalee, and Puttalam.

Roads and Transportation.— Ceylon is now well provided with roads. A highway has been made from Colombo to Nuwara-Eliya, 6,000 feet above the level of the sea. A continuous line, 769 miles in length, makes the entire circuit of the coast, and every town of importance is connected by roads with the two chief cities. The roads in general are good, many of them being macadamized, and in the neighborhood of the chief towns are adapted for carriages. During the monsoons, however, the roads in many parts are impassable from inundations. The building and maintenance of roads, bridges, streets, and canals forms one of the chief items of expenditure of the government. Railroad extension is also a government affair, and there are now about 300 miles in all, the main line being that between Colombo and Kandy (75 miles). In the early part of the 19th century there was not a single road in the country, merely a few pathways, the greater part of the island being then covered with impenetrable forests.

Climate.— Where the jungle has been cleared away and the land drained and cultivated, the country is perfectly healthy; where low wooded tracts, and flat marshy lands abound, covered with a rank, luxuriant vegetation, the climate is eminently insalubrious, showing, what is now pretty well understood, that mere heat has little to do with the unhealthiness of tropical climates. The heat is not so great as on the neighboring coast of India, the sea-breezes moderating the temperature. At Colombo, on the western side of the island, near the seventh parallel of north latitude, the mean daily variation of the temperature does not exceed 3°, and the annual range is from 76° to 86° 30′ F. At Nuwara-Eliya (6,000 feet high) the annual range is from 32° to 80°. The eastern part of the island, being exposed to the northeastern monsoon, has a hot and dry climate, resembling that of the coast of Coromandel; while the western division, being open to the southwestern monsoon, has a temperature and humid climate like that of the Malabar coast. The quantity of rain that falls annually in Ceylon is estimated at three times the quantity that falls in England, the rains being less frequent, but much heavier. The interruption which the course of the monsoons meet with from the mountain ranges of the island causes deluges of rain to fall on one side, while the other is parched with drought. At Kandy, in the interior, the average annual fall of rain is 85.3 inches; at Colombo, on the seacoast, 75 to 80 inches. The prevalent diseases are those of the liver and intestines, often accompanied by fever. Elephantiasis and other cutaneous complaints are common. The very fatal disease called beriberi (*Hydrops asthmaticus*) occasionally occurs, being almost peculiar to the island.

Animals.— Most of the animals found on the opposite continent are native to this island, excepting the royal tiger, which does not exist here. Elephants are numerous, especially in the northern and eastern provinces, where they sometimes do great injury to the growing crops. The elephants of Ceylon are esteemed for their superior strength and docility. The eagerness with which they are hunted has greatly diminished their numbers. Since 1869 licenses for the capture and exportation of elephants must be obtained from the government. Bears, buffaloes, leopards, jackals, monkeys, and wild hogs, are numerous. There are several species of deer, of which the elk and fallow deer (properly the great red Sambar and spotted axis) are most abundant. Porcupines, bandicoots, squirrels (flying and other), bats, mungooses, are to be found, as are also the pangolin or scaly ant-eater, and the loris or Ceylon sloth. Flying-foxes and rats are numerous. Pheasants, snipes, partridges, pigeons, peacocks, and a great variety of birds, of splendid plumage, are plentiful. Crocodiles, serpents, and reptiles of all sorts abound. Of the snake tribe, consisting of about 26 different species, six only are venomous. Among the insects are the leaf and stick insects, the ant-lion, the white ant, etc.

Vegetable Products.— In the luxuriance of its vegetable productions, Ceylon rivals the islands of the Indian Archipelago, and in some respects bears a strong resemblance to them; its most valuable products are tea, rice, coffee, cinnamon, and the cocoanut. Coffee used to be the chief cultivated crop, but disease has within recent years much reduced the product. Cinnamon grows in the southwest, to which it is almost exclusively confined, requiring a sandy soil with a moist atmosphere. The trade in this spice was reserved as a government monopoly by the Dutch when they had possession of the island; all that was collected beyond the quantity which it was thought could be sold at a monopoly price being burned. This absurd system was followed by the English for some years after their conquest of Ceylon, but was abandoned in October 1832, when the trade in cinnamon was declared free, subject to a duty on exportation. The cocoanut-trees grow along the entire western and southern coasts in countless numbers, each tree producing from 50 to 100 nuts in the year. Every part of this invaluable tree is capable of being turned to profitable account. The Palmyra palm, which grows principally in the northern part of the island, is of

hardly less importance than the cocoanut, being productive in seasons of drought, when the crops fail. The jaggery palm, or kittul-tree, is cultivated for the sake of its sap, which yields a coarse sugar; its pith furnishes a kind of sago; and its fruit is also eaten. The taliput palm also abounds, as do the jack- and breadfruit-trees, the fruit of which is used by the natives for food, both raw and cooked; the timber, also, of the jack-tree, not being subject to be attacked by the white ant, is much used by the natives for making furniture, and in house-building. The Ceylon areca nut, celebrated for its superior qualities, is exported in large quantities. Tobacco is raised principally in the northern district, and is of excellent quality. Indigo grows wild, but is not sought after. The cardamom plant is abundant, but inferior to that of Malabar; fruits and culinary vegetables are produced, the latter in the elevated districts, in great variety and profusion. The island abounds with timber of various descriptions, including calamander, satin, rose, sapan, iron, jack, halmalille, and other beautiful woods adapted for cabinet work. Agriculture generally, and the cultivation of the more valuable native products of the island in particular, are improving. As already stated, coffee once was the chief crop, but latterly the cultivation of tea, cinchona, and cacao has been carried to such an extent that the island has become less dependent on a single article of produce. Notwithstanding the acknowledged fertility of Ceylon, the capabilities of its soil where justice is done to it, and the efforts now in progress to develop these capabilities, by far the largest proportion of the island is still uncultivated. There are a few natives who possess considerable estates in land; but the law of inheritance has, for the most part, caused a minute subdivision of the soil, to a degree very unfavorable to its improvement. The British government claims the proprietorship of all the waste lands, which are now disposed of by public sale. Among works carried on by the government are irrigation works in suitable localities, including the cutting of channels, the construction of annicuts or dams, and the formation and repair of tanks. Some of the ancient works of this kind are of great magnitude. There is also a government forest department, part of the work of which is to provide fuel for the railroads and timber for government works.

Pearl-fishery, etc.— There has long been a pearl-fishery on the coast of Ceylon, carried on as a government monopoly. The fishery sometimes fails for years, there having been none, for instance, between 1837 and 1854, or between 1863 and 1874. Although the government still continued a strict surveillance over the banks, and occasionally subjected them to a careful examination, scarcely any trace of the pearl oyster was to be found. No cause has yet been discovered for this disappearance. When the pearl-fishery is in existence it is confined to the Gulf of Manaar, where the oyster banks extend for 60 or 70 miles along the coast south of Manaar, and perhaps 10,000 people, including 2,500 divers, will assemble in the fishing season. The Ceylon pearls are whiter than those of Ormuz or the Arabian coast. The chank or conch fishery was at one time carried on to a great extent, employing about 600 divers, but has greatly declined owing to the little demand now made for them in Bengal, to which the greater part were sent. The chank is a seashell (*Voluta pyrum,*) adapted for cutting into rings, these being formerly used in great numbers by the native women of Hindustan for bracelets and anklets.

Manufactures and Trade.— The manufactures of Ceylon are very unimportant with exception of arrack, which is distilled from the juice of the cocoanut-tree. The spinning and weaving of cotton goods, generally of the coarsest kind, was at one time a considerable industry, but is now dying out. There are numerous oil-mills for pressing the cocoanut kernels to express the oil. The Singhalese make good artisans, as is experienced at Colombo, where they are employed in making steam engines and other machinery. They are skilful in carpentry and wood-work, expert workers in gold and silver, and excel in the manufacture of lacquered ware. Salt is a government monopoly, being collected from shallow lagoons, which at certain seasons are overflowed by the sea, or it is manufactured in pans, the property of the government. The exports are chiefly tea, coffee, cinchona, cinnamon, cocoanut products, areca nuts, cacao, cardamoms, plumbago, tobacco. Tea has only begun to be exported in recent years, and the export has increased from 2,392,975 pounds in 1884, to more than 130,000,000 pounds. The total value of exports in 1899 was about $56,000,000; of the imports about $51,000,000. The trade of Ceylon is chiefly carried on with Great Britain and India, the former of which received from the island in 1899 goods approximating in value to $26,000,000, and sent thither goods to the value of over $7,000,000. The chief article exported to Great Britain is tea, the value of which in 1899 reached nearly $19,000,000. The only other exports thither worth mention are coffee, cocoanut oil, and plumbago. The principal articles of import from Great Britain are coal, cotton manufactures, apparel and haberdashery, iron and steel manufactures, machinery, etc. The value of imports from Great Britain of manufactured cotton goods in 1899 was $1,138,000; of wrought and unwrought iron, $700,000; of coal, $975,000. From other countries are imported rice, dried fish, wheat, sugar, and various other commodities.

Government, etc.—The government of Ceylon is conducted by a governor and two councils, executive and legislative, of both of which the governor is president. The first is composed of 6 members, including the governor; the other of 17 members, including the members of the Executive Council, 4 other office-holders, and 8 unofficial members selected by the governor as representative of the different classes and interests in the community. The powers of the councils are limited, being wholly subservient to the governor, who can carry into effect any law without their concurrence. All laws must be approved of by the secretary of state for the colonies before they can take effect. Any individual properly qualified may be appointed to the most responsible situation, without reference to service, nation, or religion, and native Singhalese have occupied some of the highest posts. The island is divided into nine provinces — the Eastern, Western, Northern, Southern, Central, North Central, Northwestern, Sabaragamuwa, and Uva, and subdivided into districts. In each province is stationed a government agent. For

the administration of justice there are in the civil and criminal departments a supreme court, established at Colombo; also a vice-admiralty court, and provincial courts, stationed in various districts; besides magistracies. There are municipalities or local boards in the towns, and there are also native village councils. The chief sources of revenue are the customs duties, railroad receipts, land rents, and salt farms. The chief articles of export are now free. The revenue for 1898 amounted to $12,600,000; expenditure, $11,400,000. The public debt amounts to about $17,300,000; but the finances are in a very healthy condition, as the public debt of the colony has been mostly incurred for the construction of railroads.

People.— The present population of Ceylon is composed of Singhalese, Cingalese, or Ceylonese, descendants of immigrants from Hindustan who entered the country in the 6th century B.C., Malabars or Tamils, originally from southern India, Moors, Malays, Veddahs, and a small proportion of Europeans and their descendants. The Singhalese inhabiting the coasts are a mild, timid race, obsequious to strangers, and hospitable and humane. Their statue is rather below the middle size; their limbs slender, but well shaped; eyes dark, finely cut features, hair long, smooth, and black, turned up and fixed with a tortoise-shell comb on the top of the head; color varying from brown to black, or rather from the lightest to the darkest tints of bronze. The Singhalese of the interior, or Kandian Singhalese, are a superior race, being stouter, handsomer, and of more manly and independent bearing, with a greater degree of intelligence. The Malabars of Ceylon are similar in all respects to those of the continent. The Mohammedans or Moors are an energetic and industrious people, and engross a large proportion of the commerce and traffic of the island. The Veddahs, a savage race, are supposed to be a portion of the aboriginal inhabitants of Ceylon. They inhabit the most secluded and inaccessible parts of the island, and subsist entirely on wild fruits and animals. A cloth round the loins is their only clothing; and their habitations, generally of small dimensions, are formed for security among the branches of large forest trees. They are a robust and hardy race, but extremely peaceable and inoffensive. The other inhabitants of the coast consist of Dutch, Portuguese, and English; some Malays or natives of the Eastern Archipelago, a few Chinese and Parsee traders, and a various population sprung from the intermixture of these races with each other. The descendants of the Dutch and other Europeans are known as burghers. The population is rapidly increasing. In 1832 it scarcely amounted to 1,000,000; while in 1881 it was 2,750,000. In 1901 the total was 3,576,990, including 2,334,817 Singhalese, 952,237 Tamils, 224,719 Moormen, and 9,583 Europeans. The increase is partly to be attributed to the number of coolies who come from India for employment on the plantations.

Religion, Language, Education.— More than half the population are said to be Buddhists, and about 500,000 are of the Hindu religion. Buddhism chiefly prevails in the interior, and generally among the Singhalese of the seacoasts. It is maintained and protected by the British government, agreeably to the treaty of 1815. On the western and southwestern coasts numbers of the Singhalese profess the Roman Catholic religion. There are a number of Episcopal clergy in the island, subordinate to the bishop of Colombo; various other Protestant bodies have places of worship, but the Protestants are less than half the number of the Roman Catholics. The Singhalese have a colloquial language peculiar to themselves, but their classic and sacred writings are either in Pali or Sanskrit. The Malabars use the Tamil. English is becoming more and more common, "and there is scarcely a roadside village in Ceylon now where the traveler could not find some persons to speak English, or interpret for him." The government has a department of public instruction, and good progress is being made in education throughout the island. On 1 Jan. 1891, there were 146,500 children participating in public instruction, a number of the schools being maintained or aided by the government. There are schools maintained also by the Church Missionary Society, by the Wesleyan, the American, and the Baptist Missionary societies, besides a number of private and some regimental schools.

Antiquities, History, etc.—The Singhalese annals contain a historical record of events for 24 centuries; and their authenticity, as regards description of ancient towns and buildings, and other works of art, is established by existing ruins, proving that the island had been, at a remote period, inhabited by a powerful and numerous people. The ancient capital, Anuradhapura, and its neighborhood contain many interesting and splendid relics of the ancient Singhalese civilization. Chosen as the capital in 437 B.C., it received fully a century later various relics of Guatama Buddha, and to contain these as well as other sacred articles many temples were erected. In the 1st century of our era the city occupied an area of 256 square miles, enclosed by 64 miles of walls. A remnant of the celebrated bo-tree, said to have sprung from that under which Gautama sat at the time when he became a Buddha, is still seen enclosed in the court of a temple. Here, too, is the so-called Brazen Palace, originally built in 142 B.C., and consisting of 40 rows of 40 pillars each. Dagobas, or shrines containing relics of Buddha, are very numerous. They are of brick, incrusted with a special preparation which takes on a fine white polish. One of the finest of these monuments is the Ruwanwellisaye, built about 140 B.C.; but the most beautiful of Ceylonese dagobas is the Toopharamaya, with many finely sculptured columns. Jaitawanaramaya, originally 315 feet in height, is now 269 feet high, and, like most of the ruins of the island, is overgrown by trees and brush-wood. Among the most curious and notable of the ancient relics which invest Anuradhapura with such profound interest are the numerous tanks constructed at various dates between 200 B.C. and 300 A.D., and in the 12th century. Some of these are of enormous size, and several have been restored and applied to their original purpose of irrigation. From the 8th to the 13th century the capital was Pollanarrua, now Topare, near which also are found many splendid ruins, including a fine rock temple. At Dambula, there is a celebrated cave temple, dating from the 1st century B.C.

Ceylon was known to the Greeks as Taprobane. In 543 B.C. it was conquered by Vijaya, a prince from the mainland of India, and for

several centuries the island enjoyed great prosperity under the generally beneficent rule of his dynasty. The Hindu incomers brought with them the civilization of their own country, and great part of Ceylon became covered with towns and villages. Several of Vijaya's successors had to contend with invading Malabars, and these ultimately secured the sovereignty. A restoration of the line of Vijaya in the 11th and 12th centuries contributed to the return of something of the ancient grandeur of the island. Little was known regarding it in Europe until 1505, when the Portuguese established a regular intercourse with Ceylon, being encouraged thereto by a native king. The Portuguese were subsequently expelled by the Dutch in 1658, after a stubborn struggle of 20 years' duration. The Dutch soon opened up an extensive and profitable trade with Holland, and they constructed several canals to serve as means of communication between their various posts on the island. Their policy, however, though beneficial on the whole to the Singhalese as well as themselves, was essentially a selfish and exclusive one. British intercourse with the island began in 1763, and in 1795, owing to the war with France and Holland, Great Britain was induced to attempt an effective occupation of it. In that year Trincomalee, and in the following year Colombo, was captured; and by these victories all the Dutch forts were transferred to Great Britain. By the peace of Amiens (1802) the whole coast territory was formally ceded. The king of Kandy, who remained in possession of the central mountainous region, perpetrated such atrocities on his own people that many of their chiefs in 1815 entreated Great Britain to depose him. A short campaign was ended by the capture of the tyrant and his deportation as a prisoner to India, and since then the whole island has been under direct British rule. A serious rebellion in 1817 and minor ones in 1843 and 1848 have been the only breaks in the generally tranquil subsequent history of the colony. British rule has contributed very largely to the material advancement of the island by the construction of roads and railways, the extension of the Dutch canal system, the restoration of irrigation tanks, the bridging of rivers, and the development of its great natural resources. Two important events in its modern history have been the rise and decline of coffee-planting (say from 1837 onward, and the substitution of tea-planting (about 1878) in its place. The decline of coffee-planting, as is well known, has been caused by a leaf-fungus. The planting of cinchona, cacao, and rubber-trees has also helped to add to the resources of Ceylon in recent times. In 1901 a considerable number of Boers, captured in the South African war (q.v.), were sent to Ceylon.

The principal towns of the island are Colombo, Trincomalee, Kandy, Galle, Jaffna, and Kornegalle.

Ceylon Moss. See AGAR.

Chapu, chä-poo′ or shä-poo′, or **Chapoo,** China, a seaport town in the province of Cheh-Chiang (or Che-Kiang), on the north side of Hang-Chau Bay, 35 miles from Ning-Po. Although not a treaty port, it carries on a considerable commerce with Japan. Its European trade is conducted through the treaty port of Ning-Po, and is largely in green tea. Its imports are ginseng (from the United States), and manufactured goods. The native industries are sedge hats and mats, fishing, and silk-making. Merchant vessels do not touch at Chapu ordinarily, although Chinese and Japanese junks put in regularly. Pop. about 80,000.

Chabaneau, Camille, kä-mĕl shä-bä-nō, French philologist: b. Nontron 4 March 1831. Since 1879 he has been professor of romance languages at Montpellier. He has written 'Histoire et Theorie de la conjugaison Française' (1868); 'Grammaire Limousine' (1876); 'La Langue et Littérature Provençales' (1879); 'Biographies des Troubadours' (1885); and has contributed largely to the 'Revue des Langues Romanes.'

Chabas, François, fräṅ swä shä-bä, French Egyptologist: b. Briancourt 2 Jan. 1817; d. Versailles 17 May 1882. Though at first engaged in commerce, he found time to become a learned linguist, but it was not till 1851 that he gave himself up to the study of hieroglyphics. The first results of his studies appeared in 1856, followed by a series of invaluable books and papers, elucidative chiefly of two important periods of ancient Egyptian history — the conquest of the country by the Hyksos, and the time of their expulsion. Among the more important of his many books are 'The Shepherds in Egypt'; 'History of the 19th Dynasty and especially of the Period of the Exodus'; and 'Studies of Historical Antiquity from Egyptian Sources.' From 1873 to 1877 he edited 'L'Egyptologie.'

Chabazite, a member of the zeolite family of minerals of variable composition, but in general definable as a hydrated silicate of aluminum, calcium, and sodium, with small amounts of potassium, and occasionally of barium and strontium. It has a hardness of from 4 to 5, and a specific gravity of about 2.1. It is transparent or translucent, and varies in color from white to pale red or yellow. It occurs in rhombohedral crystals that are sometimes barely distinguishable from cubes, and also in amorphous forms. It is widely distributed, and usually occurs in connection with basalt, syenite, gneiss, or mica, or hornblende schist.

Chabert de Cogolin, Joseph Bernard, zhō-zĕf bär-när shä-bär dė kō-gō-lăṅ, MARQUIS, French geographer: b. Toulon 28 Feb. 1724; d. 1 Dec. 1805. He entered the marines as a cadet in 1741. In 1750 he sailed to the North American coast, and on his return published the result of his observations in an astronomical and hydrographical work, entitled, 'Voyage sur les Côtes de l'Amérique Septentrionale' (1753). In 1758 he was chosen a member of the Academy. In the American war Chabert distinguished himself so highly that in 1781 he was made commander of a squadron. In 1792 he was made vice-admiral. During the same year the Revolution drove him to England. In 1800 he lost his sight in consequence of his intense application to study, and in 1802 returned to Paris, where Bonaparte assigned him a pension. In 1804 he was appointed a member of the Bureau des Longitudes, and in 1805 presented to it a map of Greece and a description of the coasts of that country.

Chablais, shä-blā, France, a district in Savoy, south of the Lake of Geneva. At one time it formed part of the kingdom of Bur-

gundy, but in the 11th century came into the possession of the counts of Savoy. In 1860 it was ceded to France, along with the rest of Savoy, by Victor Emmanuel, king of Sardinia. It now forms the arrondissement of Thonon (its ancient capital), in the department of Haute-Savoie.

Chablis, shä blē, **France,** a town in the department of Yonne, on the left bank of the Serein, 11 miles east of Auxerre. It stands in the midst of vineyards which produce the celebrated white wine known by its name. The annual product is about 4,400,000 gallons, but the quantity sold over the world as Chablis is much greater. Pop. 2,400.

Chabot, François, fräṅ-swä shä-bō, French revolutionist: b. Saint Geniez, France, 1759; d. Paris 5 April 1794. In early life he entered the Capuchin order. The treatises of casuistry which he perused in order to prepare him for the confessional he claimed to have corrupted his morals, and on the suppression of the monasteries, though still professing to be a priest, he gave himself up to the most scandalous excesses. The Bishop of Blois nominated him his vicar-general, and succeeded in getting him chosen deputy to the national convention for the department of Loire-et-Cher. In this capacity he displayed the bitterest animosity against the king and his ministers, and all deputies friendly to moderate courses; and labored incessantly to overturn the throne. On the night of 10 Aug. 1792, he preached in a church of the Faubourg St. Antoine, and urged the most violent incitements to insurrection; though on the following day he is said to have saved some priests and the Abbé Sicard, the celebrated teacher of the deaf and dumb, from the fury of the populace. His party, from occupying the higher seats of the national convention, were designated by the name of the Mountain, which they have since retained. The conversion of the cathedral of Nôtre Dame into the Temple of Reason is said to have originated with Chabot. He at last became suspected by his party, chiefly in consequence of his marriage with a young and beautiful Austrian, and the favoritism he displayed toward his two brothers-in-law, who were striving to enrich themselves in the general disorder. Along with several other deputies he was accused of having appropriated the effects of the former East India Company, and vainly tried to save himself by reminding Robespierre of the services he had rendered him. When he saw that he was lost he swallowed poison, but suffered such excruciating pains that he took an antidote to remove them. Three days after he was guillotined. His brothers-in-law shared his fate.

Chabot, Philippe de, fē-lēp dė, French general: b. about 1480; d. 1 June 1543. Having bravely defended Marseilles in 1524, he was made prisoner at Pavia in 1525. Appointed admiral immediately after his release, he was sent to Italy in 1529 to negotiate the ratification of the treaty of Cambrai by Charles V. Made commander-in-chief of the forces in Savoy in 1535, he effected the conquest of part of that country and of Piedmont, but was censured for not following up his victory. On his return to France charges of frauds upon the national treasury were brought against him. Found guilty and imprisoned, he was soon afterward pardoned by the king at the urgent solicitation of the duchess d'Ėtampes, and reinstated in his position. He is said to have been the first to suggest the project of colonizing Canada.

Chabrias, kā'brĭ-ăs, Athenian general. In 392 he succeeded Iphicrates in the command of the Athenian forces before Corinth, was afterward sent to chastise the Æginetes for depredations on the coast of Attica, and assisted Evagoras in Cyprus, and Acoris in Egypt, against the Persians. In 378 he commanded the army which the Athenians sent to the aid of Thebes against the Lacedæmonians, under Agesilaus, on which occasion he saved his troops from impending defeat by a military manœuvre renowned in antiquity, commanding them to await the attack of the enemy with pointed spear and shield, resting on one knee. In 376 he won an important victory over the Lacedæmonian fleet off Naxos. The Athenians having abandoned the alliance of Thebes, he defended Corinth against Epaminondas. He took part in the expedition against Thrace at the outbreak of the so-called social war. At the siege of Chios his vessel was the first to enter the harbor, but becoming isolated and disabled was soon abandoned; he alone refused to save his life, and fell fighting, 357 B.C. He was the last of the great Athenian generals. Demosthenes said of him that he conquered 17 cities, took 70 vessels, made 3,000 prisoners, and enriched the treasury of Athens with 110 talents. One of his apothegms, for which he was celebrated, was that an army of stags led by a lion is superior to an army of lions led by a stag. His life was written by C. Nepos.

Chabrier, shä-brē-ā, **Alexis Emmanuel,** French composer: b. Ambert, France, 18 Jan. 1841; d. Paris 13 Sept. 1894. He at first studied law, but presently turned his attention to music. He composed the operas of 'Gwendoline' (1886); and 'Le Roi Malgre Lui' (1887). Other works by him are 'Dix Pieces Pittoresques'; and 'España,' an orchestral rhapsody.

Chac-Mool, shäk-mool', according to tradition, a chief of the Maya Indians of Yucatan. In 1876 a statue was discovered in the ruins Chichen-Itza, Yucatan, to which Le Plongeon gave the name of Chac-Mool, because he supposed it to be a representation of the chief. The statue was taken by the Mexican government and placed in the National Museum of Mexico, but the correctness of Le Plongeon's identification is in question among archæologists.

Chacabuco, chā-cā-boo'kō, Chile, a mountain and mountain pass, 28 miles north of Santiago, in the province of that name. It is celebrated as the scene of a decisive victory of the republicans over the royalist troops on 12 Feb. 1817.

Chacma, chăk'ma, the Hottentot name for the baboon (*cynocephalus porcarius*) native to western Africa. It is grayish-black in color, and has a well-marked crest of hair along the neck. It is larger than the allied species of its native region. See BABOON.

Chaco, chä'kō, South America, the name formerly given to a region of vast size in the central part of the continent, on the left bank of the Paraguay River, and the right bank of the Paraná, and extending below the confluence of those rivers, from about 20° to or beyond 28° south latitude. For years it was claimed by both Paraguay and Argentina, but effectively occupied by neither. The southern portion, below the Pilcomayo River, now belongs to Argentina, and has been divided into the territories of El Chaco and Formosa. The northern and larger portion, from the Pilcomayo River to Bolivia, belongs to Paraguay, and is called El Gran Chaco, or Paraguay Occidental. See CHACO, EL; CHACO, EL GRAN.

Chaco, El, a territory ("territorial government") of Argentina, bounded on the north by the territory of Formosa, on the east by Paraguay and the province of Corrientes, on the south by the province of Santa Fé, and on the west by the provinces of Salta and Santiago del Estero. Its area is 62,000 square miles, and its population about 30,000. Its capital is Resistencia, on the right bank of the Paraná River, with a population of 3,000. The districts near the river are inhabited by civilized people, who cultivate the soil or exploit the forests, while Indians roam in the interior. The national government has encouraged immigration by selling land to settlers at the average price of 31 cents for an acre.

Chaco, El Gran, the western section of the republic of Paraguay. It is also called Paraguay Occidental or El Chaco Paraguayo. It extends northward and westward from the right bank of the Paraguay River to the frontiers of Bolivia; Brazil bounds it on the northeast; Argentina on the southwest. By a convention concluded 3 Feb. 1876, between Paraguay and the Argentine Republic, the territory between the Pilcomayo and Bermejo rivers was surrendered to Argentina, but the part of Chaco which extends from Bolivia to the Rio Verde was acknowledged to belong to Paraguay. The other section of Chaco, which lies between the Rio Verde and the Pilcomayo, was subsequently awarded to Paraguay by the arbitrator chosen by both governments, R. B. Hayes, President of the United States (12 Nov. 1878). The commemoration of this event, and as a compliment to the arbitrator, the name of the principal town of Gran Chaco, was changed from Villa Occidental to Villa Hayes, by which name it is now known. The interior of Gran Chaco is almost entirely in the possession of nomadic tribes of Indians, some of them hostile to white men. Save Villa Hayes, Bahia Negra, and Fuerte Olimpo, there were, until quite recently, no settlements within its limits. It was regarded as a comparatively worthless, swampy, uninhabitable region. But surveys disclosed large tracts of land as desirable as any in that part of the world can be — exceedingly fertile, suitable for agricultural and grazing purposes, and in part covered with forests of valuable hard woods. The sales of such lands have greatly increased the receipts of the Paraguayan treasury. Stock-raising has become a profitable industry along the banks of the Paraguay River and for a distance of 30 miles inland. Special interest attaches to the plan for improving navigation on the Pilcomayo River, and thus furnishing a direct outlet for the natural products and manufactures of pent-up Bolivia, via the Paraguay and Paraná rivers to Buenos Ayres and Montevideo. The area of Gran Chaco is approximately 91,499 square miles, somewhat less than one half of the total area of Paraguay.

Chacornac, Jean, zhŏñ shä-kôr-näk, French astronomer: b. Lyons 21 June 1823; d. Paris 20 Sept. 1873. He is principally known for his discoveries of asteroids, which came about in connection with his work on the formation of ecliptic charts of the stars, and for the charts just mentioned. His asteroid discoveries were six in number, and most of his work was done at the Paris Observatory under Leverrier.

Chad, chăd. See TCHAD.

Chad'band, Rev. Mr., a personage in Dickens' 'Bleak House.' He is a hypocritical minister, who pretends to be humble and to despise the world, but is in reality extremely selfish and self-indulgent.

Chadbourne, chăd'bèrn, **Paul Ansel,** American educator and writer: b. North Berwick, Maine, 21 Oct. 1823; d. New York 23 Feb. 1883. He was president of the Massachusetts Agricultural College at Amherst (1867–82); of the University of Wisconsin (1867–70); of Williams College (1872–81). He wrote: 'Natural Theology' (1867); 'Instinct in Animals and Men' (1872).

Chadd's Ford. See BRANDYWINE CREEK.

Chad'wick, French Ensor, American naval officer: b. Morgantown, W. Va., 29 Feb. 1844. He graduated at the United States Naval Academy in 1866, and became a captain in 1897. During the war with Spain he commanded the armored cruiser New York, the flagship of the North Atlantic squadron, and was chief-of-staff to Admiral Sampson. In October, 1900, he was appointed president of the Naval War College.

Chadwick, George Whitfield, American musician: b. Lowell, Mass., 13 Nov. 1854. He was graduated at the Leipsic Conservatory, and in 1897 became director of the New England Conservatory of Music. He has won distinction as a composer with 'Tabasco,' a comic opera; 'Jubilee,' a symphony; and 'Columbian Ode,' a chorus. Since 1897 he has conducted the annual music festival at Worcester, Mass.

Chadwick, James Read, American physician: b. Boston, Mass., 2 Nov. 1844. He graduated B.A. at Harvard 1865; M.D. 1871; and pursued further studies abroad. In 1873 he began practice in Boston, and has become distinguished as a gynecologist. He was a founder of the American Gynecological Society, its secretary 1876–82, and president 1897. A strong advocate of cremation, he has been president of the Massachusetts Cremation Society since 1894. He has contributed many important articles on his specialty to the 'Transactions' of the American Gynecological Association, the Boston 'Medical and Surgical Journal,' the 'American Journal of Obstetrics,' etc.

Chadwick, John White, American writer and Unitarian clergyman: b. Marblehead, Mass., 19 Oct. 1840. His radical sermons have

MAJOR-GENERAL ADNA R. CHAFFEE.

attracted attention, and he has been a liberal contributor to current literature. Since 1864 he has been pastor of the Second Unitarian Church in Brooklyn, N. Y. Among his works are: 'A Book of Poems,' (1875); 'The Bible of To-day' (1878); 'Origin and Destiny' (1883); 'A Daring Faith' (1885); 'The Man Jesus'; 'The Faith of Reason'; 'Old and New Unitarian Belief'; 'The Power of an Endless Life'; 'The Revolution of God'; 'Theodore Parker, Preacher and Reformer' (1900); 'George William Curtis.'

Chæronea, kĕr-ō-nē'a, a town in Bœotia, famous as the scene of several celebrated battles of antiquity. An important battle was fought near it in 447 B.C., by which the Athenians lost the supremacy in Bœotia. A still more celebrated battle was fought 338 B.C., in which Philip of Macedonia defeated the united forces of the Athenians and Bœotians, and crushed the liberties of Greece. A colossal sculptured lion was obtained by excavation on the site of this battle. In a third battle, fought at Chæronea, Sulla defeated the generals of Mithridates, 86 B.C.

Chætopoda, kē-tŏp'ō-da, an order or subclass of the class *Annelida,* recognized by the bristles (chætæ), usually four bundles to a segment. They comprise the earthworm (q.v.), certain fresh-water and numerous annelids which live in the sea, such as species of *Serpula,* as *S arenicola,* the lob-worm (q.v.), and many other genera; the most common and one of the largest American chætopods is the "clam-worm," (*Nereis virens*), which is associated with the clam of the New England coast, burrowing deeply in the mud. The marine forms undergo a metamorphosis, hatching as a top-shaped, free-swimming larva, called a trochosphere (q.v.). Some of the forms, as *Nais, Syllis, Autolycus,* etc., also multiply by a process of self-division called strobilation, and by alternation of generations. Some of them, as *Serpula* and *Spirorbis,* live in solid calcareous tubes or shells. Certain forms are luminous. The tracks of chætopod worms occur in Cambrian strata, which are so much like those made by existing forms as to show that the type has undergone little change since the Cambrian Period, which lies at the very base of the Palæozoic Age.

Chafer, chā'fẽr, the British name for a scarabeid or dung-beetle (q.v.). The larger ones, called cockchafers, are very destructive to vegetation, especially in the larval state.

Chaffee, Adna Romanza, American military officer: b. Orwell, Ohio, 14 April 1842. He received a public-school education; entered the regular army as a private, 22 July 1861; became a captain, 12 Oct. 1867; and colonel of the 8th U. S. Cavalry, 8 May 1899. On 4 May 1898, he was commissioned brigadier-general of volunteers for the war with Spain; on 8 July, following was promoted to major-general; and on 13 April 1899, was honorably discharged under this commission. On the last-mentioned date he was re-appointed a brigadier-general of volunteers, and on 19 July 1900, the President, having selected him to command the American military forces in China, commissioned him a major-general of volunteers. He reached Taku, China, on 28 July, and led the American contingent of the allied force which entered Peking on 15 August, and rescued the foreign legationers. Gen. Chaffee made a brilliant record in the Apache Indian campaigns; commanded the troops which captured El Caney, in Cuba; and afterward was chief of staff to both Gens. Brooke and Wood, when governor-general of Cuba. He has been widely known as a dashing cavalry officer, and his selection to command the American troops in China gave high satisfaction to his brother officers. On 19 June 1901, Gen. Chaffee was appointed military governor of the Philippines, to succeed Gen. MacArthur. He was relieved of this command in the autumn of 1902 and ordered to the command of the East. In 1904 he was chief of staff with the rank of lieutenant-general.

Chaf'finch, a brilliantly colored and well-known European finch, one of the most popular and most valuable cage-birds (q.v.). It is found in large numbers throughout the continent and England, and is migratory in the more northern parts, remaining, however, in England and around the Mediterranean in winter, where it is shot in great numbers for market purposes. The top of the head and nape of the neck of the male are bluish-gray, the back is chestnut, and the black wings are streaked with two conspicuous white bars. It is sought not only because of its loud, clear, and pliable voice, but because of its docility and beauty. Its voice is susceptible to training, and its value greatly increases by cultivation, the wild bird having an unpleasant and almost harsh cry. These birds sometimes have a repertoire of as many as six tunes, the words of which they sing with almost human articulation. Their training and rearing from the nest is an important industry throughout Europe, and particularly in Germany. For a full account of the powers of song of the chaffinch see Bechstein's 'Cage-Birds.'

Chagos (chā'gōs) **Archipel'ago,** a group of islands in the Indian Ocean, nearly on the same meridian as the Laccadives and Maldives, and probably a continuation of them. It extends from lat. 7° 39′ to 4° 44′ S., and lon. 70° 50′ to 72° 50′ E. The largest, called Diego Garcia or Great Chagos, 100 miles south of the main group, is about 12½ miles long by six broad, is of a crescent shape, and consists of a coral atoll covered with cocoa palms, and enclosing a lagoon which forms a harbor four miles broad. Fish abound, and excellent green turtle may be found on the shores. The islands belong to Great Britain, and form a dependency of Mauritius. Cocoanut oil is the chief product. Pigs and poultry are raised in abundance. Pop. 750.

Chagres, chā'grĕs, Colombia, a seaport on the north coast of the Isthmus of Panama, at the mouth of a river of the same name. It acquired some importance at one time as the station at which steamers landed the mails for the west coast of America, and has been frequently associated with the proposed communications between the Atlantic and the Pacific. The terminus of the railroad across the isthmus was, however, fixed at Aspinwall, about eight miles northeast, and Chagres then greatly declined. The projected Panama canal route is partly in the bed of the Chagres River.

Chaille', shä-yā, **Stanford Emerson,** American physician: b. Natchez, Miss., 9 July 1830. He graduated B.A. at Harvard in 1851, and M.D. at Tulane University in 1853, subsequently studying in Europe for three years. During 1862–3 he was medical inspector of the Confederate army in Tennessee, and later had charge of various military hospitals. He is a member of the National Board of Health, and in 1879 was president of the Havana yellow-fever commission. Since 1858 he has held various professorships in Tulane University, Louisiana, and since 1886 has been dean of the medical department, and professor of physiology, hygiene, and pathological anatomy. He is a member of numerous medical societies and boards of health, and has contributed many articles to their journals and periodicals. In addition, he has published: 'Yellow Fever in Havana and Cuba'; 'Origin and Progress of Medical Jurisprudence, 1776–1876' (1877); 'Laws of Population and Voters' (1872); 'Living, Dying, Registering, and Voting Population of Louisiana, 1868, 1874, 1875'; 'Intimidation of Voters in Louisiana' (1876). From 1857 to 1868 he was co-editor and proprietor of the New Orleans 'Medical and Surgical Journal.'

Chaille-Long, shä-yā-lôṅ, **Charles,** American explorer: b. of French parentage, Baltimore, Md., 1843. After serving in the Confederate army he went to Egypt, where he was appointed lieutenant-colonel by the khedive (1870). Gordon made him chief of staff and sent him on a mission to King Mtesa of Uganda. He has written: 'The Three Prophets' (1886); 'Central Africa' (1887); etc.

Chaillot, shä-yō, France, formerly a village on the right bank of the Seine. It boasts a considerable antiquity, being noticed in a map of the 11th century. In 1659 it became a suburb of Paris, and received the name of Faubourg de la Conférence, in memory of the conference at which the Peace of the Pyrenees was concluded. In 1786, when a wall of inclosure was built around Paris, it was included within it, and has since formed part of the western district of Paris, near the Champs Elysées.

Chaillu, Paul du. See DU CHAILLU.

Chain, in surveying, is a measure consisting of 100 links, equal to 4 rods, or 66 feet, used for measuring land. It is sometimes called Gunter's chain, from its inventor.

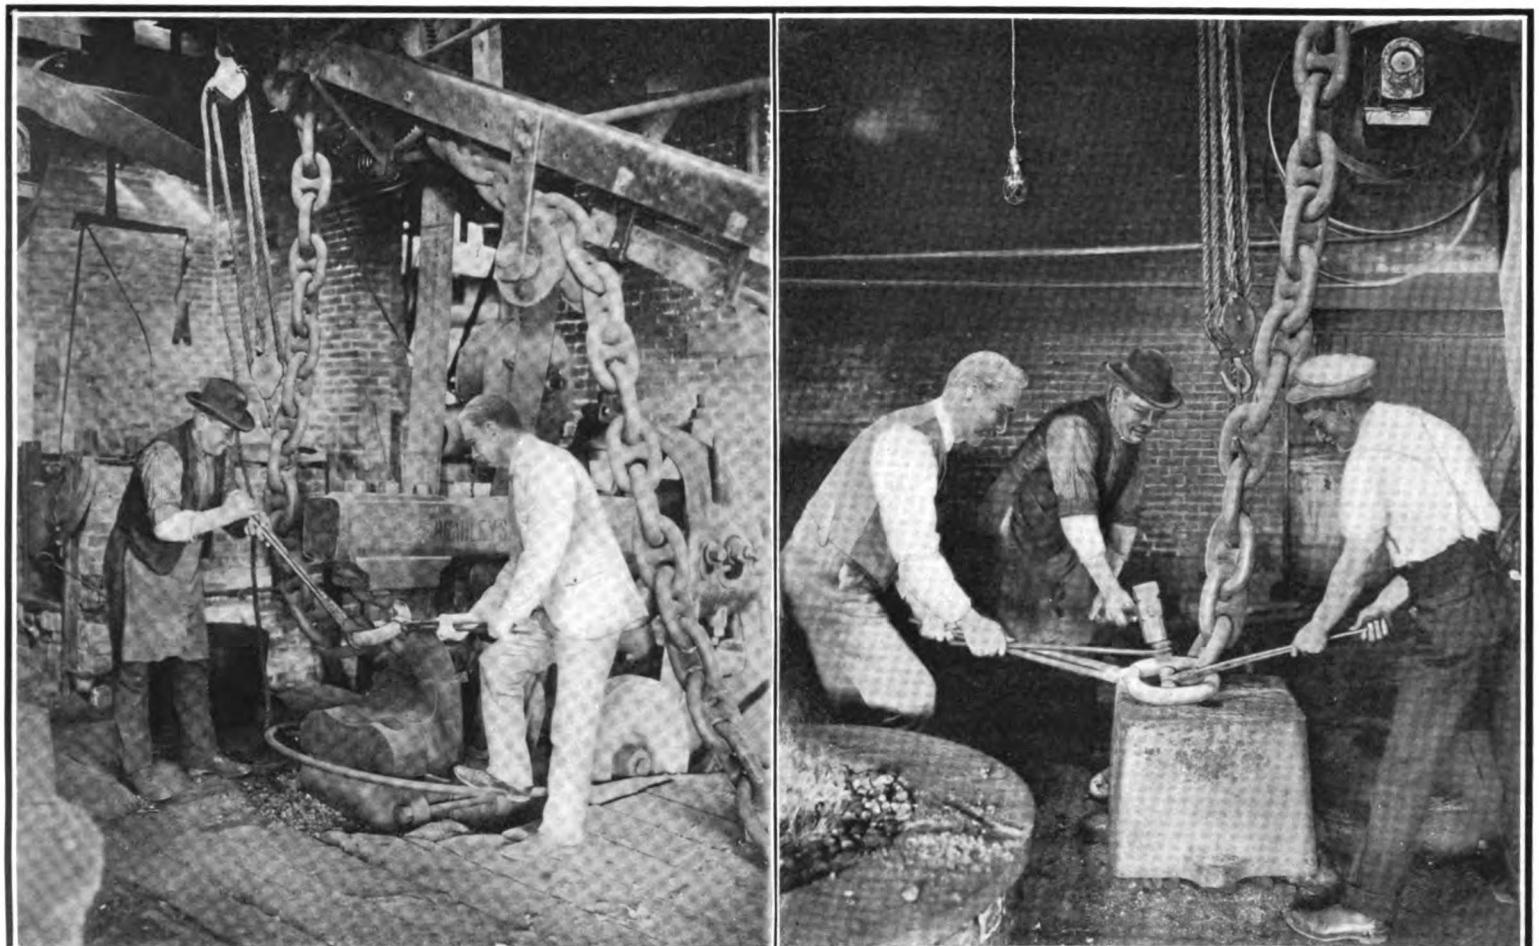
Chain-bridge. See BRIDGE.

Chain-cable. See CABLE.

Chain-making. Iron and not steel is still the favorite material from which chains are manufactured. Chain cable is employed in quarrying, for lifting heavy weights in building construction, in foundries and machine shops, or at the docks in loading and unloading vessels; while to the lumberman it is absolutely indispensable. In such work the strains are severe and sudden, the links of the chain being subjected to repeated jar and wrench due to the slipping or dropping of the material which is being hauled and lifted. It is also found performing the most important and delicate work of hauling a yacht or merchant vessel up a marine railway; while last, and most important of all, is its use as a ship's cable, where, in times of stress, a vessel costing hundreds of thousands of dollars, together with priceless human lives, may depend upon the sound quality of the material and the fidelity with which the smith has welded the chain, link by link, on his anvil.

Quality of Iron for Chain Making.— The iron used is a specially rolled grade, of high tensile strength and great ductility, the object being to secure a chain which, on the application of a sudden stress — as, for instance, when a ship is riding at anchor in a heavy seaway — will stretch and so resist the strain gradually, instead of snapping, as would be liable to happen with material of higher tensile strength but small ductility or power of elongation. Chain of from 5–16 inch up to 2 inches diameter is forged by hand, and above 2 inches it is forged with the assistance of machinery.

Hand-made Chain.— In the smaller sizes the whole operation of chain-making is done by a single smith without any helper. The length of completed chain is hung upon a hook or some convenient support near the anvil, and the operation of forging the link proceeds as follows: In his fire the smith will have two or three short rods of the required diameter, and as one is heated to, say, a cherry red, he withdraws it, cuts off the desired length for one link, gives it a couple of blows to form the welding scarf, bends it through, say, about 130 degrees, hooks it into the end of the completed chain, and brings the ends together for welding. He then raises the link to a welding heat in his fire, places the abutting ends over what is known as the bick-iron, gives it a few taps to insure a good weld, brings over a "dolly" (which is hinged at the outer end of his anvil and when brought over registers above the bick-iron), and with half a dozen blows on the dolly, accompanied with a dexterous movement of the link, the weld is completed and the link smoothed up to a neat finish. The rapidity with which the smiths do this work is very remarkable. Thus, in the case of a 7–16-inch chain, with 30 links to the yard, an expert smith will cut off from the iron bar, scarf, bend up into shape, and weld the links, at the rate of 18 yards in a day of nine working hours, which is two yards per hour, or one link per minute. In forging 1¼-inch chain the smith uses two helpers, and the iron is cut to about one-foot lengths, and several of these are being heated in the fire at the same time. The operation is as follows, the various steps succeeding each other with great rapidity: First, the helper to the right of the anvil withdraws the heated piece, drops one end into an eye at the end of the anvil, and bearing down upon the tongs, bends the piece over to an angle of about 45 degrees. The smith then takes it in his tongs, and with a few taps of the sledge it is bent around. It is heated again, passed through the end of the chain by the smith, laid flat on the anvil and the welding scarfs are put on with a few blows of the sledge. The link is now raised to a welding heat, welded by a few blows by the helpers, laid over the bick-iron, the hinged dolly is brought over, and a few rapid blows on the dolly, while the smith turns the link to and fro, serve to bring the weld up to a smooth finish. The link is now laid on edge: a single blow from the sledge brings it into shape, and with a final tap or two of the smith's hammer the link is finished. At this forge as



Bringing Scarfed Ends of Link Together Ready for Welding.

Inserting the Stud in Heavy Stud Chain.

MANUFACTURE OF HEAVY MACHINE-MADE CABLE.

many as 35 links will be added to a heavy chain of this size in one hour, or say about one every two minutes.

Machine-made Chain.— In the heavier sizes of chain of over 2 inches diameter, it becomes necessary to call in the aid of machinery in shearing the iron into lengths for the links and in bending the links into shape. The scarfs are produced by shearing the iron at an angle of 60 degrees with the axis of the bar, all cuts being taken with the inclination in the same direction, so that when the links are formed up the scarfs will lap in the desired relative position. The iron is then heated and placed in a hydraulic bending machine, where it is formed against a block into a rough U-shape at the first stroke, and then rolled into the oval link form on another block adjoining the first.. The scarfed ends are left wide enough apart to allow of the link being hooked onto the end of the chain which is being forged. The scarfed ends are now brought down snugly into contact under an automatic quick-acting hammer, and the link is heated and then welded up under the same hammer. Most of the ship cable has a cast-iron stud inserted in each link. The ends of the stud are hollow, to match the round of the chain, and when the link has been hammered down snugly into place, it is impossible for the stud to be displaced. Indeed, the pull upon the cable, by tending to straighten it out, causes the link to tighten upon the stud and hold it the more securely in place. Cables are made in standard lengths of 15 fathoms or 90 feet, and any greater length is obtained by shackling several of the 15-fathom lengths together, the average length of a ship's cable being about 90 fathoms, or 540 feet. The life of such a cable is about 10 years.

Blacking.— When the 15-fathom length is completed, it is placed in an iron box and heated by steam, and then drawn through a vat of boiling tar, known as the «tar kettle.» Here it receives a thorough coating, after which it is drawn out upon an iron grating, where the surplus tar is allowed to drain off, leaving a heavy protective coat upon the cable. In conclusion it should be noted that although each link of a chain consists of two thicknesses of bar, it must not be presumed that a chain possesses double the strength of a single bar; actually there is a reduction of three tenths in the strength, due to the formation into links, so that the chain has but about seven tenths of the united strength of two bars of the same diameter of iron. Moreover, as the strength per square inch of a heavy bar is not so great as that of a smaller diameter iron, there is further reduction to be made on this account. Thus, if a bar of ordinary rolled iron shows a breaking strength of 20 tons per square inch, the breaking strength will decrease to 19 tons up to 2 inches, and 18 tons per inch up to 3 inches diameter of rod. Consequently the breaking strength of chain made of 1-inch iron will be about 50,000 pounds, and the breaking strength of 2-inch chain about 190,000 pounds.

Chain-shot, a projectile consisting of two balls connected by a bar or a chain, formerly used for cutting and destroying the spars and rigging of an enemy's ship. It was invented by Admiral De Witt in 1666, but has long been disused.

Chain-snake, a harmless terrestrial snake, ranging from the Great Lakes to Mexico. In length it is from four to five feet, the color varying with the species. In the East and South the typical form (*Ophiobolus getulus*) is glossy black, with a chainlike pattern of yellow lines covering its back; the belly is dirty yellow, blotched with black, and the head-plates are black, spotted with yellow. A larger variety, found west of the Mississippi, is "cream-colored, sharply marked with rings of black." Chain-snakes feed upon small mammals, amphibians and reptiles, including venomous serpents.

Chain-timber, a timber of large dimensions placed in the middle of a building to give it strength. Called also bond-timber.

Chainey, George, American clergyman: b. England 1851. At first a Methodist minister, he resigned in 1877, and for the next three years was pastor of the Unitarian church in Evansville, Ind. Since then he has been chiefly engaged in lecturing and writing upon theological subjects and mysticisms, traveling through Australia and Palestine on his lecture tours. He is editor of 'The Interpreter'; and conducts a "school of interpretation." Publications: 'Foundation Stones'; 'Unitarian Sermons' (1879); 'The New Version: Discourses on the Bible' (1882); 'She: An Allegory of the Church' (1889); 'Jeanne D'Arc' (1888); 'The Ten Commandments' (1900).

Chair, an article of domestic furniture, having legs, a back, and sometimes arms; usually for the accommodation of one person. A sociable or vis-à-vis, sometimes considered as a chair, has seats for two. Among the Romans the word sella was used generically for seats of various kinds, and had usually a qualificative term appended to it, as sella curulis, sella balnearis. They had also specific names for different kinds of seats; a seat with a back, like our chairs, was called *cathedra*. Chairs were much less common, both with the ancients and in the Middle Ages, than they are in modern times; hence, perhaps, the reason why chair and *cathedra* have both given their names in an allegorical sense to various dignities. We speak of the chair of justice, and the chairman of a meeting, and *cathedra* is now most widely known by its derivative cathedral, the name still given to a metropolitan church.

Chair of St. Peter, The, a relic at Rome of which the first known mention was made by Ennodius in 500, and a feast in honor of which was instituted or restored by Paul IV. in 1558. It was exposed for public veneration by Pius IX. in 1867. It is of wood overlaid with ivory and gold.

Chaise, shāz, a two-wheeled carriage for two persons, with a calash top, and usually drawn by one horse.

Chalcedon, kăl-sē'dŏn, a city of ancient Bithynia, opposite Byzantium, at the entrance of the Euxine, about two miles south of the present site of Scutari. Chalcedon is said to have been founded before Byzantium, and was a flourishing town when it came into possession of the Romans, under the testament of Nicomedes 74 B.C., as included in the kigdom of Bithynia. It was finally destroyed by the Turks, by whom it was taken about 1075. At

Chalcedon in 451, Marcian, the emperor of the East, held the fourth general council for the purpose of destroying the ascendancy of the Monophysite doctrines obtained in 449 by the influence of the Alexandrian patriarch Dioscuros at the (so-called) robber-synod at Ephesus; and define the Christian faith so as to guard its orthodoxy against the Nestorian and Monophysite heresies. This council, which consisted of 600 bishops, mostly of the East, deposed Dioscuros, and after violent debates the articles of faith settled by them declared, in opposition to the Monophysites, the belief of two natures in Christ, existing without mixture or change, without division or separation, so that by the union of the two natures in one person and substance their distinction is not destroyed, but the characteristics of each are retained. Besides this creed the council promulgated 30 canons against clerical abuses, of which canons the twenty-eighth conceded to the see of Constantinople second rights and privileges to the Roman, but Pope Leo I. refused to confirm it. Rebellions in Palestine and Egypt were the immediate consequences of the decrees of the council of Chalcedon against Dioscuros and the Monophysites; and not till after a long period of ecclesiastical contests, during which the Monophysites were entirely separated from the orthodox and formed a distinct church, did the Chalcedon formula of faith obtain the undisputed authority which it now has in the Catholic, Greek, and many Protestant churches.

Chalcedony, kăl-sĕd'-ō-nĭ (from Chalcedon, an ancient Greek town in Asia Minor), a cryptocrystalline variety of quartz, transparent or translucent with a waxy lustre, and white, gray, blue, brown, or black in color, but commonly of a tint suggestive of diluted milk. It occurs in masses, also very frequently in mammillary, botryoidal and stalactitic forms. It is used for ornament and is often called "white agate."

Chalced'onyx, the name applied to those agates in which opaque white chalcedony alternates with the translucent gray variety.

Chalchihuitl', chăl-chī-wētl', a bluish-green mineral, highly prized by the ancient Mexicans, and identified with jadeite by some authorities, with emerald by others, and with the turquoise of the Santa Fé region by still others. The last-mentioned conjecture is probably correct.

Chalcis, kăl'sĭs, a town of Greece, in the island of Negropont or Eubœa, separated by the narrow Strait of Euripus from the mainland, with which it is connected by a bridge that opens to let vessels through. The modern town is now one of the most attractive in Greece, and consists of an inner walled town and an outer or suburban portion, the walls being the work of the Venetians. In the inner town the streets are narrow and the houses lofty. Several of the churches were formerly mosques. Ancient Chalcis was one of the greatest of the Ionic cities, carried on a large trade, and planted numerous colonies. It had also colonies on the coasts of Macedonia and Italy, in Sicily, and in the islands of the Ægean Sea. The Chalcians joined the Bœotians in a war with Athens, in which they were defeated 506 B.C. After the Persian wars Chalcis became tributary to Athens. The Chalcians revolted 445 B.C., along with the Eubœans, but were vanquished by Pericles. Another revolt occurred 411 B.C., and Chalcis for a short time became independent. A bridge was at this time built across the Euripus, and fortified; a passage sufficient for a single ship being left in the middle. It was subsequently occupied by the Macedonians, and after various vicissitudes fell under the yoke of the Romans. Chalcis joined the Achæans in their last war with Rome, when the city was taken and destroyed by Mummius. It was afterward rebuilt, and about the beginning of the Christian era was the chief city of Eubœa. It was held by the Venetians from 1210 to 1470, when it was taken by the Turks. Pop. about 10,000.

Chalcis (kăl'sĭs) **Flies,** a family (*Chalcididæ*) of parasitic *Hymenoptera,* allied to the ichneumon flies, and with similar habits. The fore wings are nearly veinless; the posterior margin of the prothorax not reaching the tegulæ; while the ovipositor issues from before the end of the abdomen. The chalcids are generally minute, a few almost microscopic; many of them of beautiful shades of green, with metallic reflections. A goodly proportion of them are secondary parasites, that is, are parasitic on other chalcids; some deposit their eggs in galls. Typical genera are *Pteromalus* (*P. puparum*), *Semiotellus,* and *Chalcis. Eurytoma hordei* is the wheat joint-worm, not being carnivorous or parasitic in other insects. Our largest chalcid is *Leucospis affinis.* Aside from the immense benefit these chalcid flies confer on agriculture by destroying noxious caterpillars, etc., the fig insect (*Blastophaga grossorum*) is the agent in enhancing the value and flavor of figs. See CAPRIFICATION.

Chalcocite, kăl'-kō-sīt (χαλκός, "copper"), a native sulphide of copper having the formula Cu_2S. It crystallizes in the orthorhombic system, and also occurs in massive and granular forms. It has a hardness of from 2.5 to 3, and a specific gravity of from 5.5 to 5.8. It is opaque and leaden in color, with a metallic lustre. In the United States it occurs in crystals at Bristol, Conn., massive as the principal copper ore at Butte, Montana, and similarly in many copper mines in Arizona; also in Mexico, Chile, and Peru. Beautiful crystals come from Cornwall, England, and one crystal, found in Tuscany, weighs half a pound. It contains 80 per cent of copper and is known also as "copper-glance," "chalcosin," and "redruthite."

Chalcondylas, kăl-kŏn'dĭ-lăs, **Deme'trius,** Greek grammarian: b. Athens about 1424; d. Milan 1511. He was a pupil of Theodore Gaza, and on the taking of Constantinople by the Turks came to Italy, where he taught the Greek language, was invited to Florence by Lorenzo di Medici about 1479, and proceeded afterward on the invitation of Lŭdovico Sforza, to Milan. He spread the study of the Greek language and literature in the west of Europe, and sent out several celebrated scholars. Among the works edited by him was 'Homer' (1488); 'Isocrates' (1493); and 'Suidas' (1499). He also compiled a Greek grammar, which was long in general use as a school-book. In his editions of the Greek authors he was somewhat arbitrary in his emendations of the text. His brother Laonicus, after witnessing the fall of Constantinople, followed his brother to Italy. He is the author of

a history of the last years of the Byzantine empire, from 1297 to 1462.

Chalcondylas, Laon'icus, Greek historian: b. Athens; d. about 1464. He was a brother of Demetrius Chalcondylas (q.v.). He was an ambassador of John VII. during the siege of Constantinople, and wrote a 'History of the Byzantine Empire 1297–1462.'

Chalcopyrite, kăl-kō-pī'rīt (Gr. Χαλκός "copper" pyrites), a native sulphide of copper and iron, having the formula $Cu_2S.Fe_2S_3$, and crystallizing in the tetragonal system, commonly with a tetrahedral aspect. Chalcopyrite is brass-like in appearance, and is often tarnished and iridescent. It has a specific gravity of about 4.2, and a hardness of from 3.5 to 4. It is widely distributed, and in Cornwall, England, it constitutes the chief ore of copper. It occurs in many parts of the United States also. Owing to the iridescence noted above, it is often called "peacock ore." It is softer and deeper in color than ordinary iron pyrites, with which it is sometimes confused.

Chaldæa, kăl-dē'ạ, in ancient geography, the southerly part of Babylonia, toward Arabia and the Persian Gulf, lying west of the mouth of the Tigris and Euphrates. The Chaldæans are supposed to have been at first a wandering and predatory race like the Arabs, who afterward became settled, and ultimately gave their name to Babylon and the Babylonian empire. The name Chaldæan was especially applied to a portion of the Babylonian Magi, who were devoted to the pursuit of astronomy and magical science.

Chaldæan (kăl-dē'ạn) **Christians,** a branch of the Nestorians, in communion with the Roman Catholic Church.

Chaldean MS., The, an extraordinary satire, now almost forgotten save by special students of literature. It was a skit at the expense of the publisher Constable, and of the Edinburgh notables specially interested in the Whig 'Edinburgh Review'; prepared by the editors for the seventh number of the new Tory 'Blackwood's Magazine,' October 1817. In form it was a biblical narrative in four chapters, attacking Constable, and describing many of the Constable clientage with more or less felicitous phrases. Many of its characterizations cannot now be identified, but they were all scathing and many of them mean. The joke was perpetrated by James Hogg, the "Ettrick Shepherd," whose original paper was greatly enlarged and modified by Wilson ("Christopher North") and Lockhart. The satire, which now seems so harmless, shook the old city to its foundations, and led to many lawsuits. Originally it was headed 'Translation from an Ancient Chaldee Manuscript,' and pretended to be derived by an eminent Orientalist from an original preserved in the great library of Paris.

Chaldee (kăl'dē) **Language,** a form or dialect of the Aramean, one of the three principal varieties of the ancient Semitic. The region called in Scripture Aram may be described generally as occupying the northern and northeastern divisions of that corner of Asia which was the home of the Semitic languages. It was bounded on the north by the Taurus range and the river Tigris, which latter also formed its eastern boundary; on the west by the Mediterranean and Mount Lebanon; and on the south by Palestine and the Arabian desert. The Aramean language was very extensively known, not only within the limits above mentioned, but beyond them. The princes of Judea and Assyria were familiar with it; it was spoken in the palace of Nebuchadrezzar, and even formed the medium of communication between the Persian court and its subjects in Judea and Samaria. It may also lay claim to a high antiquity, being probably the language of Abraham previous to his migration into Palestine, and certainly of his grand-nephew Laban. Unfortunately the older monuments of the language have perished, the Chaldee portions of Daniel and Ezra being the earliest specimens we possess of a language which had probably existed and flourished at least 2,000 years before. There is another dialect of the Aramean besides the Chaldee, namely, the Syriac, and in this as well as in the Chaldee numerous writings are still extant, but they are all of comparatively recent date. The Chaldee literature is usually arranged in two divisions: the biblical Chaldee, or those portions of the Old Testament which are written in Chaldee, namely, Daniel from ii. 4 to vii. 28; Ezra iv. 8 to vi. 18, and vii. 12–26; and Jeremiah x. 11; and the Chaldee of the Targums and other later Jewish writings. The former is distinguished by a closer approach to the Hebrew idiom, and is therefore considered less pure than the Chaldee of the Targum of Onkelos, the oldest and most valuable of the Targums.

Chalder, chäl'dėr, an obsolete Scotch dry measure containing 16 bolls or 12 imperial quarters.

Chal'dron, an English measure of 36 bushels, used chiefly in measuring coal.

Châlet, shă-lā' ("a little castle"), the wooden hut of the Swiss mountain herdsman; a French-Swiss name, which is also extended to Swiss houses generally, as well as to ornate and picturesque villas built in similar style.

Chaleur Bay, shạ-lėr, or **Bay of Chaleurs,** an inlet or arm of the sea in the Gulf of St. Lawrence, between Quebec and New Brunswick. The French fleet was here defeated by the British in 1760. There are a number of islands in this bay, notably Shippegan, near its mouth. The navigation is good and the mackerel fishery is important.

Chalice, chăl'ĭs (Latin, *calix*), a cup or bowl. This term, originally signifying a common drinking vessel, is now usually applied to a communion cup. From wood or other cheap material in early times, chalices came to be made of glass, agate, silver, and gold, with engraving, enamel, and different kinds of costly decoration. Some of them have great historic interest and value, and are preserved in church treasuries and various museums of Europe. It is generally held that a chalice must have a knop or ball in the middle of the stem or foot which supports the bowl. This is intended to secure the hold of the person who hands it to the communicant. It has also a cover which may be the paten or dish for the consecrated bread. When the Protestant separation took place in England, the communion-cup was made of a wholly different pattern from the chalice.

Chalicotherium, kăl''ĭ-kō-thē'rĭ-ŭm, or **Macrotherium,** măk-rō-thē'rĭ-ŭm, an extinct

ungulate of the Miocene Epoch, as large as a rhinoceros, but hornless and with enormous claws on the toes of both fore and hind feet,—a character almost unique among the *Ungulata.* The animal was distantly related to the *Titanotherium* (q.v.), but is usually placed in a distinct sub-order, the *Ancylopoda.* The foot-bones, when first found, were supposed to belong to an animal related to the *Edentata* (sloths, ant-eaters, and armadillos), and was described by Cuvier as a *pangolin gigantesque;* but the discovery of a complete skeleton (preserved in the Museum of the Jardin des Plantes, Paris), showed its true relationships.

Chalk'. In geology chalk is a soft, friable, finely granular variety of limestone, and may in color range from pure white to grayish or buff. It is a marine deposit, composed principally of the shells of foraminifera. In the United States are some great beds of chalk of Upper Cretaceous Age. One is exposed for 250 miles from Austin to Sherman, Texas, and is nowhere much less than 600 feet thick. Chalk beds of the same age, Colorado stage, are found in Arkansas, Kansas, and in Montana, while the great chalk belt of Texas extends southwest from Austin into Mexico, being found in the states of Chihuahua, Coahuila, and Tamulipas. In Arkansas and Texas this chalk formation and its associated chalky marls is being developed as furnishing excellent material for making Portland cement. No statistics of the amount thus used at present are available. In England the Upper Cretaceous series is marked by great beds of chalk and chalky limestones, and includes the Cenomanian, Turomain, and Senonian stages. Such strata extend across England from Flamborough Head on the east coast to west of Dover on the south coast. The chalk-mining industry of England is of importance, the toal amount of chalk produced in 1901 being 4,399,000 tons. Part was used for cement-making and part for making refined chalk. (See CEMENT; CRETACEOUS SYSTEM.) 'United States Geological Survey Report, 1900–1,' Part III.; 'The Chalk of Northwestern Arkansas.'

ROBERT THOMAS HILL,
Of the United States Geological Survey.

Chalk, Red, or **Reddle,** a red, amorphous variety of hematite or sesqui-oxide of iron, containing much clay. To this fact it owes its firm, compact texture. It has an ocher-red color and is used chiefly by carpenters for making marks on wood, and by tailors for marking on cloth; the finer, by painters. It occurs in thin beds in clay-slate and gray wacke-slate in parts of Germany.

Chalkley, châk'lĭ, **Thomas,** American Quaker itinerant preacher: b. London 3 March 1675; d. Tortola, West Indies, 4 Sept. 1741. He spent his life preaching in New England and the Southern colonies; toward its end he made his home near Philadelphia. His chief work was his 'Life, Labors, and Travels,' whose quaintness made it popular even outside the Society of Friends, and has caused it to be several times reprinted.

Challemel-Lacour, Paul Armand, pōl ärmäñ shäl-mĕl-lä-koor, French statesman: b. Avranches 19 May 1827; d. Paris 26 Oct. 1896. He was graduated at the École Normale in 1849 and soon fell under the ban of political proscription. He was elected to the French Chambers, however, and served the republic as senator, ambassador to Switzerland from 1874 to 1879, ambassador to England from 1880 to 1882, Minister of Foreign Affairs and president of the Senate in 1888. He was elected to the French Academy in 1893, and was editor of the 'Republique Française.'

Chal'lenge, originally, an accusation, charge, or claim. A challenge to jurors is an objection either to the whole panel or array, that is, the whole body of jurors returned, or to the polls, that is, to the jurors individually; and it is either peremptory, that is, without assigning any reason, or for cause assigned. A peremptory challenge is allowed to be made only by the party accused, and not by the government or prosecuting officer, and only in capital cases; and is said to be permitted on the ground that a man is liable to conceive a prejudice against another from his mere looks and appearance, for which he can give no reason: and such may be the case of the accused; and it is conceded, in favor of life, that in such case he may exclude the juror without assigning any reason; and also on the ground that, by questioning a juror as to any objection to him, his prejudice may be thereby excited against the prisoner, who, to save himself from the effect of such prejudice, is permitted to have him rejected. The ground on which peremptory challenge is allowed supposes the prisoner's life to be in danger, and he is not entitled to it if he pleads in bar or abatement; for the trial of these pleas does not decide on his life. He must, before making such challenge, plead "not guilty," or some plea the trial of which decides on his life. Having pleaded such a plea, the accused might, by the common law, peremptorily challenge 35 jurors; but the statute 22 Hen. VIII. c. 14 limited the number to 20 in felony. The regulating statute now in force in Great Britain is 6 Geo. IV. c. 1. By the law of the United States a peremptory challenge of 35 jurors is allowed in trials for treason, and 20 in those cases of felony mentioned in the statute. A challenge of the whole panel may be made because the jury is illegally drawn or summoned, whereby it is not a legal jury; and a challenge of this description may be made by the government as well as by the prisoner. Challenge to the polls may be made both in civil and criminal suits for cause, as that the juror is an alien, not from the proper district, not duly qualified as a freeholder, not of suitable age, etc., or is near of kin to one of the parties, is biased, has been guilty of felony, is interested, or is subject to any other exception, according to the common principles of proceeding or the provisions of any statute on the subject. In courts-martial a prisoner who objects to either of the judges must assign his reasons. In other words peremptory challenges are not allowed in these courts. The privilege of challenging here belongs equally to the prisoner and the prosecutor. The right of challenging the members of a court-martial prevails on the continent of Europe, as well as in England and America.

A challenge to fight a duel is punishable in England with fine and imprisonment. In several of the United States of America this offense

is subject to the additional punishment of ineligibility to any public office, either for life or for a limited term. See DUEL.

Chal'lenger Expedition, an expedition conducted in 1872–6, under the auspices of the British government, for the purpose of exploring the open ocean. The Challenger was fitted with everything that could be carried in the way of appliances for scientific research, and placed in command of Capt Nares. Prof. Wyville Thomson and scientific staff conducted the investigations and determined the depths of waters, the configuration and condition of the sea-floor, the fauna, the currents, atmospheric conditions, etc. During the three and a half years they covered nearly 70,000 nautical miles. The route was south to Madeira, thence to the Canaries, the West Indies, and north as far as Nova Scotia; south again to Cape Verde, then to Cape of Good Hope, Australia, the China Sea, Japan, the west coast of South America, through the Straits of Magellan, and back to England. The narrative of the expedition is told in popular form in Moseley's 'A Naturalist on the Challenger.' A complete account of the scientific results was gradually published in 50 splendid volumes, by Wyville Thomson and Dr. John Murray.

Chal'lis, James, English astronomer: b. Braintree, Essex, 12 Dec. 1803; d. Cambridge 3 Dec. 1882. In 1836 he was elected Plumian professor of astronomy at Cambridge and director of the observatory. In 1861 he was succeeded in the latter position by Adams, but retained the professorship of astronomy till his death. He is best known for his work upon the theory of astronomical instruments, and for his observations in connection with the discovery of the planet Neptune.

Chal'loner, Richard, English Roman Catholic bishop: b. Lewes, England, 29 Sept. 1691; d. London 12 Jan. 1781. His parents were Protestant dissenters from the established religion of England. After the death of his father young Challoner came under other influences and was received into the Catholic Church. At the age of 13 years he entered the English college at Douai in France and there, after completing his studies, was ordained priest and appointed professor of divinity. He remained in this station till 1730, when he was sent on the English mission with London as his field. He wrote many controversial tractates and many devotional manuals. Among his writings is 'The Catholic Christian Instructed,' a sort of advance catechism of the Roman Catholic faith, in the preface to which he made an ingenious and spirited reply to Dr. Middleton's famous 'Letter from Rome, Showing an Exact Conformity Between Popery and Paganism.' Middleton, smarting from the keenness of Challoner's controversial weapons, invoked against his adversary the penalties prescribed by the penal laws enacted for the extermination of the Roman Catholic religion. In 1741 Challoner was consecrated bishop and made coadjutor to the bishop in charge of the "London District," for the assumption of a see-title in England by a Roman Catholic bishop was a penal offense. Besides the work already mentioned, Challoner wrote the devotional work, 'Garden of the Soul,' which is still in general use among Roman Catholics as a prayer-book. He wrote also, in two volumes, 'Memoirs of Missionary Priests and Other Catholics of both Sexes Who Suffered Death or Imprisonment in England on Account of Their Religion, from the Year 1577 till the End of the Reign of Charles II.'; also 'Britannia Sancta,' lives of English, Scotch and Irish saints. He revised the Douai-Rheims English version of the Old and New Testaments, improving and modernizing the style.

Chalmers, chä'mėrz or chăl'merz, **Alexander,** English journalist, editor, and miscellaneous writer: b. Aberdeen 29 March 1759; d. London 10 Dec. 1834. He received a good classical and medical education in his native city, where his father, the founder of the first Aberdeen newspaper, was a printer. About 1777 Chalmers went to London, and was employed as a contributor to the *St. James' Chronicle,* the *Morning Chronicle,* the *Morning Herald,* and various critical magazines and reviews. He edited numerous editions of the English classics, particularly the 'British Essayist' (45 vols. 12mo 1803), commencing with the 'Tatler,' and ending with the 'Observer,' together with prefaces, histories, and biographies; the 'Spectator'; 'Tatler'; and 'Guardian' (12 vols. 8vo 1822); an edition of Shakespeare, with historical and explanatory notes, in 1809; 'The English Poets from Chaucer to Cowper,' with Johnson's 'Lives,' and additional 'Lives' by Chalmers (21 vols. royal 8vo 1810). The most important and valuable of Chalmers' extensive literary labors, however, was the 'General Biographical Dictionary' (32 vols. 8vo 1812–17), the fullest body of biographical information published up to his time in England, and which has rendered invaluable service to subsequent compilers. Chalmers was as much distinguished for painstaking accuracy as an editor, combining patient and intelligent investigation of facts with literary discrimination, as for the industry which enabled him to accomplish so large an amount of work.

Chalmers, George, Scottish antiquary: b. Fochabers, Elginshire, 1742; d. 31 May 1825. Having studied law at Edinburgh, he removed to America, where he practised that profession for upward of 10 years, till the colonies declared themselves independent. Chalmers being a keen Loyalist, returned to Great Britain, where he was in 1786 appointed to the office of clerk to the Board of Trade.

Previous to his appointment he had published 'Political Annals of the United Colonies' (1780); 'Estimate of the Comparative Strength of Great Britain During the Present and Four Preceding Reigns' (1782); and 'Opinions on Interesting Subjects of Public Law and Commercial Policy, Arising from American Independence' (1784). In 1790 he published his life of Daniel Defoe; in 1794 his life of Thomas Ruddiman (a very curious book); in 1800 he edited the works of Allan Ramsay, with an elaborate memoir of the poet; in 1805 the works of Sir James Stewart of Coltness, also with a life prefixed; and in 1806 the writings of Sir David Lindsay of the Mount. The first volume of his 'Caledonia' (1807), in quarto, displayed a vast extent of erudition and research. It professes to be an account, historical and topographical, of North Britain, from the most ancient to the present times; and the original intention of the author was, that it should be completed

in 4 volumes 4to, each containing nearly 1,000 pages. Chalmers left the remainder of his great work nearly ready for the press; and it was subsequently published complete, with numerous annotations. He also wrote a 'Chronological Account of Commerce and Coinage in Great Britain' (1810).

Chalmers, George Paul, Scottish painter: b. Montrose 1833; d. Edinburgh 28 Feb. 1878. After serving in succession under a surgeon and a ship-chandler, he went to Edinburgh in 1853 in order to become an artist. He was elected an Associate of the Royal Scottish Academy in 1867, and four years later was elected to full membership. His pictures, which are characterized by rich coloring, consist mainly of portraits and subjects, though during his later years he produced several landscapes. The most important are the 'Favorite Air' (1864); 'End of the Harvest' (1873); 'Running Water' (1875); 'Threescore Years and Ten' (1875); 'Prayer' (1876); 'Knitting' (1876); and 'The Legend' (unfinished).

Chalmers, Thomas, Scottish clergyman: b. Anstruther Easter, Fifeshire, 17 March 1780; d. Edinburgh 30 May 1847. At the age of 12 he was sent to the University of St. Andrews, for the purpose of studying for the Church, and after passing through a curriculum there seven years, was licensed as a preacher in July 1799, the rule of the Scottish Church requiring that a licentiate shall have reached the age of 21 being dispensed with in his case, in virtue of the exceptional clause in favor of those possessing "rare and singular qualities."

In May 1803 he was presented to the parish of Kilmany, in the northeast of Fifeshire, and opened classes of his own for teaching mathematics in the town of St. Andrews. These were so successful that he commenced a class in chemistry also, his lectures on and demonstrations in which created quite a sensation. About this time his views as to the obligations of a Christian pastor were very different from what he was subsequently led to entertain, and he deemed it a sufficient fulfilment of these to return to Kilmany on the Saturday evenings, and from thence back to St. Andrews on the Monday mornings, devoting the bulk of his time to scientific pursuits. In 1808 he published an 'Inquiry into the Extent and Stability of National Resources,' the object of which was to show that the Berlin decree would not touch the real foundations of the prosperity of Great Britain.

In 1813 his article on Christianity appeared in the Edinburgh 'Encyclopædia,' and shortly afterward his review of Cuvier's 'Essay on the Theory of the Earth,' in the 'Christian Instructor.' In this last he propounded the interpretation of the first verses of Genesis, afterward adopted by Dr. Buckland, with a view to make the truths of revelation and the discoveries of geological science harmonize. In his lectures at St. Andrews in 1803 he had already said, "The writings of Moses do not fix the antiquity of the globe. If they fix anything at all, it is only the antiquity of the species." His fame as a preacher had by this time extended itself throughout Scotland, and a vacancy having occurred in the Tron Church of Glasgow, he was elected to the charge by a large majority of the town-council, and inducted on 21 July 1815. In the month of November following he commenced his series of astronomical discourses, in accordance with a custom observed in Glasgow, of the city ministers delivering in rotation a course of sermons in the Tron Church on Thursdays. These created a sensation such as no sermons had ever before produced in Glasgow. It is related, that when the hour of delivering them arrived, merchants and men of business would regularly leave their desks and proceed to the Tron Church, while the more liberal among them would, in addition, grant a similar indulgence to their clerks and assistants. In the commencement of 1817 these discourses were published, and attained a sale of nearly 20,000 copies by the end of the year. They raised their author to the position of the first preacher of the day, and in a visit which he shortly afterward paid to London, the most distinguished literati and statesmen crowded to listen to the wondrous oratory of the Scottish divine.

The main object which engaged Chalmers on his arrival in Glasgow was the reorganizing of the parochial system, so as to provide a machinery by which the destitute and outcast might be visited and reclaimed, and the young instructed in the lessons and duties of religion. Especial efforts were directed toward the establishment of Sabbath-schools. Great exertions were also made by him to get new churches erected throughout Glasgow, the church accommodation for which comprehended scarcely a third of the inhabitants. In this he ultimately succeeded, and in addition, a new parish and church (St. John's) were erected and endowed expressly for himself by the town-council of Glasgow. To this he was in 1819 transferred from the Tron. The fatigues, however, which unremitting attention to parochial affairs involved were becoming too much for his health, and on the vacant chair of moral philosophy, in the University of St. Andrews, being offered to him, he accepted it.

In 1827 the divinity chair in the University of Edinburgh became vacant, and Chalmers was unanimously elected to it by the town-council 31 October. This appointment he held till the disruption of the Scottish Church in 1843. In 1832 he published his 'Political Economy,' and shortly afterward appeared his contribution to the celebrated Bridgewater Treatises, 'On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man.' In 1834 he was elected a corresponding member of the Royal Institute of France. An important matter which now largely engaged his attention was the subject of church extension, which he had zealously advocated from the days of his ministry in Glasgow. But Lord Melbourne's government was little disposed to aid the Church of Scotland on this occasion, and it was consequently obliged to carry out its scheme on the voluntary principle. Amid the various public movements with which Chalmers' name stands connected, there is none in which it more prominently occurs than in relation to the great non-intrusion movement in the Scottish Church. Throughout the whole of this memorable contest, from the passing of the veto law by the General Assembly to the Disruption in 1843, he acted as the leader of the Evangelical party in their struggles with the civil power, and may be regarded as the founder of the Free Church, of the first assembly of which he was

moderator. He was also the originator of the sustentation fund, out of which the ministers of that body are principally supported. Having vacated at the Disruption his professorial chair in the Edinburgh University, he was appointed, on the establishment of a new college in connection with the Free Church, to the offices of principal and primarius professor of divinity in that institution. The energy which made Chalmers remarkable as an orator was infused into all his practical undertakings; and in the social and religious movements which he inaugurated he has left his mark in the history of his country. His published works are very numerous, embracing sermons, tracts, essays, works on political economy, the parochial system, church establishments, etc. They exhibit the same energy of conviction, together with a breadth and profundity of view, which, though many of his theories have not been accepted by other thinkers, will always make them a rich mine of suggestion and instruction to inquirers into the complicated relations of human society. See 'Lives,' by Hanna (1849–52); Fraser (1881); Mrs. Oliphant (1893); Blaikee (1897).

Châlons-sur-Marne, shä-lôṅ sür märn, France, a city and capital of the department Marne (Champagne), 107 miles east of Paris. It lies on the right bank of the Marne, here crossed by a stone bridge of three arches, built in 1787. Low walls now supply the place of the old ramparts, the entrance being by six gates, which open to six main roads. The principal public buildings are the cathedral, restored by Louis XIV. after having been destroyed by fire in the 13th century; the church of Notre Dame, of the 12th and 13th centuries, and since restored; the Hotel de Ville, built in 1772; the Hotel de la Prefecture, built in 1764, one of the finest buildings of the kind in France; public library, containing 30,000 volumes; museum, hospital, etc. There is a promenade, occupying about 18 acres, formerly planted with superb elm trees, which the Germans cut down for fuel during the Franco-Prussian War. Châlons is the seat of a bishopric, and of one of the schools of arts and trades, where 300 pupils are maintained and instructed at the public expense. There are manufactures of woolen and cotton goods; cotton mills, tanneries, etc. Châlons was fortified and embellished by the Romans. Christianity was preached here about the year 250. In 451 Attila was defeated before its walls. From the 10th century it formed a kind of independent state, governed by its bishops, till 1360, when it was united to the crown. A celebrated camp was established by Napoleon III. at the distance of about 18 miles from Châlons for the purpose of training the French troops. In 1870 the town was occupied by the Germans after MacMahon's withdrawal. Pop. (1903) about 27,000.

Châlon-sur-Saône, sür sōn, France, a town in the department of Saône-et-Loir, 33 miles north of Macon, at the commencement of the Canal du Centre. It is situated on the Saône, here crossed by a bridge of five arches, communicating with the suburb of St. Laurent. It is irregularly built, and is surrounded by a wall and the remains of ancient fortifications. The public buildings include the church of St. Vincent, built in 1386–1440, a library with 22,000 volumes, a gallery of painting, etc. Châlon is the seat of a tribunal of first resort and of commerce, and has a communal college. There are foundries, dye-works, manufactories of leather, cloth, glass, etc., and a considerable trade in grain, flour, and wines. The Saône becomes navigable for steamboats here, and there is steamer connection with Lyons. Cæsar had grain magazines at Châlon, and it became the capital of Burgundy under Gontran. In 1273 Edward I. of England, being invited to a tournament here on his return from Palestine, attended with 1,000 men-at-arms; and some disputes having arisen, the English attacked the French, killed a great number, and left the tilting-ground strewed with the dead. This event is known as "the little war of Châlon." The town suffered considerably from the civil wars of the 15th and 16th centuries, and from the invasion of the allies in 1814. Pop. (1896) 26,630.

Chalybeate (kạ-līb'ē-āt) **Waters,** those which contain salts of iron in sufficient quantity to give them a special value in the treatment of cases of anæmia, etc. Iron or steel waters are not the only mineral waters in which some form of iron is found. Indeed in nearly all this ingredient exists, but in very many in such small quantity, while other ingredients are so conspicuous, that the character of the water can hardly be supposed to be affected by that metal. Those springs most successfully resorted to contain from one third to nine tenths of a grain of iron, in the form of carbonate, in 16 ounces. Some springs are classed as iron springs which contain barely one fifth of a grain in 16 ounces of water. What are called pure iron springs are those which contain but a few grains of dissolved solids, a salt of iron existing to some appreciable amount; compound iron springs contain moderate quantities of other salts, such as Epsom and Glauber's salts, common salt, sulphate of lime, besides being rich in carbonic acid gas. The reason for the use of iron waters is that iron is a necessary ingredient of the blood, and in certain conditions promotes the formation of blood. Small doses only should be employed, as excess may irritate the stomach and bowels and produce constipation. It has been found that iron springs are most useful in cases of poverty of blood quickly produced, for example, by loss of blood by bleeding from the nose, or from wounds; by drain occurring from the blood, owing to diarrhœa, suppuration, and other profuse discharges; in cases of chlorosis in young girls; and in poverty of blood dependent on acute disease, in which cases they materially promote convalescence. Iron springs are also used in disorders of menstruation, especially in its suppression; in malarious conditions and poverty of blood due to residence in tropical countries; and in neuralgia, sterility, and impotency due to enfeebled conditions of general health. In such cases as these last the improvement is not so rapid, and is often best promoted by waters which, besides the iron, contain marked quantities of other ingredients, like common salt. It is chiefly in the form of carbonate that the iron exists, and this is the best form for administration. The presence of carbonic acid gas in the water keeps the carbonate of iron in solution, and when the water

stands a yellowish rust is deposited. Iron springs are used for bathing, but it is not now believed that the iron produces any effect on the skin or is absorbed from the bath. Among the chief chalybeate springs are those at Saratoga, N. Y.; two at Harrogate, England, called the Muspratt and the Tewitt, the latter pure; a pure one at Tunbridge Wells; several at Bath; one at Bocklet, near the salt spring of Kissingen, containing much common salt and carbonic acid gas; those of Antogast, Freiersbach, Griesbach, Petersthal, and Rippoldsau, in the Black Forest region, at altitudes of from 1,280 to 1,886 feet; one at Orrezza, in Corsica, with much carbon dioxide and traces of arsenic; many at Spa; one at St. Moritz, Switzerland, situated at an elevation of 5,710 feet; one at Santa Catarina, Italy, three miles from Bormio, at a height of 5,600 feet; several very popular pure ones at Schwalbach in Nassau; one at Pyrmont, Waldeck; and one at Cheltenham, with a very high proportion of iron carbonate.

Chalybite, kăl'ĭ-bīt, or **Siderite,** a common iron ore. It is iron protocarbonate, $FeCO_3$, containing 48.2 per cent of metallic iron. It occurs in rhombohedral crystals, also botryoidal, globular, compact or earthy, but most commonly cleavable-massive. Its hardness is 3.5 to 4, but in the siliceous variety, clay iron-stone, found in many coal formations, it sometimes runs up to 7. Its specific gravity is about 3.85, lustre vitreous to pearly, color usually brown or yellowish-gray. It is generally nearly opaque. It occurs in enormous quantities in Austria, also at Roxbury, Conn. It is a frequent associate of silver, lead, and copper ores. Clay iron-stone is considered the most important iron ore of England.

Cham, shăn (pseudonym of AMÉDÉE DE NOÉ), French caricaturist: b. Paris 26 Jan. 1819; d. 6 Sept. 1879. He adopted the name Cham (Ham) as one of the sons of Noah, his father being M. de Noé (Noah). The son of a peer of France, he attended the polytechnic school; but following his artistic inclinations, became a pupil of Delaroche and Charlet, and acquired distinction as a caricaturist by his spirited and humorous contributions to the Paris 'Charivari,' and by the publication of several collections of caricatures, among the best of which are 'Annee's Comiques' (1880); 'Les Folies Parisennes' (1883).

Chama, kā'mą, a genus of mollusks, the typical one of the family *Chamidæ*. The shell has foliaceous valves, the upper one the smaller, one valve attached to another body by the left umbo; the hinge tooth of the free valve is received between two teeth of the other. The chamas are found less than 50 fathoms deep in tropical seas, especially among coral reefs. Fifty recent species are known, and 40 fossil, the latter from the Cretaceous onward. The still existing *Chama gigas* sometimes weighs 300 pounds, and may measure four feet across. The byssus by which it adheres to the rock is so tough that a hatchet is required to cut it through. One valve is sometimes used in churches as a baptismal font.

Chamærops, ką-mē'rŏps, a genus of palms established by Linnæus, and remarkable as containing those species of the palm family which are found at the greatest distance from the equator. It is characterized by its flabelliform leaves, polygamous and sometimes dicœcious flowers, and its triple monospermous drupes. The *C. humilis* is the only palm which is seen growing in the open air in any part of Europe. It is confined, however, to its hottest parts, and even there is generally only from four to five feet high. Its trunk, from five to six inches in diameter, is closely covered with triangular hard scales, the bases of the old leaves; the new leaves grow in a tuft at the top. Sometimes the stem does not appear at all; and the leaves, apparently issuing from the ground in the form of a large fan, have procured for the plant the name of the fan-palm. In hothouses the stem attains the height of 15 feet or more. The leaves are used for thatch and other purposes, and they furnish a large quantity of fibre, which forms an article of commerce and yields a material that may be used instead of horse-hair. *C. fortunei,* a species from northern China, stands the climate of southern England quite well. Brazilian grass is a fibre obtained from *C. argentea.*

Chamalari, chä-mä-lä'rē, or **Chamalhari,** a peak of the Himalaya Mountains, at the western extremity of the boundary line between Bhutan and Tibet. Height, 23,929 feet.

Chamba, chăm'bą, a state of the Punjab district, British India, north of the districts of Kangra and Gurdaspur; area 3,216 square miles. It is a mountainous tract, shut in on almost every side and traversed by two hill-ranges. The crops consist of all kinds of grain and the supply of iron and slate is plentiful. The sanitarium of Dalhousie is in this district. Pop. 130,000.

Chambal, chŭm'bŭl, a river in Rajputana, Central Provinces of British India, flowing into the Jumna; length, 750 miles.

Cham'ber, a term having various technical meanings. The chamber of a cannon is that part of the bore of a cannon which receives the powder with which it is charged. The chamber of a mine is the place where the charge of powder is lodged that is to be used for blowing up the works. In several languages chamber is used to designate a branch of government whose members assemble in a common apartment. A chamber of commerce is a board or association to promote the interests of the trade and merchandise. See CHAMBERS OF COMMERCE.

Chamberlain, Abiram, American governor: b. Colebrook, Conn., 7 Dec. 1837. He was educated in the public schools and at Williston Seminary, Easthampton, Mass., making a special study of civil engineering. In 1856 he removed to New Britain, Conn., where he learned the trade of rule-making and practised civil engineering with his father. He was teller of the New Britain National Bank for five years, cashier of the Home National Bank of Meriden, 1867, and its president since 1881. He has held local municipal offices, was a member of the General Assembly, 1877, comptroller 1901–2, and governor of Connecticut, 1903–4.

Chamberlain, Alexander Francis, American anthropologist: b. Kenninghall, England, 12 Jan. 1865. He was graduated at Toronto University in 1886, and became a member of numerous learned societies. Since 1892 he has been lecturer on anthropology at Clark Uni-

versity, Worcester, Mass. He has written 'The Child and Childhood in Folk-Thought' (1896); 'The Child; a Study in the Evolution of Man' (1900); and many essays on similar topics.

Chamberlain, Basil Hall, English Japanese scholar: b. Southsea 18 Oct. 1850. He is a grandson of Basil Hall (q.v.). He is emeritus professor of Japanese and philology at the Imperial University of Tokyo, and has published 'The Classical Poetry of the Japanese' (1880); 'Translation of the Kojik' (1883); 'A Romanized Japanese Reader' (1886); 'Language, Mythology, and Geographical Nomenclature of Japan in the Light of Aino Studies' (1887); 'Luchuan Grammar' 1895); 'Handbook of Colloquial Japanese'; 'Things Japanese.'

Chamberlain, Daniel Henry, American lawyer: b. West Brookfield, Mass., 23 June 1835. He graduated at Yale with high honors in 1862, and at Harvard Law School in 1863. In 1864 he was commissioned lieutenant in the 5th Massachusetts colored cavalry, served in Maryland, Louisiana, and Texas, and was promoted captain. In 1866 he settled as a cotton planter in South Carolina. Upon the call for a constitutional convention, he was chosen a delegate, and was subsequently elected attorney-general, a position he held for four years. From 1872 to 1874 he practised law at Columbia, S. C. He was governor of the State 1874–7. Though renominated in 1876 and reinaugurated in January 1877, his election was contested by Wade Hampton, the Democratic candidate for governor. After the inauguration of President Hayes, both contestants were invited to a conference at Washington, which resulted in the U. S. troops (which had been sent to support Chamberlain) being withdrawn from South Carolina, and Gov. Chamberlain withdrawing his claim to election. He resumed law practice in New York city until his retirement to West Brookfield, Mass. He has published several addresses and pamphlets, the latest of which is 'Charles Sumner and the Treaty of Washington' (1902).

Chamberlain, Henry Richardson, American journalist: b. Illinois 25 Aug. 1859. He engaged in journalism in Boston and New York, being managing editor of the New York *Press* in 1888, and of the Boston *Journal* in 1891, and since 1892 has been London correspondent for the New York *Sun*. He has published 'Six Thousand Tons of Gold' (1894).

Chamberlain, J. Austen, English politician, son of Joseph Chamberlain (q.v.): b. 1863. He was educated at Rugby, and Trinity College, Cambridge. He was financial secretary to the Treasury, 1900–2, and has been postmaster-general from 1902. In appearance he bears a striking resemblance to his father, the noted colonial secretary.

Chamberlain, Jacob C., American missionary: b. Sharon, Conn., 13 April 1835. He graduated at Western Reserve College 1856; studied at the Dutch Reformed Church theological seminary 1859, and also took a medical degree at the College of Physicians and Surgeons in New York. In December 1859, he went as a medical missionary to southern India, and has resided in the Madras presidency ever since, with the exception of three visits to the United States. He established a hospital and dispensary at Madanapalli 1868, and another at Palamanair 1872. He translated the Reformed Church liturgy into Telugu Madras 1873), and also 'Hymns for Public and Social Worship' (1884). He has written 'The Bible Tested' (1878; 7th ed. 1885); 'Native Churches and Foreign Missionary Societies' (1879); 'Winding up a Horse; or Christian Giving' (1879); 'Break Cocoanuts Over the Wheels: or All Pull for Christ' (1885).

Chamberlain, Joseph, English statesman: b. London July 1836. He was educated at University College School, and entered his father's screw factory at Birmingham, from which, however, he retired in 1874. He had by this time acquired considerable celebrity as a Radical politician. In 1868 he was appointed a member of the Birmingham town-council, was mayor of Birmingham from 1873 to 1876, and chairman of the Birmingham school-board from 1874 to 1876. After unsuccessfully contesting Sheffield against Mr. Roebuck in 1874, he was returned for Birmingham without opposition in June 1876. He soon made his mark in Parliament, and on the return of the Liberals to power in 1880 was appointed president of the Board of Trade, with a seat in the cabinet. To Mr. Chamberlain's exertions was due the passing of the Bankruptcy Bill, but his efforts to amend the Merchant Shipping Acts were unsuccessful. Meanwhile his influence was increasing rapidly outside the House; he came to be regarded as the leader of the extreme Radical party, and enunciated schemes for the regeneration of the masses which were based on the doctrines of the "restitution" of land and the "ransom" of property. During the last hours of Mr. Gladstone's government he was understood to be opposed to the renewal of the Irish Crimes Act; and during the general election of 1886 he was most severe in his strictures on the moderate Liberals, and produced an "unauthorized" programme (in opposition to that of Mr. Gladstone), which included the readjustment of taxation, free schools, and the creation of allotments by compulsory purchase. He was returned free of expense by the western division of Birmingham. On 1 Feb. 1886 he became president of the Local Government Board, but resigned on 26 March, because of his strong objections to Mr. Gladstone's Home Rule measures for Ireland, and after the "Round Table" conference had failed to reunite the Liberal party he assumed an attitude of uncompromising hostility to his old leader's new policy, and was bitterly assailed by Home Rulers as a renegade. He became leader of the Liberal-Unionists when the Duke of Devonshire went to the Upper House. Lord Salisbury sent him to Washington as commissioner on the Canadian fishery dispute, and in 1895 he was made colonial minister in the Unionist Cabinet.

In that capacity his chief aim has been to unite more closely the colonies with the mother country. During his tenure of office he has had various difficult matters to handle, such as the negotiations concerning the "Jameson raid" on the Transvaal in December 1895, and the French claims in West Africa. On news of the "raid" being received, Mr. Chamberlain at once repudiated all connection with it on the part

of the British authorities; and he subsequently denied in the most distinct manner having had any personal foreknowledge or suspicion of what was about to take place. His conduct of the negotiations with the South African Republic preceding the outbreak of war in 1899 met with enthusiastic support from many and severe censure from others. Since the conclusion of the Boer war he has visited South Africa and by his personal influence done much to bring about a good understanding between the Boers and the English government. He had much to do with the passing of the Workmen's Compensation Act of 1897. In 1896 the students of Glasgow University elected him lord rector. He carried the Australian Federation measure in Parliament (1900), and later had to face opposition from within the Liberal party. In 1888 he was married to Mary, daughter of William C. Endicott, secretary of war in President Cleveland's first administration. He resigned from the Cabinet in 1903, owing to his protariff views.

Chamberlain, Joshua Lawrence, American army officer and educator: b. Bangor, Maine, 8 Sept. 1828. He was graduated at Bowdoin College in 1852, and entered the volunteer service of the Union in 1862, was promoted to the rank of brigadier-general by Gen. Grant, for bravery at Petersburg 1864; became a major-general in 1865, and received the colors of Lee's army on its surrender. In 1867–71 he was governor of Maine, and in 1871–83 was president of Bowdoin, resigning to engage in business in New York.

Chamberlain, Mellen, American lawyer: b. Pembroke, N. H., 4 June 1821; d. Chelsea, Mass., 25 June 1900. He graduated at Dartmouth College in 1844, and at the Harvard Law School in 1848. In 1849 he was admitted to the bar, opened a law office in Boston, and made his residence in Chelsea, where, during 51 years of citizenship he served the town in many public capacities. In 1858 and 1859 he was a member of the Massachusetts House of Representatives, and of the Senate in 1863–4. He was associate justice of the municipal court of Boston 1866–70, and chief justice 1870–8. On 26 Aug. 1878 he was chosen librarian of the Boston Public Library, serving until ill health compelled his retirement in 1890. During his administration the new library building was begun, and the corner-stone laid. Throughout his life he was a close student and investigator of American history. Besides important chapters in Winsor's 'Memorial History of Boston' (1881), and 'Narrative and Critical History of America' (1888), he wrote: 'John Adams, the Statesman of the Revolution' (1884); 'The Authentication of the Declaration of Independence' (1885); 'John Adams, the Statesman, with Other Essays and Addresses' (1898).

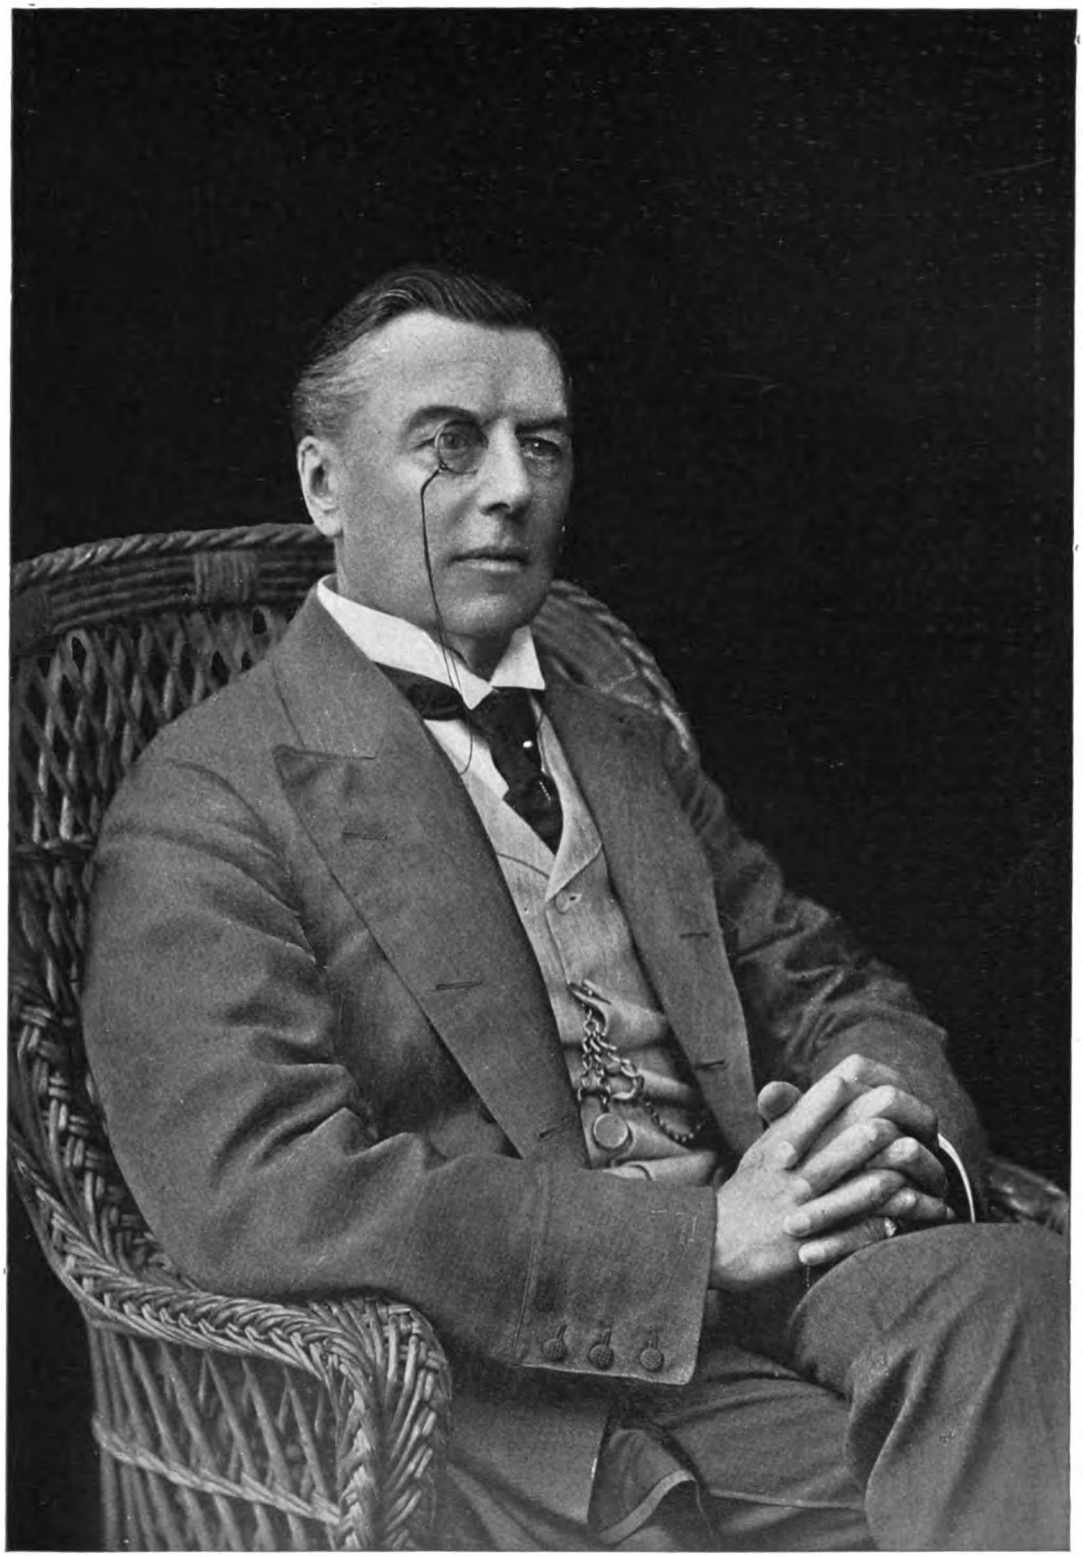
Chamberlain, Montague, American naturalist: b. St. John, New Brunswick, 5 April 1844. He was educated privately, both his parents being teachers. Though engaged in mercantile pursuits, he devoted much time to the study of natural history and came to be well known as an ornithological writer. In 1889 he became assistant secretary of the Lawrence Scientific School of Harvard University, and since 1893 has been secretary. He is a member of several scientific bodies, and his chief publications are: 'Canadian Birds' (1870); 'Birds of New Brunswick' (1882); 'Mammals of New Brunswick' (1884); 'Systematic Table of Canadian Birds' (1887); 'Birds of Greenland' (1892); 'Some Canadian Birds' (1895); 'Maliseet Vocabulary' (1899); 'The Penobscot Indians' (1899).

Chamberlain, Nathan Henry, American clergyman: b. Bourne, Mass., 25 Dec. 1830; d. there 1 April 1901. He graduated at Harvard, 1853, and studied theology at the divinity school there, and at Heidelberg, Germany, eventually becoming a Unitarian minister. He was pastor at Canton, Mass., 1857–9, and at Baltimore, Md., 1860–3. He then took orders in the Episcopal Church, and became rector at Birmingham, Conn., 1864–7; Morrisania, N. Y., 1868–71; Milwaukee, Wis., 1871–3; Somerville, Mass., 1874–9; East Boston, Mass., 1882–9. He then retired to devote himself to literary pursuits. His books are: 'Autobiography of a New England Parish' (1864); 'The Sphinx in Aubrey Parish' (1889); 'What is the Matter with our Tariff and its Taxes' (1890); 'Samuel Sewall and the World He Lived In' (1897), an admirable study of colonial life in New England; 'Life of Sir Charles Napier'; 'An Itinerary of Cape Cod.'

Chamberlain, Thomas Crowder, American geologist: b. Mattoon, Ill., 25 Sept. 1843. He was educated at Beloit College and the University of Michigan; was professor of natural sciences in Whitewater Normal School, Wis., 1869–73; professor of geology at Beloit College 1873–82; president of the University of Wisconsin 1887–92; and has been dean of the scientific faculty of the University of Chicago from 1892. He was assistant State geologist of Wisconsin 1873–6, and State geologist from 1876. He is the author of 'Geology of Wisconsin' and of many important papers printed by the United States Geological Survey.

Chamberlain, a court officer, originally employed, as the name indicates, to take charge either of the private apartments of a prince, or of a treasury, called in the 10th century *camera* (whence the word chamber). The golden key, which is worn by the chamberlains of the European courts on two small golden buttons (as well as the buttons themselves, when the key is omitted), indicates also the origin of the office. At present the employment of chamberlains (when their office is not merely nominal) is to attend on the persons of the princes and their consorts. There is generally a chief or high chamberlain. This officer in England is called Lord Great Chamberlain of England. His office is one of great antiquity and honor, being ranked as the sixth great office of the English crown. He dresses and undresses the king before and after the coronation. There exist also a lord chamberlain of the household, a lord chamberlain of the queen's household, etc.

Chamberlin, Joseph Edgar, American journalist: b. Newbury, Vt., 6 Aug. 1851. Until 1890 he was on the staffs of papers in Newport, R. I., Fall River, Mass., Chicago, and Boston. From 1891 to 1898 he was assistant editor of the 'Youth's Companion,' an essayist and magazine writer. During the Spanish war he was war correspondent of the New York *Evening Post* in Cuba. He has published: 'The Lis-



MR. JOSEPH CHAMBERLAIN.

Mau

tener in the Town'; 'The Listener in the Country.'

Chambers, chām'bėrz, **Charles Julius,** American journalist and novelist: b. Bellefontaine, Ohio, 21 Nov. 1850. In 1870 he traveled through the West Indies, Europe, the United States, and Canada, as special correspondent of the New York *Herald.* In 1876 he published an account of his few weeks of experience (incognito) in an insane institution, entitled, 'A Mad World,' which excited great interest. He has also published several novels: 'On a Margin'; 'Lovers Four and Maidens Five'; 'Chats on Journalism'; 'Missing'; 'The Rascal Club'; 'One Woman's Life.'

Chambers, Edward Thomas Davies, Canadian journalist: b. Saffron Walden, Essex, England, 1852. He removed to Canada in 1870, and after teaching a short time entered journalism, becoming chief editor of the Quebec *Daily Chronicle* in 1897. He has published 'The Port of Quebec' (1890); 'The Haunts of the Ouaniche' (1891); 'Quebec: Ancient and Modern' (1892); 'Quebec, Lake Saint John and the Saguenay' (1893); 'Chambers' Guide to Quebec' (1895); 'The Book of the Ouaniche and its Canadian Environment' (1896).

Chambers, Ephraim, English miscellaneous writer, and compiler of a popular 'Dictionary of Arts and Sciences': b. Kendal, Westmoreland, about 1680; d. 15 May 1740. On leaving school he was apprenticed to a mathematical instrument and globe maker in London. Here he acquired such a taste for the study of science, and made so much proficiency in it, that he not only formed the design of compiling his famous 'Cyclopædia,' but actually wrote some of the articles for it behind his master's counter. The first edition of this work was published in 1728, and Chambers was soon after chosen F.R.S. Two subsequent editions, in 1738 and 1739, appeared previously to his death. A French translation of the 'Cyclopædia' was the basis of the 'Encyclopédie' of Diderot and D'Alembert. A revised and enlarged edition was brought out first by Scott and Hill, and afterward, 1781–6, by Dr. Rees, who latterly built up on it the work known by his own name.

Chambers, George Frederick, English publicist: b. 18 Oct. 1841. He was educated at King's College, London, and has filled various public appointments. Besides editing various legal text-books, guides to Sussex, etc., he is the author of 'Hand-book of Descriptive and Practical Astronomy'; 'Pictorial Astronomy' (1891); 'The Story of the Sun, Stars, Eclipses, Weather' (1896–9), etc.

Chambers, Robert, Scottish prose-writer and publisher: b. Peebles 10 July 1802; d. Saint Andrews 17 March 1871. He and his brother William began in poverty as small booksellers; issued penny leaflets of useful information for the people, written in a clear and simple though not infantile style, which became very popular, and at last took regular periodical form in 'Chambers' Journal,' and the great publishing-house which bears the name of both developed gradually. The 'Chambers' Encyclopædia for the People' was the outgrowth of the 'Journal,' and edited by the brothers. Robert wrote also 'Traditions of Edinburgh'; 'History of the British Empire'; 'Domestic Annals of Scotland'; 'The Book of Days'; 'Cyclopedia of English Literature'; 'Ancient Sea Margins'; etc., but his most noted book was the anonymous 'Vestiges of Creation,' for years an unequaled theologic-scientific sensation.

Chambers, Robert William, American artist and novelist: b. Brooklyn, N. Y., 26 May 1865. He has written: 'In the Quarter' (1893); 'The King in Yellow' (1893); 'The Red Republic' (1894); 'A King and a Few Dukes' (1894); 'The Maker of Moons' (1895); 'Oliver Lock'; 'The Mystery of Choice' (1896); 'Lorraine' (1896); 'Ashes of Empire' (1897); 'The Haunts of Men' (1898); 'The Cambric Mask' 1899); 'Outsiders' (1899); 'The Conspirators' (1900); 'Cardigan' (1901); and 'With the Band,' a volume of ballads.

Chambers, Talbot Wilson, American clergyman: b. Carlisle, Pa., 25 Feb. 1819; d. New York 3 Feb. 1896. He graduated at Rutgers, 1834; studied theology at the Reformed Church Seminary there, and also at Princeton. He was pastor of the Reformed Dutch Church in Somerville, N. J., 1839–49. In 1849 he was installed a pastor of the Collegiate Dutch Church in New York, and remained in association with the Middle Dutch Church congregation until his death. He was a member of the American Bible Revision Committee, and for many years chairman of the committee on versions of the American Bible Society. He wrote: 'The Noon Prayer Meeting in Fulton Street' (1857); 'Memoir of Theodore Frelinghuysen' (1863); 'Exposition of the Book of Zechariah' (1874), in 'Lange's Commentary'; 'The Psalter a Witness to the Divine Origin of the Bible' (1875); 'Companion to the Revised Version of the Old Testament' (1885).

Chambers, Sir **William,** English architect: b. of Scottish parents, Stockholm, Sweden, 1726; d. London 8 March 1796. He was educated at Ripon, in Yorkshire, and while very young went as supercargo to the East Indies, resided for some time in China, and brought back many drawings of Chinese buildings and costume, which were afterward published. He then devoted himself to the study of architecture, and on returning from travels in France and Italy was appointed drawing master to the Prince of Wales, afterward George III. He laid out the royal gardens at Kew in the Chinese style, and built the villa of the Earl of Besborough at Roehampton, in the Italian style, a mansion for Lord Abercorn, near Edinburgh, and houses for Lord Melbourne and the Earl of Gower, at Whitehall and in Piccadilly. His masterpiece was Somerset house in London, which he rebuilt in 1775. He published in 1759–68, a 'Treatise on Civil Architecture,' several times reprinted; in 1772, a 'Dissertation on Oriental Gardening.'

Chambers, William, Scottish publisher and miscellaneous writer: b. Peebles 16 April 1800; d. Edinburgh 20 May 1883. He was a brother of Robert Chambers (q.v.). He published 'Things as They Are in America' (1853), 'American Slavery and Color' (1857); 'France: Its History and Revolutions' (1871); 'Stories of Old Families,' etc. In 1859 he bestowed on his birthplace the commodious suite of buildings known as the Chambers Institute, comprising a library, reading-room, lecture-room, art-gallery, and museum. Of his native county he published

a history in 1864. In 1865 he was elected Lord Provost of Edinburgh, in which capacity he organized and carried out many extensive and useful measures of sanitary improvement. Between 1871 and 1883 he spent upward of $100,000 on the restoration of St. Giles' Cathedral, Edinburgh.

Chambers of Commerce, associations formed by tradesmen and merchants for the purpose of protecting and furthering the commercial interests of the community to which the chamber belongs. Among the various methods employed to promote the ends of such associations are the following: The influence of legislative action for the benefit of commerce, the collection of trade statistics, the gaining of economical or other advantages, by combination, the settlement by arbitration of mercantile disagreements. The oldest body of the nature of a chamber of commerce was started in Marseilles at the close of the 17th century. The value of such bodies became apparent and they sprang up rapidly throughout the civilized world. In mediæval Venice and in the Hanse towns they do not seem to have existed in the sense in which they are understood to-day. The first institution of the kind in the United States, the New York Chamber of Commerce, was organized in 1768 and incorporated by royal charter from King George III. in 1770. There are similar bodies in every city and town of consequence in the United States. The oldest Chamber of Commerce in Great Britain, that of Glasgow, dates from 1783. Edinburgh followed two years later, and for long held a leading position, but the most important British chamber of commerce at the present time is that of London, founded so lately as 1881. It has instituted a series of examinations in commercial subjects, and lectures are delivered under its auspices. Junior and senior commercial certificates are granted after examination to those who display the amount of knowledge required. In 1860 there was formed an Association of Chambers of Commerce of the United Kingdom, which holds annual meetings in London. It includes nearly 100 chambers.

The extension of the functions of chambers of commerce in the United States has been considerable in the decade between 1890 and 1900. The movement had its origin in Germany and grew out of the organized efforts of the last 20 years to foster the world commerce of the empire. The chambers of commerce in leading cities like Berlin and Hamburg undertook the commercial training of young men, with a view to their future advancement in mercantile life and the consular service. The result was the securing of a higher order of talent in such pursuits. The hint thus thrown out was promptly taken up in the United States. The New York Chamber of Commerce, in 1899, voted a fund for the endowment of a lecture course on commerce at Columbia University; in Chicago a chair of commerce was established by that city's chamber at the University of Chicago, and in August 1900 a School of Commerce, Accounts, and Finance was established by the University of New York. Students were assured in the event of a satisfactory course of study, that they would be given posts in leading commercial establishments or appointed to consular offices so far as influence could attain that result. The movement is destined to mark a new era in the influence of chambers of commerce.

Cham'bersburg, Pa., a borough and county-seat of Franklin County, on the Conecocheague and Falling Creeks and the Cumberland Valley and W. and the Philadelphia & R. R.R.'s, 49 miles west-southwest of Harrisburg. In Early's raid in the Civil War Gen. McCausland entered Chambersburg with Confederate cavalry, 30 July 1864, and demanded a tribute of $100,000 gold; this not being paid the place was set on fire and two thirds of it burned, causing a loss of $1,000,000. It was soon rebuilt, chiefly of brick or stone, and is now the seat of Wilson College for women, and has an academy, several churches and newspapers, public schools, manufactories, machine shops, two national banks, and an assessed property valuation of $3,000,000. In the environs blue limestone, freestone, and marble abound. Pop. (1900) 8,864.

Chambertin, shäṅ'-bėr-tăṅ, a superior red Burgundy wine, named after the place where it is produced, in the department of Côte d'Or.

Chambéry, shäṅ-bā-rē, France, capital city of the department of Savoy, at the junction of two small rivers, near the Isère, between two mountains on the border of a fertile plain. It is an archbishop's see, and contains a cathedral, six hospitals, a castle, now the prefecture, the palace of justice, barracks, a covered market, a college, a museum, and a public library with 25,000 volumes. The old ramparts have been converted into public walks. In its vicinity are excellent baths, much frequented in summer. Its suburbs are large with many fine villas. It has considerable manufactures and distilleries; trade in grain, silk, cattle, etc. Chambéry was founded about the 10th century. It was under feudal lords till 1230, when it was ceded to Thomas, first Count of Savoy, who built the castle, where the princes of the house of Savoy resided till the government was removed to Turin. The town was surrendered to the French in 1792, and became the capital of the department of Mont Blanc. It was restored in 1815, and ceded to France again in 1860. Pop. (1900) 22,000.

Chambezi, chăm-bē'zĭ, a river of Africa, rising in the highlands south of Lake Tanganyika, about lat. 9° 40′ S., and lon. 33° 15′ E. Its tributaries are large, and form a considerable stream, which flows southwest to Lake Bangweolo.

Chambly, shäṅ-blē, **Fort,** a fort situated near the rapids of the Richelieu or Chambly, at the outlet of Lake Champlain, during the time of the Revolutionary War. It was captured by the Colonists under Col. Bedel in 1775, and the colors of the Seventh Regiment of British regulars was sent to the Continental Congress as trophies of the victory.

Chambly River, a river of Canada, the same as the Richelieu (q.v.) or St. John.

Chambord, shäṅ-bôr, **Henri Charles Ferdinand Marie Dieudonné,** dē-ė-dŏn-nā, COMTE DE, Duke of Bordeaux, French noble: b. Paris 29 Sept. 1820; d. Frohsdorf, Austria, 24 Aug. 1883. He was the last representative of the elder branch of the French Bourbon dynasty, and was called by his partisans Henry V. of France. He was born after the assassination of

CHAMELEON.

his father, Prince Charles Ferdinand d'Artois, Duc de Berry. Charles X., after the revolutionary outbreak of 1830, abdicated in his favor; but the young count was compelled to leave the country with the royal title unrecognized by the nation. He lived successively in Scotland, Austria, Italy, and London, keeping a sort of court, and occasionally issuing manifestos. In 1846 he married the Princess Maria Theresa, eldest daughter of the Duke of Modena; and in 1851 inherited the domain of Frohsdorf, near Vienna, where for the most part he subsequently resided. While abstaining from violent attempts to seize the crown, he let slip no opportunity of urging his claims, especially after Sedan; but his belief in divine right, and his failure to recognize accomplished facts and modern tendencies, destroyed all chance of his succession.

Chambord, France, a castle, park, and village, near Blois, department of Loir-et-Cher. The splendid castle stands in the middle of a park, enclosed by walls extending eight leagues. It contains 440 rooms, 13 large staircases, and stalls for the reception of 1,200 horses. It was built in the Gothic style, by Primatice, for Francis I., and completed under Louis XIV. Here Francis I. indulged his inclination for gallantry; here the arts first sprang to life in France; and here King Stanislaus Leczinsky resided for nine years. In 1745 it was given by Louis XV. to Marshal Saxe, who died there in 1750. The Emperor Napoleon I. gave the domain of Chambord to Marshal Berthier, and in 1821 a company of Legitimists bought it and gave it to the Duke of Bordeaux, son of the Duke de Berry and grandson of Charles X.

Chambray, Georges, zhŏrzh shäṅ-brā, MARQUIS DE, French general: b. Paris 1783; d. 1848. He served in the Napoleonic wars, fell into the power of the Russians, was banished to the Ukraine, and not permitted to return to France until after the fall of Napoleon. From 1823 to 1829, he filled high military positions at Vincennes and Perpignan. He wrote various works on military subjects. A second edition of his 'Philosophie de la guerre' appeared in 1835, and a 'Life of Vauban,' written by him, appeared in the 'Plutarque Français.' His most important production is his 'Histoire de l'expédition de Russie,' which appeared in 1837, and has since passed through several editions.

Chambre Ardente, shäṅbr är-däṅt ("fiery chamber"), an apartment hung with black and lighted with tapers, in which the corpse of a person of distinction is deposited before the funeral ceremonies. The name was formerly given in France to an apartment, similarly draped and lighted, in which sentence of death, frequently by burning, was pronounced on heinous offenders. In a historical sense the term is more especially given to those extraordinary tribunals which, from the time of Francis I., directed the persecutions against heretics, and acted as a sort of inquisition. The members of the tribunal were named by the Pope. They ferretted out heretics, directed the proceedings against them, pronounced sentence, and also saw it carried into execution. A chambre ardente was established by Louis XIV. to put a stop to the numerous cases of poisoning which, after the proceedings against the Marchioness of Brinvilliers, were brought before the public. Many persons of the highest rank, among others the Marshal of Luxemburg and Princess Louise of Savoy, were brought before this court, which, however, existed only for two years, and ceased in 1680. The last exercise of its powers was the condemnation of the celebrated sorceress, Voisin.

Chambre des Comptes, dā kŏnt, a great court established in France prior to the Revolution, for various purposes; as for the registration of edicts, ordinances, letters patent, treaties of peace, etc. The sovereign Chambre des Comptes was held at Paris; there were also inferior courts in 10 provincial cities.

Chambre Introuvable, äṅ-troo-vä-bl ("the chamber the like of which is not to be found again"), the term applied to the French Chamber of Deputies which met after the second return of Louis XVIII., and which by its fanatic loyalty threatened to again plunge France into anarchy and commotion.

Chameck, chä-mĕk', a species of spider-monkey. See COATA; SPIDER-MONKEY.

Chameleon, ka-mēl'yŭn or ka-mē'lē-ŏn, lizard belonging to the family *Chamæleontidæ.* The chameleons are generally considered as constituting a sub-order or equivalent primary division of the *Lacertilia* (q.v.). All parts of their anatomy present striking peculiarities. The parietal and equamosal bones are greatly produced and meet at a common apex, thus forming a bony tripod which supports the integument of a conspicuous crest or casque on the posterior part of the head. In many species the strangeness of the physiognomy is enhanced by warts, serrated crests, and prominent spines. Trifid teeth are situated on the ridge (acrodont) of the maxillary and dentary bones, but the premaxillary is toothless. The eyelids are almost completely united, leaving only a minute circular orifice through which the animal sees, and which moves with the eyeball in its almost constant rovings. More remarkable still is the well-known fact that the two eyeballs move quite independently; one may be directed at an object behind while the other views one in front. The tongue is club-shaped at the free end and slips into a sheath at the base, from which it can be projected by a complex mechanism to a distance of more than half the total length of the animal, and returns, like a bit of rubber, with great rapidity to its former position. Quite unique among lizards is the prehensile tail, which rolls downward in a flat spiral and is utilized for clinging to twigs. Serving the same purpose in the arboreal life of the animal are the almost equally peculiar feet, which have five toes arranged in two opposed sets on both fore and hind feet, but in the former the first, second, and third toes form the inner and the fourth and fifth the outer group; while on the hind feet the first and second are internal, the remaining three in the opposed outer group. Among internal peculiarities may be mentioned the lungs, which are produced into a series of long tubular diverticula, which extend to all parts of the trunk, and by means of which the chameleon is enabled to swell up its body in the fashion of a toad when angry or threatened. But the chameleon is most famous for an attribute which is by no means confined to it, but is common to many lizards and other animals. The well-known facility with which

it changes its colors is referred to. This is accomplished at the will of the animal, or results from the direct influence of external stimuli, by a relatively simple mechanism. The outer portion of the skin or epidermis is transparent; beneath this is a layer of cells filled with granules and oil-drops which appear white or yellow; among and beneath these again are large irregular chromatophores or cells filled with black and red pigment granules. These chromatophores are under the control of the nervous system, and have the power, when appropriately stimulated, of sending out long branching processes filled with pigment into the spaces between and external to the light-colored cells. When this occurs the latter cells are concealed by a pigment curtain and the animal appears dark-colored; when, on the other hand, the chromatophore processes are withdrawn, and the pigment is concentrated in the deeper layers of the skin, the animal appears pale. The rapid play of colors is due to the interchange of these two conditions in varying degrees.

Upward of 50 species of chameleons are known, belonging to the typical genus *Chamæleon*, and a few others. With the exception of a few species which inhabit Arabia and India, and one whose range extends across the Mediterranean into southern Spain, all are confined to Africa, and a very large number of the strangest forms to the island of Madagascar. The common chameleon (*C. vulgaris*) is the one which inhabits the shores of the Mediterranean, and, through being so well known to Europeans, has made the peculiarities of these lizards almost proverbial.

In the United States the name chameleon is commonly applied to a lizard (*Anolis principalis*) and its allies, belonging to a quite different group. The American chameleon belongs to a genus and family *Iguanidæ* (q.v.) of numerous species which swarm in tropical America and the West Indies. It is probable that it has been popularly classed with its African namesake because of the equal facility with which changes of color are effected. It may be bright green, yellowish-gray, rich brown, or almost black, and the male is peculiar in having beneath the throat a pouch of elastic skin which can be inflated by means of a pair of delicate bony rods belonging to the skeleton of the tongue, when it appears of a flaming orange or vermilion color. They are dainty, smooth-bodied little animals, and are chiefly arboreal, jumping from twig to twig in pursuit of insects with an activity that contrasts strongly with the sluggishness of the European chameleon, which depends upon its projectile tongue to secure its game. *Anolis principalis* is the only member of the genus which enters the United States, and is quite common in Florida and other southern States, from which numbers were shipped to the north a few years ago to supply the requirements of a silly fashion in vogue at that time of wearing the pretty lizards secured to the dress by a tiny golden chain about its neck. Owing to the ignorance of the wearers, many of the chameleons quickly succumbed to thirst, as they, in common with most lizards, require a constant supply of water.

Chameleon, a southern constellation containing nine stars, lying within the Antarctic polar circle.

Chameleon Mineral, manganate of potassium, so called because a solution of it changes from green, through a succession of colors, to a rich purple.

Chamfort, shän-fôr, **Sébastien-Roch Nicolas,** French revolutionist: b. near Clermont in Auvergne 1741; d. 1794. He made his début as a litterateur under the name of Chamfort, and obtained some success as a dramatist and as a critic, which procured him a place in the French Academy, a pension, and a place at court. An independent and somewhat misanthropic spirit made him, however, in spite of his interest, favor the Revolution, of which he became the epigrammatist. He resigned his employment at court, and took the literary editorship of the 'Mercury.' He furnished Sièyes with the idea and the title of his famous pamphlet 'Qu'est-ce que le Tiers-É at?' and forged such popular watch-words as: Guerre aux châteaux, paix aux chaumières ("War to the castles, peace to the cottages"). He was employed by Roland in the 'National Library,' and published the first 26 'Tableaux Historiques de la Révolution.' Threatened with imprisonment, he endeavored to blow out his brains. Though not immediately fatal, the wounds he inflicted on himself ultimately put a period to his life. His poetry has now little reputation. His best work, 'Mustapha and Zeangir,' at which he labored for 15 years, exhibits him as a feeble follower of Racine and Voltaire. It is praised for purity of style and mildness of sentiment; but, as a French critic pungently observes, he reserved all his mildness for his tragedies. A collection of 1,800 *bon mots,* under the title 'Chamfortiana,' is now considered the best memorial of him. In this he appears as a man to make himself feared rather than loved.

Chamier, shä-mēr', **Frederick,** English novelist: b. London 1796; d. 1870. He entered the navy at an early age, took part in the last campaigns against the French, and distinguished himself in the American war of 1812. He retired in 1833 with the rank of captain, and living at Waltham Hill, acted as a justice of the peace for the counties of Hertford and Essex. He imitated Captain Marryat in making his experience of a sea life the basis of a series of romantic tales, but did not equal him in humor and imagination. He has, however, been credited with great fidelity to nature. His principal works are: 'The Life of a Sailor' (1834); 'Ben Brace' (1835); 'The Arethusa' (1836); 'Jack Adams' (1838); 'Tom Bowline' (1839). He also published a review of the scenes witnessed by him in the revolution of 1848.

Chaminade, shä-mē-näd, **Cecile Louise Stephanie,** French musician: b. Paris 8 Aug. 1861. She studied at Paris under Le Couppey, Savard, Marsick, and Benjamin Godard; soon acquired a high reputation as a pianist, and played at concerts in Paris, Berlin, Vienna, London, Constantinople, and other cities. Her compositions, which are widely known, include 'Callirhoë,' a ballet symphony performed with great success at Marseilles (1888), Lyons (1889), and Bordeaux (1901); 'Les Amazones'; 'Ménétriers'; and a number of songs, among which are 'Madrigal'; 'Chanson Slave';

'Ritournelle'; 'Fleur de Matin'; and 'Sans Amour.'

Chamisso, shä-mēs'sō, **Adelbert de** (properly Louis Charles Adelaide de Chamisso de Boncourt), German writer: b. at the castle of Boncourt, Champagne, 27 Jan. 1781; d. Berlin 21 Aug. 1838. When a boy his family were driven by the breaking out of the Revolution to seek an asylum in Berlin. On the Peace of Tilsit he returned with his family to France, and in 1810 was appointed professor in the Lyceum of Napoleonsville; but shortly after returned to Prussia, and during three years devoted himself enthusiastically to the study of natural science at Berlin. Count Romanzoff having in 1815 fitted out a vessel, under the command of Otto von Kotzebue, for the discovery of the northwest passage, Chamisso accepted the appointment of naturalist to the expedition, and added greatly to his store of scientific knowledge. He afterward took up his residence at Berlin, was appointed superintendent of the botanic garden, and received the diploma of doctor from the university for the collections in natural history which he had presented to the museum. His abilities as a naturalist are displayed in his work 'De Animalibus quibusdam e Classe Vermium Linnæi' (1819); and his 'View of the Most Useful and the Most Noxious Plants of North Germany, with Remarks on Scientific Botany.' In 1827, partly for the purpose of rebutting the charges brought against him by Kotzebue, he published 'Views and Remarks on a Voyage of Discovery,' and 'Description of a Voyage Round the World.' Both works display great accuracy and industry. His last scientific labor was a tract on the 'Language of Owyhee.' His reputation as a naturalist has been somewhat eclipsed by that which he acquired as a poet. As early as 1804–6 he, in concert with Varnhagen von Ense, published a collection of poems, under the name of the 'Muses' Almanac'; and in 1813 appeared his celebrated and most original tale, 'Peter Schlemihl,' which has been translated, among other languages, into English, and admirably illustrated by Cruikshank. His poetry is marked by vigor, correctness, and a thorough command of the German language; but is in general of a gloomy and terrific cast. He is the author, however, of several humorous pieces; and his political poems are distinguished by caustic, yet wholesome raillery. Many of his ballads and songs are masterpieces of their kind. See Hitzig, 'Leben und Briefe von A von Chamisso' (1839); Fulda, 'Chamisso und seine Zeit' (1881); Raymond, 'A von Chamisso als Naturforscher' (1889).

Chamois, shăm-wä or shăm'ĭ, a horned animal (*Rupicapra tragus*) classed among the goat-antelopes, and native to the mountains of middle and southern Europe from the Pyrenees to the Caucasus and Georgian Mountains, and as far east as Persia. The chamois found in the Pyrenees and in the Caucasus differ in local peculiarities from the Tyrolese, which is the race-type. This is about the size of a goat; but its neck is somewhat longer in proportion than that of the goat and is more graceful. The general color is brown; the head pale, almost yellow, with a dark marking on each cheek; the nails black. The short black horns rise straight from the forehead, and are recurved at the tip. The chamois may be found in summer, in the highest Alpine altitudes, close to, and indeed beyond, the snow-line. In winter it seeks the forests, where it is somewhat protected. These forests furnish also a covert for the females and fawns, and supply the aromatic herbs on which the chamois feed, sometimes in considerable herds, though in the Alps, where they have been much hunted, the herds are small. The breeding season is in May and June.

The chamois is famous for its agility. It crosses easily, and without hesitation, chasms 15 feet or more in width; leaps rock walls a dozen feet high as easily as a boy vaults a low fence, and roams through mountain passes which other quadrupeds would shun,— dashing, with sudden leap, down almost perpendicular walls, and alighting on incredibly narrow ledges, with its fore feet so close to its hind feet as almost to touch. The creature is timid; and when feeding in flocks, one is always on the watch to announce danger by a peculiar whistling noise.

Chamois-hunting as a sport is almost impossible in the Alps, as the numbers have been so reduced by continuous hunting that the remaining ones are protected by law — only a few being annually at the disposal of the hunter; but, in the Carpathians and eastward the sport is not restricted; and he who possesses the mountaineering and sportsman-like qualities necessary may there stalk his game alone, or with a native guide, through dangerous mountain defiles.

Chamois leather is valuable commercially for its softness and warmth (see Leather), and the flesh is esteemed a table delicacy. The horns are used for ornamental purposes, especially in making souvenirs of Alpine tourist resorts.

Cham'omile. See Camomile.

Chamond, St. See St. Chamond.

Chamore'ril, a lake with apparently no outlet, in Middle Tibet, on a plateau 15,000 feet above the sea, between the upper waters of the Sutlej and the Indus. It is surrounded by mountains some 5,000 feet in height, from which it receives much water. Its length of 15 miles and width of 2½ are pretty constant. On account of its great depth it freezes only in winter.

Chamouni, shä-moo-nē, or **Chamonix,** shä-mō-nē, a celebrated valley of France, in the department of Haute-Savoy, district Faucigny, in the Pennine Alps, fully 3,000 feet above sea-level. It is about 12 miles long, and only about half a mile wide; lies southwest to northeast, its east side formed by Mont Blanc and other lofty mountains of the same range, and its west side by Mont Brévent and the Aiguilles Rouges. It is traversed in its whole extent by the Arve, which leaves the valley by a narrow gorge at the southwest end, through which also passes, high above the river, the highway to Sallanches and Geneva. At its north end the valley communicates with Canton Valais by two roads and a bridle-path, the latter crossing the Col de Balme; and it may also be left by other passes, as the Col du Géant, but they are difficult and dangerous, and only suited for practised and daring pedestrians. The mountains on the west side of the valley, though attaining a height of 8,500 feet above sea-level, are not covered with snow in summer; but those on the east side, in the

range of Mont Blanc, being from 10,000 to upward of 15,000 feet high, are always snow-clad, excepting where the peaks are too perpendicular for snow to lie. From the snowy range proceed the glaciers, some of which approach close to the cultivated fields. They are very numerous, and of different sizes; but the two most important are the Glacier des Bossons and the Mer de Glace, the latter one of the largest glaciers in the Alps. From its lower extremity, called the Glacier des Bois, the meltings of the glacier flow off, in greater or less volume according to the season of the year, from under a naturally formed ice-arch, the source of the Arveyron, the name given to the stream thus formed, which is an affluent of the Arve. The lower slopes of the mountains are covered with timber, through which is frequently to be seen the devastating course taken by the avalanche. The soil is not fertile, but it is assiduously cultivated; and the inhabitants, who are gathered together in numerous vilages, of which Chamouni or Le Prieuré is the chief, raise barley, oats, spelt, flax, potatoes, etc., raise cattle, and keep bees. During the winter, yarns, cloths, hats, and implements are made, and many articles of wood are carved. All the valley is famous for its scenery, which was first brought to public notice by Windham and Pococke, two Englishmen who visited it in 1741. It presents various points from which the whole mass of Mont Blanc may be seen at one view. The village of Chamouni, 39 miles east-southeast of Geneva, originated in a Benedictine priory founded about 1090. It has several hotels, and is supported mainly by visitors to the scenery of the valley. The ascent of Mont Blanc is most commonly made from this village. There is a monument to De Saussure, who did much to bring the valley before the notice of travelers. Pop. 2,435.

Champ clos shăn klō (Fr. «a closed-in field or area»), formerly a place set apart for duels between those who wished to determine, in that manner, either a lawsuit or dispute of honor. This name was also given to the place set apart for tournaments.

Champ-de-Mars, shăn-dė-mārs, and **Champ-de-Mai,** dė mā, the annual public assembly of the Franks. They were held originally in March and called from the place of meeting Champs-de-Mars; in the 8th century they were transferred by Pepin, the father of Charlemagne, to the month of May, and called the Champs-de-Mai. At the Champs-de-Mai, all questions relating to public affairs, such as war, peace, the enactment of laws, were decided by the majority. These assemblies were held irregularly under the Merovingians, but became more frequent and systematic under the first Carlovingians. Pepin called together only the nobility and the clergy; but Charlemagne ordered that every count should bring with him 13 men from his jurisdiction, to represent the people in the General Assembly. The first descendants of Capet departed from this usage; but Philip IV., who reigned from 1285 to 1314, restored the third estate by calling together delegates from the cities.

The modern Champ-de-Mars in Paris is an extensive area, on the left bank of the Seine, which originally formed a place of exercise for the young men in the military school, and subsequently has been the scene of various public festivals and great gatherings of people. Louis XVI. and his family took part here, in 1790, in the great Fête de la Fédération, in which the king swore to defend the new constitution; in June 1794, it was the scene of the Fête de L'Être Suprême. In 1815 Napoleon selected the Champ-de-Mars for the scene of a general assembly of the French people, at which he placed before the representatives of the nation the articles of a supplementary constitution, called the *Acte additionnel,* intended to establish the legality of his throne. It has also been the site of international expositions of 1867, 1878, 1889, and 1900. See PARIS.

Champac. See CHAMPAK.

Champaigne, Philippe de, Flemish painter: b. Brussels 26 May 1602; d. Paris 12 Aug. 1674. He went to Paris at the age of 19, and worked on the decorations of the Luxembourg under Duchesne; he was later appointed court painter by Marie de Medicis. He was also a member and finally rector of the Academy of Painting and Sculpture. His coloring is excellent and his portraits possess great merit. His best pictures are at Vincennes and at Paris; among them are a portrait of himself, a portrait of Richelieu, 'The Apostle Philip,' and 'The Last Supper,' all in the Louvre.

Champagne, France, an ancient province which before the Revolution formed one of the 12 great military governments of the kingdom. The name Champagne, formerly Champaigne, is derived from the vast plains (Lat. *campus,* «a plain») which occupy the territory. Champagne was bounded on the north by Hainaut and the bishopric of Liége; on the east by the duchy of Luxembourg and Lorraine; on the south by Franche-Comté and Burgundy; and on the west by L'Orléanais, L'Isle de France, and Picardie. It forms at present the departments of the Marne, Haute Marne, Aube, Ardennes, and part of those of the Yonne, the Aisne, Seine-et-Marne, and Meuse. The land is fertile, and produces the celebrated wine called after its name. In the Middle Ages it was a countship of which Troyes was the capital, and was incorporated with France in 1361.

Champagne, shăm-pān'; (Fr. shŏn-pä-ṅyĕ), a French wine made chiefly in the department of the Marne, in the former province of Champagne. It is commonly divided into river and mountain wines (*vins de la rivière de Marne,* and *vins de la montagne de Rheims*), the former being for the most part white, the latter red. Not all of these wines are sparkling or frothing, though by the name «champagne» is generally understood such wine as has been subjected to an imperfect fermentation, and contains a quantity of carbonic acid gas, generated during the insensible fermentation in the bottle, this gas being disengaged on removing the pressure by which it was detained in solution. The briskest wines are not always the best; they are, of course, the most defective in true vinous quality, and the small portion of alcohol which they contain immediately escapes from the froth as it rises on the surface, carrying with it the aroma, and leaving the liquor that remains in the glass nearly vapid. Hence the still or the creaming or slightly sparkling Champagne wines (*vins crémants* or *demi-mousseux*) are more highly valued by connoisseurs and bring greater

prices than the full-frothing wines (*vins grand-mousseux*). By icing these wines before they are used the tendency to effervesce is in some degree repressed; but when they are kept cool this prcaution is unnecessary. In general, it may be observed that the vineyards on the banks of the Marne supply the choicest wines, and that the quality degenerates in proportion as they recede from the river. Among the white wines of Champagne the first rank is generally assigned to those of Sillery, the produce of the vineyards of Verzenay, Mailli, Raumont, etc. Of the Rheims Mountain wines those of Verzi, Verzenay, Mailli, Bouzy, and St. Basle are most esteemed; but the Clos St. Thierry furnishes perhaps the finest red champagne. The soil of the principal vineyards throughout Champagne is composed of a loose marl resting on chalk and sometimes mixed with flints. For the manufacture of the white Champagne wines black grapes are now generally used. In making the red wines the grapes are trodden before they are introduced into the vat. Champagne, when well made, and placed in cool cellars, will retain its good qualities from 10 to 20 years.

Champagny, shäṅ-pän-yē, **Jean Baptiste Nompere** (nŏṅ-pār) **de,** (DUKE OF CADORE), French naval officer, diplomatist and politician: b. Roanne 4 Aug. 1756; d. Paris 3 July 1834. He entered the navy in 1780, and was a member of the States-General, National, and Constituent Assemblies. Thrown into prison in 1793, he was released after the 9th Thermidor (1794), and became councilor of state. He was employed by Napoleon as ambassador to Vienna, and as minister of the interior and of foreign affairs, and he negotiated the marriage with Marie Louise. After Napoleon's downfall he transferred his allegiance to the Bourbons, under whom he became a peer.

Champaign, shăm-pān', Ill., a city in Champaign County, on the Illinois Cent., the Cleveland, C., C. & St. L., and other R.R.'s, 48 miles southeast of Bloomington. It is the trade centre of the richest agricultural county in the State, and has also a number of manufacturing interests. It is the seat of the University of Illinois, and of the Burnham Athenæum and Hospital. Pop. (1900) 9,098.

Cham'pak, chŭm'păk, an East Indian tree (*Michelia champaca*), of the natural order *Magnoliaceæ*. It has large axillary flowers of a deep yellow color, and very fragrant, which are much celebrated in Hindu poetry. The tree is sacred to Krishna, and the women of India adorn their hair with its blossoms. The bark has tonic properties.

Champaran, chŭm-pä-rŭn', India, a district in the province of Behar, in the northwestern part of Bengal, south of Nepal, and east of Oudh; area, 3,531 square miles. The surface is mostly a fertile plain which produces rice, grains, sugar, opium, indigo, etc. Gold is washed down by the rivers from the mountains of Nepal. The climate is very unhealthful. Pop. 1,500,000.

Champe, chămp, **John,** American soldier: b. Loudon County, Va., 1752; d. Kentucky about 1790. He was selected by request of Washington to go to New York as a deserter and spy, and if possible to seize and bring off Arnold in time to save the life of André. Champe undertook the enterprise with courage, passed the American lines with difficulty, was hotly pursued by his comrades as a deserter, reached New York, underwent an examination before Sir Henry Clinton, and by him was consigned to Gen. Arnold, who gave him in the British army his former rank. He discovered the custom of Arnold to walk in his garden at a late hour every night, formed a plan with a comrade to seize and gag him there, and to take him between them as a drunken companion to a boat on the Hudson, whence arrangements were made for his transportation to the American headquarters. On the appointed night Arnold failed to appear in the garden, and Champe, after waiting for him till near morning, returned with deep chagrin to his position in the British army. It proved that Arnold had the day before changed his quarters, preparatory to the embarkation of his troops for Virginia. There was nothing left for Champe but to embrace the first opportunity to escape to the American army, which he did soon after landing in Virginia, and joined the troops under Gen. Greene. Washington discharged him from further service, lest, falling into the hands of the enemy, he should be immediately put to death upon a gibbet. When subsequently Washington sought for him to reward him for his faithful and dangerous service, he learned of his recent death.

Champeaux, Guillaume de, gē-yōm dė shäṅ-pō, French philosopher: b. Champeaux in Brie, about 1050; d. 1121. He was so called from the place of his birth. He studied at Paris under Anselme, De Laon, and Manégolde, and afterward himself opened a school there, in which he had numerous pupils. The schools opened by De Laon and Champeaux are regarded by Pasquier as the origin of the University of Paris. Among the pupils of Champeaux were Robert de Bethune, one of the most distinguished prelates of the age, and still more famous Abelard. He defended the doctrine of realism against the nominalism of Abelard; but it is only in the works of Abelard that any record of their contention remains. Champeaux has left a treatise on the origin of the soul, 'De Origine Animæ,' in which he examines the question how children dying without baptism are justly damned, which he concludes by referring to the unfathomable judgments of God. The only other work of his which has been printed is 'Moralia Abbreviata.' He founded in 1113 the abbey of St. Victor.

Cham'perty, or **Cham'party** (Lat. *campi partitio,* "a division of lands"), in law, a bargain with the plaintiff or defendant in any suit to have part of the land, debt, or other thing sued for, if the party that undertakes the suit prevails therein, the champertor carrying on the party's suit at his own expense. It is a species of maintenance, and is generally held to be illegal both in courts of common law and equity; but in some of the States of this country such agreements are recognized by law, and the tendency is toward freedom of action in these as well as other contracts. See MAINTENANCE.

Champfleury, shäṅ-flė-rē, pseudonym of JULES FLEURY-HUSSON, French novelist and miscellaneous writer: b. Laon 10 Sept. 1821; d. Sèvres 5 Dec. 1889. His story of 'Les Chien-Caillous' was in Victor Hugo's opinion a masterpiece of realistic description. He wrote an

autobiographical novel of his youthful years in 'The Confessions of Sylvius' (1849), continuing the story in 'The Adventures of Mariette' (1856). But his 'Burghers of Molinchart' (1855), a satiric delineation of the provincial bourgeoisie, made him famous. He is a pronounced "realist." Among his later novels 'The Tourangeau Girls' (1864), and 'The Little Rose,' are most worthy of mention. He compiled a 'General History of Caricature' (5 vols. 1865–85), with a supplementary volume, 'Secret Museum of Caricature' (1888); and several other works on the arts of design and ceramics.

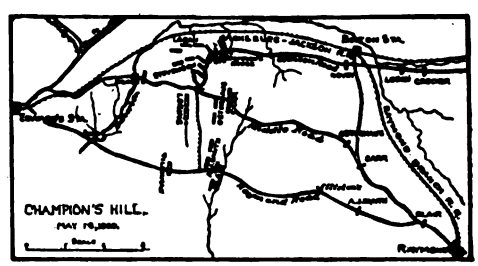
Champier, shäṅ-pē-ā, **Symphorien,** French historian: b. St. Symphorien-le-Loise, Lyonnais; d. Lyons about 1540. Famed as a physician, with powerful friends at court and an ample fortune, he took delight in literature and the society of literary men, himself writing a series of poems for 'Virtuous Ladies' (1503), in four divisions, entitled 'The Flower of Dames,' 'The Rule of Love,' 'The Prophecies of the Sibyls,' and 'The Book of True Love,' respectively. His best history is an account of 'Princes and Battles' (1502).

Champignon, shäṅ-pē-ñoṅ, the French name for the common mushroom (*Agaricus campestris*). See AGARIC.

Cham'pion, chăm'pĭ-ŏn, one who undertakes to defend, in combat or by argument, another person, a doctrine, or a cause. In the rudest state of society men avenge their own wrongs without restraint. The first step commonly made toward a better state of things in the rude beginnings of political society is to confine this right within certain bounds, and allow it to be exercised only with certain formalities. This was done by the feudal institutions of Europe, which recognized in many circumstances, under the toleration of the Church itself, the right of private combat. In some countries, however, particularly in England, the legal recognition of the right of combat had this injurious effect, that the practice became so settled as to be allowed to continue even after more rational ideas had grown up on the subject of the administration of justice. The combat, after it had become a common means of settling disputes, was not always waged by the contending parties. This was the case, indeed, in appeals of felony, and if the heir, either from sex or age, was incapable of "waging his battle," as it was called, the question was left to a more rational mode of settlement. But in the writ of right, the last and most solemn decision respecting real property, the tenant was required to produce his champion, who threw down his glove as a challenge to the champion of the demandant, and the latter, by taking it up, accepted the challenge. The laws authorizing judicial combat, though fallen into disuse, continued to disgrace the English statute-book till 1819. Even the right to the English crown was in some degree put in issue by appeal to judicial combat; and the appearance of a champion offering battle to any one who gainsays the right of the king to the crown was till recently a part of the ceremonial of an English coronation. This office was for four centuries hereditary in the family of Dymoke, of Lincolnshire. The champion's function was to ride into Westminster Hall in full knightly armor, throw down his gauntlet, and proclaim his readiness to defend the title of the sovereign to the crown against any one disputing it. The last exercise of the office was at the coronation of George IV.

The term "champion" is also used in the realm of athletics to designate one who is pre-eminent in a certain branch. More especially is it applied to the foremost boxer, wrestler, or billiard-player, or in the case of the first two sports, to the leader in his class as distinguished by weights, etc. See BOXING. Those pre-eminent in track athletics are usually said to "hold the record."

Champion's Hill, Battle of. On 30 April 1864, Gen. Grant crossed to the east side of the Mississippi River at Bruinsburg, 32 miles in a direct line below Vicksburg. On 1 May he marched to Port Gibson, defeating a Confederate force under Gen. J. S. Bowen. This turned the position at Grand Gulf, and on the 3d Grant reached Hankinson's Ferry; then, after bringing up supplies, marched northeast to interpose between the Confederates, under Gen. J. C. Pemberton, in and near Vicksburg, and those at Jackson, the capital of Mississippi, 40 miles east of Vicksburg. The battle of Raymond was fought and won on the 12th, and on the 14th Gen. Joseph E. Johnston was attacked, defeated, and driven north from Jackson, Grant occupy-



ing the place. Learning from an intercepted dispatch, one of three sent by Johnston to Pemberton, on the 13th, that Pemberton had been advised to march with all his available force on Clinton, 10 miles west of Jackson, and attack Grant's rear, while Johnston operated on his front or flank, Grant, leaving Sherman with two divisions at Jackson to destroy all public property and manufacturing establishments, turned the rest of his army from Clinton, Raymond, and Auburn, on Bolton and Edwards' Station, on the Vicksburg & Jackson R.R., the nearest points where Johnston could unite forces with Pemberton, and at night of the 15th the various divisions were near their designated positions. Pemberton, with the three divisions of C. L. Stevenson, J. S. Bowen, and W. W. Loring, was near Big Black River, on the 14th when he received one of the triplicate dispatches sent by Johnston on the 13th. Anxious to hold Vicksburg and the line of the Big Black, 13 miles east, he questioned the wisdom of acting upon Johnston's suggestion, and called a council of his leading officers, a majority of whom agreed with Johnston; but he adopted the suggestion of Loring and Stevenson, to move on Grant's rear in the direction of Raymond, and advanced on the 15th for that purpose, Loring's division halting at night on the Raymond road at Ellis-ton's, eight miles east of Edwards' Station, the other divisions farther north on roads coming

into the Raymond road. Early next morning the march was resumed, but the head of column had scarcely left camp when Pemberton received a despatch from Johnston that he had been driven north from Jackson, and advising that he move directly on Clinton, and inform him of the movement, that he also might move to that point with 6,000 men. Pemberton concluded to make the movement. He immediately turned back his trains to Edwards' Station to get the road leading to Brownsville on the north, and had scarcely done so, when Osterhaus' and Smith's divisions of Grant's army made their appearance on the Raymond road and attacked his skirmishers, upon which he suspended his movement to join Johnston. Continuing the reversal of his trains to the rear, he formed for battle on the general line of a cross-road, connecting the Raymond and Clinton roads, Loring on the right, covering the Raymond road, Bowen in the centre, and Stevenson on the left, on the northern point of a narrow ridge, known as Champion's Hill, about 60 to 70 feet above the general level of the country, covering the Clinton road and the intersection of the cross-road. Stevenson formed line while heavy skirmishing was going on to his right. Pemberton had about 17,500 men. The position of Grant's army on the night of the 15th was as follows: Hovey's division was at Bolton on the Clinton road; Logan's and Crocker's were on the same road a few miles in Hovey's rear; Osterhaus' was on a cross-road half-way from Raymond to Bolton; Carr's a short distance in his rear; and the divisions of A. J. Smith and Blair were west of Raymond on the Edwards' Station road. These seven divisions numbered about 32,000 men, on the three roads converging on Edwards' Station, and known as the Raymond road on the south, the middle road, and the Clinton road on the north. Early on the morning of the 16th Grant, who was at Clinton, heard that Pemberton was marching to attack him, upon which he sent orders for McPherson, with the divisions of Logan and Crocker, to close up rapidly on Hovey, and for the four divisions under McClernand on the Raymond and middle roads to move forward cautiously and establish communications with each other. He then hastened by the Clinton road to the front. A. J. Smith, advancing on the Raymond road, attacked and drove in Loring's skirmishers about 8 o'clock, and Osterhaus on the middle road engaged those in his front, artillery was brought up and opened fire, but McClernand, who was in command of the four divisions, more than half the army on this part of the field, doubtful if Grant wanted him to bring on a general engagement, deferred attack until 2 P.M., when he received Grant's order to attack, upon which he ordered Smith and Osterhaus to attack vigorously and "press for victory," but the attack was not a vigorous one, and meanwhile the battle was being fought out and decided on the right, on Champion's Hill. Hovey, advancing on the Clinton road began skirmishing with Stevenson about 10 o'clock, and began to form line for a general attack, but was directed by Grant to wait until McClernand could be heard from. Logan came up at 11 o'clock; nothing had been heard from McClernand, and line was formed for a general attack, Hovey south of the Clinton road and Logan on his right. It was about noon when Hovey advanced with great spirit, climbed Champion's Hill, and attacked; finally, after a hard contest with varying success, driving back the right of Stevenson and capturing 11 guns, soon after which Logan, who had worked around on Stevenson's left, on the north side of the hill, attacked and drove back Stevenson's left and captured seven guns. The positions thus gained were held until 2 o'clock. Meanwhile Stevenson, who had been compelled to take ground to the left to meet Logan's flank movement and cover the road to Baker's Creek and Edwards' Station, had induced Pemberton to draw Bowen to the left and close the interval between the two divisions, and Loring was ordered to close in on Bowen. It was after 2 o'clock when Bowen closed in on Stevenson, and his two leading brigades, F. M. Cockrell's and Green's, attacked Hovey furiously and drove him back down the hill, Hovey contesting every foot, but forced to abandon nine of the captured guns. As Hovey fell back two brigades of Crocker's division came to his support, and the Confederates were checked. Artillery was now massed, and poured such an effective enfilading fire upon Stevenson's line that it was much shaken, and Hovey and Crocker again charged up the hill, driving Stevenson and Bowen, after a desperate resistance, before them; and Pemberton, seeing his left entirely broken, at 3 o'clock gave the order for a general retreat, which he ordered Loring to cover. Before this, Loring, leaving Gen. Lloyd Tilghman's brigade on the Raymond road to oppose Smith and Blair, had already with two brigades nearly closed up on Bowen, and when the retreat began was forming his men between the Clinton and Raymond roads, when he was attacked by Osterhaus, and soon gave way, falling back to the Raymond road. Meanwhile A. J. Smith had advanced on the Raymond road, defeated and killed Tilghman. Loring reunited his command and retreated on the Raymond road, but when he came to the ford of Baker's Creek he found it in Union possession, upon which, after vain effort to find a crossing lower down, and realizing that he had been cut off from Pemberton's army, he moved off to the south, abandoning his artillery, and on the 19th joined Johnston, who meanwhile had re-occupied Jackson. Stevenson's and Bowen's men retreated to the Big Black, Grant following as far as Edwards' Station, where darkness ended the pursuit. Grant says he fought the battle with about 15,000 men actually engaged, in four hours of hard fighting, preceded by two or three hours of skirmishes, some of which rose almost to the dignity of battle. The Union loss was 410 killed, 1,844 wounded, and 187 missing. The Confederate loss was 380 killed, 1,018 wounded, 2,441 missing, and 24 guns taken. Grant pursued next day, the 17th, defeated Pemberton at the Big Black, and on the 19th invested Vicksburg. Consult: 'Official Records' (Vol. XXIV.); Greene, 'The Mississippi'; Grant, 'Personal Memoirs'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

E. A. CARMAN.

Champlain, shăn-plăn or shăm-plān', **Samuel de,** French navigator, colonizer, and soldier: b. Brouage, Saintonge, about 1570; d. Quebec 25 Dec. 1635. In early life he served in the army of Henri IV., as quartermaster of

cavalry, but in January 1599 he sailed to the West Indies, Mexico, and Panama. On his return (1601) he prepared a record of this cruise, with charts, etc. In March 1603 he sailed for North America, and explored, by boat, the St. Lawrence River up to the Falls of St. Louis, and down to Gaspè. In May 1604 he sailed with De Monts along the shores of Nova Scotia, wintered on the island of St. Croix, and founded a colony at Port Royal. From 1604 to 1606 he made careful surveys and charts of the coast as far as Cape Cod. He revisited France in 1607, but sailed again in 1608, and founded Quebec, which, owing to the development of its fur-trade, rapidly increased in size. In 1609 he accompanied an Algonquin and Huron expedition against the Iroquois, and thereby discovered Lake Champlain, on the borders of which the Iroquois were defeated. From September 1609 to March 1610 he was engaged in bringing over French mechanics for his colony. He became lieutenant-governor of New France, 8 Oct. 1612; fortified Quebec in 1620; but was compelled in 1629 to surrender to an English fleet, and was taken to England. Released in 1632, he sailed again for New France, with three well-equipped vessels, and spent his last years in the government and development of the French colonies. He published 'Voyages à la Nouvelle France' in 1632.

Champlain, shăm-plān', **Lake,** a body of water chiefly in the United States, between the states of New York and Vermont, but having the north end of it within the Canadian boundary, in the province of Quebec. Its extreme length, north to south, is about 125 miles; breadth, from half a mile to 15 miles; area, about 600 square miles. It is 90 feet above the level of the sea. It was discovered in 1609 by Samuel Champlain, governor of Canada, whence its name. It is navigated by steamboats and other vessels, and is deep enough for ships of the largest class. Its waters are carried northward to the St. Lawrence by the river Richelieu or Sorel, which, in conjunction with the Chambly Canal, affords navigation for large vessels, and forms a well-frequented line of communication. The south end of the lake is connected by a canal with the Hudson River, Lake Champlain thus affording water communication between the St. Lawrence a few miles below Montreal and the Atlantic at New York. Upwards of 50 islands are scattered over its surface; and it receives numerous streams, none of which are very important. The scenery along its sides is picturesque. It abounds in salmon, shad, pike, and other fish; in winter it is usually frozen over. The chief port on its banks is Burlington, Vt. During the wars between the United States and Great Britain, this body of water was the scene of numerous military operations. On 13 Oct. 1776, Benedict Arnold engaged a vastly superior English force, and made a daring escape. On 11 Sept. 1814, the American Commodore McDonough gained, under adverse circumstances, a most brilliant and thorough victory over the English fleet, near Plattsburg. This was one of the earliest substantial successes for the United States in the War of 1812.

Champlain Summer School. See SUMMER SCHOOL.

Champlain Stage, the name given by American geologists to the subsidence that was a feature of the close of the Glacial Epoch in New York, New England, Ontario, and Quebec. At the beginning of the Glacial Epoch the elevation of this section of the continent may have been greater than now, but when the ice-sheet finally retreated the sea extended up the St. Lawrence River nearly to Lake Ontario, and the lower Ottawa River and Lake Champlain were occupied by salt water. The stage is named from the lines of old sea beaches containing whale and walrus bones, thus showing the submergence, typically developed about Lake Champlain. The total amount of the depression varied, being greatest over the St. Lawrence valley. About New York harbor the coast was depressed fully 70 feet; at Albany 355 feet. Along the Maine shore the land was 150 to nearly 300 feet lower than now, and in the St. Lawrence valley the depression was over 500 feet, making allowance for the previous elevation the total depression in the St. Lawrence valley reached 1,500 feet. The climate of Champlain time was probably warmer and moister than that of the present. On the Pacific coast are evidences of depression in the region about Mount St. Elias, shells of Champlain species being found at an altitude of 5,000 feet. See GLACIAL PERIOD; QUATERNARY PERIOD.

Champlin, chămp'lĭn, **James Tift,** American educator: b. Colchester, Conn., 9 June 1811; d. Portland, Maine, 15 March 1882. He graduated valedictorian at Brown University in 1834, and was tutor there, 1835–8. He was a Baptist pastor at Portland, Maine, 1838–41; professor of Greek and Latin, Waterville (now Colby) College, 1841–58; president of the college, 1857–73; professor of intellectual and moral philosophy, 1858–73, when he removed to Portland to devote himself entirely to literary work. He published a large number of school and college text-books, including English, Greek, and Latin grammars, editions of Æschines' and Demosthenes' orations, Tacitus, and Butler's 'Analogy of Religion.' Others are: 'Textbook of Intellectual Philosophy' (1860); 'First Principles of Ethics' (1862); 'Political Economy' (1868); Scripture Reading Lessons' (1876); 'Constitution of the United States; with Brief Comments on the Constitutions of England and France' (1880).

Champlin, John Denison, American author: b. Stonington, Conn., 29 Jan. 1834. He was graduated at Yale in 1856, and admitted to the bar in 1859. In 1864 he became associate editor of the 'Standard,' at Bridgeport, Conn. He afterward published 'The Sentinel' (1865–9) at Litchfield, Conn., and became associate editor of the 'American Encyclopædia' (1875). He is author of 'Young Folks' Cyclopædia of Common Things' (1879); 'Young Folks' Cyclopædia of Persons and Places' (1880); 'Young Folks' Catechism of Common Things' (1880); 'Young Folks' Astronomy' (1881); 'Young Folks' History of the War for the Union' (1881); 'Chronicle of the Coach' (1886); 'Young Folks' Cyclopædia of Games and Sports' with A. E. Bostwick (1890); 'Young Folks' Cyclopædia of Literature and Art' (1901).

Champneys, chămp'nĭz, **Basil,** English architect: b. 1842. He was educated at Trinity College, Cambridge, and after studying archi-

tecture with the architect Prichard, of Llandaff, began the practice of his profession in 1867. Important works of his are the divinity and literary schools of Newnham College, and the Archæological Museum at Cambridge; Indian Institute, Robinson Tower at New College, and Mansfield College at Oxford; Rylands Library in Manchester; Butler Museum at Harrow; and Quincentenary buildings at Winchester College. He is cathedral architect at Manchester. He has published 'A Quiet Corner of England,' a delightful description of Rye and Winchelsea (1875); 'Henry Merritt: Art Criticism and Romance' (1879); 'Coventry Patmore: Memoirs and Correspondence' (1900).

Champney, chămp'nĭ, **Benjamin,** American artist: b. New Ipswich, N. H., 20 Nov. 1817. He went to Boston in 1834, and for three years worked in a lithographic establishment. From 1841 to 1848 he studied painting in Paris and Italy, exhibiting several times in the Paris Salon. He works chiefly in landscape and flower painting, and his White Mountain paintings, which are owned in and around Boston, are famous. Since 1853 he has passed most of his summers at his cottage and studio in North Conway, N. H.

Champney, Elizabeth (WILLIAMS), American writer for young people: b. Springfield, Ohio, 6 Feb. 1850. She was married to J. W. Champney (q.v.), 15 May 1875. Many of her books are illustrated by her husband. Among them are the Vassar Girls' Series, 'Three Vassar Girls Abroad,' 'In England,' 'In South America,' etc.; 'In the Sky-Garden'; 'All Around a Palette'; 'Rosemary and Rue'; 'The Bubbling Teapot'; 'Bourbon Lilies'; 'Sebia's Tangled Web'; 'Romance of the Feudal Chateaux'; 'Fables in Astronomy'; 'Six Boys'; 'Dames and Daughters' Series.'

Champney, James Wells, American artist: b. Boston, Mass., 16 July 1843; d. New York 1 May 1903. He studied in Europe under Edouard Frere, and in 1882 became a member of the National Academy. He excelled in genre pictures and portraits, and exhibited oil paintings at the Columbian World's Fair (1893), and at the Paris (1900) Exposition.

Champollion, Jean François, zhŏń frăn-swä shăn pōl yóń, LE JEUNE, French Egyptologist: b. Figeac, Lot, France, 23 Dec. 1790; d. Paris 4 March 1832. At an early age he devoted himself to the study of Hebrew, Arabic, Coptic, etc. In 1807 he read a paper before the Academy of Grenoble on the ancient Egyptian geographical names, which he endeavored to explain by the Coptic. He then went to Paris, where he continued his Oriental studies, paying particular attention to the Coptic, and endeavoring through it to find the key to the Egyptian hieroglyphics. In 1809 he became professor of history at Grenoble, but soon retired from this post and went to Paris, where he devoted himself almost exclusively to the study of Egyptian antiquities. Assisted by the trilingual inscription of the Rosetta stone he at length discovered the key to the graphic system of the Egyptians, the three elements of which — figurative, ideographic, and alphabetic — he expounded before the Institute in a series of memoirs in 1823. These were published in 1824 at the expense of the state, under the title of 'Précis du Système hiéroglyphique des anciens Égyptiens.' In 1824 he went to Italy, and investigated the collections of papyri and other Egyptian antiquities in the principal cities there. In 1826 Charles X. appointed him to superintend the new department of Egyptian antiquities in the museum of the Louvre. In 1828 M. Champollion went as director of a scientific expedition to Egypt, at the expense of the king. He was admitted a member of the Academy of Inscriptions in 1830. In 1831 the chair of Egyptian archæology was created for him in the Collége de France. His principal works are: 'Grammaire Égyptien,' and 'Dictionnaire hiéroglyphique,' both published after his death. They are indispensable to the student of heiroglyphics.

Champollion-Figeac, fē-zhăk, **Jacques Joseph,** French archæologist, elder brother of the preceding: b. Figeac, Lot, 5 Oct. 1778; d. 9 May 1867. He completed his studies at Grenoble, published his first archæological memoirs in 1803, and was named successively librarian of Grenoble, professor of Greek literature, secretary and dean of the Faculty of Letters of the same town. He took an active part in everything connected with science and letters in the department of the Isère. He acted as secretary to Napoleon in drawing up under his instruction the account of his memorable passage from Elba to Grenoble. In 1828 a place was made for him as keeper of the manuscripts in the Royal Library, and shortly afterward he was installed in the chair of paleography in the École des Charts. He was made an officer of the Legion of Honor in 1866. His principal works are: 'Antiquités de Grenoble' (1807); 'Paléographie Universelle'; 'Annales des Lagides' (1819); 'Traite élémentaire d'Archéologie' (1843); 'Écriture démotique Égyptienne' (1843); 'L'Égypte Ancienne' (1850); besides several other interesting works on Oriental history, and on the language and antiquities of the department of the Isère.

Champs-Elysees, shăńz-ā-lē-zā (Fr. "Elysian Fields"), an avenue in Paris, with its surrounding gardens. It extends from the Place de la Concorde to the Place de l'Etoile, a distance of one and a quarter miles, and is a famous public resort and promenade. It became the property of the crown in 1616 and was ceded to the city in 1828.

Chanca, chăn'ka, **Dr.** (believed to have been DIEGO ALVAREZ CHANCA), Spanish physician: b. Seville; who became a companion of Columbus on his second voyage in 1493. One of the principal authorities for this voyage is the letter which he wrote to the Catholic college at Seville, giving an account of his journey. No record has been kept of his subsequent life.

Chance, SIR **William,** English writer on sociology: b. 1853. He was educated at Harrow and Trinity College, Cambridge, and has been honorary secretary of the Central Poor Law Conference since 1893. He has published 'The Housing of the Working Classes of London' (1895); 'Children Under the Poor Law' (1897); 'Our Treatment of the Poor' (1899).

Chance, in its original and strict meaning, may be defined as that which determines the course of events in the absence of law, ordinary causation, or Providence. Strictly speaking, it is an idea which few men would now be disposed to admit as corresponding to anything

which really exists; the religious mind excluding it as inconsistent with the belief in the divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be popularly accepted as a term denoting an unknown cause, or a cause so remote that it is overlooked when events are considered superficially and apart from their universal connection.

Chance Acquaintance, A, a story by William Dean Howells, published in 1873. This agreeable and entertaining sketch contains many charming descriptions of the picturesque scenery and places about Quebec.

Chance, Games of. See GAMBLING.

Chance'-Medley, homicide happening either in self-defense, on a sudden quarrel, or in the commission of an unlawful act without any deliberate intention of doing mischief.

Chancel, that portion of a church occupied by the clergy, and often separated from the nave and aisles by screens of carved stone or oak. The screen separating the chancel from the nave is called the rood screen, because anciently a rood or large crucifix was usually placed on it, accompanied with two figures representing Saint John and the Virgin Mary. In the chancel were situated the high altar, the sedilia, or seats for the officiating clergy, and the piscina, in which the water used for washing the hands of the celebrant was poured. It usually contains carved seats or stalls, occupied by the clergy not engaged in the services. These are usually enriched with carvings, and have canopies of carved oak. The chancel occupies the same place with the apsis in the ancient basilicas, and was called so from the *cancelli* or rails used in the early churches to separate the clergy from the laity. The chancel is always at the east end of the church (churches being technically considered as having their major axes extending east and west), and is often constructionally a separate building opening from the nave with a lower roof elevation and raised several steps above the nave. In architecture the term is often employed as synonymous with choir (q.v.).

Chan'cellor, Charles Williams, American physician: b. Spottsylvania County, Va., 19 Feb. 1833. He studied at Georgetown College, and the University of Virginia, 1848–52, and was graduated at Jefferson Medical College, Philadelphia, 1853. During the Civil War he was medical director of Gen. Pickett's division in the Confederate army, 1863–5. He was professor of surgery in and dean of Washington University, Baltimore, 1868–75; secretary of the Maryland State board of health, 1875, president of the Maryland State Insane Asylum, 1880; and United States consul at Havre, France, 1893–7. Among his numerous reports and articles on medical and sanitary topics are the following: 'Report upon the Condition of the Prisons, Reformatories, and Charitable Institutions of Maryland' (1875); 'Contagious and Infectious Diseases' (1878); 'Mineral Waters and Seaside Resorts' (1883); 'Drainage of the Marsh Lands of Maryland' (1884); 'Heredity' (1886) 'Sewerage of Cities' (1886); 'Climate of the Eastern Shore of Maryland.'

Chancellor, Richard, English navigator: d. 10 Nov. 1556. He seems to have been brought up in the household of the father of Sir Philip Sidney, and was chosen in 1553 as captain of the Bonaventure and pilot-general of Sir Hugh Willoughby's expedition in search of a northeast passage to India. The ships were parted in a storm off the Lofoden Islands, and Chancellor, after waiting seven days at Vardöhus, the rendezvous agreed upon, proceeded alone into the White Sea, and traveled thence overland to the court at Moscow, where he was very hospitably treated, and was able to conclude a treaty giving freedom of trade to English ships. His interesting account of Russia was published in Hakluyt's 'Navigations.' Next spring Chancellor rejoined his ship and returned to England, where his hopeful reports led to the establishment soon after of the Muscovy Company. In the summer of 1555 he made a second voyage in the Bonaventure to the White Sea, and was at Moscow once more in the succeeding winter. In July 1556, he set sail on his voyage homeward, but was lost in the wreck of his ship in Aberdour Bay off the Aberdeenshire coast.

Chan'cellor, an officer supposed to have been originally a notary or scribe, under the emperors, and named *cancellarius,* because he sat behind a lattice, called, in Latin, *cancelli,* to avoid being crowded by the people. There are, however, other derivations of this title. Whatever may have been its origin, the office and name of chancellor were undoubtedly known at the court of the Roman emperors, where the title seems to have signified originally a chief scribe or secretary, who was afterward invested with several judicial powers, and with superintendence over the other officers of the empire. From the Roman empire the title and office passed to the Roman Catholic Church, and hence every bishop has to this day his chancellor, the principal judge of his consistory. When the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preserved its chancellor, with different jurisdictions and dignities according to their different constitutions. In all he seems to have had the supervision of all charters, letters, and such other public instruments of the Crown as were authenticated in the most solemn manner, and therefore, when seals came into use, he had always the custody of the king's great seal. This officer has now great authority in all the countries of Europe.

The *Lord High Chancellor of Great Britain (originally of England)* is the first judicial officer of the Crown and exercises an extensive jurisdiction as head of the supreme court of judicature. He ranks as first lay person of the state after the blood-royal. He is always one of the commissioners appointed to represent the sovereign in opening and closing Parliament or giving the royal assent to bills. He is created by the delivery of the great seal into his custody. In like manner the act of taking away the seal by the sovereign formally determines his office. He is a cabinet minister and a privy councilor in virtue of his office, is speaker of the House of Lords by prescription, and vacates his office with the ministry which appoints him. He has a salary of £10,000. He has the appointment of all justices of the peace in the

kingdom, is visitor, in the king's right, of all royal foundations, and patron of all Crown livings under the value of 20 marks in the king's books. The office having in early times been always filled by ecclesiastics (for no others were then capable of an employment requiring so much writing), he became keeper of the king's conscience; and by special appointment he now exercises a general superintendence as guardian over all infants, idiots, and lunatics, though these latter powers are not necessarily attendant on his office, as Blackstone seems to have imagined, but can be delegated by the Crown to any other judicial officer, as in fact they were delegated even as late as the reign of James I., when the seals were held by Dr. Williams, then dean of Westminster, and afterward bishop of Lincoln. The great seal has been not unfrequently put in commission, and was last so on the resignation of Lord Thurlow in the year 1793. One vice-chancellor was appointed to preside in the courts of equity by 53 George III., c. 24, and two by 5 Vict. c. 5, § 19. The two last-mentioned were at first subordinate vice-chancellors, but they were afterward all made of equal rank. They sat in separate courts, and an appeal lay from their decisions to the lord chancellor. They latterly sat in the chancery division of the supreme court of judicature. See CHANCERY; SUPREME COURT OF JUDICATURE.

Chancellors of Ireland and Scotland.— There is a lord high chancellor of Ireland, who is the head of the judical bench, with a salary of £8,000. He is not a member of the British ministry. The chancellorship of Scotland was abolished at the union. The Scottish chancellor had no independent jurisdiction in equity, as there has never been a separate court of equity in Scotland; but he presided in Parliament, and was head of all the courts of judicature, and of the Scottish office of chancery, in which all charters and other writs appointed to pass the great seal were recorded. This office still exists under a director of chancery.

The *Chancellor of the Exchequer* is the principal finance minister of the government, and as all questions of supply originate in the House of Commons, a peer cannot be conveniently appointed to this office. When the first lord commissioner of the treasury is a commoner, the two offices have sometimes been united.

The *Chancellor of the Duchy of Lancaster* presides in the court of the duchy chamber, to decide questions relating to lands holden of the king as Duke of Lancaster; but it does not appear that this is a court of record. The chancellorship is generally bestowed during pleasure, though there are two instances of its being granted for life; the last being that of the celebrated Lord Ashburton. The Chancellor of the Duchy of Lancaster is a cabinet minister.

The *Chancellor of a University* is an official at the head of the university, generally a man of rank, whose duties are more or less nominal, but who is regarded as conferring the degrees. At Oxford his duties are almost entirely discharged by the vice-chancellor; the chancellor's own acts being limited to the signing of diplomas, etc. Under the vice-chancellor are four pro-vice-chancellors, nominated by him from among the heads of colleges, to one of whom, in his absence from the universty, he delegates his authority. The chancellor of Cambridge University, whose duties are very similar to those of the Oxford official, is elected biennially by the Senate; but there is no instance, at least in modern times, where a re-election has not taken place.

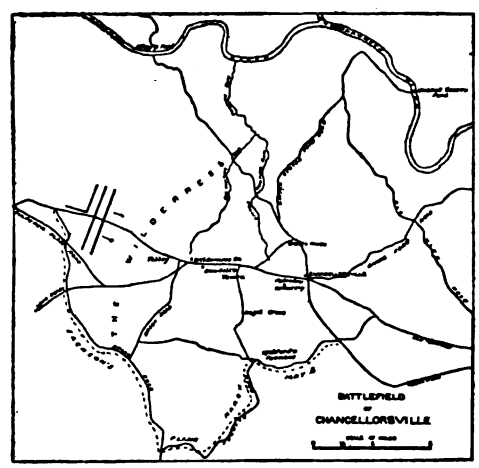
Chancellor of the Order of the Garter and Other Military Orders, an officer who seals the commissions and the mandates of the chapter and assembly of the knights of the order, keeps the register of their proceedings, and delivers their acts under the seal of their order. The title "chancellor" is given, in England, to several officers of other bodies.

Chancellors of Other European Countries.— The chancellor was one of the highest officers in the German states, and by the influence of his office was one of the most important. In Germany this dignity was from the remotest times vested in one of the higher clergy, until the head of the German clergy, the Archbishop and Elector of Mainz, united it forever with his office as Arch-chancellor of the empire. The two other spiritual electors held the same dignity, but it was merely titular; the Archbishop of Cologne, as Arch-chancellor of Italy; the Archbishop of Trèves, as Arch-chancellor of Gaul and Arles, that is, the kingdom of Burgundy, once belonging to Germany. The Arch-chancellorship of Mainz, on the contrary, had important duties attached to it — the direction of the Diet and of the public business, as well as of all the imperial chanceries. The Elector appointed a vice-chancellor, who was the actual minister of the empire at the imperial court. In the new German Empire the chancellor (*Reichskanzler*) is the president of the Federal Council (*Bundesrath*), and has the general conduct of the imperial administration. All laws of the empire, after being sanctioned by the emperor, must be countersigned when promulgated by the chancellor.

The Chancellor of France was the highest officer of state, and the only one who, when once appointed, could not be dismissed. In case, therefore, it was desired to remove him from participation in affairs, a keeper of the seals (*garde des sceaux*) was appointed. As the chancellor was properly the minister of justice, he was chosen from the body of jurists. A relic of his spiritual character was, that all his furniture, liveries, and even his coach, were black.

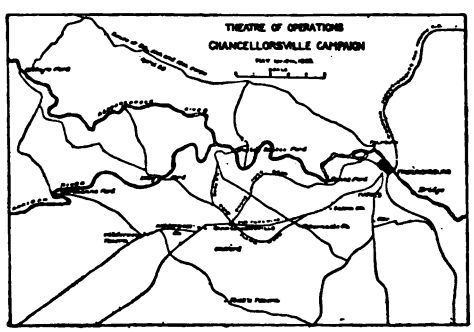
Chan'cellorsville, Battle of. The Chancellorsville campaign included the battle of Chancellorsville, 1–3 May 1863, the action at Marye's Heights, 3 May 1863, and the engagement at Salem Church, 3 and 4 May 1863. In the fore part of April 1863 the Army of the Potomac, under Gen. Hooker, and the Army of Northern Virginia, Gen. Lee, confronted each other on opposite sides of the Rappahannock at Fredericksburg. Lee was so strongly entrenched on the south side of the river from Port Royal on the right to Banks' Ford on the left, a distance of 25 miles, that an attack on his front was not to be thought of, and Hooker concluded to march his cavalry far beyond and around Lee's left, destroy his communications with Richmond, and compel him to leave Fredericksburg, when he proposed to fall on his flank and rear as he fell back. For this purpose Gen. Stoneman with 10,000 cavalry was put in motion, 13 April, under orders to ascend

the Rappahannock, cross it west of the Orange & Alexandria R.R., attack Lee's cavalry wherever found, and plant himself firmly across his line of retreat. Stoneman found the Rappahannock and other streams so swollen by heavy rains that he was compelled to abandon the movement, and Hooker modified his plans. He determined to flank Lee's position and compel him to come out and fight on open ground of Hooker's own choosing. Lee had, in and around Fredericksburg, exclusive of cavalry, about 60,000 men and 170 guns; the two divisions of McLaws and R. H. Anderson of Longstreet's corps, and Jackson, with the divisions of A. P. Hill and D. H. Hill, commanded by R. E. Rodes; Trimble, commanded by R. E. Colston and J. A. Early. Hooker had, not including his 12,000 cavalry, about 118,000 men and 380 guns, divided into seven corps: First, Gen. J. F. Reynolds; Second, D. N. Couch; Third, D. E. Sickles; Fifth, Geo. G. Meade; Sixth, John Sedgwick; Eleventh, O. O. Howard; Twelfth, H. W. Slocum. Both armies were in the best of condition. On the 27th the Eleventh and Twelfth corps marched for Kelly's Ford, 25 miles up the Rappahannock, arriving on the 28th, and being joined by the Fifth corps, all crossed the river next morning, the Eleventh and Twelfth corps marching for Germanna Ford on the Rapidan, the Fifth corps for Ely's Ford, lower down the same stream. Pleasanton's cavalry brigade accompanied the two columns. Some opposition was met at the fords, and at 2 P.M. of the 30th, after some sharp encounters with Stuart's cavalry, on the Germanna road, the three corps united at Chancellorsville, 11 miles west of Fredericksburg, and were joined the same day by two divisions of the Second corps, under Couch, which had crossed the Rappahannock at United States Ford, the Third corps also being near. The cavalry was thrown out on the roads toward Fredericksburg and Spottsylvania. Hooker had concentrated with great ability 71,000 men on Lee's left and joined them before night. Mahone's and Posey's brigades of Anderson's Confederate division had been guarding United States Ford; the passage at Germanna Ford turned this position, and the two brigades on the 29th fell back to Chancellorsville, where Anderson had come up with Wright's brigade. Next morning Anderson fell back with the three brigades to near Tabernacle Church, four miles, and began to throw up works covering the roads converging at that point. These movements on Lee's left were covered by demonstrations on his right and front below Fredericksburg. They began as early as the 21st, and on the 29th Sedgwick, with the First, Third, and Sixth corps, moved to points two to four miles below town, threw pontoon bridges across the river, and crossed troops to hold them. On the 30th he was ordered to demonstrate on Lee's right down the river, and the Third corps marched by the north bank of the river for Chancellorsville. Sedgwick's movements did not deceive Lee. On the afternoon of the 29th Stuart had informed him that heavy Union columns were marching for the Rapidan, and he ordered Anderson to march with Wright's brigade to Chancellorsville. When informed that Hooker had crossed the Rapidan he ordered McLaws, leaving Barksdale's brigade on Marye's Heights, to march with three brigades, at midnight of the 30th, and take position on Anderson's right. Jackson was ordered with three divisions to Chancellorsville, leaving Early's division with Barksdale's brigade — in all, about 8,500 men, and 30 guns — to hold the lines at Fredericksburg against Sedgwick. McLaws arrived on Anderson's right about daylight, and was joined by two of Anderson's brigades from near Banks' Ford. Jackson marched at 3 o'clock on the morning of 1 May, and came up to Anderson at Tabernacle Church at 8, suspended work on the entrenchments and, at 11 o'clock, ordered McLaws and Anderson forward on the two roads leading to Chancellorsville, his own three divisions following Anderson. Three roads lead from Chancellorsville to Fredericksburg, the most direct, the old turnpike, passing Salem Church. The second, the plank road, led south from Chancellorsville, then east, uniting with the turnpike beyond Tabernacle Church. Both these roads were covered by Anderson's works. The third road led northeastward, passed Banks' Ford, about six miles distant, and continued to Fredericksburg. It was 11 o'clock, 1 May, when Meade pushed out two divisions on the Banks' Ford road and one, Sykes', on the turnpike, under orders to



be at or near Banks' Ford at 2 P.M., and at the same hour, 11 A.M., Slocum advanced on the plank road, to be at Tabernacle Church at noon, Hooker's intention being to get out of the Wilderness, uncover Banks' Ford, and form for battle in open, elevated country, his right at Tabernacle Church, his left covering Banks' Ford. Meade's left divisions had come in sight of Banks' Ford; Sykes, supported by Hancock's division, Second corps, had encountered McLaws and driven him back nearly to Anderson's works; Slocum, over two miles out, had met Jackson and was sharply skirmishing with him; and all was going well, when Hooker, impressed by the unexpected advance of the enemy, and fearing his own inability to get entirely out of the tangled forest, onto open ground, before being beaten in detail, ordered the columns back to Chancellorsville, thereby giving up the advantage of position practically gained and losing the confidence of his corps commanders. Jackson and McLaws followed the retiring troops and felt the lines with skirmishers, and McLaws got guns in position and cannonaded the left of the line. Hooker's line,

as completed on the morning of the 2d, extended from the Rappahannock on the left to a point on the Germanna plank road full two and a half miles west of Chancellorsville. The Fifth corps and a division of the second was on the left, facing east, the right in advance of the Chancellor House. The Twelfth corps was south of the plank road, its left less than one fourth of a mile in front of the Chancellor House, its right near Hazel Grove, a little over a mile southwest of Chancellor's. Birney's division of the Third corps was on the right of the Twelfth, and the Eleventh corps continued the line from Dowdall's tavern westward beyond Talley's farm. The works held by the Twelfth, Third, and Eleventh corps faced south, those of the Twelfth in form of a bow, the plank road being the string of the bow; those of the Eleventh ran in a straight line generally just south of the road. For nearly the entire distance the line ran through an almost impenetrable forest of scrub-oak and pine. There was a spacious clearing around the Chancellor House, where Hooker had his headquarters, and open ground around Dowdall's. A division of the Second corps and two of the Third were in reserve. Pleasanton's cavalry was near



Chancellor's House. On the evening of 1 May Lee had a conference with Jackson. To attack Hooker's 71,000 men, behind works, with 48,000, was certain to entail a terrible loss of life, and it was determined that Jackson, with nearly 30,000 men, infantry, cavalry, and artillery, should march across Hooker's front and assail his right flank and rear, Lee remaining with McLaws' and Anderson's 18,000 men to watch his left, demonstrate on it, and guard the roads to Fredericksburg. Jackson moved on the morning of the 2d with his accustomed celerity, and about 4.30 P.M. his head of column was on Hooker's right and rear, and he began to form line a scant mile from the right flank of the Eleventh corps. His movement had been discovered and misunderstood. As early as 9 o'clock he was seen marching a mile or so to the south; information of the fact was sent to Slocum and Howard, and instructions to both to strengthen their flanks. Hooker soon came to the conclusion that Lee was retreating, and about 1 P.M. Sickles, at his own request, was ordered to take two divisions of the Third corps, move out and attack, which he did, falling on Jackson's rear at Welford's Furnace, taking some prisoners. Barlow's brigade of the Eleventh corps was sent to Sickles, and Pleasanton's cavalry joined him, but the forest was too dense for cavalry operations, and Pleasanton withdrew two of his regiments and battery to Hazel Grove, where Sickles had left some of his artillery. Williams' division of the Twelfth corps was sent from its works to form on Sickles' left, attack Anderson's left and roll him back on Chancellorsville. Williams was about to attack when Jackson fell on the flank of the Eleventh corps, and he went back to his works. The Eleventh corps was badly posted and, though repeatedly informed by brigade and regimental commanders and picket officers of the gathering enemy on the flank, the superior officers, with one exception, lulled into security by the pleasing reports that Jackson was retreating, made no adequate provision against a flank attack, and most of the men were preparing supper when the storm broke. Jackson had formed his 26,000 infantry in three lines across the plank road, a mile on either side of it, artillery in the road, and a little after 5 o'clock gave the order to advance. The lines advanced with a rush, startling the game in the forest. The Union skirmishers were quickly driven in, and with a wild yell the main Confederate line struck the right brigade of Devens' division, flanked it, and after two or three rounds had been fired it gave way, the enemy following, striking and flanking everything in the way. No troops in the world, so placed, could stay such an attack. Some regiments made heroic stand and fought brilliantly, but in 30 minutes Deven's division of 4,000 men, was routed and the Confederates advanced upon Schurz's division, which had changed front. Schurz held ground about 20 minutes, and then fell back upon Buschbeck's brigade, east of Dowdall's. Here Schurz rallied some of his men. Buschbeck stood three quarters of an hour, and it was after 7 o'clock, when, attacked in front and flank, he fell back in good order to Fairview, where 40 guns of the Eleventh and Twelfth corps were being massed on high ground in his rear. Howard's corps had been driven two miles in less than two hours, losing nearly 1,500 killed and wounded, and 1,000 prisoners. The force of Jackson's attack had spent itself; his two leading divisions — Rodes' and Colston's — had become inextricably mixed; the men were tired and hungry, and Jackson suspended their further advance and ordered A. P. Hill to relieve them. Meanwhile Hooker had sent Berry's division, of the Third corps, and Hays' brigade, of the Second, to the west edge of the open field north of the road; on Berry's right were some of Schurz's regiments; and Williams, desisting from his attack on Anderson, regained part of his works and formed south of the road on Berry's left, Buschbeck in his rear. This covered the road at a distance of a little over a half mile west of Chancellor's House. Sickles, when informed of Howard's disaster, fell back from Welford Furnace to Hazel Grove, and formed on Pleasanton's left. Barlow drew up in Pleasanton's rear, all close to Williams' left and front. The two Confederate lines fell back to the open ground around Dowdall's, to re-form, and A. P. Hill was brought up and his leading brigade pushed along the plank road beyond the intersection of a road leading left to White House, and United States Ford, the road to be taken by Hill to cut off Hooker's retreat. While Jackson was reconnoitering on this road, beyond his main line, skirmishing began between the opposing pickets in the woods, and as

Jackson, with his staff and orderlies, was riding back, the mounted body was mistaken for Union cavalry, and fired into, Jackson (about 9.20 P.M.) was wounded in three places, both arms being shattered. Nearly the entire escort were also killed or wounded. Jackson died 10 May. At the sound of the firing in the woods the Union guns on Fairview opened a furious fire down the plank road, causing some confusion to the Confederate column on it. During this fire A. P. Hill, next in command, was wounded; the intended advance was suspended, and Gen. J. E. B. Stuart was sent for to take command. During the night and early morning some changes were made in the Union line by which the approaches on the right to United States Ford were covered by Reynolds' corps and part of Meade's, and the Eleventh corps took position on the extreme left vacated by Meade. At 9 P.M. Hooker, not knowing that Sedgwick's entire corps was at Fredericksburg, ordered him to cross from Falmouth and march up the south side of the river to Chancellorsville, and attack Lee's rear at daylight, 3 May, while he attacked in front. Pleasanton and Sickles were ordered to fall back from Hazel Grove at dawn. Pleasanton marched back at 4 o'clock, and Sickles was following when his rear was caught by the oncoming Confederate line. Stuart, who had assumed command of Jackson's corps, advanced at 5 o'clock, 3 May, with great impetuosity, his right attacking Sickles as his rear brigade was about retiring from Hazel Grove. The brigade was soon driven, four guns were captured, and Stuart swept on. Thirty Confederate guns were put in position at Hazel Grove which swept the open ground of Fairview and poured an enfilading fire on the right of Geary's division of the Twelfth corps, which was fighting Anderson, and at the same time Geary's left was being pounded by McLaws' guns. The battle now became fierce along the entire line of the Second, Third, and Twelfth corps. On the right Stuart's men fought French's division of the Second corps and the three divisions of the Third, taking the Union works, being driven from them, and retaking them. Williams was fighting Stuart's right, Geary of the Twelfth corps was desperately engaging Anderson, and on his left, covering Fredericksburg road, Hancock's division of the Second corps was resisting the fierce attacks of McLaws. Stuart gradually gained ground and united his right with Anderson's left near Hazel Grove. The Union ammunition began to fail, and finally, about 9 o'clock, French, of the Second corps, the Third corps, and Williams' division of the Twelfth, after frightful losses, began to fall back, and the Confederates gained the west of the Chancellor plateau and swept it with artillery. A cannon-shot struck a pillar of the Chancellor House against which Hooker was leaning. He was knocked down and stunned, and Couch, who was second in command, was instructed by Hooker to withdraw to a position, already selected, about three fourths of a mile north of the Chancellor House, and covering United States Ford. The right and centre, closely pressed, fought their way back; Geary, attacked in front, right flank, and rear, followed; Hancock followed Geary; before noon the troops were in the new position; and here the battle of Chancellorsville proper ended, for, before Lee had completed preparations to renew his attack, he heard of the capture of Fredericksburg and Marye's Heights and the advance of Sedgwick. Suspending further operations against Hooker, he turned his attention to Sedgwick, sending McLaws' division to oppose him.

When Sedgwick received Hooker's order of 9 P.M., 2 May, to cross the river at Fredericksburg, he had already done so and was three miles below the town. It was 11 P.M. when he received the order; he had 14 miles to march before he could reach Chancellorsville; and an enemy barred the way. He had about 23,000 men. His three divisions were commanded by Gens. John Newton, W. T. H. Brooks, and A. P. Howe. Brooks was left below Fredericksburg, and Newton led the advance on the town. The night was dark; progress was slow; frequent halts being made while the skirmishers were feeling the way; it was the gray of the morning when Newton reached the rear and left of Fredericksburg; and as daylight came Marye's Heights were seen to be held by the enemy. Gibbon crossed the river from Falmouth and reported to Sedgwick with his division, and under cover of a demonstration by Newton, advanced on the right to turn the position, but was stopped by the canal and a concentrated fire of artillery. He found also that Hays' brigade of Early's division, and Wilcox's of Anderson's were in his front, and he was obliged to fall back. On the other flank Howe's division failed to make an impression. Nothing remained but to assault the heights, and storming columns were formed, Howe forming three on the left, and Newton, two, of two regiments each, strongly supported. These were launched against the Confederate position, and were bloodily repulsed by Barksdale's brigade. The assault was renewed and Marye's Heights carried about 11 o'clock, with a loss to Sedgwick of nearly 1,000 killed, wounded, and missing, in a very few minutes. He took 15 guns and nearly 1,000 prisoners. Here a delay occurred to get Brooks' division up, which was to take the advance, and it was 3 o'clock before Sedgwick marched for Chancellorsville, leaving Gibbon to hold the town and cover the bridges there. His march was impeded by Wilcox, who had regained the road in his front and made a stand half a mile in advance of Salem Church, where McLaws had now come up and formed across the road. Brooks' division advanced and Wilcox fell back to the church, Brooks closely following, and a desperate encounter raged around the church, in which at first Brooks, supported by Newton, was successful, but was finally compelled to fall back after losing 1,500 men. Dispositions were made to renew the struggle, but night came and both sides slept on their arms. Early, who had concentrated his command at Cox's, on the telegraph road, south of Fredericksburg, had Lee's permission to attack Marye's Heights and Sedgwick's rear at daylight. He was joined by Barksdale and, as Marye's Heights were held by a small Union force, his attack succeeded. Leaving Barksdale to hold the heights and prevent an advance of Gibbon, who was in the town, Early moved toward Salem Church and asked McLaws to co-operate with him. Meanwhile Lee, retaining only Jackson's three depleted divisions to confront Hooker at Chancellorsville, led Anderson to unite with McLaws and Early, and drive

Sedgwick across the Rappahannock, the three divisions aggregating about 21,000 men. Anderson arrived about noon of the 4th, and took position betweeen McLaws and Early. Sedgwick was now hemmed in on three sides, his line in shape of a horseshoe, both flanks on the river covering Banks' Ford. The line was five or six miles in length, Newton, on the right, facing McLaws on the west; Brooks, in the centre, facing south, confronting Anderson, and Howe, on the left, facing east, opposing Early. Skirmishing was kept up during the day, and at 6 o'clock, Lee, after reconnoitering the position, ordered an attack to break the centre. Newton was not seriously attacked, but Howe and Brooks were assailed with great spirit, Early, falling upon the former and endeavoring to turn his left, in which he did not succeed, two of his brigades being repulsed and thrown into confusion by Howe's artillery. An attack on Howe's right and Brooks' left was also repulsed. The Confederates continued the contest until darkness put an end to it. Sedgwick then withdrew from the field to Banks' Ford, where he was covered by 34 guns on the north side of the river, but he had lost so heavily and was hemmed in so closely that, with Hooker's approval, he crossed the river during the night, taking with him nine captured guns and about 1,400 prisoners. His loss, since crossing the river on the 2d, had been 3,200 killed and wounded and 1,500 captured. During the night Gibbon recrossed the river to Falmouth, and on the morning of the 5th Lee was again in full possession of the south side of the river below Chancellorsville. Early was left to hold Fredericksburg, and Lee marched back with McLaws and Anderson to renew the battle with Hooker. A heavy storm came up, converting dry ravines into torrents and the soil to deep mire, and the attack was deferred until next morning. When day came Hooker had recrossed the river at United States Ford, and the Army of the Potomac marched to its old camp, and Lee returned to his old position at Fredericksburg. The Union loss at Chancellorsville was 1,082 killed, 6,849 wounded, and 4,214 missing. Including the losses at Fredericksburg, Marye's Heights, and Salem Church, the Union loss in the entire campaign, 27 April to 5 May, was 1,606 killed, 9,762 wounded, and 5,919 missing; an aggregate of 17,287. The Confederate loss during the campaign was 1,665 killed, 9,081 wounded, and 2,018 captured; an aggregate of 12,764. Dodge, 'The Campaign of Chancellorsville'; A. C. Hamlin, 'The Battle of Chancellorsville'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. CARMAN.

Chancery, formerly the highest court of justice for England and Ireland. It obtained its name from being under the presidency of the lord chancellor. It embraced six superior courts called high courts of chancery, and numerous inferior courts. The superior courts were the court of the lord high chancellor, the court of the master of the rolls; the court of appeal in chancery, constituted by the lord chancellor sitting along with either of the two lords justices in appeal or by the two lords justices sitting together apart from the lord chancellor; and the courts of the three vice-chancellors. The ordinary legal jurisdiction of chancery embraced the issuing of writs for a new Parliament; of pleas of *scire facias* to repeal letters patent, and of all original writs. There was also a jurisdiction acquired by statute or special delegation in issuing writs of habeas corpus and inquiring into charitable uses. There were numerous other powers conferred by act of Parliament, and the lord chancellor, together with the lords justices of appeal, had exclusive authority over the persons and property of idiots and lunatics. Appeals in bankruptcy were heard by the court of appeal in chancery. The sittings and business of this court of appeal were regulated by the lord chancellor.

The procedure of the court of chancery at one time, by reason of its traditions and forms (commonly known as "red tape") became so cumbersome as partially to defeat its own ostensible aims, and rendered reform imperative. Charles Dickens made a determined attack upon the delays of chancery practice in his 'Bleak House,' and subsequent changes have been commonly attributed to his influence.

The English court of chancery is now a division of the high court of justice, which is itself one of the two departments of the supreme court of judicature (q.v.). The present judges of chancery, as a division of the high court of justice, are the lord chancellor, who presides over the division, and five justices, each of whom has the title of "Sir" and receives a salary of £5,000. According to the provisions of the act by which the supreme court of judicature was established, there were to be no more judges appointed than were already connected with the court; and the distribution of business, both as to its commencement and its transfer, was made subject to rules of court and orders of transfer. By the operation of these provisions chancery, like the other divisions of the court to which it now belongs, was gradually to cease to be a separate department; but in the meanwhile, subject to these rules and orders, certain causes and matters were assigned to chancery until these provisions should take their full effect. These are enumerated in the Supreme Court of Judicature Act (36 & 37 Vict. c. 66, § 34), and are (1) all causes and matters pending in the high court of chancery at the commencement of the act (finally fixed for 1 Nov. 1875); (2) all causes and matters to be commenced after the commencement of the act under any act of Parliament by which exclusive jurisdiction in respect to such causes or matters has been given to the court of chancery, or to any judges or judge thereof, except appeals from county courts; (3) all causes and matters for the administration of the estates of deceased persons; for the dissolution of partnerships or the taking of partnership or other accounts; for the redemption or foreclosure of mortgages; for the raising of portions or other charges on land; for the sale and distribution of the proceeds of property subject to any lien or charge; for the execution of trusts, charitable or private; for the rectification or setting aside or cancellation of deeds or other written instruments; for the specific performance of contracts between vendors and purchasers of real estates, including

contracts for leases; for the partition and sale of real estates; for the wardship of infants and the care of infants' estates. Chancery, as a division of the high court of justice, has no exclusive right to the administration of equity, the act already mentioned making provision under certain rules for the concurrent administration of law and equity in all the divisions of the supreme court of judicature. The court of appeal in chancery no longer exists, and its functions are transferred to the court of appeal, which in the new supreme court of judicature is the complementary department to the high court of justice. The affairs of lunatics are still under the supervision of the lord chancellor.

In the United States the general tendency has been likewise to abolish courts of chancery as separate departments, and equity jurisdiction is generally conferred on the courts of law. Delaware, New Jersey, and Tennessee are among the few States that still retain the former practice.

Chancre, shăngk'ẽr, two forms of venereal disease which go by this name: hard chancre, the initial lesion of syphilis (q.v.); and soft chancre, or chancroid (q.v.).

Chancroid, shăngk-roid, a contagious venereal disease characterized by the presence of one or more, often several, suppurative ulcers, chiefly located in the genital regions. These are due to infection by the organisms of dirt and are not true syphilitic lesions. Very frequently both hard and soft chancres are communicated at the same time, but they can be distinguished, although it has been only within the last 50 years that a definite line has been drawn between these two varieties of venereal disease. Chancroid is definitely a dirt disease, and is due to uncleanliness as well, perhaps, as to a specific micro-organism. Chancroid usually develops, within 24 to 48 hours after infection, as a minute macule, or pin-point vesico-pustule surrounded by a reddish halo. This increases day by day until a pustule or ulcer about the size of a small coin is developed. This ulcer is usually a soft ulcer. There is not much induration in the connective tissue beneath it, which is one of the distinguishing features between it and true syphilitic chancre. Chancroids are usually multiple, whereas chancres are usually single. They persist usually from three to six weeks and are often very difficult to cure, and furthermore a patient with chancroid may reinfect himself and thus spread the lesion at times very widely.

Chanda, chŭn'dä or chän'dä, India, chief town of the district of Chanda in the Nagpur division of the Central Provinces. It is surrounded by a stone wall five and a half miles in circuit, inside which are cultivated fields and detached villages, while there are also suburban quarters outside. There is a citadel now inclosing the jail, tomb of the Gond kings, three interesting temples, massive monoliths, etc. The town has a public park, civil station, and military cantonments. The manufactures include cottons, silks, brass utensils, etc. There is an annual fair beginning in April and lasting three weeks. Pop. 16,000.

Chandausi, chŭn- or chän-dow-sē', India, a town in the Northwestern Provinces, 27 miles south of Moradabad. It is the centre of a considerable trade, especially in sugar and cotton, and has limestone quarries. Pop. 29,000.

Chandeleur (shăn-dė-lėr) **Islands** lie east of Chandeleur bay, on the southeast coast of Louisiana. On the northern or smaller island is a fixed white light.

Chanderi, chŭn- or chän-da'rē, or **Chandhairee,** India, a town of Scindia's Dominions (Gwalior), Central India, 105 miles south of the town of Gwalior. It contains many ruins showing its former greatness and magnificence, but is now an insignificant place. The fort, which figures much in the wars of the Mogul dynasty, is on a hill, enclosed by a stone rampart, flanked with circular towers. Pop. 6,000.

Chandernagor, chŭn-dėr-nŭ'gōr or chăndėr-na'gōr, or **Chandarnagar,** India, a town on the right bank of the Hooghly, 16 miles north-northwest of Calcutta. Its only manufacture is of cotton cloth, and there is no trade but with Calcutta. The French established a factory there in 1676, and in 1688 obtained a formal cession of it, together with its territory of about three and a half square miles, from Aurungzebe. It was three times taken by the British, first in 1757, but finally restored to the French in 1816. Chandernagor is under a subgovernor, subordinate to the governor of Pondicherry. Pop. of town and territory 26,000.

Chand'ler, Abiel, American merchant: b. Concord, N. H., 1778; d. Walpole, N. H., 22 March 1851. He was graduated at Harvard College in 1806, and was for many years a merchant in Boston. He died a widower, without children, and devised $50,000 to Dartmouth College. The Chandler School of Science at Dartmouth was established in 1851 in pursuance of this bequest. For many years it was maintained as a separate department, but has recently been formally incorporated into the college and it is now known as the Chandler scientific course leading to the degree of bachelor of science.

Chandler, Charles Frederick, American chemist: b. Lancaster, Mass., 6 Dec. 1836. He studied at the Lawrence Scientific School of Harvard College, and at the universities of Berlin and Göttingen, receiving his doctor's degree at the latter in 1856. He was professor of chemistry in Union College, 1857–64, and professor of analytical and applied chemistry in the Columbia College School of Mines, 1864–1903. In 1858 he was elected to the chair of chemistry in the New York College of Pharmacy, and in 1876 to the chair of chemistry and medical jurisprudence in the College of Physicians and Surgeons. He became chemist to the Metropolitan Board of Health in 1865, and its president in 1873, being instrumental in securing great reforms in connection with the sanitary condition of the markets and the purity of the food-supply, notably in the case of milk. He is a member of the chemical societies of Berlin, London, and Paris, and of the National Academy of Sciences. With his brother, Prof. W. H. Chandler, he founded the 'American Chemist,' a monthly journal devoted to chemical science. To this and to the annual reports of the New York health department he has contributed many papers on chemistry, water-supply of cities, purification of coal gas, on petroleum, milk, sorghum, and glucose.

Chandler, Elizabeth Margaret, American poet: b. near Wilmington, Del., 24 Dec. 1807; d. 22 Nov. 1834. Her most popular poem was 'The Slave Ship.' Many of her subsequent verses were written in the same strain, and published in the 'Genius of Universal Emancipation,' a Philadelphia abolitionist periodical. Her poems were published with a memoir by Benjamin Lundy (1836).

Chandler, Frank Wadleigh, American writer: b. Brooklyn, N. Y., 16 June 1873. He graduated at the Polytechnic Institute of Brooklyn, 1894; studied literature and philosophy at Columbia University, and at Oxford, London, and Paris, 1895–9. Since 1899 he has been professor of literature and history in the Polytechnic Institute, and since 1901 lecturer in comparative literature at Columbia. He has written 'Romances of Roguery, an Episode in the History of the Novel' (1899), and 'Some Theories of the Novel's Evolution in East and West' (1900).

Chandler, Richard, English archæologist: b. Elson, Hampshire, 1738; d. Tilehurst, Berkshire, 9 Feb. 1810. He was educated at Winchester and at Queen's and Magdalen colleges, Oxford. His first important work was 'Marmora Oxoniensia' (1763), an elaborate description of the Oxford marbles. He afterward traveled through Greece and Asia Minor, with Revett, architect, and Pars, a painter, at the expense of the Dilettanti Society, to examine and describe the antiquities. The materials collected were given to the world in the following publications: 'Ionian Antiquities' (1769); 'Ancient Inscriptions' (1774); 'Travels in Asia Minor' (1775); and 'Travels in Greece' (1776). Chandler was an Anglican clergyman and at his death was rector of Tilehurst, near Reading.

Chandler, Seth C., American astronomer: b. Boston, Mass., 16 Sept. 1845. He is well known for his investigations and observations of the phenomena of variable stars, the computation of comet orbits, and, in connection with Ritchie, for devising a system of astronomical code-telegrams for the announcement of astronomical discoveries. He also invented the Almucantar, and published a very complete treatise on the method of its use. He is an authority on the subject of variable stars, of which he has published a complete catalogue.

Chandler, William Eaton, American politician: b. Concord, N. H., 28 Dec. 1835. He was graduated at Harvard Law School in 1855, entered the New Hampshire legislature in 1862, became judge advocate general of the navy department in 1865, and secretary of the navy in 1882, serving three years. In 1887–1901 he was a United States senator from New Hampshire.

Chandler, Zachariah, American statesman: b. Bedford, N. H., 10 Dec. 1813; d. 1 Nov. 1879. He received a common school education, and early in life went to Detroit, and engaged in the dry goods business, in which his energy and ability soon brought success and put him in possession of a handsome fortune. He was mayor of Detroit in 1851, the defeated Whig candidate for governor of Michigan in 1852, an active organizer of the Republican party in 1854, and in January 1857 was elected to the United States Senate to succeed Gen. Lewis Cass. He was re-elected in 1863 and 1869; then served for a time as secretary of the interior in President Grant's cabinet, and was again elected to the Senate in February 1879. He opposed the admission of Kansas under the Lecompton constitution 1858, and he was the author of the famous "blood letter," in which he said "without a little blood-letting, this Union will not, in my estimation, be worth a rush." Though a warm friend of Lincoln, he was more radical than the latter, and often differed from him in matters of public policy. In July 1861 he introduced a sweeping confiscation bill which failed to pass; and in July 1862 violently assailed McClellan in a speech in the senate. He was a man of imposing presence, fine judgment, great energy, and perseverance. He was found dead in bed on the morning after delivering a political address in Chicago.

Chandler School of Science. See CHANDLER, ABIEL.

Chan'dos, the name of a noted English family, descended from a follower of William the Conqueror, the last representative in the direct male line being Sir John Chandos (d. 1428), whose sister married one Giles Brydges. Their descendant, Sir John Brydges, was lieutenant of the Tower under Queen Mary, and was created Baron Chandos in 1554. James Brydges (1673–1744), eighth Lord Chandos, sat in Parliament for Hereford from 1698 to 1714, and was created Duke of Chandos in 1719. The lucrative post of paymaster of the forces abroad supplied means for building a palace at Canons, near Edgeware, which cost $1,000,000, but was torn down at the Duke's death. Here Handel lived two years, wrote anthems for the chapel service, and produced 'Esther.' In 1796 the title passed by marriage to the family of Grenville, now retaining the title of Duke of Buckingham and Chandos.

Chandpur, chŭnd- or chänd'-poor, India, a town in the Bijnaur district of the Northwest Provinces, about 40 miles east-northeast of Meerut. It is thriving, well paved, and drained; there is a trade in sugar and grain, besides some manufactures of cotton cloth, pipes, etc. Pop. 13,000.

Chang-Chau, chäng'-chow', China, a city in the province of Fokien, 35 miles west-northwest of Amoy, which is its port. It stands in a valley surrounded by hills and intersected by a river. Its walls are about four and a half miles in circuit, and immediately within is a space planted with large trees. It is the centre of the silk manufacture of the province. Pop. about 900,000.

Chang-Sha, chäng'-shä', China, capital of the province of Hu-Nan, on the Siang River. It is not a treaty port, but has an important native trade carried on in small boats. A telegraph station is projected and in 1900 surveys were completed for a railway. Pop. about 350,000.

Chan'ga, a species of mole-cricket (*Scapteriscus didactylus*) injurious in Porto Rico. The changa is found throughout that island, living in galleries in the earth, and damaging the crown and roots of the tobacco, cane, and small crops; it is the most serious insect pest in the island. (See MOLE-CRICKET.) Consult Barrett, 'The Changa, or Mole-cricket'; 'Bulletin No. 2, Porto Rico Agricultural Experiment Station,' Washington, 1902.

Changarnier, shäṅ-gär-nē-ā, **Nicholas Anne Theodule,** French general: b. Autun 26 April 1793; d. Versailles 14 Feb. 1877. He was educated at Saint-Cyr, and went in 1830 to Algeria, where for 18 years he saw much active service. On the proclamation of the republic in 1848 he acted as provisional governor-general of Algeria, but returned to Paris to take command of the garrisons of Paris and of the national guard. He did much to check the outbreaks of the anarchist party during 1849. At the *coup d'état* in December 1851, after being imprisoned in Ham, he went into exile till the Franco-Prussian war, when he offered his services to Napoleon III. He was in Metz with Bazaine, and, on its capitulation, retired to Brussels. He returned to France in 1871, entered the assembly, and assisted M. Thiers in reorganizing the army.

Change of Colors. See CHATOYANCY.

Change of Function. During the metamorphosis of insects, *Crustacea,* and other animals, organs at first adapted for certain uses become, with change of conditions of life, media, and consequently of habits, adapted to quite different uses or functions. Thus in the young larva (Nauplius) of many of the lower *Crustacea,* the three pairs of head appendages are formed for swimming; the first two pairs afterward change into the two pairs of antennæ, the third pair becoming the jaws of the adult. In the tadpole, which lives on dead leaves or animal matter, the intestine is very long and coiled, but in after life, when the frog feeds on living insects, it is very much changed in form, being much shorter. There are many examples of change of function by suppression of the original or chief function, what was a minor use becoming the chief one. Other examples are the transformation of the jaws of biting insects into the needle-like elements, aiding in the formation of the beak of bugs (q.v.); the transformation of the hypopharynx of caddis-flies into the piercing organ of fleas and flies; the modification of the maxillæ of biting insects into the spiral tongue of the butterfly. The mouth-parts of bees and butterflies lost their primitive functions and adopted entirely new shapes and uses after flowers appeared. Among fishes the clearest example is the change of the swimming-bladder of the gar pike, where it also functions as a breathing organ, until in the lung-fishes, which have probably descended from some ganoid, it becomes a lung.

These changes of functions are due to change of the surroundings, and consequently of habits, finally bringing about change of function. Hertwig states that a muscle may from many causes become functionless, but finally becomes transformed into a ligamentous band. What are the gill-supports of fishes may, as the results in certain of their descendants of the adoption of a terrestrial mode of life, become in part degenerate, while another part persists by assuming a new function, forming the jaws, the hyoid bone, and the small bones of the ear, which are morphologically the same structures as the gill-arches. Consult: Dohm, 'Der ursprung der Wirbelthiere und das Princip des Functions nichsels'; Hertwig-Kingsley, 'Manual of Zoology.'

Change of Life. See MENOPAUSE.

Change'ling, a child left or taken in the place of another. It was at one time a common superstition that young children were liable to be stolen or changed by fairies before being baptized; and hence they were carefully watched till that ceremony was over. It was thought that the fairies were always anxious to change their own starveling elves for the more robust children of men. The children so left were called changelings, and were known by their greater backwardness in growth or learning; hence, stunted or idiotic children were regarded as changelings.

Chank-shell, the shell of a gastropod mollusk (*Turbinella rapa*). An extensive fishery of these shells, which live in water from 12 to 15 feet deep along the shores of Ceylon and India, has been established at Tuticorin. The shell is a sacred emblem of Vishnu, who is often represented as holding a "sinistral" one in his hand. They are used by the Hindu women as bangles and leg ornaments, or anklets. The chank appears as a symbol on the coins of some of the ancient Indian empires, and is still retained on the coinage of the Rajah of Franvacore.

Chanler, Amelie Rives. See TROUBETSKOY.

Chan'ler, William Astor, American explorer: b. Newport, R. I., 11 June 1867. He studied at Harvard, but left the university to make explorations in Africa. He was elected to the New York legislature in 1897, and to Congress in 1898 as a Democrat. He served in the war with Spain and was commended in Gen. Shafter's reports. He has written 'Through Jungle and Deserts' and 'Travels in Eastern Africa'; etc.

Chan'nel Islands, a group of islands in the English Channel belonging to Great Britain, off the west coast of the department La Manche, in France. They consist of Jersey, Guernsey, Alderney, and Sark, with some dependent islets; area, 75 square miles. They are picturesque and very fertile, and are celebrated for a peculiar breed of cattle, the chief strains of which are the Jerseys, Guernseys, and the Alderneys, which differ from each other in minor characteristics. The islands are almost totally exempt from taxation, and the people enjoy besides all the privileges of British subjects. There are two lieutenant-governors, one for Jersey, and the other for Guernsey, Alderney, and Sark. The government is in the hands of two corresponding bodies called the "states," some members of which are named by the Crown, while others are chosen by the people, and others sit *ex officio.* These islands have been fortified at an immense expense. Ecclesiastically they belong to the diocese of Winchester. The Channel Islands form the only remains of the Norman provinces once subject to the English crown. They now export large quantities of fruit, vegetables, and flowers to the English markets, including grapes, tomatoes, and potatoes, partly grown under glass. The fisheries also are important. French is generally spoken. Pop. (1901) 95,841.

Channeling-machine, a machine for cutting the channels in boot-soles, to allow the thread to bury itself in the leather and be protected from immediate wear. It consists of a knife, which makes an oblique cut in the sole to a gauged depth and regulated as to distance from the sole-edge by a guide.

In stone-working the term is applied to a machine having a series of jumpers or chisels which make a groove across the face of a block in the quarry, or detached. It has a gang of cutters operated by direct-acting steam cylinder. The cutters have direct motion from the piston. The valve is reversed at the blow of the cutters; or, in case of no blow being given, it is reversed before the cylinder bottom is touched by the piston. The cutter-bar is adjustable on the cylinder-bar to suit the depth of groove cut. The whole mechanism is mounted on vertically adjustable rollers, and the feed device is operated from the cross-head.

Channels, or **Chain-wales,** of a ship, pieces of wood or iron projecting edgewise like a ledge from the ship's outside, abreast of and extending somewhat behind the masts. They serve to extend the shrouds and to prevent them from touching the gunwale, or being injured by rubbing against it.

Chan'ning, Blanche Mary, American author: b. Liverpool, England, about 1863; d. Brookline, Mass., 9 Aug. 1902. Her father was Rev. William Henry Channing (q.v.), an American clergyman, for many years in charge of a Unitarian Church in Liverpool, and she was a grandniece of the famous Dr. William Ellery Channing (q.v.). In 1890 she came to the United States and devoted herself to literary work and poster and book-cover designing. She was the author of 'Zodiac Stories' (1899); 'Winifred West' (1901); 'The Balaster Boys' (1902).

Channing, Edward, American historian: b. Dorchester, Mass., 15 June 1856. He graduated at Harvard in 1878, and in 1883 was appointed instructor in history there, becoming successively assistant and full professor of history. He has written: 'The Narragansett Planters' and 'Town and County Government of the English Colonies in North America' (Johns Hopkins Studies, 1883–4); 'Columbus and His Companions,' in Winsor's 'Narrative and Critical History of the United States' (1888); 'The United States, 1765–1865'; in collaboration with A. B. Hart, 'Guide to the Study of American History' (1896); and with T. W. Higginson, 'English History for Americans.' In 1882 he translated B. Delbrück's 'Introduction to the Study of Language.' He is a son of William Ellery Channing (1818–1901) (q.v.).

Channing, Edward Tyrrel, American scholar: b. Newport, R. I., 12 Dec. 1790; d. Cambridge, Mass., 8 Feb. 1856. He was a brother of William Ellery Channing, 1780–1842 (q.v.). He studied law with his elder brother, Francis Dana Channing, in Boston, and was admitted to the bar. He gave his attention chiefly to literature, and carried forward a careful and critical study of the Greek and Roman classics, with that of the great writers of England. The 'North American Review,' the earliest permanent periodical in America, had its origin in a club of young men, who, in the winter of 1814–15, projected a bi-monthly magazine. Willard Phillips, afterward author of the celebrated works on the law of insurance and of patents, was to be its editor. The committee on politics was composed of George Cabot, James Lloyd, John Lowell, Josiah Quincy, and others. The chief managers were to be President Kirkland, Jared Sparks, George Ticknor, Mr. Channing, Richard H. Dana, and John Gallison. At this time, William Tudor, author of the 'Life of James Otis,' returned from Europe with a matured plan for a quarterly review; and as the field was not large enough for two such works, the plan of the magazine was merged in that of Mr. Tudor, and the first number of the 'North American Review' was issued in May 1815, as a bi-monthly, the quarterly publication not being adopted until the commencement of the eighth volume. Tudor edited it for two years, and in 1817 it passed under the control of a club. Jared Sparks was chief editor for one year, when the duty was undertaken by Channing, aided by his cousin, Richard H. Dana. In October 1819, Mr. Channing was succeeded in the editorship of the 'Review' by Edward Everett, having been appointed Boylston professor of rhetoric and oratory in Harvard University. This post he held for 32 years, resigning it in 1851. During all this time, the department of rhetoric and oratory, including the charge of all the English compositions of the students, and carrying great influence over their reading and taste, was filled by him with more than satisfaction to the public of reading and thinking men.

He established and maintained for the college a high reputation for purity and elegance of style in composition and elocution, and gave direction to the reading of an entire generation of leading men in all departments of intellectual labor. He was a constant contributor to the 'North American Review,' almost to the time of his death. In 1856 a volume of his lectures to the senior class at Harvard was published. He was highly esteemed for the charm of his conversation, which was choice and pure in style, with an occasional use of a restrained but effective humor. He was a man of pure and just character, thoughtful and scholarly habits, with few and warm friendships; tolerant and liberal views of his fellow beings; a Unitarian of the old school in his theology, and a philanthropic conservative in his politics.

Channing, Francis Allston, English writer: b. United States 21 March 1841. He is a son of William Henry Channing (q.v.) and a brother of Blanche Mary Channing (q.v.) and was educated at Exeter College, Oxford. He has been prominent in advocating agricultural and educational reforms and has published 'Instinct'; 'The Greek Orators as Historical Authorities'; 'The Second Ballot'; 'The Truth About Agricultural Depression.'

Channing, William Ellery, American Unitarian clergyman: b. Newport, R. I., 7 April 1780; d. Bennington, Vt., 2 Oct. 1842. Entering Harvard College at 14 he took his degree in 1798 and though at first inclining to the study of medicine, presently decided upon the profession of the ministry. After his graduation he spent two years in Virginia as a tutor, but in pursuance of his ascetic views regarding renunciation, and the necessity of subduing the animal nature, he endeavored to accustom himself to hardships during this period, even denying himself sufficiency of food and clothing. The result of this unwise course was to implant in him the tendency to disease that made him for the greater part of his career a semi-invalid. Returning from Virginia he took up the study of theology, making at the start a careful study of the evidences of Christianity, wishing, as he

said, to know what Christ taught and not what men made him teach. In 1801 he was made regent of Harvard, the duties of this office being light, and the salary sufficient for his support while continuing his studies. In 1802 he preached his first sermon at Medford, Mass., from the text "Silver and gold have I none; but such as I have, give I thee." In 1803 he was ordained pastor of the Federal Street Church in Boston and continued in that relation for the rest of his life. In the earlier years of his ministry the denominational spirit was not especially strong in him and with the ministers of the Trinitarian churches in Boston, he was on most friendly terms. His opinions were ripening during this period, however, and in 1819, at the ordination of Rev. Jared Sparks in Baltimore, he preached a sermon in which for the first time he gave free expression to the principles of Unitarian Christianity, upholding the exercise of reason in religious matters; declaring the Bible to be "a book written for men in the language of men, and its meaning to be sought in the same manner as that of other books." He also objected to the doctrine of the Trinity, affirming his belief that Christ was distinct from and inferior to God, and sent to men as a great moral teacher, not as a mediator between erring man and offended deity. This discourse gave rise to much controversy and fixed definitely the Unitarian position as distinguished from that of the Trinitarians. It made him, moreover, the recognized leader of American Unitarianism, and much as he disliked controversy he never hesitated from uttering what he believed to be true because of hostile criticism. His greatest dread was of becoming creed-bound and thus losing perception of new truths, and he even spoke of himself as "little of a Unitarian," and standing aloof "from all but those who strive and pray for clear light, for a purer and more effectual manifestation of Christian truth." After 1824 Rev. Ezra Stiles Gannett was associated with him in the ministry of the Federal Street parish, and from this epoch his time was largely given to philanthropic and literary work, the asceticism of his youth having long since been supplanted by a more wholesome understanding of life and its requirements and duties. He visited Europe in 1822 and became acquainted with Coleridge and Wordsworth. He was one of the first to acknowledge the greatness of the latter, and save Shakespeare, he read no poet oftener. Channing was a fearless defender of freedom, and upheld Garrison when that great abolitionist was the most generally detested person in Boston. In the pulpit his mission, as he saw it, was to free men's minds from servile conceptions of God, to disabuse religion of its benumbing terrors, and to show forth to men the real significance of their moral natures. His writings on theological, social, and philanthropic themes have received the widest circulation and been translated into French, Italian, German, Icelandic, Russian, and Hungarian. The most notable of them include: 'Evidences of Revealed Religion'; 'Essay on National Literature' (1823); 'Remarks on the Character and Writings of John Milton' (1826); 'Character and Writings of Fénelon' (1829); 'The Duty of the Free States' (1835); 'Self Culture' (1838). He had a life-long abhorrence of slavery, but in his 'Duty of the Free States' his feelings on the subject find fullest expression. His name, moreover, was associated with the most of the social reforms of his day and besides bearing a part in the great anti-slavery agitation, he warmly sympathized in the temperance movement, was an ardent lover of peace, and deeply interested in schemes for educational advance. He stood for intellectual and spiritual ideals and foresaw dangers both to nations and individuals, in the spread of materialism, in the contented adoption of inadequate aims, complacent satisfaction with perishable interests. In an age when comparatively few religious leaders dared to think outside of narrow prescribed limits, Channing stood forth as the intellectual champion of freedom. Much of his influence may have been due, no doubt, to the singular sweetness of his disposition, and his entire nobility of character, but more of it was due to the fact that he spoke with utter fearlessness and thus inspired other men to free themselves from the fetters of dogma or of intellectual timidity. Although two generations have passed since his death, his name is still both familiar and beloved, and his beneficent influence, far from lessening its hold upon men, has deepened and widened with the years. Channing's literary style, while not highly ornamental, was both clear and vigorous, and his sentences were usually short and direct, though it is said that his personal preferences in the writings of others were for long and involved sentences. On 1 June 1903, a bronze statue of Channing by Herbert Adams was unveiled in the public garden in Boston, Mass., its site being opposite the Arlington Street Church, the successor of the Federal Street Church, of which he was so long pastor. The statue and its monumental setting were the gift of John Foster to the city. See 'Lives' by W. H. Channing and C. T. Brooks; 'Correspondence of Channing and Lucy Aikin'; Peabody, 'Reminiscences.'

OSCAR FAY ADAMS,
Editorial Staff 'Encyclopedia Americana.'

Channing, William Ellery, American poet; nephew of William Ellery Channing, the elder: b. Boston, Mass., 10 June 1818; d. Concord, Mass., 23 Dec. 1901. After some years spent in newspaper work he retired to Concord, where he lived the life of a recluse. His writings include: 'Poems' (1843–7); 'The Woodman' (1849); 'Near Home' (1858); 'The Wanderer' (1872); 'Conversations in Rome' (1847); and 'Thoreau, the Poet-Naturalist' (1873); 'Eliot'; 'John Brown.'

Channing, William Henry, American clergyman: b. Boston 25 May 1810; d. London 23 Dec. 1884. His father, Francis Dana Channing, died when he was very young. He graduated at Harvard College in 1829, and entering the Unitarian ministry preached with much success in Meadville, Penn., New York, Cincinnati, Nashua, Boston, and Rochester. Settling in England, he succeeded James Martineau as pastor of the Hope Street Chapel in Liverpool 1852–62. He was for two years chaplain of the Senate at Washington, but from the close of the Civil War lived entirely in England. He published: 'Memoirs of Dr. William Ellery Channing' (1848); 'Life and Writings of James H. Perkins'; 'Memoirs of Madame Ossoli (Margaret Fuller),' in connection with R. W. Emerson and J. F. Clarke. His addresses and discourses were often extemporaneous and deliv-

ered in a style highly impassioned and imaginative. During a considerable part of his career he was an earnest advocate of social reform. See 'Life,' by Frothingham (1886).

Chanson de Roland, the culmination of a cycle of 'Chansoms de Geste' or 'Songs of Valor,' celebrating the heroic achievements of Charlemagne. They are inspired especially by the joy and pride of the triumph of Christian arms over the Mohammedan invasion, which, through the gate opened by the Moors of Spain, threatened to subdue all Europe. The French text of the 'Chanson' was first published in Paris by M. Francisque Michel in 1837, and afterward in 1850 by M. F. Genin. Tyrwhitt, in his edition of Chaucer, was the first to call the attention of English readers to the 'Chanson'; but English tradition has it that the song was sung by the Norman Taillefer just before the battle of Hastings. The best and oldest French MS., called the 'Digby,' is preserved in the Bodleian library at Oxford. The French poem contains 6,000 lines. A fragment of 1,049 lines, translated in Middle English from what is known as the Lansdowne MS., is published by the Early English Text Society.

Chansons de geste, shänsôn' de zhest', the romances of the Middle Ages sung or recited by wandering minstrels. Their number in French is very large; in English they are not so numerous and most of them are translations of a French original.

Chant, Laura Ormiston Dibbin, English lecturer and reformer: b. Chepstow, Monmouthshire, 1848. In 1876 she was married to Thomas Chant. She has taught in schools as well as nursed in hospitals and has lectured widely both in England and the United States on literary and scientific subjects, being a prominent advocate of woman's suffrage, temperance, etc. She has published: 'Verona and Other Poems'; 'Short Stories'; and several collections of original songs.

Chant, a short musical composition adapted to the singing of the psalms and canticles. Chants are single when adapted to a single verse, and double when adapted to two verses, the former consisting of two strains of three and four bars respectively, and the latter being of twice that length. More recently quadruple chants extending over four verses have been introduced. The complete chant consists of four parts, namely: (1) the intonation or initial phrase leading up to the reciting note; (2) the reciting note, which is the dominant of the mode employed; (3) the mediation, or main body of the chant; and (4) the termination or concluding phrase. In modern Anglican chants, however, there is no intonation. The origin of the plain song of the Church is unknown, but the first attempt to reduce the traditional music to some definite system was made by Saint Ambrose, bishop of Milan (d. 397). More important, however, by far is the Antiphonarium of Gregory the Great, which appeared in the latter half of the 6th century and soon established itself as the chief and in fact only authority on Church music. The Gregorian tones were introduced into England by Saint Augustine, and in the course of their history in that country they underwent many modifications in the various local «uses.» During the Civil War and the Commonwealth they went out of use, but were revived at the Restoration. Not long afterward, however, the Gregorian chants began to give place to the modern double chants, and it is only in quite recent years that attempts have been made to revive them.

Chant du Depart, shäṅ dü dā-pär (Fr. «Song of Departure»), a popular French military song of the period of the Revolution, written by the poet Marie Joseph Chenier, to the music of Méhul.

Chantabon, shän-tä-bŭn', or **Chantiban,** an important commercial port of Siam, on the east side of the Gulf of Siam, near the mouth of the Chantibun River. It is occupied by the French as security for fulfilment of the treaty of 1893. It is a place of considerable trade, and gives access to a rich mineral district. Pop. (estimated) 30,000.

Chantal, shäṅ-täl, **Jane Frances Frémiot** (frām-yō) **de,** SAINT, French devotee, foundress of the order of the Visitation B. V. M.: b. Dijon, France, 1572; d. Moulins 13 Dec. 1641. She was the daughter of a president of the Dijon parliament. On the death of her husband, Christophe Rabutin-Chantal, in 1600, she vowed not to marry again but to devote herself wholly to religious and charitable duties, under the direction of St. Francis de Sales, bishop of Geneva. The institute of the Visitation nuns was founded in 1610 at Annecy, and at her death it had 87 houses, and 60 years later 150 houses with 6,000 inmates — nuns and girls receiving a secular and religious education. She was canonized by Clement XIII. in 1767; her day in the Roman Calendar is 21 December. Her son, Celse Benigne de Rabutin-Chantal, was the father of the celebrated Madame de Sévigné. Her life and letters were published at Paris (1779).

Chanterelle, an edible mushroom (*Cantharellus cibarius*) of a bright orange color, with a pleasant fruity smell, growing in woods and on dry pastures. See MUSHROOM.

Chantibun. See CHANTABON.

Chantilly, shäṅ-tē-yē, France, a town in the department Oise, 25 miles north-northeast of Paris, on the Nonnette, celebrated for its splendid château, built for the Duc d'Aumale in 1876. It stands on the site of an older château which first became important under Anne de Montmorency. In 1632 it passed to the house of Condé, but the greater part was demolished at the Revolution. The last prince of Condé bequeathed the domain to the Duc d'Aumale in 1830. The present building and domain, including fine grounds and gardens, an extensive forest, etc., were presented by the Duke to the French Institute in 1886. The château contains a valuable library and a precious collection of works of art. The place was formerly celebrated for its manufacture of lace («Chantilly lace»). It is a great horse-racing and training centre. Pop. 4,500.

Chantilly, shăn-tĭl'lĭ, or **Ox Hill, Battle of.** On 31 Aug. 1862, the day after the second battle of Bull Run, Gen. Lee marched his army by way of Sudley Ford around Pope's right at Centreville, to seize Fairfax Court-House and interpose between Pope and Washington; and at night Jackson, who was in advance, bivouacked six miles west of Chantilly, on the Little River turnpike, Longstreet some distance in rear.

Next morning Gen. Stuart informed Jackson that a part at least of the Union army was at Fairfax Court-House, and that Pope's trains were passing on the road from Centreville to that place. Jackson moved cautiously toward Fairfax Court-House, and on reaching Ox Hill, three miles east of Chantilly, was informed by Stuart that the Union force seemed very strong on the road in front. Then Jackson formed line on Ox Hill ridge, his artillery massed on the left of the road, his infantry on the right, extending in the direction of the Centreville road. He had not completed his formation when he became aware of an approaching force from the Centreville road, upon which he strengthened his right and threw out skirmishers. About 1 P.M. Pope, who had heard of Jackson's advance toward his rear, sent Gen. I. I. Stevens with nine regiments, about 3,000 men, of Reno's corps to gain the road two miles east of Chantilly and hold Jackson in check until the army could be brought into position at Fairfax Court-House. Stevens moved from near Centreville across the fields, unexpectedly struck Jackson's advancing skirmish-line, thrown out from his right, and drove it back into a body of woods. Jackson then advanced a regiment from the woods, which was immediately driven back by Benjamin's battery. Stevens now formed a column of assault, six regiments in three lines, two regiments in a line. At 4.30 P.M. he placed himself in the centre of this column of 2,000 men, on open ground, and ordered it forward, Benjamin shelling the woods in front. Not a sight nor sound betrayed the presence of an enemy, until the advancing column, ascending a gentle slope, came to within 75 yards of the woods, when from a worm fence bordering them, came a terrific volley from Branch's brigade, smiting the column with great effect, men going down by the score. At first it began to waver, but quickly bracing up returned the fire, five color-bearers of the 79th New York, Stevens' old regiment, went down in succession. The assault was checked, Stevens ran forward, seized the colors and, calling upon his men to follow him, all rushed forward, routed Branch, and gained the fence, Stevens falling dead on it, with a bullet through his brain and the colors upon his head and shoulders. The column pushed on into the woods. At the moment of reaching the fence a sudden and terrific thunderstorm and fierce gale burst over the field, blowing the rain into the faces of the men on both sides, impeding their movements and wetting their ammunition. Jackson brought up fresh men, and after a contest of more than an hour the six regiments were driven out of the woods and fell back to the point where they had formed, and on the right of where Birney's brigade of Kearny's division had come up. Meanwhile three regiments of Reno's command had been sent in on Stevens' right, one only of which, the 21st Massachusetts, became seriously engaged and was repulsed with great loss. Gen. Kearny now came up with a battery, which he put in position and went to the right for a regiment to fill an interval on Birney's right. He met the 21st Massachusetts as it came out of the woods, and was leading it to the left when his attention was called to the fact that the Confederates were advancing from the woods and through a cornfield on Birney. He spurred his horse into the cornfield to reconnoiter, ran upon a skirmish-line, saw his mistake, and turned to ride back, when he was shot through the body and killed. A sharp encounter ensued between the 21st Massachusetts and the Confederates, which was ended by darkness; the regiment withdrew, the Confederates retired to the woods, and the battle was ended, neither side having permanently gained a foot of ground. The other two brigades of Kearny came up, and the ground was held until 3 o'clock in the morning of the 2d, when Kearny's and Reno's men fell back to Fairfax Court-House after the last of Pope's army from Centreville had passed. Pope fell back to Washington, and Lee marched to cross the Potomac into Maryland. The Union loss at Chantilly was about 800; that of the Confederates about 700. In the death of Kearny and Stevens the Union army lost two of its best officers. Consult: 'Official Records,' Vol. XII.; Hazard Stevens, 'Life of Gen. I. I. Stevens,' Vol. II.; G. H. Gordon, 'Army of Virginia.'

E. A. CARMAN.

Chantrey, chăn'trĭ, SIR **Francis Legatt,** English sculptor: b. Jordanthorpe, Derbyshire, 7 April 1781; d. 25 Nov. 1842. The chief amusement of his boyhood was in modeling figures in clay and drawing likenesses, and at his own request he was apprenticed in 1797 to a carver and gilder at Sheffield. Here he attracted the attention of J. Raphael Smith, a mezzotinto engraver and portrait-painter, who, perceiving his decided inclination for drawing and modeling, gave him instructions which tended greatly to prepare him for his future career. By 1804 he was resident in London, studying at the Royal Academy. Having acquired much reputation as a sculptor, he became the successful candidate for the marble bust which the inhabitants of Sheffield had resolved to erect to the memory of the Rev. J. Wilkinson. This interesting work, which may be said to have finally decided his future course, is in Sheffield Parish Church. Having settled permanently in London, he presented numerous busts at the exhibitions of the Royal Academy. About the same time he was a successful candidate for a statue of George III. for the city of London, and soon was almost universally regarded as the first monumental sculptor of the day. In 1815 he was chosen an associate and in 1818 a member of the Royal Academy. In 1819 he visited Italy, where he was elected member of the academies of Rome and Florence. He was knighted in 1835. His most celebrated works are the 'Sleeping Children,' a monument erected to two children of the Rev. W. Robinson, in Lichfield Cathedral; the statue of Lady Louisa Russell, daughter of the Duke of Bedford, in Woburn Abbey; Lady Frederica Stanhope with her infant child, in Chevering Church; Sir Joseph Banks, at the British Museum; Roscoe and Canning, at Liverpool Town Hall; James Watt, at Glasgow; the bronze statue of William Pitt, in Hanover Square, London; and statues of Horner, Sir J. Malcolm, etc., in Westminster Abbey, and a statue of Washington in the State House at Boston, Mass. His finest works are his busts, among the best of them being Sir Walter Scott, Watt, Wordsworth, and Porson. His full-length figures are said to betray an insufficient acquaintance with anatomy, and several of his equestrian statues in bronze are still more defective. The

postures are formal, and the horses, in their bodies and limbs, are very inanimate. He made munificent bequests for the advancement of art, the Royal Academy being endowed with a large fund for the purchase of works of sculpture and painting by artists residing in Great Britain.

Chan'try (old French, *Chanterie*), an ecclesiastical endowment to provide for the celebration of masses for the prosperity of the living or repose of the dead. Previous to the Reformation chantries were very numerous, almost every family of importance having founded one or more. Wealthy founders would endow a church or monastery, in which religious services should be celebrated continually. For less wealthy founders, an altar in the church of the locality was made to suffice. Sometimes small chapels, called chantry chapels, were appended to the main edifice, and occasionally, as at Wakefield and Bradford-on-Avon, such chapels were erected on bridges. The residences of priests engaged in the services were known as chantry houses, chantries, or colleges. The Chantry schools were widely spread over England prior to the Reformation. Chantries were dissolved in England by King Edward VI., and nearly all endowments were devoted to the purposes of the Crown.

Chanute, chạ-noot', Kan., a city in Neosho County, 125 miles southwest of Kansas City, Mo., on the Atchison, T. & S. F. and the Missouri, K. & T. R.R.'s. The city was incorporated in 1873. Manufactories here, including railroad shops, utilize the abundant natural gas of this locality, which is also used for lighting and various domestic purposes. The recent discovery of extensive oil-fields in the vicinity has led to a new and important industry, over 250 productive oil-wells having been opened. This industry promises rapid growth for the city, and also developments of great importance to the State. Pop. (1900) 4,208.

Chanzy, shäṅ-zē, **Antoine Eugène Alfred,** French general and politician: b. Nouart, Ardennes, 18 March 1823; d. Châlons-sur-Marne 4 Jan. 1883. After a course at the military school of Saint Cyr, he became sub-lieutenant of infantry in 1843, and was sent to Algeria. He subsequently served in Italy and Syria, but on becoming colonel he returned to Africa in 1868. On the outbreak of the war with Germany, in 1870, he was created a general of division, and after gaining the battles of Coulmiers and Patay, was put in command of the second army of the Loire. Here he fought heroically against the much stronger and more disciplined Germans, but finally had to retreat. He was elected to the National Assembly for the department of Ardennes, and during the Commune he narrowly escaped with his life. In 1873 he went to Algeria as governor-general, and in 1879 he stood for the presidency. In that year also he was sent to Russia as ambassador, a post which he held till 1881, when he became commander of the sixth army corps.

Chao-chow, chow'-chow', China, a city in the province of Kwang-tung, on the River Han, 195 miles northeast of Hong Kong. It is the centre of an important maritime division of the province. The channel leading to it is very shallow, so that ships of large burden can sail up only at high water. This city was included in the Treaty of Tientsin (1858) as a port open to foreign trade, but the foreign trade is transacted at Swatow. Pop. (1900, estimated) 200,000.

Chaos, according to the signification of the word, the void which embraces all things. Hesiod mentions, as the original principles of all things, Chaos, Earth, and Eros (Love); other ancient poets made Chaos alone the primeval source from which everything is derived; others added to it Night, Erebus, and Tartarus; and others still represented Chaos as the parent of the Earth and Heaven; after the production of which Eros (Love) completed the creation. Modern writers commonly understand by chaos the unformed primeval matter from which the universe was made.

Chap-books, a species of cheap literature, in the form of small pamphlets, which preceded the popular periodicals of the present day and were so called because prepared expressly for sale by the chapmen, or pedlars, who hawked them from district to district. They were largely productions of the provincial presses. The writers are mostly unknown, but one of the authors of Scottish chap-books was Dougal Graham (1724–79), bellman of Glasgow. Their matter was of the most varied character, and some of them were decidedly coarse and vulgar.

Chapala, chä-pä'la, Mexico, a lake on the high plateau of Jalisco, surrounded by steep, bare mountains. It has an estimated area of 1,300 square miles, contains many islands, and is traversed by the Rio Grande de Santiago.

Chapeaux, shä-pō (Fr. «hats»), a name applied to the partisans of France in Sweden in the 18th century, while those of Russia were called bonnets (caps). Having instigated war against Russia in 1741, and again in 1756, the calamities thus inflicted upon Sweden impaired the popularity of the *chapeaux*. Succeeding in 1769 in regaining their former position, the party was soon extinguished altogether by the advent of Gustavus III. and his reforms. The same names were also formerly applied in the French academy, the *chapeaux* constituting the party supported by the philosophers and the public, and the bonnets that upheld by the clergy and the court.

Chaparral-cock, chăp-a-răl'-kŏk, one of the English names of a species of ground-cuckoo (*Geococcys californianus*), so called from the chaparral, or somb, which it inhabits. A remarkable bird which Coues aptly describes as a «cuckoo compounded of a chicken and a magpie,» having a length of about two feet, of which a half is tail, very short wings, powerful legs, and feet of the cuckoo type, a rather long bill and crested head. The colors are changing and varied bronzes with brown and white markings. The chaparral-cock inhabits northern Mexico and southwestern United States, while a second related species is confined to Mexico. When pursued it seldom flies, but runs with great speed with upraised wings. Like other American cuckoos it builds a flimsy nest of twigs, in which six or more white eggs are laid at intervals. In feeding both animal and vegetable matter are partaken of. They are sometimes domesticated and trained to catch mice and other house pests. Other names applied to

this bird are road-runner, ground-cuckoo, paisand, and snake-killer, each of which suggests one of the peculiarities of the bird. See CUCKOO.

Chapel (French *chapelle*, Latin *capella*), a name for religious edifices of various kinds, especially for such as hold a subordinate position. In England and Scotland there are several kinds of chapels — parochial chapels, subordinate to, but distinct from, the mother church; chapels of ease, built for the accommodation of the inhabitants in large parishes; university chapels, and private chapels, whose names explain their uses. The term is also applied to small buildings attached to cathedrals, and separately dedicated. In England nonconformist places of worship are commonly called chapels in distinction from those of the Established faith to which the term church is applied. In the early history of the Massachusetts Bay Colony the Congregational body was the established church, and the first Episcopal church in Boston was consequently termed a chapel, retaining that name, "King's Chapel," to the present time. (See KING'S CHAPEL.) The word chapel is also applied to an association of union workmen in a printing-office for the purpose of promoting and enforcing order among themselves.

Chapelain, Jean, zhŏn shăp lăn, French poet, one of the earliest members of the French academy: b. Paris 4 Dec. 1595; d. there 22 Feb. 1674. Having gained a high literary reputation, more by ingratiating himself with Richelieu and other influential persons than by his intrinsic merits, he conceived the project of writing an epic, 'La pucelle,' which proved a total failure, although he spent over 20 years upon it. The first 12 cantos appeared in 1656; and to so high a pitch had public expectation been wrought, that, notwithstanding the adverse criticism of Boileau and Voiture, six editions came forth within the following 18 months. Eight new parts appeared in 1757, and the concluding four parts which never were printed, are in manuscript in the imperial library of Paris. Richelieu, to whom he dedicated a poem and whom he assisted in concocting literary works, conferred a pension on him; he presided over the organization of the French academy, took a conspicuous part in the early labors of that body, sat as academical critic upon Corneille's 'Cid,' and possessed during nearly 40 years a literary prestige, which was broken by his 'Pucelle,' although he remained in favor with the court.

Chapelle, shä-pĕl', **Placide Louis,** American Roman Catholic clergyman: b. Mende, France, 28 Aug. 1842. He came to the United States in 1859, and was graduated at St. Mary's College, and was ordained a priest in 1865. For five years he was a missionary, and from 1870 to 1891 held pastorates in Baltimore and Washington. He was made coadjutor archbishop of Santa Fé in 1891; archbishop in 1894; and archbishop of New Orleans in 1897. The following year he was appointed by the Pope Apostolic Delegate to Cuba, Porto Rico, and the Philippines. In the latter archipelago he warmly espoused the cause of the friars, resisting the demand of the factions which sought their expulsion.

Chaperon, shăp'ē-rōn, a cap or hood. Such a covering is worn by Knights of the Garter, and was at one time in general use, but was latterly appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places is called a chaperon, probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

Cha'pin, Edwin Hubbell, American clergyman: b. Union Village, N. Y., 29 Dec. 1814; d. New York 27 Dec. 1880. In 1837 he was ordained to the Universalist ministry, was a pastor at Richmond, Va., Charlestown and Boston, Mass., 1838–48, and then accepted a call to the Fourth Universalist Church in New York, a connection he retained until his death. His preaching attracted such throngs, especially of non-churchgoers, that within four years two changes were made to larger quarters. He was a pulpit orator of remarkable power and eloquence, and a popular lecturer whose services were always in demand. He laid small stress on creeds, but preached a high standard of earthly conduct, and his sermons dealt with every kind of social and political topic. His collected sermons and addresses are: 'Discourses on the Beatitudes' (1855); 'Select Sermons' (1860); 'Living Words' (1861); 'Lessons of Faith and Life' (1876); 'God's Requirements' (1881); 'The Church of the Living God, and Other Sermons' (1881). See 'Life,' by Ellis (1882).

Chapin, John R., American illustrator: b. Providence, R. I., 1823. He received a common school education and studied law, but took up art. He was a pioneer in periodical illustration in the United States. In 1853 he became art manager of the 'United States Magazine' and in 1861 for Harper Brothers. In 1863 he made the designs for the new series of bills for the national currency.

Chap'lain, a clergyman not having a parish or similar charge, but connected with a court, the household of a nobleman, an army, a prison, a ship, or the like. Chaplains in the United States army rank as captains of infantry; in the navy they have the rank of lieutenant, commander, and captain, according to length of their service.

Chaplain of the Fleet, The, a novel by Walter Besant and James Rice, published in 1881. It gives a detailed account of the famous Liberties or Rules of the old Fleet prison in London, and of the Fleet marriages of the 18th century. These "Rules" were houses in certain streets near the Fleet Market, where prisoners for debt were allowed to live, outside the prison, on payment of fees. Among these prisoners were clergymen, who performed clandestine marriages. A regular trade sprang up, touters were employed to bring clients, and every species of enormity was practised. Gregory Shovel was one of these clergy, and so plumed himself on his success in this iniquitous traffic that he took the name of "Chaplain of the Fleet." This novel is considered one of the best of those written under the firm-name of Besant & Rice.

Chapleau, shä-plō, SIR **Joseph Adolphe,** Canadian statesman: b. Saint Therese de Blainville, Quebec, 9 Nov. 1840; d. Montreal 13 June 1898. He studied law and distinguished himself at the bar. He was chosen leader of the Quebec Conservatives and formed a cabinet in 1879, re-

maining premier of Quebec till appointed secretary of state for the Dominion in 1883. He was lieutenant-governor of Quebec in 1893-8.

Chaplin, shăp-lăn, **Charles Joshua,** French portrait painter: b. Les Andelys 6 June 1825; d. Paris 30 Jan. 1891. He was of English parentage, but was naturalized as a French citizen. Under Napoleon III. he was engaged in decorating the Tuileries and the Elysée, and he also painted many ceilings and wall decorations in Parisian public and private buildings as well as various portraits, mainly those of women.

Chap'lin, Heman White, American lawyer and short-story writer: b. Rhode Island 1847. His 'Five Hundred Dollars and Other Stories of New England Life' ranks with the best works of its kind.

Chaplin, Jeremiah, American historical writer: b. Danvers, Mass., 1813; d. New Utrecht, N. Y., 5 March 1886. He was author of: 'Life of Charles Sumner'; 'Life of Franklin'; 'Riches of Bunyan'; 'Life of Galen'; and 'Life of Henry Dunster, First President of Harvard College' (1872), a work of much historical value.

Chap'man, Alvan Wentworth, American botanist: b. Southampton, Mass., 28 Sept. 1809; d. 6 April 1899. He graduated at Amherst 1830, studied medicine in Georgia and Florida, and in 1846 settled in Appalachicola, where he was collector of internal revenue 1865–6, and collector of customs 1866–9. He attained a high rank as a botanist, and the genus *Chapmannia* was named in his honor. He wrote: 'Flora of the Southern United States, Arranged According to the Natural System; the Ferns by D. C. Eaton' (1860, 2 ed. enlarged, 1883).

Chapman, Frank Michler, American naturalist: b. Englewood, N. J., 12 June 1864. Since 1887 he has been assistant curator in the department of vertebrate zoology in the American Museum of Natural History, New York. He is editor of 'Bird-Lore' and associate editor of 'The Auk.' Besides many papers in scientific journals, etc., he has published: 'Hand-book of Birds of Eastern North America' (1895); 'Bird-Life, a Guide to the Study of Our Common Birds' (1897); 'Bird Studies with a Camera' (1900).

Chapman, George, English poet, the earliest and perhaps the best translator of Homer; b. Hitchin Hill, Hertfordshire, 1557; d. London 12 May 1634. He was educated at Oxford, and in 1576 proceeded to London, where he made the friendship of Shakespeare, Spenser, Marlowe, and other distinguished writers of the time. As to his personal history little is known, but he is supposed to have held some post in connection with the court. The first of his works, so far as known, was the 'Shadow of Night,' a poem published in 1594. His translation of the 'Iliad,' in rhyming lines of 14 syllables each, was published in three separate portions, in 1598, 1600, and 1603. It has been highly commended by such poets as Pope, Keats, and Coleridge, as also by Lamb. Keats' sonnet 'On First Looking Into Chapman's Homer' ("Then felt I like some watcher of the skies," etc.) is well known. In 1614 appeared his translation of the 'Odyssey' in the same metre as the 'Iliad,' followed in the same year by that of the 'Battle of the Frogs and Mice' and the Homeric hymns. He also translated Hesiod's 'Works and Days' and portions of various classic poets. He wrote numerous plays, almost all now forgotten, though containing some fine passages. The earliest of these was 'The Blind Beggar of Alexandria,' a comedy, 1598. He was associated with Jonson and Marston in writing the comedy of 'Eastward Ho!' which from its satirical reflections on the Scotch is said to have nearly brought severe punishment on the authors. Among his tragedies are 'Bussy d'Ambois', 'Cæsar and Pompey', 'Revenge for Honor', and two dramas on the life of Marshal Biron, which Swinburne characterizes as "a storehouse of lofty thought and splendid verse, with scarcely a flash or sparkle of dramatic action." An edition of his works was published (1873–4). See Swinburne, 'George Chapman: a Critical Essay' (1875); Matthew Arnold, 'On Translating Homer.'

Chapman, Henry Cadwalader, American physician: b. Philadelphia 17 Aug. 1845. He graduated at the University of Pennsylvania in 1863, from the medical department in 1867, and after three years study in Europe settled in practice in Philadelphia. He has lectured on 'Anatomy and Physiology' in the University of Pennsylvania; on 'Physiology of the Nervous System' in Jefferson Medical College, and is curator of the Philadelphia Academy of Sciences. He has published: 'Evolution of Life' (1878); 'History of the Discovery of the Circulation of the Blood' (1884); 'Medical Jurisprudence and Toxicology' (3 ed. 1903).

Chapman, J. Wilbur, American clergyman: b. Richmond, Ind., 17 June 1859. He graduated at Lake Forest University, Illinois, in 1879, and at Lane Theological Seminary in 1882. After pastoral work in Albany and Philadelphia, and evangelistic work in all parts of the country, he became pastor of the Fourth Presbyterian Church in New York. He is a prolific writer of Sunday-school and Christian Endeavor literature, of which the following are among his most recent titles: 'The Lost Crown' (1898); 'Spiritual Life of the Sunday-school' (1899); 'The Surrendered Life' (1899); 'From Life to Life' (1900); 'Life and Work of D. L. Moody' (1900); 'Revivals and Missions' (1900); 'Day by Day' (1901); 'Man Who Said He Would' (1902).

Chapman, John Gadsby, American artist: b. Alexandria, Va., 1808; d. 28 Nov. 1889. Early indicating his taste for design, he was enabled by the liberality of a friend to visit Rome, and to study and practise his art there for several years. After his return to the United States, he removed to the city of New York, where, by his rare union of mechanical ingenuity with artistic taste, he rapidly obtained ample employment. He executed many original designs for the illustration of works of taste or fancy, and also painted the 'Baptism of Pocohontas' for one of the panels in the rotunda at Washington. In 1848 he returned to Rome.

Chapman, John Jay, American lawyer and essayist: b. New York 1862. He was graduated from Harvard in 1884, was admitted to the New York bar and has been in active practice there since. His essays and speeches have attracted considerable attention on account of their striking individuality and original point of view. His published volumes include: 'Emerson, and Other Essays' (1898); 'Causes and Consequences' (1898); 'Practical Agitation' (1900).

Chapman, Maria Weston, American reformer: b. Weymouth, Mass., 1806; d. there 1885. She was a daughter of Warren Weston, and received her education in her native place and also in England. She married in 1830; became an active opponent of slavery in 1834; and after the death of her husband in 1842, went to Paris, France, and assisted the anti-slavery cause with her pen. She returned to America in 1856. She edited the autobiography of her friend, Harriet Martineau (1877), and wrote: 'Songs of the Free' (1836); 'Right and Wrong in Boston; Report of the Boston Female Anti-Slavery Society' (1836); 'Right and Wrong in Massachusetts' (1840).

Chapone, shą-pōn', **Hester,** English story-writer and poet: b. Northamptonshire 27 Oct. 1727; d. 1801. She wrote: 'Ode to Peace'; 'Fidelia,' a story; 'Miscellanies in Prose and Verse'; and other works.

Chapoo, chä-poo', China, a seaport in the province of Chekiang, on the north side of a large bay, 35 miles north from Ningpo. It is fortified and garrisoned by Manchu troops, carries on a very considerable trade, and was once the only Chinese port which was permitted to trade with Japan.

Clappe, Claude, klōd shäp, French engineer and mechanician: b. Rouen 1760; d. Brulon 23 Jan. 1805. Having invented an ingenious system of signals to communicate at a distance with his friends, he presented it to the French legislative assembly in 1792. It was successfully tried between Paris and Lille, on a length of 48 leagues, and was adopted by the government. Chappe established several lines in France, and the one running north was first put in motion to announce the recapture of the town of Condé from the Prussians. The inventor was at once rewarded by the convention, which, by a decree, appointed him *ingénieur télégraphe.* The lines were extended all over France, and the system was also adopted, with some alterations, through Germany and England. The attacks to which he was subjected, by persons jealous of his invention, preyed so much upon his mind that he committed suicide.

Chappe d'Auteroche, dō-tē-rōsh, **Jean,** French astronomer: b. Mauriac, Auvergne, 2 March 1722; d. San Lucas, Cal., 1 Aug. 1769. He was a priest, but giving his whole attention to astronomy, became one of the assistants of Cassini in delineating the general map of France, and edited the astronomical tables of Halley. In 1760 he was designated by the academy to make an observation of the transit of Venus over the sun's disk, which Halley announced would happen 6 June 1761. He consequently set out for Tobolsk, in Siberia, which was pointed out as the most favorable point of observation. His mission was successfully accomplished; and returning to France at the end of two years, he published in 1768 his 'Voyage en Sibérie.' The following year he sailed for California to observe another transit of Venus, which was to take place June 3. He was equally successful on this occasion, but died soon afterward. The results of his last expedition were published by Cassini, under the title of 'Voyage de la Californie.'

Chap'pell, William, English author: b. 20 Nov. 1809; d. London 20 Aug. 1888. For the most of his life he lived in London, where he was for some years a member of a great music publishing house. His first work of importance was 'A Collection of National English Airs, Consisting of Ancient Song, Ballad, and Dance Tunes' (1838-40). He took a principal part in the foundation in 1840 of the Musical Antiquarian Society and the Percy Society, and published the first volume of a 'History of Music' in 1874.

Chapple, Joseph Mitchell, American journalist: b. La Porte City, Ia., 18 July 1867. He studied at Cornell College, Iowa, and was engaged in journalism in Dakota, Ashland, Wis., and Chicago until 1897, when he became editor and publisher of 'The Bostonian,' afterward changed to 'The National Magazine,' Boston, Mass. He has written two novels: 'The Minor Chord' (1895; new ed. 1898); and 'Boss Burt, Politician' (1896).

Chap'ra. See CHUPRA.

Chaptal, Jean Antoine Claude, zhŏn äṅ-twäṅ klōd shäp-täl, COUNT DE CHANTELOUP, French chemist and statesman: b. Nogaret, Lozère, 4 June 1756; d. Paris 30 July 1832. During his medical studies and practice he devoted much research to the science of chemistry, in which he soon became eminent, and was appointed professor at Montpellier, where he taught successfully the doctrines of Black, Lavoisier, and Cavendish. He established chemical works near Montpellier, being the first attempted of the kind, and by which he was soon enabled to produce various chemicals hitherto imported, such as the mineral acids, alum, soda, and salts of lead. The authorities of Languedoc heaped honors on him; the Spanish government offered him a pension of 56,000 francs to go to Spain, and according to his biographer, Washington wrote three times to Chaptal, inviting him to America. After the outbreak of the French revolution he published a political pamphlet, entitled 'Dialogue Between a Montagnard and a Girondist,' and was arrested, but through the intercession of friends was liberated. The Committee of Public Safety placed him in charge of the powder mills of Grenelle, which produced, under his management, 3,500 pounds of gunpowder daily. Once more returning to Montpellier, he was elected member of the institute, and devoted himself to science, till Bonaparte summoned him to the council of state, where he had the supervision of national education. When Lucien Bonaparte resigned the portfolio of the interior, Chaptal took his place as minister, and for four years performed the duties of the department with much administrative ability. He founded the conservatory, school of arts,

and society for encouragement of industry, introduced the modern French system of weights and measures, established a model farm and a system of distribution of agricultural seeds, reorganized the prisons and hospitals, extended the network of highways over the face of the country, and organized the carrying out of the plans of extension of the Louvre and rues de Rivoli and Castiglione, since completed by Napoleon III. On Napoleon's return from Elba, the count was appointed director-general of commerce and manufactures. Louis XVIII. struck him from the list of peers, but left him on the roll of the academy. His works are all on chemical subjects, and may yet be consulted with advantage, especially his 'Treatise on Chemistry Applied to the Arts.'

Chap'ter (Latin *caput*, head), one of the chief divisions of a book. As the rules and statutes of ecclesiastical establishments were arranged in chapters, so also the assembly of the members of a religious order, and of canons, was called a chapter, because some or all of the chapters containing the rules were read there; and the place where they assembled, as well as the reproof administered to a delinquent member, by reading the rules of the chapter transgressed, had the same name. The orders of knights, which originally had much of the ecclesiastical constitution, used this expression for the meetings of their members, and even some corporations of mechanics or tradesmen call their assemblies chapters. In England, as elsewhere, the deans and chapters had the right to choose the bishop, but Henry VIII. assumed this right as a prerogative of the crown.

Chap'ter-house, a building attached to a cathedral, collegiate church, or church belonging to a religious house in which the chapter meets for the transaction of business. Chapter-houses are of different forms, being sometimes regular polygons of four, eight or ten sides, and in other cases circles or parallelograms; and their architecture is often noteworthy. Sometimes they were the burying-places of clerical dignitaries. Among the most notable of English chapter-houses are those at Lincoln cathedral (which is decagonal, with a central column), Salisbury, Wells, Southwell, and York, the two last named excelling all others in Great Britain in the beauty and richness of their carven stonework. There is a chapter-house at Bristol, of the Norman period, in shape a parallelogram, much enriched with arcading and various kinds of Norman ornament. The chapter-houses at Gloucester and Canterbury are likewise parallelograms, but of the Third Pointed or Perpendicular period.

Chapuis, shä-pwē, **Auguste Paul Jean Baptiste,** French musician: b. Dampiene-sur-Saône 20 April 1862. Since 1895 he has been inspector-general of musical instruction in the Paris schools. He has composed 'Tancred', a lyric drama, and much successful church music.

Chapultepec, chä-pool-tĕ-pĕk' ("Grasshopper Hill"), **Battle of.** This, the last considerable engagement of the Mexican war, and which was followed by the immediate occupation of the City of Mexico, was fought 12–13 Sept. 1847. Chapultepec is an isolated rocky mound 150 feet high, two miles southwest of the southwestern or Belen gate of the city, and guarding a main road into it; sharply precipitous on the northern, eastern, and part of the southern sides, but on the west and southwest sloping gradually to level marshy ground partly covered with a cypress grove. Here Montezuma and his predecessors had their pleasure grounds, and Chapultepec was their country-seat. A fortified castle was started here by the viceroy Galvez in 1785, but left unfinished; from 1822 it was used as a military academy, in 1847 having some 40 students, who fought heroically in the battle. It was guarded by strong batteries, and its approaches were protected by walls (an aqueduct on the north) which shielded other batteries; through the marshy fields in front of these were irrigating ditches, some large and deep, with high banks and sticky bottoms, very serious obstacles to troops and artillery. The one military defect of the castle for modern warfare was the limited force that could effectively use arms within it; the garrison of 800, commanded by Gen. D. Nicholas Bravo, was as large as could well operate there. Along its approaches were some 4,000 to 4,500 more troops, while Scott had 7,500; but Santa Anna dared not strip the other entrances to the city. By the battle of Molinos del Rey (q.v.) on the 8th Scott had carried a set of long stone buildings southwest of Chapultepec and, though under its guns, forming some protection for hostile artillery. On the 12th Captain Huger planted heavy batteries here and at three other places, to range the south and west of the hill, the only accessible portions, on which an assault had been determined; and their fire gradually silenced that from Chapultepec, breached the defenses, and caused much loss. About 8 A.M. on the 13th Scott launched two assaulting columns: Pillow on the west, from Molinos del Rey through the cypress grove, supported by Worth; Quitman against the south, from the heights of Tacubaya, where Scott had his headquarters, supported by Persifer F. Smith's brigade. Preceded by the pioneer companies with ladders, axes, picks, and crowbars, and under a plunging fire, they surmounted all obstacles, cleared the approaches, broke through the walls, climbed the heights, entered the castle gates, and having cut off retreat by the northwestern road to Mexico, captured the entire garrison. The approaches and castle had been mined, but the defenders waited too long before exploding the mines, and failed. The next day the American army overcame all remaining resistance and entered the capital. Their loss in these three days was 863 killed and wounded, including Col. T. B. Ransom killed, Pillow and Shields wounded. The Mexican loss was unknown, but certainly as heavy, and included several gallant and brilliant officers; and 823 prisoners were taken, including three generals, one the commandant of the academy. Among the American officers prominently engaged were a remarkable number afterward distinguished in military and civil life: Robert E. Lee, Joseph E. Johnston, James Longstreet, "Stonewall" Jackson, David E. Twiggs, Gideon J. Pillow, D. H. Hill, J. B.

Magruder, Barnard E. Bee, P. G. T. Beauregard, Geo. E. Pickett, Raphael Semmes; George B. McClellan, Silas Casey, E. V. Sumner, Jesse L. Reno, James Shields, I. I. Stevens, Z. B. Tower, William S. Harney; Thomas H. Seymour, John W. Geary, Mayne Reid. Franklin Pierce had been severely wounded at Molinos del Rey. See C. M. Wilcox, 'History of the Mexican War' (1892).

Char, här, **Friedrich Ernst (Fritz),** German composer: b. Cleve-on-Rhein 3 May 1865. He is a noted opera conductor, and wrote the celebrated romantic opera, 'The Rogue of Bergen' (Der Schelm von Bergen), besides sonatas and cantatas.

Char, chär, a genus of fishes (*Salvelinus*) of the family *Salmonidæ*. They were formerly classified in the same genus as the trout (Salmo), from which they are, however, differentiated by color and by the shape of the vomer. There are several varieties of this fish, all having intense and beautiful colors; length from 10 to 15 inches; weight sometimes as high as two pounds, but generally ranging under one pound. All kinds are held in esteem for the table. They are found plentifully in the deeper lakes of England, Wales, Ireland, and more rarely in Scotland, also in the Lake of Constance and Lake Geneva. The best known American variety is the brook-trout, *S. fontinalis;* there is also a variety found in Maine, known as the Rangeley Lake trout, which is very similar to the European char.

Chara, kā'ra, in botany, a genus of plants, the typical one of the order *Characeæ* (q.v.). The species are found in ponds. In palæontology, the nucules, known under the name of *Gyrogonites,* are found for the first time in the fresh-water beds of the Jurassic (Oölitic) formations. They are the minute spiral seed-vessels or sporangia of these plants.

Characeæ, kā-rā'se-ē, an order of cryptogamous plants, division *Algæ,* composed of an axis consisting of parallel tubes, from which the branches are given off in whorls. The axes are either transparent or incrusted with carbonate of lime. The plants inhabit stagnant water, both fresh and salt, beneath which they are always submersed. They are found in almost every part of the world, but are most common in the temperate zone. The fetid odor which many species emit renders the surrounding locality very unhealthy.

Charade, sha-rād', a syllabic enigma, that is, an enigma the subject of which is a name or a word that is proposed for discovery from an enigmatical description of its several syllables, taken separately, as so many individual words. A charade may be called complete if the different enigmas which it contains are brought into a proper relation to each other, and, as a whole, unite in an epigrammatic point. The French excel in this species of literary amusement.

Acting Charades, a kind of entertainment made up of pantomime and dialogue, and improvised by the members of an evening party. The syllables and complete word are meant to be suggested by the various divisions of the piece.

Charadriidæ, kă-ra-drī'ī-dē, the plovers, a family of birds of the order *Limicolæ,* which along with several equivalent groups is sometimes considered as constituting a more extended order, *Charadriiformes.* Even as limited by American ornithologists the family is a large and important one, embracing many genera and species from all parts of the world. They have long, slender legs, with the toes united by a small membrane, the hinder one very small and elevated, or wanting; the tarsus reticulate; the neck short and thick; body stout; plumage compact, with 12 short tail-feathers and very long primary wing-quills; the beak is short and shaped much like a pigeon's. By European ornithologists the limits of the family are extended to include various related groups, especially the snipes (*Scolopacidæ*), which then constitute sub-families. See Killdeer; Lapwing; Plover; etc.

Charadrius, ka-răd'rī-ŭs, the genus to which the plover belongs, forming the type of the family *Charadriidæ,* which includes also the lapwings, dotterels, oyster-catchers, turnstones, sanderlings, etc. (qq.v.).

Charcoal, an impure variety of carbon, prepared from vegetable substances or bones. Wood charcoal consists of wood burned with but little access of air. Billets of wood are built into a heap, which is covered with earth or sand. The heap is fired at openings left near the bottom of the pile, and the gases escape at small openings above. For making fine charcoal, such as that of willow, used in the manufacture of gunpowder, the wood is burned in iron cylinders, or rather retorts, in which a process of destructive distillation removes the volatile hydrocarbons, pyroligneous acid, etc. By this more perfect means the process is accurately regulated. Charcoal is used in the arts as a fuel; as a polishing powder; a table on which pieces of metal are secured in position to be soldered by the blowpipe; a filter; a defecator and decolorizer of solutions and water; an absorbent of gases and aqueous vapors; a non-conducting packing in ice-houses, safes, and refrigerators; an ingredient in gunpowder and fireworks; and in the galvanic battery and the electric light.

Animal charcoal, used largely in sugar-refining and as a disinfectant and filtering medium, is prepared by calcining bones in closed vessels. These are either retorts, similar to those in which coal is distilled for the production of illuminating-gas, or they are earthenware pots, piled up in kilns and fired. Charges of 50 pounds of bones to a pot will require 16 hours of firing. The bones are then ground between fluted rollers, the dust removed, and the granulated material used for charging the filters of the sugar-refiner. The material is used for removing color, feculences, and fermenting ingredients from the syrup.

In medicine charcoal is sparingly used, but is of service in gastric indigestion in which there is much evolution of gas. Charcoal takes up the gas and therefore prevents distention and pain. It has no curative qualities and is solely alleviative.

Charcot, Jean Martin, zhŏn mär tăn shär-kō, French physician: b. Paris 29 Nov. 1825; d. 16 Aug. 1893. His specialty was in the treat-

ment of nervous and mental diseases, and he performed many curious and successful experiments in hypnotism and mental suggestion, in the Salpetriere, where he founded a clinic for the treatment of nervous diseases in 1880. He published several works treating of these subjects.

Chard, the leaves of artichoke (*Cynara scolymus*) covered with straw in order to blanch them and make them less bitter. Beet chards are the leaf-stalks and midribs of a variety of white beet (*Beta cicla*), in which these parts are greatly developed, dressed for the table.

Chardin, shär-dăn̈, Sir **John,** French Oriental traveler: b. Paris 26 Nov. 1643; d. London 26 Jan. 1713. Before he had reached his 22d year his father, a jeweler, sent him to the East Indies in order to buy diamonds. Chardin lived six years in Ispahan, where he was less engaged in mercantile business than in profound studies and scientific researches, making use of his connections at court for collecting the most authentic information of the political and military state of Persia. He collected the most valuable materials relating to antiquities and history. In 1670 he returned to France, but again left France for Persia, in 1671, taking with him a considerable quantity of precious stones artistically set, exquisitely worked jewelry, etc. He spent 10 years partly in Persia and partly in India. In 1681 he arrived in London, when he received the honor of knighthood. He published the first volume of his 'Travels into Persia and the East Indies,' in London, in 1686. The other volumes were about to follow, when he was appointed minister plenipotentiary of the king of England to the States-General of Holland, and agent of the English East India Company to the same. In 1711 two editions of his 'Travels' appeared. He soon after returned to England. The exactness and truth of his statements, and the extent of his knowledge, have been confirmed by all succeeding travelers, and have been serviceable to Gibbon, Helvetius, and Montesquieu. The best edition of Chardin's 'Travels' is that by Langlès, 1811, in 10 volumes.

Charente, shä-rŏn̈t, France, an inland department, formed chiefly out of the ancient province of Angoumois, and deriving its name from the river Charente, by which it is traversed; area, 1,487,447 acres; capital, Angoulême. It is in general uneven, with hills covered with chestnut-trees, sandy plains, meadows, etc. The principal rivers are the Charente, joined by the canal of Poitou with the Vienne, the Dronne, Tardoire, Bandiat, Touvre, and Né. The wines of the department are of inferior quality, and in little request for the table; but they yield the best brandy in Europe. The celebrated cognac brandy is made in the districts of Champagne, Cognac, Jarnac, Rouillac, and Aigre from a grape called the *folle blanche*, which yields a white wine. The red wines furnish an inferior brandy, without the bouquet that distinguishes the genuine cognac. The wine-growers themselves carry on the distillation, each estate being furnished with stills and the necessary apparatus. Excepting brandy and paper, the manufactures of the department are inconsiderable, consisting of sacking, cloth, cordage, hats, corks, and earthenware. The paper made at Angoulême is said to be the best in France. The department is divided into the five arrondissements of Angoulême, Barbezieux, Cognac, Confolens, and Ruffec. Pop. (1896) 356,236.

Charente, a river in France, rising in the department of the Upper Vienne; flowing west, and emptying into the Bay of Biscay, about 10 miles below Rochefort, opposite the Isle of Oleron; length about 200 miles. It gives its name to two departments, Charente (q.v.) and Charente-inférieure (q.v.).

Charente-inférieure, ăn̈-fā-rē-ėr, France, a maritime department on the west coast, bounded on the north by the department of the Vendée, and on the south by Gironde; area, 2,635 square miles. It comprises parts of the former provinces of Angoumois and Poitou. The principal rivers that traverse or bound the department are the Charente, Gironde, Seudre, Boutonne, and Sèvre Niortaise — all of which are navigable, as well as the canal of Brouage, and that between Niort and Rochelle. The soil is fertile, and well cultivated; and a considerable portion planted with vines. The pastures are good and well stocked with cattle, horses, and sheep. Along the coast are extensive salt marshes. Salt and brandy are the only articles manufactured to any great extent; the oyster and sardine fisheries are also of importance. Capital, La Rochelle. Pop. 453,000.

Charenton-le-Pont, shä-rŏn̈-tŏn̈-lė-pŏn̈, France, a town situated about a mile to the southeast of Paris, with which it is connected by rail and tramway, at the confluence of the Marne with the Seine. It has numerous mercantile and manufacturing establishments. The stone 10-arched bridge across the Marne used to be considered as the key to Paris on this side; hence the memorable attacks upon it both in the civil wars of France and in those with foreign enemies. At Petit-Charenton is the celebrated asylum for the insane of both sexes. From its connection with the asylum the town has given several significant popular phrases to the French language, equivalent to the use of Bedlam in English. A person of marked eccentricity is called a "Charenton boarder." Pop. 16,811.

Chares, kā'rēz, the name of two well-known Greeks. The Athenian Chares was the general through whose incapacity the Thracian colony was lost to Athens during the Social war in 358–356 B.C., and who exposed his country to the designs of Persia, by entering for mercenary purposes the service of the revolted satrap, Artabazus. Although recalled in disgrace, Chares was sent in 349 to the aid of Olynthus, and again he returned without having achieved anything. In 340 he commanded the army sent to Byzantium against Philip, again gave evidence of his incompetency, was replaced by Phocion, but once more invested with the supreme command. In 338 the fatal issue of the battle of Chæronea seems to have been mainly due to his ignorance. He was noted for his athletic figure, his profligacy, and his unscrupulous recklessness. Chares, the sculptor, a native of Lindus, Rhodes, flourished toward the close of the 3d century B.C. He was a pupil of Lysippus and the sculptor of the Colossus of Rhodes, one of the "seven wonders of the world," a representation of the Rhodian sun god erected in commemoration of the successful defense of

Rhodes against Demetrius Poliorcetes in 303 B.C. See COLOSSUS.

Charge, in heraldry, one of the bearings. This may be one of the ordinaries, as they are called, the straight line bearings, as fess or chevron or a much more elaborate figure, as the representation of an animal or the head of one. Sometimes the charge is imposed upon another charge.

In gunnery, charge signifies the quantity of powder used at one discharge of a gun.

In military tactics, charge is the rapid advance of infantry or cavalry against an enemy, with the object of breaking his lines by the momentum of the attack. Infantry generally advances to about 100 yards and fires, then gradually quickens the pace into the charge-step, and dashes at the enemy's lines. Cavalry charges in echelon or column against infantry, which is usually formed in squares to receive the charge.

Chargé d'Affaires, shär-zhā däf-fār, a representative of a country at a less important foreign court, inferior to an ambassador, or a minister, to whom is intrusted all matters of diplomacy. The title is also given to the officer to whom the charge of an embassy is entrusted during the temporary absence of the ambassador or minister plenipotentiary.

Charge of the Light Brigade, The, a remarkable military movement at Balaclava, 13 Oct. 1854, made by 600 English soldiers. The Russians were advancing in great strength to cut off the Turkish force from the English. Lord Raglan sent an order to Lord Lucan to advance, and Lord Lucan, not understanding what was intended, applied to Captain Nolan, who brought the message, and Nolan replied: «There, my lord, is your enemy.» Lucan then gave orders to Lord Cardigan to attack, and the 600 men rode forward into the jaws of death. In 20 minutes 12 officers were killed and 11 wounded; 147 men were killed and 110 wounded, and 325 horses were slain. The blunder must be shared by Lord Lucan, Gen. Airey, and Capt. Nolan. However, never victory was more glorious to the devoted men, than this useless charge. «It was magnificent, but it was not war.» When Lord Cardigan rallied the scattered remnants, and said: «My men, some one has blundered,» they replied: «Never mind, my lord, we are ready to charge again, if it is your lordship's command.»

Charikar', Afghanistan, a town in the district of Kohistan, 36 miles north of Kabul. It has a trade in the coarse cotton cloths manufactured throughout the district, and in iron, and also a considerable transit trade to Turkestan and central Asia. Charikar is the place of residence of the governor of Kohistan; and duties are levied here on merchandise passing between it and Turkestan. Pop. 5,000

Charing (chār'ing) **Cross,** a triangular piece of roadway at Trafalgar Square, forming the titular centre of London, so named from a cross which stood until 1647 at the village of Charing in memory of Eleanor, wife of Edward I. When the queen's remains were brought in 1290 from Grantham to Westminster Abbey, the king accompanied the bier and erected at each stage where it rested a memorial cross. Of the 13 crosses raised, but two beside that in London remain. The modern cross, erected in 1863, stands on about the same place as the older one, of which it is as nearly as possible a reproduction, its style being the decorated Gothic of Edward's time.

Chariot, a vehicle used in ancient times either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honor to Erichthonius, a mythical king of Athens, who is said to have appeared at the Panathenaic festival, founded by him, in a car drawn by four horses. The ancient chariot had only two wheels, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem never to have used more than one pole, but the Lydians had carriages with two or three. In general the chariot was drawn by two horses. Such was the Roman *biga,* but we also read of a *triga,* or three-horse chariot, and a *quadriga,* or four-horse one. In ancient warfare chariots were of great importance; thus we read of the 900 iron chariots of Sisera, as giving him a great advantage against the Israelites. The Philistines in their war against Saul had 30,000 chariots. The sculptures of ancient Egypt show that chariots formed the strength of the Egyptian army. We have also numbers of sculptures which give a clear idea of the Assyrian chariots. These resembled the Egyptian in all essential features. In modern times the name chariot has been given to a kind of light traveling carriage now out of vogue.

Charitable Irish Society, Boston, Mass.; the oldest existing Irish organization in the United States. It was founded 17 March 1737, by a number of Irish Protestants, and has borne on its roll many distinguished people. Among its founders was the father of Gen. Henry Knox, of the Revolution. Gen. Knox, himself, was also a member of the society. It celebrated its centennial anniversary in 1837 with great eclat, among the guests on that occasion being Gov. Edward Everett, of Massachusetts; Mayor Samuel A. Eliot, of Boston; Hon. John P. Bigelow, secretary of state; Hon. Josiah Quincy, Robert Rantoul, Jr., and other prominent men. Andrew Jackson, president of the United States, during his visit to Boston, in 1833, received the society at the Tremont House, that city, and replied to an address from the organization. The society is in a flourishing condition, and is non-sectarian and non-political.

Charitable Trusts. A charitable trust is «a gift, to be applied consistently with existing laws, for the benefit of an indefinite number of persons, either by bringing their minds or their hearts under the influence of education or religion, by relieving their bodies from disease, suffering, or constraint, by assisting them to establish themselves in life, or by erecting and maintaining public buildings or works, or otherwise lessening the burdens of government; a gift to a general public use, which extends to the poor as well as the rich.» The things necessary to raise a valid trust are sufficient words to create it, a definite subject, and an object. In charitable trusts the object is generally uncertain, because if described with definiteness it would cease to be a charity and would be governed by

the ordinary rules of trusts. At one time it was held that charitable trusts were created by an act passed during the reign of Queen Elizabeth, and known as the statute of charitable uses, but it has been shown that these trusts existed long before that act was passed. Charitable trusts are recognized in all of the States of the Union, while a number of the States have never adopted the statute at all. Even where the statute is enforced, trusts while not within the letter, if within the spirit of the statute, are held to be good. Uncertainty of the object is one of the characteristics of a charitable trust, and it has led to what is known as the *cy près* doctrine, which is that the courts will interpret instruments creating charitable trusts so that if the exact object of the donor cannot be carried out the donation will be applied to something of a nature similar to that specified by the donor.

When a testator leaves property to his executors in such a manner that they are to be the sole judges of its use, and the executors die before the testator, it is doubtful whether the trust will come into existence, as the executors were the only persons who could designate for what the donation was to be applied. In some jurisdictions the rule is that if the property can be applied to other than charitable purposes it is too indefinite.

In cases in which the particular charitable purpose does not exhaust the whole fund, if from the instrument creating the fund, the intention appears that the entire amount is for charity, the surplus will be devoted to some other charity and will not form a resulting trust for the heir or next of kin. A gift may be made to a charity not in existence, and a gift to a specific charity will not fail for want of a trustee.

After the trust has come into existence, if the purpose for which the trust was created fails for any reason, it will be applied to some other purpose of a similar character, so as to fulfil as nearly as possible the purpose for which it was intended.

Charitable trusts are not subject to the rule against perpetuities, which is that property cannot be tied up for more than a life or lives in being and 21 years thereafter. If property left to a charitable trust is limited upon another estate not a charitable trust, and the first estate is in violation of the rule against perpetuities, the trust will not be sustained; but after the trust once comes into existence the rule against perpetuities is not applied to it. In the State of New York charitable trusts are governed by the same rules as any other trust.

By English law all bequests for charitable purposes, to be valid, must be strictly for the public benefit; that is to say, in favor of institutions for the advancement of learning, science, and art; for the support of the poor; or for other objects connected with the welfare of the public; and such bequests include those in favor of the Church or of other religious bodies sanctioned by the law. Bequests for superstitious uses are null and void. A body of commissioners (the charity commissioners), under whose superintendence such benevolent trusts are placed, was established under the Charitable Trusts Act of 1853. They have the power of inquiring into the administration of all English public charities. See MORTMAIN.

Charites, kă'rīt ēz, the Greek name of the Graces (q.v.).

Charities, Public. Following in the footsteps of civilization there has come a development of charity, often slowly and haltingly, but ever persistently, until to-day the treatment of its dependent poor is accepted as evidence of the civilization of a community. A glance through history discloses not merely neglect of the defective mentally and physically, by savage and barbarous peoples, but an aggressively cruel policy to rid the community of the burden of their care. Crippled children were left to die and helpless old persons were put out of the way. In contrast to that condition we find in the dawn of the 20th century a settled conviction in all civilized communities that it is as much the duty of the State to care for its dependents as it is to conserve the educational interests of its children. But this change was wrought only by self-sacrificing devotion of charitably inclined students of sociology through centuries of unremitting labor. So slow, indeed, was the development of the practice of charity that it is well within the last hundred years that the care of the helpless was left to individuals or was treated by society at large as an unreasonable burden on the State. Even after the conviction became permanent that for its own protection, if for no higher reason, the State should assume the responsibility of caring for its helpless classes the conception of its duties were so vague and the method to be followed was so undefined, that the results were eminently unsatisfactory. Society regarded its dependents as being much on the same plane as its criminals and treated them much in the same way. Prisoners, dependent children, sick poor persons, the insane, the epileptics and the helpless aged were huddled together under one department of government and it was not infrequently the case that little or no discrimination was made in their care. General demoralization ensued and it became apparent that a remedy must be found if further progress was to be made in the development of the practice of charity. This remedy was found in segregation. It was clear that not only physical separation but governmental separation of the various classes was necessary. Custom and tradition were hard obstacles to overcome, but the adherents of segregation were not to be denied, and after a long and bitter and often disheartening struggle they won their first victory, in the segregation of criminals. A separate and independent department of government was established for their care, although society retained in a large degree its old habit of regarding its criminals and its dependents in much the same light. But an opening had been made for segregation and its adherents were quick to press their advantage. They next demanded and obtained the segregation of the insane and followed this up by the successful demand for the segregation of epileptics, idiots, dependent children, the sick poor, homeless men and women, and the helpless aged. The aim was not merely to assure to each of these classes distinct physical separation from the others, but to give to each a government of its own so that it could receive the undivided attention and care

of persons competent to do the work entrusted to them and held directly responsible for that work. So beneficial did the experiment of segregation prove to be that the practice of charity made strides for good after it was adopted far out of all proportion to progress in previous years. Indeed the benefits from segregation are so marked and so convincing that the policy has been extended to different conditions in the same class. This is particularly noticeable in the modern treatment of consumptives, for whom special hospitals are being constructed and special diet prepared. And yet the subject has not been exhausted. It is susceptible of further development and closer application. There is a crying need for it in the care of helpless old persons, in the treatment of whom the causes of destitution and the moral character of the individual should always be considered. The demonstrated advantages of segregation may be summed up in the more intelligent attention that each class receives and in the promise that eventually the choice of persons entrusted with the care of dependents will be made with no other purpose in view than fitness for the position to be occupied. The greatest obstacle to the fulfilment of this promise is politics, but the time will come when the practice of charity will be above all politics, as by right and justice and humanity it should be. But in spite of segregation and in spite of all the other remarkable advances made in charitable work in the last half century, society, in a large part at least, persists in regarding the criminal and the pauper from the same view-points. Manifestly this is unfair and unjust. Poverty is not a crime, and the victims of poverty should not be classed with criminals, even in the public mind. The State has not always recognized this principle. On the contrary, its theory and its practice have been to force the poverty-stricken individual into association with the criminal. It is scarcely more than a quarter of a century ago that convicted criminals wearing the uniform of the penitentiary were employed as nurses in public hospitals. When the force of union labor had driven prisoners as laborers out of the public streets, out of the public parks, off public works, and from every other place where public moneys were expended for the improvement of the general community, prisoners wearing prison garb were retained as workmen in the public charitable institutions. At a time when it would have meant a riot to have placed prisoners to care for the trees in the parks, to clean the cobblestones in the streets, or even to look after the sewers, the sick poor man, the helpless imbecile, and the abandoned child were left in part to the care of convicts. This was done in the name of charity, but it was such a rank injustice to the individual, such a blot on the civilization of the community, that the long-growing and firmly founded conviction of earnest students of sociology rebelled against it and, by energetic insistence won, step by step, a victory over such conditions.

The first great move toward the separation of the dependent poor from criminals was made in the introduction of the trained nurse into the public hospitals. Although that was but little more than a quarter of a century ago, in America, it was potent in its influence, and appealed so strongly to the sense of justice of all communities that to-day every hospital, public or private, has its corps of trained nurses; and the fact that once the place held by the trained nurse was held by a convict in prison garb, is regarded as a barbaric horror. With the elimination of the convict as a nurse in the public hospitals, the cause of progress and reform was encouraged to extend its efforts to the elimination of prison labor in all public charitable institutions. The battle was not an easy one, but the adherents of reform never wavered. They were confronted by old theories and old customs. Chief among these was that which held that prison labor should be utilized and that inasmuch as the institutions that took care of the sick and the poor had always been associated intimately with those that punished the prisoners, it was economy on the part of the State to utilize the labor of the prisoner in the care of the sick and the poor. Changes of government in public charitable institutions, brought about by changes in political domination, retarded the victory, because new men coming into office had to go over all the ground that had been gone over by their predecessors, and often when they were in a frame of mind to take the necessary step forward, they were replaced by some political change which forced a new man into government, and left him in a like position to that occupied by his predecessor at the beginning of his term of office. But the conviction of the justice of the cause had grown so firmly that it was prepared to overcome all obstacles. It was persistent and insistent. It knew that it was right and it would not acknowledge defeat. The final outcome was that prison labor at the end of the 19th century was practically eliminated from public charitable institutions. The sentiment of communities had forced the powers that had the appropriation of public moneys to increase the appropriations for public charitable institutions to the extent that honest, self-respecting, paid labor, could be employed to care for the sick and the poor in public institutions. With that victory gained, it is not probable that there will ever be a relapse into the practice of using prison labor in any degree in public charitable institutions. The divorce between the prisoner and the pauper to-day is complete in almost every civilized community. Justice and humanity and charity will compel this divorce to stand.

Public sentiment has gone even further than the separation of prisoner and pauper. It has gone deep into the study of the condition of children, looking always to the best chance to develop a dependent child, or a criminal child, into a good citizen. It has recognized that environment is a powerful factor in the development of character, and one of its chief endeavors has been to disassociate the plastic mind of childhood from impressions that would tend to retard reform in a child already started on the downward path, as well as to protect a child not contaminated by vicious surroundings from influences tending to contaminate it. The crowning work of this endeavor has been the establishment of children's courts, wherein the cases of children charged with crime are tried, free from even the sight of adult criminals. Further than this, it has been brought about that the adult pauper and the dependent child

are segregated through the agency of established bureaus for the care of dependent children, protecting them from contact with adult paupers.

The theory and practice of modern charity does not stop with the treatment of conditions as they are found. It has gone deep into the subject and has found that in past ages, too much attention has been given to effect and too little to cause. It recognizes that if a poor man falls ill, it is economy on the part of the State to make him well in as short a time as possible, not only that he may not be a burden in the hospital, but that he may return to the support of his wife and family. To this end, it has built more and better hospitals for his care. It has looked into the causes that led to his sickness, and having found these in wretched dwellings and unsanitary surroundings, it has, through the agency of tenement house reform, sought to bring about conditions of living that, in a great measure, will prevent sickness. It is recognized that it is economy on the part of the State, to take a homeless and friendless child and give it a good physical foundation for a healthy mind in a healthy body. It is recognized that the morally imperfect child should be taken in hand as soon as possible and trained under moral influences, so that the imperfection may be removed. To bring this about, sociology has not been satisfied with the mere treatment of the child as it was found, but it has studied the origin of the child and has sought to remove the causes that produced such results, in order that other similar results should not have to be treated by the State. Out of this theory and practice, have grown day nurseries, kindergartens, manual training schools, and numerous other similar institutions, supported by public or private charity, all striving to remove evil influences and replace them with good influences. Not only do the day nurseries take care of children while their mothers work, but they teach the mothers how to care for the children physically and morally. Kindergartens give the first rudiments of education, and manual training schools lay the foundation for useful occupations. These institutions, by suggestion and encouragement, increase the sense of responsibility on the part of parents, and thus render a priceless service to the community.

In the broadest sense, all men may be said to need help. Interchange of service is a necessity in the economic structure. Charity is not confined to the mere giving of alms. At some time or other in his experience, every man has felt the need of a helping hand. He may not have needed money, but he has needed advice, or kindness, or sympathy. At some time or other, everyone has felt the need of something from another, and the filling of that need is charity. It may be sometimes indefinable, but it exists, and the realization of its existence has caused the development of that vast system of help in civilized countries which is designated by the general term charities. The impulse to relieve distress is almost universal, but how to give and when to give is a problem that must be seriously considered, for it is not infrequently the case that giving does harm. The first appeal for alms is always the most difficult. No person ever asked for alms without, in the first instance, feeling a loss of self-respect. The second asking is easier than the first, and the third than the second, and so on until finally a beggar, without self-respect, is made. It were better in many instances to have refused the first appeal, and thus thrown the applicant back upon his own resources to meet the emergency that confronted him. It were better in almost all instances to refuse the appeal unless some satisfactory investigation has been made as to the real condition of the applicant. This is particularly true in communities where institutions are provided for the immediate relief of the needy. In most of the great municipalities, there is no need for any one to go without food or shelter, for food and shelter are provided by the State, and are to be had for the asking. It is a recognized truth that the poorest people are the most charitable. This is due to two causes. The first is, that a poor person understands from his own experience what another poor person suffers. The second is that by the force of circumstances poor people live in close juxtaposition, and are subject to the appeals of their neighbors. Out of this comes neighborly charity, which is probably the best form of charity, because there is less chance of imposition, on the one hand, and of unnecessary help, on the other. It is less mistaken than any other form of charity. It finds expression in innumerable ways. The tenement-dweller knows of the want of his neighbor, and gives him a share of his own necessaries. The physician recognizes the impecuniosity of his patient and gives his services free. The retail dealer in his little shop knows the financial condition of his customers and extends credit. The lawyer sometimes makes no charge for his services. The landlord is not insistent on the immediate payment of his rent. The employer often advances wages before the work is done. Neighborly charity takes a hundred other forms and rarely makes a mistake, because the one who lends the helping hand knows the recipient is worthy of it. It is sound and sensible and is the most beautiful form of all charity. But there comes a time when, by demonstrated unworthiness, or continued helplessness, an object of charity breaks the patience or exhausts the resources of the neighborhood, and has to reach out for aid from others. Then it becomes necessary for some organized charity to exert itself. The Church is a powerful organization in extending charity. Churches of all denominations have always looked after their poor and helpless; and the Church is really the first organized charity. But the question arises as to whether, after all, it is not the duty of the community as a whole, rather than that of the Church, to care for the poor. It is well for the Church to do all that it can, but the fundamental responsibility for the care of the poor rests upon the community. Whatever the Church does lessens the burden upon the State, but the conviction has grown that the State is responsible, and should be held responsible, and this may be said without in any degree lessening the responsibility that any church may feel for the care of its own. Churches are powerless to supply universal co-operation, because of their individual limitations, but they can assist and do assist in a general organization of charity.

Out of this feeling of the necessity for general co-operation in charity, organized charity has grown. To every student of sociology, the conviction comes that organization is necessary in the distribution of charity. The first step in this direction was the formation of relief societies, designed to replace indiscriminate alms-giving by individuals, and intended to increase the funds available for the help of classes that might have been neglected. Then followed the associations for improving the condition of the poor, which were not to deal in relief except in so far as relief might tend to the permanent elevation of those relieved. The relief societies increased in numbers, but the organizations for the improvement of the condition of the poor have generally lost sight of the fundamental purpose of the organization, and have developed into mere relief societies. Neither filled the want, and so a third form of organized charity came into existence. This is designated as "The Charity Organization Society."

The first thing done by the Charity Organization Society is to investigate. On this point, the evidence of Edward T. Devine, Ph.D., general secretary of the Charity Organization Society of the city of New York, may be taken as authoritative. He says in his book, 'The Practice of Charity':

> In modern organized charity, investigation has come to mean something more than it had meant for those who had proclaimed the necessity for discriminating between the deserving and the undeserving. Investigation is not solely or even primarily for the purpose of thwarting the expectations of impostors. It is not even merely a device for preventing the waste of charity upon unworthy objects, in order that it may be used for those who are really in need. Investigation is rather an instrument for the intelligent treatment of distress. It is analogous to the diagnosis of the physician who does not attempt to treat a serious malady from a glance at its superficial indications, but who carefully inquires into the hidden and early manifestations of the disease, and seeks to know as much as possible of the complicating influences with which he must reckon in effecting a cure. Investigation, therefore, while it should never be inconsiderate or blundering, or heartless, must be painstaking, conscientious and honest. This kind of an investigation has been developed as one feature of organized charity and its possibilities have been only gradually unfolded, and they are realized only gradually in the experience of individual workers. A bad investigation may be too full or too meagre, or it may be neither. The investigation is made not for its own sake, but as a necessary step in the careful remedy of the defects or misfortunes that have brought the applicant to seek relief. In the majority of cases, if the investigation is wise and complete, it will reveal personal sources and facts which will enable the situation to be met without calling in outside aid, and in this way, in the large proportion of instances, investigation might be said to become a substitute for relief.

The Charity Organization Society not only insists on investigations, but on co-operation. On this point, Mr. Devine has this to say:

> By co-operation is meant not merely agreement among various societies and organized agencies, upon general plans of co-operation, but rather co-operation in dealing with individual cases of distress upon the basis of facts as ascertained by investigation. It involves, in other words, acceptance of the plan of relief which is calculated to remedy the defects or to supply the deficiencies that have been discovered. This may mean that each of the co-operating individuals or societies shall supplement the efforts of the others by contributing part of the money or work needed, or it may mean that they will agree to a division of the work, each leaving to the other the part for which its facilities are adapted; or it may mean a division of the cases to be dealt with, each agreeing to leave entirely to the other such classes of individuals or families whose needs are to be studied and adequately met by the agency to which they are assigned. One of the simplest forms of co-operation is that between the Church and the relief agency, secured by either directly from the other in the case of a given family, or secured by the agent of the Charity Organization Society from both. In this case, the material needs should be supplied by the relief agency, and the Church should provide the necessary spiritual oversight and the necessary formative influences for the children, and, if necessary, reformative influences for older members of the family. It sometimes happens that the family has no need of reformation; that it contains within itself all the necessary resources for education and training, while the financial income alone is lacking, or not sufficient. Even in such circumstances, another friend may not be unwelcome in sickness or in trouble and in periods of unusual difficulty. Enlargement of social opportunities may all be entirely appropriate.

In order to carry out a scheme so comprehensive as this, a machine was necessary, and charity organization made a machine, not merely to investigate objects of charity and to promote co-operation among all charitable agencies, but to keep a record of all work done in charity, and to employ individuals, competent and trained, to do that work. It has even gone further, and is agitating the possibility of establishing a school for workers in charity, whose ultimate purpose is to receive pay for charitable work. Organized charity, by its insistence upon co-operation and by its intelligent discussion of all matters pertaining to charity, exerts a powerful influence upon the State in its relation to charity. There can be no step backward by the State in its treatment of its dependents, which organized charity will not at once detect and seek to stop. The experience of its years of struggle to benefit the poor must be learned by officials having charge of public charitable institutions, and must be practised by them. The good done by organized charity is not confined to the relief that it gives individuals, or to the fraud that it detects, or to the imposition that it prevents, but it extends to the making of public opinion about charitable matters which forces good government in public charitable institutions. The problems of charity are many and difficult, and humanity has been wrestling with them through the ages, but the sum total of the effort of man to help man, while not wholly satisfactory, is eminently encouraging.

The answer has been made with varying degrees of satisfaction to the question as to what should be done with the insane, the sick poor, the dependent child, the imbecile, the epileptic, and to almost every other class, save one, and that is the adult pauper. This is the hardest of all charitable problems. The old person who is destitute, who is driven to ask and to expect public alms, is practically hopeless under existing conditions. He is a dead leaf fallen from the tree of life, swept away into a corner with a heap of others to await dissolution. There ought to be some greater discrimination in the treatment of adult paupers. Indeed, there ought to be some means of saving certain persons destitute in their old age from the demoralization and degradation of living in public institutions at public expense. The influences that drive an individual into an almshouse ought to be considered in his treatment after he is received there. The man who has tried all his life to be respectable and

independent and has failed, through no lack of effort on his own part, should not be compelled to associate in his last days with the utterly demoralized and vagabond type, that never made an effort to be better than it is. The individual that still preserves some remnant of self-respect should not be compelled to associate with those that have lost all self-respect. Indeed, there are certain persons compelled in their old age to accept public charity that ought not to be sent to an almshouse at all. This idea has been grasped with more or less vagueness in all civilized communities, and efforts have been made to put it into practice. England has made some study of the subject, and Germany has gone so far as to put into practice a scheme to prevent helplessness and resourcelessness in old age. The German scheme compels each man to save during the time that he is able to work, something of his earnings, so that he shall not be destitute when he is no longer able to work. It is really compulsory insurance. German authorities claim that it has worked advantageously, and from the point of view that it has saved some men from destitution in their old age, this cannot be denied. The difficulty about the scheme is, that it may transfer the burden from one class to another. The wages paid for labor in Germany, as in other countries, are not superfluous. Any plan to take away the wages of a working man from his daily necessities, merely to give him a pension when he is old, is not satisfactory unless it can be demonstrated that his wage is in excess of his necessities. It is not charitable to deprive a man of his immediate necessities in order to meet future necessities. It is worse than uncharitable to deprive a man's family of their necessities in order to prevent him from becoming a charge on the community in his old age. It were better to let him use his wage, even all of it, to protect and develop his family, even if the more prosperous members of the community should have to support him in his old age by general taxation. Moreover, there will always be a class, in spite of any system of compulsory insurance, which will not qualify to profit by a pension. There are a thousand causes to prevent a man from going into an insurance scheme, as well as to cause him to drop out of it after he has gone into it; sickness, loss of employment, starvation wages, matters over which he can have no control, will interfere to deprive him of the benefits of such insurance. What is to be done with him then? He must still be taken care of. Therefore, Germany's experiment of compulsory insurance does not solve the problem satisfactorily. The most radical and progressive step taken in the care of the adult pauper was made by New Zealand some five years ago. In the preamble of the Old Age Pension Act, passed by the New Zealand parliament in 1898, these words occur:

> It is equitable that deserving persons who, during the prime of life, have helped to bear the public burdens of the colony by the payment of taxes, and to open up its resources by their labor and skill, should receive from the colony a pension in their old age.

There is no suggestion of charity in this proposition. It is a demand for justice and right. There is nothing said about relief from the burden of the care of these people in their old age, or that it is humane and kindly and charitable to care for them; but the claim is made that it is theirs by right and they ought to have it. On this ground, and this alone, do the New Zealanders, in their legislation, propose to make old age not only comfortable, but honorable in their community. The suggestion here is not one of charity, but of gratitude. The act was passed and is in full operation in New Zealand, but it is too early yet to say what the result will be. By the New Zealanders it is regarded as an experiment. But whatever the result may be, it has at least sounded a new note in the treatment of the aged poor, which is certain to receive an answering echo in the hearts of all who believe in justice.

It may be urged that the New Zealand plan discourages frugality and encourages paternalism. The man who knows that the State is going to take care of him when he shall have reached a certain age, will not make as great an effort to prosper as the man who knows that his comfort in old age will have to depend upon the fruits of the labor of his youth and full manhood; and there must still be those in every community, even in New Zealand, who do not come under the preamble of the Old Age Pension Act of New Zealand, for there are those who have never helped to bear the public burdens by the payment of taxes, or to open up the resources of the country by their labor and their skill. These, fallen into destitution in their old age, must be taken care of in some way. If they are to be taken care of outside of the Old Age Pension Act, then it does not answer the question. If they are to be included in the Pension Act, in spite of their non-productiveness, then the man who is worthless as a member of the community is treated on the same plane as the one who is worthy, and a premium is placed on worthlessness. There ought to be some better solution of this problem of caring for the respectable destitute person than that contained in either the German insurance scheme or the New Zealand Old Age Pension Act. There is no doubt that the community owes something to an individual who has worked all his life. Such a person should not be sent to the almshouse when he can work no longer. He should be able to go to the treasury of the community, not as an applicant for alms, but as a claimant for his own, and say, "The fruit of my labor is shown in the general prosperity of this community. Certain conditions have interfered with my sharing in that prosperity sufficiently to protect me from want in my old age, but by right and justice a share is mine, and I have come to collect it." At least enough to keep him supplied with the necessaries of life should be at his command on the establishment of his rightful claim to it, and there should be no difficulty in his getting it. Just how this can be done is a problem for students of sociology. New Zealand has taken a novel step, and the world is watching the outcome. It is not a question of charity, but a question of right, growing out of charity, and the answer will come, even as all the other answers to difficult problems in relation to the human race have come, through the best, the most disinterested, and the most earnest thought of the world.

JOHN W. KELLER,
Ex.-Com. of Charities, New York.

Chariton, kăr'ĭ-tŏn, Greek prose writer: fl. 5th or 6th century A.D. He was the author of a romance which describes the loves and adventures of Chæreas and Callirrhoë. Critics generally think that the birthplace usually assigned to the author is fictitious, and that it is by no means certain that he was a native of Aphrodisias in Caria. The romance was first published with a learned commentary by D'Orville (3 vols. 4to, Amsterdam 1750), from a MS. in Florence, the only one yet known.

Chariton, chăr'ĭ tŏn, Iowa, city and county-seat of Lucas County, situated on the Chariton River, and on the Chicago, B. & Q. R.R. It has several manufacturing interests, including flour-mills, carriage factories, and manufactories of agricultural implements. Pop. (1900) 3,989.

Charity, one of the three great theological virtues, consisting of love to God and to men, or the disposition to love God with all our heart and our neighbor as ourselves. In a narrower sense, it signifies kindness and goodwill toward mankind in general, and in a still narrower sense, the giving of alms and the alms itself. Organized charity is the system of poor relief carried out by bodies of a quasi-public character, such as the Charity Organization Society in New York. See PUBLIC CHARITIES.

Charivari, shä-rē-vä-rē, a term used especially in France to denote a mock serenade of discordant music with such accompaniments as tin kettles, shouting, whistling, groaning, hissing, and screaming, and the like, meant for the annoyance and insult of an obnoxious person. The etymology of Charivari is obscure; the Germans translate it by *Katzenmusik*, to which in English cat's-concert, and the American callithumpian concert, correspond. In France, during the Middle Ages, a charivari was generally raised against newly married persons, especially those married for the second time. The term is now sometimes applied to periodicals which ridicule the government's policy and public men.

Charju'i, Bokhara, a town situated on the river Oxus at the point where it is crossed by the railway from Bokhara to the Caspian Sea. Owing to its position it has considerable commercial importance.

Charlemagne, shär'lē-mān. See CHARLES THE GREAT.

Charlemont (shär-lē-mŏń) **and Givet,** zhē-vā, France, a fortified stronghold in the department of the Ardennes. The works occupy both banks of the Meuse, about 25 miles above Namur, at the junction of several roads, on a steep mountain, and completely command the river. They consist of four fortresses, two of which, Charlemont and Great Givet, lie on the left bank of the Meuse, and the other two, Little Givet and Mont d'Haur, upon the right. The fortification is calculated for a garrison of 11,000 men, but in case of necessity can contain 25,000, and may be defended by 3,000 to 4,000. The castle and small town of Charlemont were built in 1555 by Charles V. Louis XIV. enlarged it by fortifying the small town of Givet, which lies at the foot of the hill, and by increasing the fortifications of Charlemont. The Givets and Mont d'Haur capitulated to the Prussians in 1815, but Charlemont, which is almost impregnable, was not taken.

Charleroi, shär-lē-rwä, Belgium, a town in the province of Hainaut, on both sides of the river Sambre, 20 miles east-northeast of Mons, the low town standing on the right and the middle town and high town on the left bank. The only public building of importance is the parish church, which was built by Louis XIV. Charleroi possesses a college, an academy of design, a hospital, and several schools. It stands in a densely populated district with productive coal and iron mines, which have given rise to flourishing industries; it may be considered the centre of the Belgian iron trade. It was fortified by the Spaniards in 1666 and named for Charles II. of Spain. Taken by the French in November 1792, was recovered by the Austrians in June 1793, but it again surrendered to the French in July 1794. Pop. 25,000.

Charleroi, shär-lē-roi', Pa., city of Washington County, on the Monongahela River and on the Pittsburg, V. & C. R.R. Over $2,000,000 of capital is invested in the manufactures here, which include glass-works of various sorts. Pop. (1900) 5,930.

Charles Martel, king of the Franks: b. about 689 A.D.; d. 22 Oct. 741. He was a son of Pepin Héristal (mayor of the palace under the last kings of the Merovingian dynasty). His father had governed under the weak kings of France with so much justice, and so much to the satisfaction of the people, that he was enabled to make his office hereditary in his family. Chilperic II., king of the Franks, refusing to acknowledge Charles Martel as mayor of the palace, the latter deposed him, and set Clothaire IV. in his place. After the death of Clothaire he restored Chilperic, and subsequently placed Thierri on the throne, showing how absolute was the control of the mayor, and that the royal dignity was a mere phantom. Charles Martel rendered his reign famous by the great victory which he gained in October 732, over the Saracens, near Tours, from which he acquired the name of Martel, signifying hammer.

Charles the Great, or **Charlemagne** (CAROLUS MAGNUS), king of the Franks, and subsequently emperor of the west: b. probably at Aix-la-Chapelle 2 April 742; d. there 28 Jan. 814. His father was Pepin the Short, king of the Franks, son of Charles Martel. After the decease of his father, in 768, he was crowned king, and according to the wish of Pepin divided the Frankish dominions with his younger brother, Carloman; but the conditions of this partition were several times altered, without being ever adjusted to the satisfaction of the parties. Their mutual discontent was fostered principally by the king of the Lombards, Desiderius (the father-in-law of both princes), because Charlemagne had repudiated his wife. Desiderius sought revenge for the rejection of his daughter by exciting and encouraging commotions in the realm, in which he was assisted by the circumstance that the nobles aspired to independence. The people of Aquitania were the first who attempted to become independent. Charlemagne marched against them with rather a small army; but he relied on the assistance of his brother, Carloman, to whom a portion of Aquitania then belonged. Carloman appeared, indeed, on the field, but at the decisive moment

deserted his brother, who was obliged to sustain alone an unequal conflict. His great courage and conduct, after a long and doubtful contest, procured him the victory, and the insurgents submitted (770). At Carloman's death in 771, and after the flight of his wife and her two sons to her father in Italy, Charlemagne made himself master of the whole empire, the extent of which was already very great, as it embraced, besides France, a large part of Germany. He now formed the plan of conquering the Saxons, for which his zeal for the diffusion of Christianity served him as a pretence. The Saxons, in possession of Holstein and Westphalia, preferred pillaging to peaceful occupations, and a wandering to a settled mode of life. An irruption into the territory of the Franks was the alleged cause of the first war which Charlemagne began against them in 772. The other wars were produced by the rebellions of this warlike nation, which was never reduced to complete submission till the peace of Seltz, in 803, after it had embraced Christianity. A part of the Saxons Charlemagne removed to Flanders and Switzerland, and their seats were occupied by the Obotrites, a vandal tribe in Mecklenburg. The famous pillars called *Irminsäulen* were destroyed as monuments of pagan worship. During 32 years did the Saxons resist a conqueror who, striving with equal eagerness to convert and to subdue them, never became master of their country till he had transformed it almost into a desert. They might have made a more successful defense had they not been distracted by internal dissensions. The most celebrated of their leaders was Wittikind, and next to him Albio, who finally embraced Christianity in 783.

While he was combating the Saxons on the banks of the Weser, Pope Adrian implored his assistance against Desiderius, who had torn from him the exarchate of Ravenna, which Pepin the Short had presented to the holy see, and who was urging the Pope to crown the nephews of Charlemagne, that Charlemagne himself might be considered a usurper. Charlemagne immediately left Germany and marched with his army to Italy. Desiderius fled to Pavia, which was bravely defended by the Lombards. The city finally fell, and Desiderius, with the widow and sons of Carloman, were carried prisoners to France. Desiderius ended his life in a monastery. In 774 Charlemagne was crowned King of Lombardy with the iron crown.

In 778 he repaired to Spain to assist a Moorish prince, conquered Pampeluna, made himself master of the county of Barcelona, and spread the terror of his name everywhere. But on his return his troops were surprised in the valley of Roncesvalles by some Saracens, in connection with the mountaineers, the Basques, and the rear-guard defeated; remakable from the circumstances that Roland, one of the most famous warriors of those times, fell in the battle. (See RONCESVALLES.) The disaffection of the tribes of Aquitania induced Charlemagne to give them a separate ruler: for this purpose he selected the youngest of his sons, Louis (called le Débonnaire). The Lombards were no less turbulent, and the Greeks made incessant efforts to reconquer Italy; and the nobles to whom he had intrusted a part of the sovereignty of this country, evinced little fidelity. He therefore gave them his second son, Pepin, for a monarch; his eldest son, Charles, remaining constantly with him, and assisting him in his manifold undertakings. In 781 he caused these two sons to be crowned by the Pope in Rome, hoping to render the royal dignity inviolable in the sight of the people. Charlemagne had another son, also called Pepin, who was the oldest of all his children, being the son of his divorced wife. This circumstance probably inspired the monarch with an aversion to the elder Pepin, and prevented him from admitting him to a share in the government.

After returning from Spain Charlemagne was again obliged to take the field against the Saxons. The year 790, the 22d of his reign, was the only one which he passed without taking up arms. As his power increased, he meditated more seriously the accomplishment of the plan of his ancestor, Charles Martel, to restore the Western Empire. On Christmas Day (800) he was proclaimed Cæsar and Augustus by Pope Leo III.; he was invested with the ornaments of the ancient Roman emperors, and the only thing forgotten was, that the empire could not subsist long in a family where the authority was, by law, divided among the children of the deceased monarch. Pepin, king of Italy, died in 810, and his death was followed the next year by that of Charles, the eldest. Thus of his legitimate sons only one remained, Louis, king of Aquitania, whom Charlemagne adopted as his colleague in 813. He was buried at Aix-la-Chapelle, his favorite and usual place of residence. He was deposited in a vault, where he was placed on a throne of gold, in full imperial costume. The sepulchre was sealed, and over it was erected a kind of triumphal arch, on which were the words, «Here lies the body of Charles, the great and orthodox emperor, who gloriously enlarged, and for forty-seven years happily governed, the empire of the Franks.»

Charlemagne was a friend of learning; he deserves the name of restorer of the sciences and teacher of his people. He attracted by his liberality the most distinguished scholars to his court; among others, Alcuin, from England, whom he chose for his own instructor; Peter of Pisa, who received the title of his grammarian; and Paul Warnefried, better known under the name of Paulus Diaconus, who gave the emperor instruction in Greek and Latin literature. By Alcuin's advice, Charlemagne established an academy in his palace at Aix-la-Chapelle, the sittings of which he attended with all the scientific and literary men of his court — Leidrades, Theodulphus, the archbishops of Trèves and Mentz, and the Abbot of Corvey. All the members of this academy assumed names characteristic of their talents or inclinations. One was called Damætas, another Homer, another Candidus; Charlemagne himself took the name of David. From Italy he invited teachers of the languages and mathematics, and established them in the principal cities of his empire. In the cathedrals and monasteries he founded schools of theology and the liberal sciences. He strove assiduously to cultivate his mind by intercourse with scholars; and, to the time of his death, this intercourse remained his favorite recreation. His mother-tongue was a form of the Teutonic, but he spoke several languages readily, especially the Latin. He was less successful in writing, because he had not applied

himself to it till he was further advanced in years. In the winter he read much, and even caused a person to read to him while he took his meals. He endeavored to improve the liturgy and church music. He was desirous of introducing the Roman liturgy into his states; but the clergy, who clung to the ancient usages, offered some resistance. Several churches, however, complied with the wish of the monarch, and others mingled the Roman and Gallican liturgy. He attempted to introduce uniformity of measures and weights, but was unable to accomplish his design. Another great plan of his was to unite the Rhine with the Danube, and consequently the Atlantic with the Black Sea, by means of a canal. The whole army was employed on the work; but its accomplishment was prevented by want of knowledge of hydraulic architecture. The arts, however, under his patronage, produced other monuments of his fame. The city of Aix-la-Chapelle received its name from a splendid chapel which he caused to be built of the most beautiful Italian marble. The doors of this temple were of bronze, and its dome bore a globe of massive gold. The imperial palace was built in the highest style of splendor. Charlemagne also erected baths, in which more than one hundred persons could swim in warm water. He was himself very fond of swimming, and frequently used these baths, with all the nobles of his court, and even with his soldiers. At Seltz, in Alsace, he had a no less splendid palace. To Charlemagne France is indebted for its first advances in navigation. He built the lighthouse at Bologne, and constructed several ports. He encouraged agriculture, and made himself immortal by the wisdom of his laws. Thus his law *de villis* is esteemed a monument of his views on rural economy. His fame filled even the East. He received ambassadors from the patriarch of Jerusalem, from the Emperors Nicephorus and Michæl, and was twice complimented with embassies from Harun al-Rashid, the famous caliph of Bagdad, all of which he received with a splendor unexampled even in the East. He convened councils and parliaments, published capitularies, wrote many letters (some of which are still extant), a grammar, and several Latin poems. His empire comprehended France, most of Catalonia, Navarre, and Aragon; the Netherlands, Germany as far as the Elbe, Saale, and Eyder, Upper and Middle Italy, Istria, and a part of Sclavonia.

In private life Charlemagne was exceedingly amiable: a good father and generous friend. His domestic economy afforded a model of frugality; his person, a rare example of simplicity and greatness. He despised extravagance of dress in men, though, on solemn occasions, he appeared in all the splendor of majesty. His table was very plain. He was large and strong; his height, according to Einhard, equaled seven times the length of his foot. His head was round; his eye large and lively; his nose of more than common size; his countenance had an agreeable expression of serenity. His gait was firm; his bearing manly. He enjoyed perfect health till the last four years of his life, when he was attacked by fevers, and began to limp. In summer he was accustomed to repose for two hours after dinner, but at night he slept uneasily. He wore the dress of his country; on his body a linen shirt, over which was a coat with a silk border, and long breeches. For his outer dress he wore a cloak, and always his sword, the hilt and belt of which were of gold and silver. He possessed a natural, impressive eloquence, and in his expression of countenance there was something to excite respect, united with gentleness and kindness. See Einhard, 'Vita Caroli Magni'; Gaston Paris, 'Histoire Poétique de Charlemagne' (1865); Guizot, 'Charlemagne and the Carlovingians' (1880); Brosien, 'Karl der Grosse' (1885); Mombert, 'History of Charles the Great' (1888); Burr, 'Charlemagne' (1888); Hodgkin, 'Charles the Great' (1897); Dairs, 'Charlemagne' (1900).

Charles I., king of Great Britain and Ireland: b. Dunfermline, Scotland, 19 Nov. 1600; d. London 30 Jan. 1649. He was the third son of James VI. and Anne of Denmark. Soon after the birth of his son James succeeded to the crown of England, and on the death of Prince Henry in 1612, Robert, the second son, having died in infancy, Charles became heir-apparent, but was not created Prince of Wales till 1616. Little is recorded of him previous to his romantic journey into Spain in company with Buckingham, in order to pay his court in person to the Spanish infanta. Through the arrogance of Buckingham this match was prevented, and the prince was soon after contracted to Henrietta Maria, daughter of Henry IV. of France. In 1625 he succeeded to the throne on the death of his father. The first Parliament which he summoned, being much more disposed to state grievances than grant supplies, was dissolved; and by loans and other expedients an expedition was fitted out against Spain which terminated in disgrace and disappointment. In the next year a new Parliament was summoned, and the disgust and jealousy prevailing between the king and this assembly laid the foundation of the misfortunes of his reign. The House of Commons held fast the public purse, and he intimated a design of following new counsels should they continue to resist his will, and suddenly and angrily dissolved them, after a short session, while they were preparing a remonstrance against the levying of tonnage and poundage without consent of Parliament. Charles then began to employ his threatened mode of raising funds by loans, benevolences, and similar unpopular proceedings; which, however partially sanctioned by precedent, were wholly opposed to the rising notions of civil liberty, and to the constitutional doctrine which rendered the Commons the guardian and dispenser of the public treasure. His difficulties were further increased by a war with France, intended to gratify the private enmity of Buckingham, who added to the odium against him by an ill-fated expedition to assist the Huguenots of Rochelle.

In 1628 the king was obliged to call a new Parliament, which showed itself as much opposed to arbitrary measures as its predecessor, and after voting the supplies prepared a bill called "A Petition of Right, Recognizing all the Legal Privileges of the Subject," which, notwithstanding the employment of all manner of arts and expedients to avoid it, Charles was constrained to pass into a law.

The assassination of Buckingham soon after by Felton removed one source of discord, but the Parliament which met in January 1628 manifested so determined a spirit against the king's claim of levying tonnage and poundage by his own authority, that it was suddenly dissolved, and Charles was determined to try to reign without one. For this purpose, having judiciously terminated the pending wars between France and Spain, he raised Sir Thomas Wentworth, afterward so celebrated as Lord Strafford, to the principal place in his councils. This able statesman had begun his political career in opposition to the court, but having been gained over, was by his austerity, talent, and firmness, an exceedingly fit instrument to curb the spirit of resistance to prerogative, which had become so strong among the Commons. In ecclesiastical affairs Charles, unhappily for himself and the Church, was guided by the counsels of Laud, then bishop of London, a prelate whose learning and piety were accompanied by a zeal as indiscreet as intolerant.

Under these counsels about 11 years passed away in the execution of plans for raising money without the aid of Parliament, with other dangerous expedients. The arbitrary courts of high commission and star chamber, in the hands of Laud, also exercised in many instances the most grievous oppression. In 1634 ship money began to be levied, which being strictly applied to naval purposes, the nation at large acquiesced in it with less than usual repugnance; and some writers, who courageously attacked the court against the principle, were treated with so much severity that others were deterred from following their example. So desperate did the cause of liberty at this time appear, that great numbers of the Puritans emigrated to New England, and by order of the court a ship was prevented from sailing, in which were Sir Arthur Hazelrig, John Hampden, and Oliver Cromwell. It was in 1637, not long after this remarkable event, that Hampden commenced the career of resistance by refusing to pay ship money, the right to levy which, without authority of Parliament, he was determined to bring before a court of law. His cause was argued for 12 days in the court of exchequer; and although he lost it by the decision of 8 of the judges out of 12, the discussion of the question produced a very powerful impression on the public mind.

It was in Scotland, however, that formal warlike opposition was destined to commence. From the beginning of his reign Charles had endeavored to introduce into that country a liturgy copied from the English — an innovation which produced the most violent tumults, and ended in the formation of the famous «Covenant» in 1638, by which all classes of people mutually engaged to stand by each other. The Covenanters levied an army, which the king, opposed by an ill-disciplined English force, so equivocally inclined, that, not able to trust it, Charles agreed to a sort of pacification. His finances being exhausted, after an intermission of 11 years he again assembled a Parliament, which, as usual, began to state grievances previous to granting supplies. Losing all patience, he king once more hastily dissolved it, and prosecuted several members who had distinguished themselves by their opposition. Raising money in the best manner he could devise, an English army was again made to proceed toward the north; but, being defeated by the Scots, it became obvious that affairs could no longer be managed without a Parliament, and in 1640 that dreaded assembly was again summoned, which proved to be the famous Long Parliament, whose career forms so memorable a portion of English history. Charles soon found himself obliged to be a comparatively passive spectator of the ascendency of the democratic portion of the Constitution, and was obliged, both in Scotland and in England, to yield to the torrent which assailed him.

In the meantime a flame burst out in Ireland, which had no small effect in kindling the ensuing conflagration at home. The oppressed Roman Catholic population of that country, during the confusion of the times, rose against the government for the purpose of regaining their rights. Very exaggerated accounts of the massacre of the Protestants are given by several of the historians. Later writers have established the fact that the number who perished in this insurrection was not great.

The Parliament being summoned, the king left the conduct of the war entirely to it; but it now became evident that the Commons intended systematically to pursue their advantages, and to reduce the crown to a state of complete dependence. They framed a remonstrance containing a recapitulation of all the errors of the reign; renewed an attempt for excluding bishops from the House of Lords; passed ordinances against superstitious practices and so inflamed the popular odium against the Episcopal orders as to intimidate its members from attending to their duty in Parliament.

At length, it being apparent that either zealous adherents of prerogatives, or those anxious to establish the government on a more democratic basis, must give way, Charles caused his attorney-general to enter, in the House of Peers, an accusation against five leading members of the Commons, and sent a sergeant-at-arms to the House to demand them. Receiving an evasive answer, he, the next day, proceeded himself to the House, with an armed retinue, to seize their persons. Aware of this intention, they had previously withdrawn; but the king's appearance with a guard caused the House to break up in great disorder and indignation. The accused members retired into the city, where a committee of the House was appointed to sit, and the city militia was mustered under a commander appointed by Parliament, which also demanded the control of the army. Here the king made his last stand, the matter having now arrived at a point which arms alone could decide. The queen fled to Holland to procure ammunition, and Charles, with the Prince of Wales, proceeded north, and for a time fixed his residence at York. The king was received in his progress with great demonstrations of loyalty from the gentry; and many eminent and virtuous characters, the conscientious opposers of his arbitrary measures in the first instance, now joined his party. On the other hand, all the Puritans, the inhabitants of the great trading towns, and those who had adopted republican notions of government, sided with the Parliament; and in no public contest was more private and public virtue ranged on both sides, however alloyed, as in all such cases, with ambition, bigotry, and the baser passions. The first action of consequence was the battle of Edge Hill

23 Oct. 1642, which, although indecisive, enabled the king to approach London, and produce considerable alarm. Nothing decisive, however, happened against the royal side till the battle of Marston Moor in 1644, which was gained chiefly by the skill and valor of Cromwell. The succeeding year completed the ruin of the king's affairs, by the loss of the battle of Naseby.

Thenceforward a series of disasters attended his armies throughout the kingdom, and he took the resolution of throwing himself into the hands of the Scottish army, then lying before Newark, 5 May 1646. He was received with respect, although placed under guard as a prisoner; and, a series of abortive negotiations ensuing, an agreement was made with Parliament to surrender him to their commissioners, on the payment of a large sum, claimed as arrears by the Scottish army. The king was accordingly surrendered to the commissioners appointed 30 Jan. 1647, and carried, in the first place, to Holmby House, in Northamptonshire; subsequently, to the headquarters of the army at Reading; and soon after to Hampton Court. In the meantime, however, the army and Independents becoming all powerful, he was led into some fears for his personal safety, and, making his escape with a few attendants, proceeded to the south coast. Not meeting a vessel, as he expected, he crossed over to the Isle of Wight, and put himself into the hands of Hammond, the governor, by whom he was lodged in Carisbrooke Castle.

While the king was in this situation, the Scots, regretting the manner in which they had delivered him up, and indignant at the proceedings of the English, marched a considerable army to his relief, under the Duke of Hamilton. This force, although strengthened by a large body of English royalists, was entirely routed and dispersed by Cromwell at Preston, as were the insurgents in Kent and Essex by Fairfax. During this employment of the army and its leaders a new negotiation was opened with the king in the Isle of Wight, who agreed to nearly everything demanded of him, except the abolition of Episcopacy; and so much had it now become the interest of the Parliament itself to comply with him, that a vote was at length carried, that the king's concessions were a sufficient ground for a treaty. The triumphant army, however, on its return, cleared the House by force of all the members opposed to its views; and thereby procuring a reversal of this vote, the king's person was again seized, and, being brought from the Isle of Wight to Hurst Castle, preparations were made for trying him on the capital charge of high treason against the people. As the House of Lords refused to concur in a vote for this purpose, the Commons declared its concurrence unnecessary; and the king, being conducted to London and stripped of all ensigns of royalty, was brought before the court of justice specially erected for this unprecedented trial, on 20 Jan. 1649.

The behavior of Charles had been calm and dignified throughout his adversity, and in no respect was it more so than on this occasion. Three times he objected to the authority of the court when brought before it, and supported his refusal by clear and cogent arguments. At length, evidence being heard against him on the proof that he had appeared in arms against the parliamentary forces, sentence of death was pronounced against him. He requested a conference with both Houses, which was rejected, and only three days allowed him to prepare for his fate. After passing the three days in religious exercises, and in tender interviews with his friends and family, he was led to the scaffold. His execution took place before the Banqueting House, Whitehall, on 30 Jan. 1649, where, after addressing the people around him with great firmness and composure, the ill-fated king submitted to the fatal stroke.

Thus died Charles I., in the 49th year of his age. He was, in an eminent degree, temperate, chaste, and religious, and although somewhat cold and reserved in demeanor, was really kind and affectionate. His talents were also considerable; but he was deficient in the decision and self-reliance necessary to superior executive ability. His mind was cultivated by letters and a taste for the polite arts, particularly painting, the professors of which he munificently encouraged; and his collections of work on art show judgment in the selection. To all these personal and private requirements he joined a graceful figure and pleasing countenance, and, under happier circumstances, would doubtless have been regarded as a very accomplished sovereign.

With respect to his political character, as exhibited in the great struggle between himself and the Parliament, it is impossible not to perceive that he strove to maintain a portion of prerogative that had become incompatible with any theory of civil and religious liberty; but it is equally certain that he only sought to retain what his predecessors had possessed. There are periods in the history of every people in which old and new opinions conflict, and a concussion becomes unavoidable; and it was the misfortune of Charles to occupy the throne at a time when the development of the representative system necessarily brought it into conflict with the claims of prerogative. If the Parliament had acquiesced in the kingly pretensions, as usually explained by Laud and the high churchmen of the day, it would have dwindled into a mere registry of royal edicts, like those of France. On the other hand, Charles acted a part which every monarch in his situation may be expected to act; for a philosophical appreciation of the true nature of a political crisis is scarcely to be expected from one who sits upon a throne. The most forcible accusation against Charles is on the score of insincerity. It is asserted that he never intended to fulfill the conditions imposed upon him. This can scarcely be denied; but it is equally certain that some of them might justly be deemed questionable, and may even have been imposed in order to produce that conduct in the king which so naturally followed. See Chancellor, 'Life of Charles I., 1600–25' (1886); Skelton, 'Life of Charles I.' (1898); S. R. Gardiner, 'History of the Great Civil War.'

Charles II., king of Great Britain and Ireland, son of Charles I. and Henrietta Maria of France: b. London 29 May 1630; d. there 6 Feb. 1685. He was a refugee at The Hague on the death of his father, on which he immediately assumed the royal title. He listened to an invitation from the Scots, who had proclaimed him

their king 5 Feb. 1649, and arrived in the Cromarty Firth 16 June 1650. Being obliged to throw himself into the hands of rigid Presbyterians, they subjected him to many severities and mortifications, which caused him to regard that sect ever after with extreme aversion. In 1651 he was crowned at Scone; but the approach of Cromwell soon rendered his abode in Scotland unsafe. Hoping to be joined by the English royalists, he took the spirited resolution of passing Cromwell and entering England, Carlisle readily throwing open its gates to receive him. He was immediately pursued by that active commander, who, with a superior army, gained the battle of Worcester, and Charles, after a variety of imminent hazards, being on one occasion sheltered for 24 hours in the branches of the famous Boscobel oak, reached Shoreham, in Sussex, and effected a passage to France.

It is the province of history to state the circumstances that produced the Restoration, which Gen. Monk so conducted that Charles, without a struggle, succeeded at once to all those dangerous prerogatives which had cost the nation so much blood and treasure, first to abridge and then to abolish. On 29 May 1660, Charles entered his capital amid universal and almost frantic acclamations; and the different civil and religious parties vied with each other in loyalty and submission. His first measures were prudent and conciliatory. Hyde, Lord Clarendon, was made chancellor and prime minister; and an act of indemnity was passed, from which those alone were excepted who were immediately concerned in the late king's death. A settled revenue was accepted in lieu of wardship and purveyance, and the army was reduced. In respect to religion, there was less indulgence; for not only were prelacy and the parliamentary rights of bishops restored, which was to be expected, but an act of uniformity was passed, by the conditons of which nearly all the Presbyterian clergy were driven to a resignation of their livings. In 1662 he married the Infanta of Portugal, a prudent and virtuous princess, but in no way calculated to acquire the affection of a man like Charles. The indolence of his temper and the expenses of his licentious way of life soon involved him in pecuniary difficulties; and the unpopular sale of Dunkirk to the French was one of his most early expedients to relieve himself.

In 1663 a rupture took place with Holland. It was attended, in the first instance, by various naval successes; but France and Denmark entering into the war, as allies of the Dutch, the English were overmatched, and a Dutch fleet entered the Thames, and, proceeding up the Medway, burned and destroyed ships as high as Chatham. The domestic calamities of a dreadful plague in 1665, and of the great fire in London in 1666, added to the disasters of the period. Soon after, Clarendon, who had become very unpopular, and was personally disagreeable to Charles, was dismissed, and sought shelter from his enemies by a voluntary exile. A triple alliance between England, Holland, and Sweden, for the purpose of checking the ambition of Louis XIV., followed. It did honor to the political talents of Sir William Temple, and was one of the few public measures of the reign which deserve approbation. In 1670 Charles threw himself into the hands of the five unprincipled ministers, collectively denominated the cabal, who supported him in every attempt to make himself independent of Parliament. The party troubles of this reign commenced about this time by the open declaration of the Duke of York, presumptive heir to the crown, that he was a convert to the Roman Catholic religion. Soon after the ministry broke the triple alliance, and planned a rupture with the Dutch; and as the king did not choose to apply to Parliament for money to carry on the projected war, he caused the exchequer to be shut up in January 1672. The naval operations against the Dutch were by no means successful, and a new Parliament being called, which strongly expressed the discontent of the nation, the cabal was dissolved, and a separate peace made with Holland in 1674. Divisions in the cabinet, fluctuations in the king's measures, and parliamentary contests followed, and occupied the next three years, till, in 1677, Charles performed a popular act, by marrying his niece, the princess Mary, to the Prince of Orange. By taking some decided steps in favor of the Dutch he also forwarded the Peace of Nimeguen in 1678. The same year was distinguished by the pretended discovery of the popish plot for the assassination of the king, and the introduction of the Roman Catholic faith. Notwithstanding the infamous characters of Oates and Bedloe, and the improbable nature of their disclosures, their tale, supported by the general suspicions of the secret influence of a Catholic faction, met with universal belief; the Parliament exhibiting nearly as much credulity and heat as the masses. Many Catholic lords were committed; Coleman, the Duke of York's secretary, and several priests hanged; and a venerable nobleman, the Earl of Stafford, beheaded. The Duke of York thought fit to retire to Brussels, and a bill for his exclusion from the throne passed the House of Commons. Such was the state of the country that Charles was obliged to give way to some popular measures, and the great palladium of civil liberty, the Habeas Corpus bill, passed during this session. The temper of the Parliament was so much excited that the king first prorogued and then dissolved it. The court now sought to establish a balance of parties; to distinguish which, the terms Whig and Tory were about this time brought into use.

In 1680 a new Parliament assembled, and the Commons again passed the Exclusion Bill, which was rejected by the Lords. This Parliament was also dissolved in the next year, and a new one called at Oxford, which proved so restive, that a sudden dissolution of it ensued; and, like his father, Charles determined henceforward to govern without one. By the aid of the Tory gentry and the clergy he obtained loyal addresses from all parts of the kingdom, and attachment to high monarchical principles came again into vogue. The charge of plots and conspiracies was now brought against the Presbyterians. The Nonconformists, generally, were also treated with much rigor; and a step of great moment, in the progress to arbitrary power, was the instituting suits at law (*quo warrantos*) against most of the corporations in the kingdom, by which they were intimidated to a resignation of their charters, in order to receive them back so modeled as to render them much more dependent than before. These rapid strides toward the destruction of liberty at length produced the celebrated Rye House plot,

the parties to which certainly intended resistance; but that the assassination of the king was ever formally projected seems very doubtful. It certainly formed no part of the intention of Lord William Russell, whose execution, with that of Algernon Sidney, on account of the plot, forms one of the striking events of this disgraceful reign.

Charles was at this time as absolute as any sovereign in Europe; and had he been an active prince, the fetters of tyranny might have been completely riveted. Scotland, which at different periods of his reign had been driven into insurrection by the arbitrary attempts to restore Episcopacy, was very nearly dragooned into submission; and the relics of the Covenanters were suppressed with circumstances of great barbarity. At his death he received the sacrament according to the rites of the Catholic Church.

The character of Charles II. requires little analysis. He was a confirmed sensualist and voluptuary; and his reign was the era of the most dissolute manners that ever prevailed in England. The stage was an open school of licentiousness, and polite literature was altogether infected by it. Charles was a man of wit, and a good judge of certain kinds of writing, but too deficient in sensibility to feel either the sublime or the beautiful in composition; neither was he generous even to the writers whom he applauded. He possessed an easy good nature, but united with it a total indifference to anything but his own pleasure; and no man could be more destitute of honor or generosity. His ideas of the relation between king and subject were evinced by his observation on Lauderdale's cruelties in Scotland: "I perceive," said he, "that Lauderdale has been guilty of many bad things against the people of Scotland; but I cannot find that he has acted in anything contrary to my interest." Yet, with all his selfishness and demerits as a king, Charles always preserved a share of popularity with the multitude from the easiness of his manners. Pepy's 'Memoirs' and other private documents, however, clearly show the opinion of the more reflecting portion of his subjects; and it is now pretty generally admitted that, as he was himself a most dishonorable and heartless monarch and man, so his reign exhibited the English character in a more disgraceful light than any other in English history. It need not be added that he left many illegitimate children, the descendants of some of whom are still among the leading nobility of the country. The fate of his most distinguished son, the ill-fated Duke of Monmouth, is an affair of history.

Charles (shärl) **I.** ("le Chauve," or "the Bald"), king of France, son of Louis le Débonnaire: b. Frankfort-on-the-Main 13 June 823; d. 877. He was invested by his father with the kingdoms of Alemania, Burgundy, Provence, and Septimania, and subsequently with that of Aquitaine. On Louis' death in 840, Charles found himself confronted with two enemies — his half-brother Lothaire, who, as eldest son, claimed the whole of the Frank empire of Charlemagne, and his nephew Pepin, who asserted, in right of his father, a preferable claim to the sovereignty of Aquitaine. After considerable bloodshed, a treaty was entered into between Charles and Lothaire at Verdun, by which the former received, as his share of the dominions of Charlemagne, all those territories comprehended between the ocean on the one part, and the Meuse, the Scheldt, the Saône, the Rhone, and the Mediterranean on the other. His struggle with Pepin was long and obstinate, and in 844 he was obliged to recognize him as king of southern Aquitaine. In 875, by the death of his nephew, the Emperor Louis II., he gained possession of the imperial crown, and thereby provoked the hostility of his brother, Louis the German, who ravaged the territory of Champagne, and otherwise committed great havoc in his dominions. In 877 he proceeded to Italy on a crusade against the Saracens, to which he had been summoned by the Pope, but died when crossing Mount Cenis.

Charles II. ("le Gros," or "the Fat"), king of France, also known as Charles III., emperor of Germany: b. about 832; d. Neidingen, Suabia, 13 June 888. He was the son of Louis the German, and the grandson of Louis le Débonnaire, and was recognized as emperor of Germany by the Pope. In 885 he ascended the French throne, to the prejudice of his cousin, Charles the Simple, whose youth prevented him from asserting his rights, but in 887 was deposed, and the following year died miserably, strangled, as is asserted, by his servants.

Charles III. ("the Simple"), king of France, the posthumous son of Louis the Stammerer: b. 17 Sept. 879; d. 929. On his father's death France was divided between Charles' two brothers, Louis III. and Carloman, and an aristocratic oligarchy. On the death of his brothers he ought in right to have ascended the throne, but his extreme youth prevented his claims being recognized, and his cousin, Charles the Fat, was proclaimed king in 885. On the deposition of the latter in 887 Count Eudes of Paris succeeded in obtaining the crown; but his death in 898, left Charles undisputed king of the whole country. The reign of Charles is chiefly noted for the piratical incursions of the Northmen or Normans, who ravaged the coasts of France, sailed up the principal rivers, and spread such dismay that, to conciliate them and put an end to their devastations, he agreed to cede to their chief, Rollo, the territory of Normandy, to be held as a fief of the French crown. Latterly also Charles' tranquillity was much disturbed by the turbulence of some of his great vassals, who broke into open rebellion, declared the throne forfeited, and proclaimed as king, Robert, brother of Count Eudes. Through the treachery of Herbert, Count of Vermandois, Charles was inveigled into the town and imprisoned in the fortress of Peronne. From this he was only liberated a short time before his death.

Charles IV. ("the Fair"), king of France, third son of Philippe le Bel: b. 1294; d. 1328. In virtue of the salic law he ascended the throne in 1322, to the exclusion of the daughters of Philip the Long. He reigned six years, dying in 1328 without male issue, the last of the direct line descended from Hugh Capet. Isabella, his sister, married Edward II. of England, and was materially aided by Charles in fitting out, along with her paramour Mortimer, the expedition which resulted in the dethronement of her husband.

Charles V. ("the Wise"), king of France, son of John II.: b. Vincennes 21 Jan. 1337; d. there 16 Sept. 1380. While Duke of Normandy, and during the captivity of his father in England, after the battle of Poitiers, he took the title of lieutenant of the kingdom. The vices and extravagance of the court were extreme, and the demands of the States-General for reform, headed by Stephen Marcel, provost of the merchants of Paris, were loudly and persistently urged. This assembly was supported in its claims by Charles the Bad, king of Navarre, who, as grandson of Louis le Hutin, maintained a preferable right to the crown. By artfully temporizing Charles contrived to detach the leading orders from the cause of the states, and having brought about indirectly the assassination of Marcel, succeeded in crushing their party. Meantime his father John still continued in captivity in England till liberated by the Treaty of Brétigny in 1360. Four years afterward he died, leaving Charles as successor to the French crown. The reign of the latter presents a series of combined hostilities and intrigues carried on with the view of establishing his power and extending his dominions. In these he was so far successful as to keep at bay the king of Navarre and deprive the English of a great part of their possessions in France. The magnanimity and wisdom of Charles have been greatly commended by some writers, and if we make due allowance for the times in which he lived, the high character which these have assigned him may not appear overcharged. That in his public administration, however, he was guilty of various acts of perfidy and cruelty cannot be disputed. He possessed some literary tastes, and was the founder of the Bibliothèque Royale. A less beneficial act was the erection of the Bastile, for the purpose of overawing the Parisians, whose outbreaks he had found reason to dread.

Charles VI. ("the Silly"), king of France, and son of Charles V.: b. Paris 3 Dec. 1368; d. 21 Oct. 1422. When his father died he was not 12 years old, and the contending pretensions of his uncles, the Dukes of Anjou, Berry, Burgundy, and Bourbon, rendered his minority a scene of unbounded turbulence and license. In 1385 he was married at Amiens to Isabella of Bavaria. In 1388 he declared himself independent of guardians, and took the reins of government into his own hands. His mild and amiable, though somewhat dissipated character, had already secured for him a considerable share of popularity, when he was overtaken by a fearful calamity, the loss of his reason — a condition in which, with a few lucid intervals, he remained to the end of his days. The origin of this was constitutional, aggravated by a fright and a severe accident. Perhaps at no period in her history was France the scene of greater disasters and miseries than during the reign of this unhappy prince. The rival factions of the Burgundians and the Armagnacs, kept up constantly throughout the country the horrors of a most rancorous civil war; while brigandage and every kind of violence prevailed to the most fearful extent. Such a conjunction afforded the most favorable opportunity for an invader; and accordingly, in 1415, Henry V. of England crossed over to Normandy with a numerous army, took Harfleur by storm, and signally defeated the French forces in the battle of Agincourt. Improving these advantages he advanced into the country, gained possession of the capital, and compelled the crazy king to sign the Treaty of Troyes, by which his daughter Catharine was given in marriage to Henry, and the latter acknowledged successor to the French crown after Charles' death. Neither monarch long survived this celebrated paction, both dying within a few months of each other.

Charles VII., king of France, 5th son of Charles VI.: b. Paris 22 Feb. 1403; d. Mehun 22 July 1461. He became, by the successive deaths of his elder brothers, dauphin and heir-presumptive to the crown. On the king of England's death in 1422 his son Henry VI. was proclaimed king of France at Paris. The war with the national party, represented by the Orleanist faction, with the dauphin at their head, was maintained for several years by the English, under the command of the Duke of Bedford. So successfully did the latter conduct operations that Charles was brought to the verge of despair, and almost reduced to abandon the struggle as hopeless, when his fortunes were retrieved by the arrival in his camp of the Maid of Orleans, who by the enthusiasm which she inspired first turned the tide of success against the English. (See JOAN OF ARC.) The fresh spirit thus infused into the breasts of the French was heightened by mismanagement on the part of the English, whose military operations were conducted with greatly diminished efficiency after the death of the Duke of Bedford, while discord and confusion prevailed in the home councils. Through the intervention of the Earl of Suffolk a marriage was concluded between the young king Henry VI. and Margaret of Anjou, niece of Charles VII.'s queen. In the treaty entered into on this occasion the territory of Maine was secretly surrendered to France, and subsequently, on hostilities being resumed between the two countries, the troops of Charles conquered the whole of Guienne, and finally expelled the English from all their possessions in France except Calais. The last years of Charles' reign were embittered by domestic broils, in which his son and successor Louis XI. took a prominent part against his father. So hemmed in at last was the latter by the emissaries of the dauphin that he conceived the idea of Louis having formed a deliberate plan to poison him; and so firmly was this notion rooted in his mind that he could only with the greatest difficulty be induced to take any food. A romantic interest has been thrown around Charles VII. by his early reverses and the re-establishment of French nationality, which he effected mainly through the heroism inspired by the Maid of Orleans. His personal character, however, was weak and contemptible, without energy and without principle, surrendering himself continually to sensual and degrading pleasures. His share in the treacherous murder of the Duke of Burgundy, and base abandonment to her fate of Joan of Arc, are stains on his memory which cannot be effaced.

Charles VIII., king of France, son of Louis XI.: b. Amboise 30 June 1470; d. there 7 April 1498. He succeeded his father in 1483, his sister Anne de Beaujeu acting as regent till he attained the age of 20. In 1491 he mar-

ried Anne, the heiress of Brittany, and thereby annexed that important duchy to the French crown. By so doing, however, he both broke faith with the daughter of Maximilian, king of the Romans, to whom he had been espoused, and also robbed Maximilian of his bride, a marriage by proxy having been already concluded between him and Anne. The leading incident of Charles VIII.'s reign is his Italian expedition and conquest of the kingdom of Naples, having been instigated thereto by Ludovico Sforza, the usurping Duke of Milan. The title pretended to Naples was asserted in virtue of the rights to that sovereignty transmitted by the house of Anjou to the royal family of France. The whole of Charles' expedition reads like a page from one of the old chivalrous romances. With an army of 30,000 men, unprovided either with money or stores, he suddenly crossed the Alps, advanced rapidly southward, and meeting with scarcely any obstruction, arrived before the walls and gained possession of Naples. This conquest, however, he did not retain for many months. Having left 5,000 men to guard his new acquisition he returned to France, and had scarcely reached it when the arms of Gonsalvo de Cordova effected the re-annexation of Naples to Spain. The expedition of Charles VIII. left thus hardly a trace upon the country, but is memorable as the commencement of that series of French incursions into Italy which, under his successors deluged that fair land with bloodshed. He left no children, and was succeeded by his relative, the Duke of Orleans, under the title of Louis XII.

Charles IX., king of France, son of Henry II. and Catharine de Medici: b. St. Germain-en-Laye 27 June 1550; d. 30 May 1574. He ascended the throne at the age of 10, after the death of his brother, Francis II. No regency was appointed, and it was deemed sufficient to write to the Parliament, through the young prince, that he had requested his mother to undertake the administration of the public affairs. The Parliament acquiesced in this resolution, to avoid exciting new contests between the Guises and the princes of the blood. The Duke of Guise, who obtained possession of the person of the young king, was shot by an assassin before Orleans, in February 1563. In his last moments he advised the king and the queen mother to negotiate with the parties. This advice was followed; a treaty was signed 19 March and Havre taken from the English 27 July. The king, who was the same year declared of age, visited the provinces in company with his mother. At Bayonne he had a meeting with his sister Isabella, the wife of Philip II. of Spain. This excited such suspicions in the Calvinists that they took up arms, and immediately formed the plan of attacking the king on his return to Paris. Being warned in season he escaped the danger; but this plot could not fail to arouse the hatred of Charles. After the battle of St. Denis, 1567, in which the constable of Montmorenci lost his life, Catharine entered into negotiations for peace. But the Calvinists reserved a part of the places which they were to have surrendered, and continued to keep up a communication with England and the German princes. A new civil war soon broke out. Notwithstanding the jealousy of Charles, Catharine placed the Duke of Anjou at the head of the royal army. The Prince of Condé having been shot in the battle of Jarnac in 1569, and the Admiral Coligny having been defeated at Montcontour in the same year, the king concluded peace, in 1570, on terms so favorable to the Calvinists that they seem even to have suspected treachery under them. The heads of that party did not therefore all appear at court when Charles celebrated his marriage with Elizabeth, the daughter of Maximilian II. By degrees this distrust disappeared, and the marriage of the young king of Navarre (afterward Henry IV.) with Margaret, sister of Charles X., seemed to banish every suspicion. This marriage took place 18 Aug. 1572. On the 22d the first attempt was made on the life of Coligny, and on the 24th began that massacre known under the name of the massacre of St. Bartholomew, from having taken place on the night of the festival of that saint. Civil war broke out for the fourth time, and Catharine now became aware of the errors of her policy. Charles could no longer conceal his aversion to her, and was on the point of assuming himself the reins of government, when he died, childless, in 1574.

Charles X., Comte d'Artois, king of France: b. Versailles 9 Oct. 1757; d. Goritz, Austria, 6 Nov. 1836; grandson of Louis XV. He was the youngest son of the dauphin, and brother of Louis XVI. He spent a dissipated youth, and left France in 1789, after the first popular insurrection and destruction of the Bastile, and at Pilnitz attended the Congress of Princes, for the purpose of opposing the spread of revolutionary principles. After Louis XVI. had accepted the Constitution of 1791, he invited Charles to return to France, but he refused, and the legislative assembly, after stopping his allowance on the civil list, confiscated his property in 1792. He afterward assumed the command of a body of emigrants, and acted in concert with the Austrian and Prussian armies on the Rhine. At a later period he made a descent on the coast of Brittany, but despairing of success, retreated to Great Britain, and resided for several years in the palace of Holyrood at Edinburgh. After the downfall of Napoleon he entered France with the title of lieutenant-general of the kingdom, and issued a judicious proclamation, promising the reign of law and an entire oblivion of the past. In 1824 he succeeded his brother, Louis XVIII., under the title of Charles X., and gained a momentary popularity by the abolition of the censorship of the press, but measures of a very different description soon followed, and the spirit of disaffection was so widely spread that a collision with the popular party became inevitable. Charles X. endeavored to gain the start by what is called a *coup d'état*, and issued his celebrated ordonnances, but victory declared against him, and he was ignominously driven from the throne in 1830. After formally abdicating in favor of his grandson, the Duke de Bordeaux, he revisited England, resumed his residence for a short time at Holyrood, and finally settled at Göritz in Styria. See Lorieux, 'Histoire de Règne de Charles X.' (1834).

Charles I., king of Germany. See Charles the Great.

Charles II., king of Germany. See Charles I. of France.

Charles III., surnamed LE GROS, king of Germany. See CHARLES II. of France.

Charles IV., emperor of Germany, of the house of Luxemburg: b. Prague 14 May 1316; d. there 29 Nov. 1378. He inherited the kingdom of Bohemia, and had been chosen emperor in 1346 by five electors, hoping to occupy the imperial throne without opposition. But the princes of the empire regarded him as a servant of the Pope. He however used every effort to appease his enemies, married the daughter of the Elector of the Palatinate, gave Tyrol as a fief to the Elector of Brandenburg, and was unanimously elected emperor, and consecrated at Aix-la-Chapelle. But no sooner was he crowned than he took possession of the imperial insignia, and conveyed them to Bohemia. In 1354 the emperor went to Italy to be crowned by the Pope; but this favor he purchased on terms which made him an object of ridicule and contempt. He engaged to appear without any armed force. Having been consecrated king of Italy at Milan, he confirmed the Visconti in the possession of all the usurpations of which he had promised to deprive them. He also annulled all the acts of his grandfather, Henry VII., against Florence, and by a treaty concluded at Padua resigned the latter city, with Verona and Vicenza, to Venice. He refused the request of some Romans to claim the city, as belonging to him in the name of the empire, and in a treaty renounced all sovereignty over Rome, the states of the Church, Ferrara, Naples, Sicily, Sardinia, and Corsica, and even took an oath not to return to Italy without the consent of the Pope. Despised by the Guelphs, detested by the Ghibellines, Charles returned to Germany, where he issued the celebrated golden bull, which, till modern times, continued a fundamental law of the German empire. He thus acquired some claims to the public gratitude, but these were soon effaced by the general indignation, excited by the proposal made, with his consent by the papal nuncio, to introduce a tax, equal to the tithe of all ecclesiastical revenues, for the benefit of the holy see. All the members of the diet opposed it; and Charles, in his anxiety to conciliate the princes of the empire, announced that he would propose to the Assembly a reform of the German clergy. The Pope, opposing this proposal of the emperor, exhorted the electors to depose him. Charles immediately relapsed into his accustomed submissiveness, and not only abandoned all his reforms, but even confirmed, in 1359, all the privileges of the clergy, all their present and future possessions, and made them independent of the secular power. Such vacillating conduct subjected him to the contempt of both parties. Under such an emperor Germany could not enjoy internal tranquillity. Bands of robbers plundered the country in all quarters. The emperor left the princes and cities to protect themselves by mutual alliances. The state of Italy was no less melancholy. Tuscany was suffering the evils of anarchy; Lombardy was distracted by civil wars, and the Visconti had made themselves masters of the Milanese. During his residence in Italy, he sold states and cities to the highest bidder, or, if they themselves offered most, made them independent republics. With great treasures he returned to Germany. Gregory XI. having given his consent that his son Wenceslaus should be elected king of the Romans, he employed his ill-gotten wealth to purchase the votes of the electors, who were irritated at the conduct of the Pope, and, moreover, distributed among them the domains of the empire on the Rhine, and several free imperial cities. Thus he attained his object. To maintain their rights against the arbitrary measures of the emperor, the imperial cities in Suabia formed the Suabian league, which Charles opposed in vain. His reign is notable for the improvement and prosperity of Bohemia; for the founding of the universities of Prague and Vienna; for a terrible persecution of the Jews, and as the period when the sale of letters of nobility commenced in Germany.

Charles V., emperor of Germany and king of Spain (in the latter capacity he is called Charles I.): b. Ghent 24 Feb. 1500; d. Yuste, Spain, 21 Sept. 1558. He was educated in the Netherlands under the care of William of Croy, lord of Chièvres, who taught him history, formed him for affairs of state, and gave him that gravity of manner which he retained through life. After the death of Ferdinand of Spain, his grandfather, in 1516, Charles assumed the title of king of Spain. The management of this kingdom was intrusted to the celebrated Cardinal Ximenes. In 1519 Charles, on the death of Maximilian, was elected emperor. He left Spain to take possession of his new dignity, for which he had to contend with Francis I., king of France. His coronation took place at Aix-la-Chapelle with extraordinary splendor. The progress of the Reformation in Germany demanded the care of the new emperor, who held a diet at Worms. Luther, who appeared at this diet with a safe conduct from Charles, defended his cause with energy and boldness. The emperor kept silent; but after Luther's departure a severe edict appeared against him in the name of Charles, who thought it his interest to declare himself the defender of the Roman Catholic Church.

In a very few years the power of Charles became a source of uneasiness to most other princes of Europe. Pope Clement VII. placed himself at the head of a league of the principal states of Italy against the emperor, but their ill-directed efforts were productive of new misfortunes. Rome was taken by storm by the troops of the constable of Bourbon, sacked, and the Pope himself made prisoner. Charles V. publicly disavowed the proceedings of the constable, went into mourning with his court, and carried his hypocrisy so far as to order prayers for the deliverance of the Pope. Henry VIII. of England now allied himself with the French monarch against Charles, who accused Francis of having broken his word. The war was terminated in 1529 by the Treaty of Cambray, of which the conditions were favorable to the emperor. Charles soon after left Spain, and was crowned in Bologna as king of Lombardy and Roman emperor. In 1530 he seemed desirous, at the Diet of Augsburg, to reconcile the various parties; but not succeeding, issued a decree against the Protestants, which they met by the Schmalkaldic League. Notwithstanding his undertakings in favor of the Roman Catholic religion, Charles always practised moderation toward the Protestants whenever his interest left room for toleration. Nor did the Protestant

princes hesitate to furnish their contingents when he was assembling an army against the Turks. Having compelled Solyman to retreat, he undertook in 1535 an expedition against Tunis, reinstated the dey, and released 20,000 Christian slaves. This success added to his character somewhat of the chivalric, which gave him still more influence in Christendom, and promoted his political projects.

The policy of Charles was to reconcile the two great religious parties, and with this view he alternately threatened and courted the Protestants. After some show of negotiation the Protestant princes raised the standard of war. The emperor declared, in 1546, the heads of the league under the ban of the empire, excited divisions among the confederates, collected an army in haste, and obtained several advantages over his enemies. John Frederick, the elector of Saxony, was taken prisoner in the battle of Mühlberg in 1547. Charles received him sternly, and gave him over to a court-martial consisting of Italians and Spaniards, under the presidency of Alva, which condemned him to death. The elector saved his life only by renouncing his electorate and his hereditary estates, but remained a prisoner. Meanwhile the emperor appeared somewhat more moderately inclined toward the vanquished party. On coming to Wittenberg he expressed surprise that the exercise of the Lutheran worship had been discontinued. He visited the grave of Luther, and said, "I do not war with the dead; let him rest in peace; he is already before his Judge." The Landgrave of Hesse-Cassel, one of the heads of the Protestants, was compelled to sue for mercy. Notwithstanding his promise Charles deprived him of his freedom. After having dissolved the League of Schmalkalden the emperor again occupied himself with the plan of uniting all religious parties, and for this purpose issued the Interim, which was as fruitless as the measures proposed by him at the Diet of Augsburg. Neither was he successful in securing the imperial crown to his son. Discord still agitated public sentiment, and a new war broke out against him. Maurice of Saxony, whom he had invested with the electoral dignity, formed a league, which was joined by Henry II., king of France, the successor of Francis. The preparations had been made with the greatest secrecy. Charles was at Innsbruck superintending the deliberations of the Council of Trent, and meditating great plans against France and Turkey. He was expecting the aid of Maurice when this prince threw off the mask, appeared suddenly at the head of an army, and invaded the Tyrol in 1552 while Henry II. entered Lorraine. Charles was very nearly surprised in Innsbruck. Maurice abandoned the imperial castle to plunder, the Council of Trent was dissolved, and the Protestants dictated the conditions of the Treaty of Passau in 1552. Charles was not more successful in Lorraine. He was unable to recover Metz, defended by the Duke of Guise. In Italy he lost Sienna by a revolt. He withdrew to Brussels, where, hard pressed by his enemies, he became gloomy and dejected, and for several months concealed himself from the sight of every one, so that the report of his death was spread through Europe. His last exertions were directed against France, which constantly repelled his assaults. The Diet of Augsburg in 1555 confirmed the Treaty of Passau, and gave the Protestants equal rights with the Roman Catholics.

Charles, seeing all his plans frustrated and the number of his enemies increasing, resolved to transfer his hereditary states to his son Philip. Having convened the estates of the Low Countries at Louvain, in 1555, he explained to them the grounds of his resolution, asserted that he had sacrificed himself for the interests of religion and of his subjects, but that his strength was inadequate to further exertion, and that he should devote to God the remainder of his days. At that time Charles conferred on Philip the sovereignty of the Netherlands alone. On 15 Jan. 1556 he conferred upon him, in like manner, the Spanish throne, reserving for himself merely a pension of 100,000 ducats. He selected for his residence the monastery of St. Justus, near Plasencia in Estremadura, and here he exchanged sovereignty, dominion, and pomp for the quiet and solitude of a cloister. His amusements were confined to short rides, to the cultivation of a garden, and to mechanical labors. It is said that he made wooden clocks, and being unable to make two clocks go exactly alike, was reminded of the folly of his efforts to bring a number of men to the same sentiments. He attended religious services twice every day, read books of devotion, and by degrees fell into such dejection that his faculties seemed almost impaired. He renounced the most innocent pleasures, and observed the rules of the monastic life in all their rigor.

Charles had a noble air and refined manners. He spoke little, and smiled seldom. Firm of purpose; slow to decide; prompt to execute; equally rich in resources and sagacious in the choice of them; gifted with a cool judgment, and always master of himself. Circumstances developed his genius and made him great. Although he did not scruple to break his promises, he imposed, by the semblance of magnanimity and sincerity, even on those who had already experienced his perfidy. An acute judge of men, he knew how to use them for his purposes. In misfortune he appears greater than in prosperity. He protected and encouraged the arts and sciences, and is said to have picked up a brush which had fallen from the hand of Titian with the words, "Titian is worthy of being served by an emperor." By his wife Eleonora, daughter of Emanuel, king of Portugal, he had one son, afterward Philip II., and two daughters. He had also several natural children. No minister had a decided influence over him. He was indefatigable in business, weighing the reasons on both sides of every case with great minuteness. Wherever he was he imitated the customs of the country, and won the favor of every people except the Germans. Gachard, 'Correspondance de Charles Quint' (1859); Stirling Maxwell, 'Cloister Life of the Emperor Charles V.' (1852); Guntram, 'Kaiser Karl V.' (1865); Robertson, 'History of the Reign of Charles V.'

Charles VI., emperor of Germany, the second son of the Emperor Leopold I.: b. 1 Oct. 1685; d. 20 Oct. 1740. His father destined him for the Spanish throne. The last prince of the house of Hapsburg, Charles II., disregarding the house of Austria, whose right to the Spanish throne was undoubted, according to the

law of inheritance by descent, had by will made Philip, Duke of Anjou, second grandson of Louis XIV., heir of the Spanish monarchy. Accordingly, on the death of Charles II., 1 Nov. 1700, Philip took possession of the vacant kingdom. England and Holland united against him, and this alliance was soon joined by the German empire, Portugal, and Savoy. Charles was proclaimed king of Spain at Vienna, in 1703, and proceeded by way of Holland to England, from whence, in January 1704, he set sail with 12,000 men for Spain, which was almost wholly occupied by the French, and landed in Catalonia. He succeeded in making himself master of Barcelona; but was soon besieged there by his rival Philip V. At the head of a garrison of hardly 2,000 men, he made the most obstinate resistance, till the long-expected English fleet appeared, which compelled the French speedily to raise the siege. This event was followed by alternate reverses and successes. Twice Charles reached Madrid, and twice was he driven from the city. The first time, in 1706, he caused himself to be proclaimed king in the capital, under the name of Charles III. He had been a second time compelled to flee to the walls of Barcelona, when he was informed of the death of his brother Joseph I. According to the will of Leopold, this event placed the double crown of Charles V. on his head; to his claims on Spain it added the more certain possession of the Austrian dominions. But the allies did not like to see so much power united in the same hands. Charles returned to Germany, and on his arrival learned that, at Eugene's suggestion, he had also been elected emperor. His coronation took place at Frankfort, in December 1711; and in the following year he received, at Presburg, the crown of Hungary. At the same time he still retained the empty title of king of Spain. He now prosecuted, under the conduct of Eugene, the Spanish war of succession; the allies concluded a peace with France at Utrecht in 1713, in spite of all the efforts of the emperor to prevent it. He was obliged, in the following year, to sign the Treaty of Rastadt. This treaty secured him in the possession of Milan, Mantua, Sardinia, and the Netherlands. To secure his dominions to his daughter, Maria Theresa, in default of male heirs, Charles strove to induce the powers to guarantee the pragmatic sanction, which settled the succession in her favor. He succeeded in gaining the concurrence of all the European powers. The reign of this prince was marked with perpetual agitations. The succession to the Polish throne, after the death of Augustus II., in 1733, disturbed the peace of Europe. Charles, with Russia, supported the son of this prince; but France and Spain declared themselves for Stanislaus Leczinsky. From this arose a war, which terminated, in 1735, in the loss of the Two Sicilies, and a part of the duchy of Milan. Austria received Tuscany in exchange for Lorraine, and obtained Parma. Hardly had Charles finished this war, when his alliance with Russia involved him anew in a war with the Turks. In 1737 his troops invaded Servia, without any declaration of war. and occupied Nissa. But the Turks renewed their attacks with a continually augmented force, and obliged the emperor, after three unsuccessful campaigns, to cede to them by the Peace of Belgrade, in 1739, Walachia and the Austrian part of Servia, with Belgrade.

Charles VII. (properly CHARLES ALBERT), emperor of Germany: b. Brussels 6 Aug. 1697; d. Munich 20 Jan. 1745. He was the son of Maximilian Emanuel, elector of Bavaria, then governor of the Spanish Netherlands. His youth was spent at the imperial court, and in the war against the Turks he commanded the army of auxiliaries sent by his father. In 1722 he married the daughter of Joseph I., having previously renounced all rights which this marriage might give him to the succession to the throne of Austria. In 1726 he succeeded his father as Elector of Bavaria. He was one of the princes who protested against the pragmatic sanction, guaranteed in 1732 by the Diet of Ratisbon, and in consequence concluded a defensive alliance with Saxony. After the death of Charles VI., in 1740, he refused to acknowledge Maria Theresa as his heiress, founding his own claims to the succession on a testament of Ferdinand I. He was supported by the king of France with a considerable force. In 1741 he was recognized at Lintz as Archduke of Austria. The obstacles thrown in his way by Cardinal Fleury, who wished not to dismember the Austrian monarchy, as well as the want of artillery and ammunition, prevented him from getting possession of Vienna. On the other hand he took Prague, where he was crowned and proclaimed king of Bohemia. In 1742 he was unanimously elected king of the Romans: he made a solemn entry into Frankfort, and was crowned by his brother, the Elector of Cologne. But fortune soon deserted him. The armies of Maria Theresa reconquered all Upper Austria, and overwhelmed Bavaria. It was necessary to abandon Bohemia. Charles fled to Frankfort, and convoked a diet, when an attack of the king of Prussia on Maria Theresa allowed him to return to Munich in 1744. He was succeeded in the electorate by his son Maximilian Joseph, in the imperial dignity by Francis I., husband of Maria Theresa.

Charles I. of Anjou, king of Naples, the son of Louis VIII. of France: b. about 1220; d. Foggia 7 Jan. 1282. He waged war on King Manfred of Sicily, and having defeated him, seized on the Neapolitan crown in 1266. His cruelty and exacting rule induced such a detestation of the French name, that the Sicilians, headed by John de Procida, rose in arms on the eve before Easter Day, 1282, and slaughtered all the French in the town and neighborhood of Palermo, the signal for rising being the tolling of the vesper-bell; this tragedy is hence recorded in history as the «Sicilian Vespers» (q.v.). By this act the French were entirely expelled from the island.

Charles I., king of Portugal: b. 28 Sept. 1863. He is the son of Luiz I. and of Maria, the daughter of Victor Emmanuel II. of Italy, and came to the throne 19 Oct. 1889. Since that event a powerful radical element has made itself felt in Portugal. The country has, however, become of more importance than for some time previous owing to the progress that Portuguese colonization has lately been making in east Africa.

Charles I., Karl Eitel Friedrich Zephym Ludwig (of HOHENZOLLERN SIGMARINGEN), king of Rumania: b. Germany 20 April 1839. The second son of Prince Karl of Hohenzollern, he entered the Prussian army early and held the

rank of lieutenant of dragoons when, at the suggestion of the Prussian ambassador, he was elected Prince of Rumania 10 May 1866. He subsequently proclaimed Rumania independent of Turkey and was declared king 26 March 1881. He was married in 1869 to Princess Elizabeth von Neuwied, who as «Carmen Sylva» (q.v.) is well known as an author.

Charles Albert, king of Sardinia: b. 2 Oct. 1798; d. Oporto, Portugal, 28 July 1849. He was the son of Charles Emmanuel, prince of Savoy-Carignan. He was educated in France, and in 1831 succeeded to the throne as the nearest heir on the death of Charles Felix, and in the first years of his reign showed himself favorable to the cause of progress by promoting a number of beneficial reforms. Subsequently, indeed, he became more absolute in his views, but after the French revolution of February 1848 he granted the nation a constitution, and took the field against Austria on behalf of the revolted peoples of the Lombardo-Venetian kingdom and the duchies of central Italy. His arms were at first very successful, defeating the Austrians in various encounters, but he was at last repulsed by Marshal Radetzky, and obliged to apply for an armistice. On its expiration he resumed hostilities, but only to endure reverses. The battle of Novara, fought on 23 March 1849, proved fatal to the aspirations of Charles Albert and Sardinia. That very day he abdicated in favor of his son, Victor Emmanuel II., afterward king of Italy, and retired to Oporto, in Portugal.

Charles I., king of Spain. See CHARLES V., emperor of Germany.

Charles II., king of Spain: b. 6 Nov. 1661; d. 1 Nov. 1700. He succeeded his father, Philip IV., in 1665. In this reign, Spain, which for nearly three centuries had held the foremost rank in Europe as a great military nation, reached the highest point of its greatness, and began rapidly to decline both in influence and glory, but such was the prestige attached to its name and past history, that it had long become powerless before it ceased to be respected. Charles died in 1700, bequeathing his throne to the Duke d'Anjou, grandson of Louis XIV. of France, an act which led to the long and calamitous «War of the Spanish Succession.»

Charles IV., king of Spain: b. Naples 12 Nov. 1748; d. there 19 Jan. 1819. He came to Madrid in 1759, when his father, Charles III., after the death of his brother, Ferdinand VI., ascended the Spanish throne, and succeeded him, 13 Dec. 1788. He was married to the Princess of Parma, Louisa Maria. Too imbecile to govern, he was always ruled by his wife and his ministers, among whom the Prince of Peace, Godoy, Duke of Alcudia, from the year 1792, had unbounded influence over him. The hatred which this favorite drew on himself from the Prince of Austrias and other grandees brought on a revolution in 1808, which enabled Napoleon to dethrone the Bourbons. Charles abdicated at Aranjuez, 19 March, revoked this abdication, and finally ceded, at Bayonne, his right to the throne of Napoleon, who settled on him for life the palace of Compiègne and a pension of 6,000,000 francs. Charles after this lived at Compiègne with the queen and her paramour the Prince of Peace, but subsequently exchanged this residence for Rome, where the climate was more congenial to him. From 1815 he occupied the palace Barberini in this city. Hunting he always made his principal employment.

Charles IX., king of Sweden: b. 5 Oct. 1550; d. Nyköping 30 Oct. 1611. He was the fourth son of Gustavus Vasa and was chosen king in 1604. He fostered trade and mining, and established the University of Gothenburg, at the same time that he was subduing the turbulent nobles of the realm and forming alliances with the Protestant princes of Pennany.

Charles X., king of Sweden: b. Nyköping 8 Nov. 1622; d. Gothenburg 13 Feb. 1660. He succeeded his cousin, Christina, in 1654, and by his prudence and valor considerably extended his dominions, wresting Livonia from the Poles, and several provinces from the crown of Denmark. After a short reign of six years, in which he was constantly engaged in war, sometimes meeting with severe reverses, but, on the whole, a considerable gainer, he was fatally attacked with an epidemic disease then raging among his troops, and was succeeded by his son Charles.

Charles XI., king of Sweden: b. 25 Dec. 1655; d. Stockholm 15 April 1697. He succeeded to the throne at five years of age, but the country was governed by a regency till 1672. He then put in force a system of tyrannous exaction and arbitrary oppression, by which he in a short time made himself absolute. Having once become independent of the states, he studied to appease the people by ruling with justice and impartiality. In war he was unsuccessful, and lost much of his father's territorial acquisitions. He founded the University of Lund, reorganized the army and navy and strengthened the fortresses of the country.

Charles XII., king of Sweden: b. Stockholm 27 June 1682; d. Frederikshall, 30 Nov. 1718. He was well instructed in the languages, history, geography, and mathematics. Curtius' 'History of Alexander' was his favorite book. On the death of his father, in 1697, he was declared of age by the estates. Meanwhile the young king showed but little inclination for business: he loved violent bodily exercises, and especially the chase of the bear. To his jealous neighbors this seemed a favorable time to humble the pride of Sweden. Frederick IV. of Denmark, Augustus II. of Poland, and the Czar Peter I. of Russia therefore concluded an alliance which resulted in the northern war. The Danish troops first invaded the territory of the Duke of Holstein-Gottorp. Charles proposed in the Council of State the most energetic measures against Denmark, the result of which was the discomfiture of the Danes, while the Duke of Holstein was confirmed in all the rights of which it had been attempted to deprive him. Thus ended the first enterprise of Charles XII., in which he exhibited as much intelligence and courage as disinterestedness. He adopted at this time that severe and temperate mode of life to which he ever remained true, avoiding relaxation and useless amusements; wine was banished from his table; at times coarse bread was his only food; he often slept in his cloak on the ground; he generally wore a blue coat, with copper buttons, large boots reaching above his knees, and gloves of buffalo skin.

After thus checking Denmark the attacks of Augustus and Peter were to be repelled. The

former was besieging Riga, the latter menaced Narva and the country situated about the Gulf of Finland. Without returning to his capital, which in fact he never revisited, Charles caused 20,000 men to be transported to Livonia, and went to meet the Russians, whom he found 80,000 strong in a fortified camp under the walls of Narva. On 30 Nov. 1700, between 8,000 and 10,000 Swedes placed themselves in order of battle, under the fire of the Russians, and the engagement began. In less than a quarter of an hour the Russian camp was taken by storm. Thirty thousand Russians perished on the field or threw themselves into the Narva; the rest were taken prisoners or dispersed. After this victory Charles crossed the Dwina, attacked the intrenchments of the Saxons, and gained a decisive victory.

The war continued: the Swedes gained a brilliant victory at Clissau; in 1703 all Poland was in the possession of the conquerors. At Altranstadt he dictated the conditions of peace in 1706. The Livonian Patkul, who was the prime mover of the alliance against Sweden (at that time Peter's ambassador in Dresden), was delivered up to him on his demand, and was broken on the wheel. It might well cause general astonishment that a prince, till then so magnanimous, could stoop to such intemperate revenge. In other respects Charles exhibited, during his stay in Saxony, moderation and magnanimity.

In September 1707 the Swedes left Saxony. They were 43,000 strong, well clothed, well disciplined, and enriched by the contributions imposed on the conquered. Six thousand men remained for the protection of the king of Poland; with the rest of the army Charles took the shortest route to Moscow. But having reached the region of Smolensk he altered his plan, at the suggestion of the Cossack hetman Mazeppa, and proceeded to the Ukraine, in the hope that the Cossacks would join him. But Peter laid waste their country, and the proscribed Mazeppa could not procure the promised aid. The difficult marches, the want of provisions, the perpetual attacks of the enemy, and the severe cold, weakened Charles' army in an uncommon degree. Pultawa, abundantly furnished with stores, was about to be invested when Peter appeared with 70,000 men. Charles, in reconnoitering, was dangerously wounded in the thigh; consequently, in the battle of 8 July 1709, which changed the fortunes of the Swedish hero and the fate of the North, he was obliged to issue his commands from a litter, without being able to encourage his soldiers by his presence. They were obliged to yield to superior force, and the enemy obtained a complete victory. Charles saw his generals, his favorite minister, Count Piper, and the flower of his army, fall into the power of those Russians so easily vanquished at Narva. He himself, together with Mazeppa, fled with a small guard, and was obliged, notwithstanding the pain of his wounds, to go several miles on foot. He finally found refuge and an honorable reception at Bender, in the Turkish territory. The regency in Stockholm took measures for the defense of the Swedish territory. Gen. Steinbock assembled a body of militia and peasants, defeated the Danes at Helsingborg, and compelled them to evacuate Schonen. Several divisions were sent to Finland to keep off the Russians, who nevertheless advanced, being superior in numbers. Charles, meanwhile, negotiated at Bender with the Porte; succeeded in removing the ministers who were opposed to him, and induced the Turks to declare war against Russia. The armies met on the banks of the river Pruth, 1 July 1711. Peter seemed nearly ruined when the courage and prudence of his wife produced a peace, in which the interests of Charles were entirely neglected. This monarch, however, projected at Bender new plans, and through his agents solicited of the Porte auxiliaries against his enemies. But the Russian agents were no less active to prepossess the Porte against him, pretending that Charles designed to make himself, in the person of Stanislaus, the actual master of Poland, in order from thence, in connection with the German emperor, to attack the Turks. The seraskier of Bender was ordered to compel the king to depart, and in case he refused, to bring him, living or dead, to Adrianople. Little used to obey the will of another, and apprehensive of being given up to his enemies, Charles resolved to defy the forces of the Porte with the 200 or 300 men of which his retinue consisted, and, sword in hand, to await his fate. When his residence at Varnitza, near Bender, was attacked by the Turks he defended it against a whole army, and yielded only step by step. The house took fire, and he was about to abandon it when, his spurs becoming entangled, he fell and was taken prisoner. The Turks now removed their prisoner from Bender to Demotica, near Adrianople. Escaping in disguise he reached Stralsund on the night of 22 Nov. 1714. A combined army of Danes, Saxons, Russians, and Prussians immediately invested Stralsund. Charles performed, during the defense, miracles of bravery. But being obliged to surrender the fortress, on 23 Dec. 1715, he proceeded to Lund, in Schonen, and took measures to secure the coast. He then attacked Norway. The Baron of Görtz, whose bold but intelligent plans were adapted to the situation of the Swedish monarchy, was at that time his confidential friend. His advice was, that Charles should gain Peter the Great to the interest of Sweden by important concessions, make himself master of Norway, and from thence land in Scotland, in order to dethrone George I., who had declared himself against Charles. Görtz discovered resources for prosecuting the war, and entered into negotiations at Aland with the plenipotentiaries of the czar. Peter was already gained and a part of Norway conquered; the fortunes of Sweden seemed to assume a favorable aspect; Charles was besieging Frederikshall, when, on 30 Nov. 1718, as he was in the trenches, leaning against the parapet and examining the workmen, he was struck on the head by a cannon-ball. He was found dead in the same position, his hand on his sword, in his pocket the portrait of Gustavus Adolphus and a prayer-book.

At Charles' death Sweden sank from the rank of a leading power. In his last years he had formed great plans for the improvement of its navy, trade, and commerce. At Lund he often conversed with the professors of the university, and attended public disputations on geometry, mechanics, and history. In Bender, the reading of useful books was one of his principal employments: he sent for Swedish scholars, and caused them to travel through

Greece and Asia. Accounts of some of these travels have been printed; there are others in manuscript at Upsal. Firmness, valor, and love of justice were the grand features of Charles' character, but were disfigured by an obstinate rashness. After his return he showed himself more peaceable, gentle, moderate, and disposed to politic measures. Posterity, considering him in relation to his times, will say that he had great virtues and great faults; that he was seduced by prosperity, but not overcome by adversity.

Charles XII., The History of, a famous work by Voltaire, published in 1731. It is divided into eight books, and is considered its author's historical masterpiece.

Charles XIII., king of Sweden: b. 7 Oct. 1748; d. 5 Feb. 1818. He was the second son of King Adolphus Frederick. Having been appointed at his birth high-admiral of Sweden, his education was directed chiefly to the learning of naval tactics, for which purpose he engaged in several cruises in the Cattegat. In 1765 he became honorary president of the Society of Sciences at Upsal. In 1770 he commenced the tour of Europe. The death of Adolphus Frederick recalled him to Sweden, where he took an important part in the revolution of 1772. His brother, Gustavus III., appointed him governor-general of Stockholm, and Duke of Sudermannland. In the war with Russia, in 1788, he received the command of the fleet, defeated the Russians in the Gulf of Finland, and, in the most dangerous season of the year, brought back his fleet in safety to the harbor of Carlscrona, after which he was appointed governor-general of Finland. After the murder of Gustavus III., in 1792, he was placed at the head of the regency, and, happily for Sweden, preserved the country at peace with all other nations, while he united with Denmark for the protection of the navigation in the northern seas. In 1796 he resigned the government to Gustavus Adolphus IV., who had become of age, and retired to his castle of Rosersberg. He did not again appear in public life till a revolution hurled Gustavus Adolphus IV., in 1809, from the throne, and placed Charles at the head of the state, as administrator of the realm, and some months afterward, 20 June 1809, as king of Sweden, at a very critical period. The peace with Russia, at Frederiksham, 17 Sept. 1809, gave the country the tranquillity necessary for repairing its heavy losses, and for completing the constitution. He had already adopted Prince Christian of Holstein-Sonderburg-Augustenburg as his successor, and after his death, Marshal Bernadotte, who was elected by the estates, in August 1810, to take the place of the prince. On him he bestowed his entire confidence. His prudent conduct in the war between France and Russia in 1812 procured Sweden an indemnification for Finland by the acquisition of Norway 4 Nov. 1814. Although some disappointed nobles may have given utterance to murmurs against his government, Charles XIII. nevertheless enjoyed the love of his people till his death.

Charles XIV., king of Sweden. See BERNADOTTE, JEAN BAPTISTE JULES.

Charles XV. (LOUIS EUGÈNE), king of Sweden and Norway: b. 3 May 1826; d. 18 Sept. 1872. He was the son of Oscar I., whom he succeeded 8 July 1859. In his reign the Storthing, or parliament, was reconstituted and given a more representative character. He was the author of a book of poems.

Charles, archduke of Austria, third son of the Emperor Leopold II.: b. Florence 5 Sept. 1771; d. 30 April 1847. In his 20th year he distinguished himself in the battles of Jemappes and Neerwinden, in both of which the French republican armies were beaten, and was appointed governor-general of Belgium in 1793. Appointed in 1796 field-marshal of the empire and commander-in-chief of the Austrian army on the Rhine, he opened the campaign by the victory of Neumarkt over Jourdan, which were quickly followed by the successes of Teining and Amberg, which compelled Moreau to make his memorable retreat. In the winter of 1797 he captured Kehl, the only position the French occupied in Germany. After the fruitless congress at Rastadt he put himself at the head of the Rhine army, and again defeated his old opponent Jourdan at Ostrach and Stockach. Misunderstandings that arose between him and the Russian generals, Suwarow and Korsakow, and his weak state of health, compelled him to throw up his command and retire to Bohemia. In the protracted struggle in the heart of Germany Napoleon's genius was on every occasion triumphant, once only, at Aspern, did Charles snatch a victory from him, but the battle of Wagram laid Austria at the feet of the French emperor.

Charles, 1st Duke of Lorraine: b. 953; d. Orleans 994. He early succeeded to his paternal inheritance. No sooner, however, was he invested with sovereign power, than he laid claim to the crown of France, on the death of Louis V., and immediately endeavored to sustain his claim by force of arms; but in the first battle fought between the two powers, was made prisoner, his army entirely defeated, and himself cast into a dungeon in the gloomy castle of Orleans, where he died a prisoner, 994.

Charles Augustus, Grand Duke of Saxe-Weimar: b. 3 Sept. 1757; d. Graditz, Prussia, 14 June 1828. He succeeded to power in 1775, was a general in the army of Prussia 1772–93, and with the allies opposed Napoleon 1813–15. By the Congress of Vienna his principality was made a grand duchy. He liberally patronized science and art, and under him his capital of Weimar became the literary centre of Germany. He was a close friend of Goethe.

Charles the Bald. See CHARLES I. of France.

Charles the Bold, Duke of Burgundy: b. Dijon 10 Nov. 1433; d. Nancy 5 Jan. 1477. He succeeded to the dukedom in 1467, and immediately engaged in a war with the citizens of Liége, whom he conquered and treated with extreme severity. Before this undertaking he had been obliged to restore to the citizens of Ghent the privileges which had been taken from them by Philip the Good. He now revoked his forced concessions, caused the leaders of the insurrection to be executed, and imposed a large fine on the city. In 1468 he married Margaret of York, sister of the king of England. Learning that the inhabitants of Liége, instigated by the king, Louis XI., had rebelled anew, and made themselves masters of Tongres, he compelled the king to sign a treaty, the most disgraceful condition

of which was that he should march with Charles against the city of Liége, which he had himself excited against the Duke. Charles encamped before Liége in company with the king; the city was taken by storm, and abandoned to the fury of the soldiers. Such success rendered the mind of the Duke utterly obdurate, and added the last traits of that inflexible sanguinary character which made him the scourge of his neighborhood, and led to his own destruction. Edward IV. conferred on him in 1470 the Order of the Garter. Shortly after he received in Flanders Edward himself, who came to seek an asylum with the Duke. Charles gave him money and ships to return to England.

About the end of the same year the war between the king of France and the Duke of Burgundy was renewed, and never did Charles show himself more deserving of the name of the "Bold" or "Rash," than in this war.

Having completed the conquest of Lorraine by the taking of Nancy in 1475, he turned his arms against the Swiss; and notwithstanding the representations of these peaceful mountaineers, who told him that all that he could find among them would not be worth so much as the spurs of his horsemen, he took the city of Granson, and put to the sword 800 men, by whom it was defended. But these cruelties were soon avenged by the signal victory which the Swiss obtained near the same city 3 March 1476.

With a new army he returned to Switzerland, and lost the battle of Murten (Morat) 22 June. The Duke of Lorraine, who had fought in the army of the Swiss, led the victors to the walls of Nancy, which surrendered 6 October. At the first information of this siege Charles marched to Lorraine, to retake the city of Nancy from the Duke René. On 5 or 6 January 1477 the two armies met: the wings of the Burgundian army were broken through and dispersed, and the centre, commanded by the Duke in person, was attacked in front and flank. As Charles was putting on his helmet, the gilded lion which formed its crest fell to the ground, and he exclaimed with surprise, *Ecce magnum signum Dei!* Defeated, and carried along with the current of fugitives, he fell, with his horse, into a ditch, where he was killed by the thrust of a lance. His body, covered with blood and mire, and with the head imbedded in the ice, was not found till two days after the battle, when it was so disfigured that for some time his own brothers did not recognize it. See Kirk, 'History of Charles the Bold' (1863–8). In 'Quentin Durward,' Sir Walter Scott has portrayed the character of Charles, and some of the quarrels between him and Louis of France.

Charles Edward Stuart (The Young Pretender), grandson of James II., king of England: b. Rome 31 Dec. 1720; d. there 31 Jan. 1788. From the cradle he was inspired with an impulse that induced him to attempt the recovery of the throne of his ancestors. With borrowed money, and seven trusty officers, he landed, 28 July 1745, at Lochnanuadh, Scotland, from a ship of 18 guns called the Doutelle, which contained arms for 1,500 men. He found so many adherents among the discontented Scottish nobles, who went over to his party together with the Highlanders under them, that he was soon at the head of a little army. With this he conquered the British troops which advanced to meet him from Edinburgh, captured Perth, and caused himself to be proclaimed regent of England, Scotland, and Ireland. He also took Edinburgh, 17 Sept. 1745, where he was once more proclaimed regent, and surrounded with his ministers and generals. On 22 Sept. 1745 he defeated at Prestonpans an army of 4,000 British under Sir John Cope. He set the prisoners at liberty. His force was now 7,000 strong. With this he advanced, and laid siege to Carlisle, 15 November, which, after three days, surrendered and supplied him with a great number of arms.

He now caused his father to be proclaimed king, and himself regent of England; removed his headquarters to Manchester, and soon found himself within 100 miles of London, where many of his friends awaited his arrival. The rapid successes of the adventurer made the British government tremble; and a part of the British forces in Germany was recalled. Want of support, disunion, and jealousy among his adherents of the house of Stuart, and the superior force opposed to him, compelled Prince Charles to retire in the beginning of 1746. The victory at Falkirk, 28 Jan. 1746, was his last. As a final attempt he risked the battle of Culloden, against the Duke of Cumberland, 16 April 1746, in which his army was defeated and entirely dispersed. The prince now wandered for a long time through the wilds of Scotland, often without food, and the price of £30,000 sterling was set on his head. Once, when fairly surrounded by enemies, he succeeded in escaping by the devotion and courage of Flora McDonald. On 20 Sept. 1746, five months after the defeat of Culloden, he sailed from Scotland, and arrived in France destitute of everything. By the interest of Madame de Pompadour Charles now received an annual pension of 200,000 livres for life; he had also 12,000 doubloons yearly from Spain.

The Peace of Aix-la-Chapelle in 1748 deprived him of all prospects of recovering the throne of Great Britain. He went to Rome, the residence of his father, James III.; but his relations to the Roman court were changed after his father's death 1 Jan. 1766. His often ridiculous requests in regard to the etiquette to be observed toward him, which he made under the name of Count of Albany, rendered his presence troublesome. He went to Florence till Pius VI. recalled him to Rome by withdrawing his pension. That his family might not become extinct, he married in the 52d year of his age, 17 April 1772, a princess of Stolberg-Gedern; but his violence led to a separation in 1780. He now became addicted to intoxication. He died 31 Jan. 1788, in the 68th year of his life. Three years before he sent for his natural daughter from France, legitimated her, and declared her, on his royal authority, his lawful heiress, under the title of Countess of Albany. His body was carried to Frascati, and entombed in a style worthy of a king. A sceptre, crown, sword, and the escutcheons of England and Scotland adorned his coffin; and his only brother then living, the Cardinal of York, performed the funeral services for "dead King Charles." The Cardinal of York received a pension from Great Britain after 1799, and died in Frascati 13 July 1807.

Charles Emmanuel I., Duke of Savoy, surnamed "the Great": b. Rivoli 12 Jan. 1562; d. Savillan 26 July 1630. He formed (1590) the plan

of uniting Provence to his dominions. Philip II. of Spain, his father-in-law, obliged the parliament of Aix to acknowledge him as the protector of this province, in order by this example to induce France to acknowledge the king of Spain as protector of the whole realm. The Duke of Savoy, not less ambitious, likewise aimed at this crown, and after the death of Matthias desired also to be chosen emperor of Germany. He likewise intended to conquer the kingdom of Cyprus, and to take possession of Macedonia, the inhabitants of which, oppressed by the Turks, offered him the sovereignty over their country. The citizens of Geneva were obliged to defend their city in 1602 against this ambitious prince, who fell upon them by night in time of peace. Henry IV., who had reason to complain of the Duke, and whose general, the Duke of Lesdiguieres, had beaten Charles Emmanuel several times, entered at last into a treaty of peace with him, not disadvantageous to the Duke of Savoy; but he could not remain quiet, and began again a war with France, Spain, and Germany.

Charles the Fair. See CHARLES IV. of France.

Charles the Fat. See CHARLES II. of France.

Charles Friedrich August Wilhelm, Duke of Brunswick: b. 30 Oct. 1804; d. 1873. He succeeded to the dukedom in 1823, but his rule was so arbitrary and oppressive that the German Diet deposed him. He subsequently lived in Paris and London, and at his death bequeathed his vast fortune to the city of Geneva.

Charles d'Orleans, shärl'dor-lā-än', French nobleman and poet, son of Louis d'Orléans: b. 26 May 1391; d. 4 Jan. 1465. He was the grandson of Charles V. of France, and the father of Louis XII. He was taken prisoner at Agincourt, and kept in captivity in England from 1415 to 1440, when he was ransomed. He wrote a number of lyrics while in prison and after his return to France. At Blois, where he held his court, he gathered together the chief French writers of his time, and took part with them in poetical tournaments, in one of which François Villon competed successfully. He has been termed the father of French lyric poetry, but has no claim to the title. His light and graceful lyrics are the last flowering of the courtly poetry of the Middle Ages; they show no trace of the modern spirit which appears so strongly in the works of his contemporary, Villon. His favorite themes are love and the springtime; his favorite form is the rondel, with two rhymes, of which he is considered the chief master, as Villon is of the ballade, and Voiture of the rondeau.

Charles the Simple. See CHARLES III. of France.

Charles the Wise. See CHARLES V. of France.

Charles, Elizabeth Rundle, English writer of religious stories: b. 1826; d. London 28 March 1896. She was married to Andrew Charles in 1851. Her books have been widely popular in England and America, the most famous of them being 'The Chronicles of the Schonberg-Cotta Family' (1863). Among her other works are: 'Diary of Miss Kittie Trevelyan' (1864); 'The Draytons and Davenants' (1866); 'Winifred Bertram' (1866); 'Martyrs of Spain' (1870); 'Against the Stream' (1873); 'The Bertram Family' (1876); 'Lapsed But Not Lost' (1881).

Charles, Jacques Alexander César, French scientist: b. Beaugency, France, 12 Nov. 1746; d. 7 April 1823. He lectured on physical science in Paris and in 1783 made with M. Robert the first ascent ever made in a balloon. A height of 7,000 feet was reached on this occasion.

Charles, R. H., Irish theologian and scholar: b. County Tyrone 6 Aug. 1855. He was educated at Queen's College, Belfast, and Trinity College, Dublin, and was admitted to the Anglican priesthood in 1883. He was curate of St. Mark's, Whitechapel, 1883–5; of St. Philip's, Kensington, 1885–6; and of St. Mark's, Kennington, 1886–9. Since 1898 he has been professor of biblical Greek at Trinity College, Dublin. He has published 'Forgiveness, and Other Sermons' (1886); 'Book of Enoch Translated From the Ethiopic' (1893); 'Ethiopic Text of Book of Jubilees' (1894); 'Book of the Secrets of Enoch' (1895); 'The Assumption of Moses' (1897), etc.

Charles Grandison, The History of, the title of an extremely prolix novel by Samuel Richardson, published in 1753.

Charles City, Iowa, a city and county-seat of Floyd County, on Cedar River, and on the Illinois Cent., and the Chicago, M. & St. P. R.R.'s. It is supplied with good water-power by the river and has a number of manufacturing interests. It is the seat of Charles City College, a co-educational institution, organized in 1891, under the auspices of the German Methodist Church, which had 246 students at the end of 1901. Pop. 4,227.

Charles City Cross-roads, Battle of. See GLENDALE, BATTLE OF.

Charles River, a river in Massachusetts, which flows into Boston harbor, dividing Boston from Charlestown. The source of the principal branch is a pond bordering on Hopkinton. It is navigable for lighters and large boats to Watertown, seven miles west of Boston.

Charles's Wain, a common name for the constellation of the Great Bear or Ursa Major. Originally instead of Charles's Wain, the name was "carl's" or "churl's wain," meaning the farmer's wagon. Since the time of Homer this constellation has been called a wagon; but since the 17th century the name has been associated with Charles I. and Charles II. Shakespeare calls it Charles's Wain.

Charleston, chärlz'tŏn, Ill., county-seat of Coles County, situated at the junction of the Cleveland, C. C. & S. L. and the Toledo, S. L. & K. C. R.R.'s, 49 miles southeast of Decatur. It has manufactories of woolen goods, carriages, stoves, plows, brooms, and also flour-mills, banks, good schools, and several churches. Pop. (1900) 5,488.

Charleston, S. C., the chief city of the State, and largest on the Atlantic seaboard south of Chesapeake Bay, seat of Charleston County; on the Atlantic C. L. and Southern R.R. (Charleston & S. and South C. & Georgia) systems; 130 miles southeast of Columbia, the capital, and 82 miles north of Savannah. Pop. (1900) 55,807, over half colored.

CHARLESTON

Charleston lies on a peninsula, 10 or 12 miles long and 8 or 10 feet above high water, between the navigable Ashley and Cooper rivers, 2,100 yards and 1,400 yards wide respectively at the mouth; the latter reinforced by the Wando at the city, and the estuary of the three forming a magnificent landlocked harbor, six miles long by three wide, with 40 feet of water at the city, — one of the finest on the Atlantic coast.

The government jetties have scoured a channel across the bar to a mean depth already of 26 feet at low water, or 31 feet at mean high tide, which it is believed will be soon increased by several feet. There are about nine miles of available water front, most of the wharfage being on the Cooper, which is navigable 30 miles to the canal connecting it with the Santee, and so with the west and northwest of the State. Ocean traffic has been quick to follow the favorable new channel opened for it; besides the Clyde Line of steamships, which taps the Atlantic ports from Boston to Jacksonville, and includes Charleston, two ocean freight lines, in 1901, established terminal docks at the city, one to the West Indies and Central America. The prospects for a large commerce with those regions are favorable, Charleston as a distributing port saving the passage around Cape Hatteras out through the Gulf. The resemblance of the city's position to that of New York in its rivers and harbor is striking, and freight here is moved directly from vessel to freight cars, or *vice versa*, without lightering or trucking. The distances from the central West are also favorable, and for the first time in its history Charleston seems entering on a period of rapid growth. The government is aiding in this by its great new navy-yard projects. The naval station has been moved to Charleston, where a tract on the Cooper River about seven miles from the city has been bought; the plans contemplate an outlay of $8,000,000 to $10,000,000, and it will certainly not be less. The harbor is defended by the historic Fort Moultrie, at Sullivan's Island on the eastern side, which the government is improving into one of the best equipped defenses on the coast at a cost of some $500,000; by Fort Sumter on a small island in the centre; and batteries Sergeant Jasper (from a Revolutionary hero) and Capron. Fort Wagner, Fort Ripley, and Castle Pinckney, once celebrated, are now abandoned.

Trade and Commerce. — The Civil War nearly ruined Charleston's commerce, which consisted mainly in exports of cotton (it stood third in the United States, next to New York and New Orleans), rice, and naval stores, to the amount of some $17,000,000 at the time of the War. The silting up of docks, decay of wharves, and destruction of railroads, were repaired slowly, and the commerce which had found new outlets was reclaimed: the total in 1901 being but $7,084,215, of which $6,728,665 was cotton, the remainder being cotton goods, rice, naval stores, and turpentine casks, lumber, phosphate fertilizers, fruits and vegetables. Charleston has a very valuable staple in the Sea Island cotton, with its long fibre, which grows in most perfection on the islands near the city; the raising of fruits and early vegetables for Northern markets also relies on Charleston's shipping facilities.

Manufactures. — The great manufacture of Charleston is fertilizers, from the inexhaustible beds of phosphate rock in the vicinity, discovered by Dr. St. Julien Ravenel some time after the War: out of a total manufactured product valued at $9,562,387 in 1900, $3,967,090 was of phosphates, none other amounting to $500,000. From May 1901 to May 1902, the shipment of manufactured fertilizers was 296,646 carloads; there were 11 establishments, with a capital embarked of $7,868,639, employing 1,409 people besides stockholders, paying $488,842 in wages and salaries, and $2,238,615 for materials. Of the other industries, besides domestic and jobbing ones, like food, clothing, plumbing, etc., the chief were of tobacco products, foundry and machine-shop work, cotton compressing, and oil and rice milling, bagging factories, cigar factories; making baskets to ship fruit and vegetables in, and casks for turpentine; ice, soap, beer, and mineral waters.

Interior, Buildings, Suburbs, etc. — Charleston's long existence for an American city, and its position of leadership in all political movements as well as vital importance in war time, give it much historical interest; and its old garden-set mansions and surroundings are often of great beauty in themselves. It is laid out generally at right angles, but with some picturesque irregularities in the streets; four of these, King Street, the principal retail thoroughfare; Meeting Street; and Rutledge and Ashley avenues, run the entire length of the city, north and south. King Street ends in White Point Garden, a handsome wooded park containing monuments to Sergeant John Jasper and William Gilmore Sims; east of this is the Battery, a broad esplanade 1,500 feet long, affording a noble view of the harbor and the forts. At the junction of Broad and Meeting streets are grouped the public buildings, consisting of the court-house, a solid brick building; the city hall, an imposing structure entered by a double flight of steps, and containing a historical museum with valuable relics; and the new post-office, a magnificent four-story building of Carolina granite, with a tower and all modern appliances, costing about $500,000. The United States custom-house, near Market wharf on the Cooper River, is a superb structure of white marble, costing some $3,000,000. In front of the city hall is Washington Park, containing two handsome fountains and a statue of William Pitt, erected before the Revolution — the British shot off one of the arms in 1780. There are monuments also to the Confederate dead and to John C. Calhoun, and a bust of Henry Timrod, the poet.

The Ashley is crossed by two bridges: that of the Charleston & S. R.R., and a toll-bridge known as the «New Bridge.» Charleston has one of the best electric street railways in the country, having some 30 miles of track within the city limits, connecting with Chicora Park, about four miles from the city, on the Cooper, and with the Isle of Palms, a magnificent seaside resort about 10 miles north of the harbor. It also runs to the suburb of Mount Pleasant, across the Cooper, and eastern side of the harbor, and to Sullivan's Island, about

three miles off, where is a fine bathing beach. Magnolia Gardens, 12 miles west on the Ashley, is a popular summer resort, but the chief one is Summerville, 22 miles northwest, with a dry, cool climate. Of the open spaces near the city, Magnolia Cemetery at the north end, beautifully kept with flowers and shrubs, and with many fine monuments, is the chief. The city has a complete system of tidal drainage, and is in excellent sanitary condition.

Education.— The public-school system, established in 1810, had in 1902, six school buildings, about 100 teachers, and a total attendance of about 7,750, 4,200 colored; besides some 800 in private and parish schools. For higher education, the chief institutions are Charleston College, chartered in 1785, with a museum of natural history and a library; the South Carolina Military Academy, a State institution, established in 1843, one of the foremost military schools in the country, and famed for the active part its students took in the Civil War; Porter Military Academy, including Porter Manual Training Institute; the State Medical College, chartered in 1852; the Charleston and Memminger High Schools; the Academy of Our Lady of Mercy; Smith's School for Young Ladies; University School; and the Avery Normal Institute and the Wallingford Academy for Colored Youth.

Churches and Charitable Institutions.— There are over 60 churches in Charleston, the leading denominations being the Protestant Episcopal and the Presbyterian. It is a Roman Catholic bishop's see, and has a cathedral, St. Finbar's, rebuilt in 1890. The oldest church building is St. Michael's (P. E.), dating from 1761, with a fine chime, of interesting history; the oldest organization, however, is St. Philip's (P. E.), whose building was burned in the great fire of 1835, and whose present one is a Gothic structure of great beauty and originality, with a steeple nearly 200 feet high, bearing at night a beacon, visible far out at sea; and with a churchyard full of distinguished names, including Calhoun, Gadsden, Rutledge, and Pinckney. The Circular Church (Congregational) is also noted; among others of interest are: Grace (P. E.), the Scotch, the Second, and Westminster (Presbyterian), Citadel Square (Baptist), the Old Huguenot, Unitarian, Bethel, and Trinity Methodist, and the Hebrew Synagogue. Of the charitable institutions, the most important are the Orphan House, founded in 1792, the oldest of its kind in the United States; the Euston Home for the Aged; Home for Mothers, Widows and Daughters of Confederate Soldiers; the City and the Roper hospitals; the almshouse; and the Old Folks' Home for Aged Colored People. Among charitable societies are St. Andrew's Society, founded by Scotchmen in 1720, the oldest society in the city; and the South Carolina Society, founded by Huguenots in 1736,— renamed from the Two-Bit Club, so called from the sum contributed by each member at each meeting for the relief of their own indigent.

Banks.— In 1900 there were 3 national and 13 savings and State banks, with an aggregate capital and surplus of over $2,700,000. There were also 14 building and loan associations in active operation, with aggregate capital amounting to about $1,500,000.

Government and Finances.— The government is, by the charter of 1836: a four-years' mayor and a council elected half by wards and half at large. The administrative boards and officials are partly appointive by the mayor and partly elective by the council. The city expenses are about $600,000 a year, of which $60,000 each goes for schools and charities, $75,000 for police, and $50,000 for the fire department. The net debt is about $3,800,000; the assessed valuation of all taxable property, $17,300,000, of which $12,400,000 is real estate; the city tax rate is $26.50 per $1,000, besides a school tax of $1 and a State and county tax of $10.62½.

Population.— In 1790, the first census, 16,359; 1800, 18,924; 1810, 24,711; 1820, 24,780; 1830, 30,289; 1840, 29,261; 1850, 42,985; 1860, 40,522; 1870, 48,956; 1880, 49,984; 1890, 54,955; 1900, 55,807; of which 31,522 were negro.

History.— The first settlement in South Carolina was made at Port Royal by the French, in 1562; it was not successful, but they never forgot the experiment or their favor for the region. In 1670 an English colony under Gov. William Sayle made for Port Royal also; but on the advice of the cacique of Kiawah (the then name of the Ashley), settled instead at Albemarle Point, on the west bank of the Kiawah, three miles from the present site,— fortunately, as the colony Lord Cardross planted at Port Royal was exterminated by the Spaniards in 1686. The settlement was named Charles Town after Charles II. Within two years the settlers had discovered that Oyster Point, the end of the Charleston peninsula, was a better site, and in 10 the latter had become the main settlement and the offices were removed there. The first village was on the Cooper entirely, as the main business still is. The commerce even at this early date was lively, 16 vessels sometimes discharging at once. In 1685–6 a colony of Huguenot refugees settled there and built a church: this strain has deeply molded Charleston and South Carolina, and its fiery zeal in heading every political movement is perhaps due to this quick French blood. In 1704 there were five churches: St. Philip's, the Huguenot, the First Baptist, a Presbyterian and Congregational meeting-house, and a Quaker one. In August 1706 an allied French and Spanish fleet attacked it, but were driven off by a small improvised fleet under Lieut.-Gov. Rhett; shortly afterward another French vessel, unaware of the others' defeat, came up and landed a party, which was routed with heavy loss, and the survivors, with the ship and the rest of the marines, captured. The city at this time was desolated with yellow fever, but this militia action counts among the brilliant feats of the War of the Succession. In 1755 a colony of 1,200 deported Acadians settled there, still further reinforcing the French element. In 1773, Josiah Quincy of Boston writes in his diary that the town was "beautiful and in many respects magnificent"; and "far surpassed everything he ever saw or expected to see in America." It was at this time the third seaport in size in America, and in 1774 established a chamber of commerce. It

was not only the first Southern city to join the Revolutionary movement, but was the prime agent in bringing about the first provincial congress 10 years before; it held the first constitutional convention in any colony in March 1776, and promulgated an independent constitution. On 28 June the British fleet, under Sir Peter Parker, besieged the city, and was beaten off with terrible loss by the garrison of Fort Moultrie behind an improvised palmetto fortification. In 1779 a second attack under Gen. Augustine Prevost was defeated. But on 12 May 1780 Sir Henry Clinton with 16,000 men captured it and its garrison of 7,000 under Gen. Lincoln, after a six weeks' siege; it was not reoccupied by the Americans till 14 Dec. 1782. In 1783 it was incorporated as a city, and remained the capital of South Carolina till 1790. In 1784 it exported the first bale of cotton sent from the United States to Europe. In 1793 some 500 French refugees from the massacres of San Domingo settled there. It was the heart of the nullification movement in 1832, as of all movements to oppose Federal authority first and last; and the Breckenridge convention of 1860 met here before adjourning to Baltimore. The convention which proclaimed the State's secession from the Union was held here 20 Dec. 1860. The Civil War was begun by its bombardment and capture of Fort Sumter on 12-13 April 1861; and from 7 April 1863 on, for nearly two years, the fort was incessantly besieged and steadily bombarded by the Union fleet, for the last 18 months it being only a heap of ruins, but impregnable. On 17 Feb. 1865, on the surrender of Columbia, Hardee evacuated the city and burned all public buildings, stores, and shipping, and the next day Foster and the union forces took possession. Despite its devastation and wreckage, it grew 21 per cent from 1860 to 1870, while it had fallen off in the previous decade,—a curious phenomenon. In 1886, on 31 August, the heaviest earthquake ever recorded in the United States destroyed several hundred buildings, and made three fourths of the whole uninhabitable, killed scores of people, and caused a property damage estimated at $8,000,000. On 2 Dec. 1901 the South Carolina Interstate and West Indian Exposition was inaugurated in the city.

(For a compact sketch of its history, see Yates Snowden in Powell's 'Historic Towns of the Southern States'; in connection with State history, McCrady's three volumes of South Carolina history, 1897-1901.)

HENRY TUPPER,
Secretary Chamber of Commerce.

Charleston, W. Va., a city, capital of the State, and county-seat of Kanawha County, at the junction of the Kanawha and Elk rivers, on the Chesapeake & O., the Ohio Cent., and the Charleston, C., and Sutton R.R.'s, 130 miles south by west of Wheeling. It is an important commercial, lumber, and coal-mining centre, with steamer communications with all Ohio and Mississippi River ports. In 1900 it contained 119 manufacturing establishments, valued at $1,371,807. It has extensive salt springs, State-house, custom-house, hospital and opera house, three national banks, several daily and weekly newspapers, and an assessed property valuation of over $4,000,000. Pop. (1900) 11,099.

Charleston Phosphate, a valuable fertilizer obtained at Charleston, S. C., and classed as "land" or "river" phosphate, the latter being procured by dredging. It was discovered in 1837 by Francis S. Holmes, but its value was not demonstrated until 1867. For over 20 years South Carolina was the chief source of the world's supply. In 1888 the phosphate rock was found in Florida, and later in several other States, including North Carolina and Tennessee. In 1897 nearly 1,000,000 tons were mined, of which Florida supplied fully a half, and South Carolina rather less. The river phosphate occurs in nodules washed out of the original Tertiary formations and ranging from a half inch to two feet in diameter. They usually contain 50 to 60 per cent of "bone phosphate." See FERTILIZERS.

Charlestown, Mass., since 1874 a part of the municipality of Boston, previously a separate city and seaport. The principal public buildings are the State prison, the hospital for the insane, a market-house, school houses and churches. One of the chief navy yards in the United States, occupying an area of about 100 acres, is in the southeast part of Charlestown. Charlestown was the scene of stirring events in the Revolutionary War. See BUNKER HILL, BATTLE OF.

Charlestown, South Africa, a town in the extreme north of Natal, on the railway from Durban to Johannesburg. It stands at a height of over 5,300 feet. Majuba Hill is four miles distant.

Charlestown, Va., a village and county-seat of Jefferson County: situated on a branch of the Baltimore & O. R.R., 10 miles southwest of Harper's Ferry. It is the centre of an agricultural region, is noted as being the place of trial and execution (2 Dec. 1859), of John Brown (q.v.), and has a national bank, several weekly newspapers, and an assessed property valuation of about $1,000,000. Pop. (1900) 2,392.

Charlet, Nicolas Toussaint, nĭk-ō-lä toosăṅ shär-lä, French painter and engraver: b. Paris 20 Dec. 1792; d. Paris 29 Oct. 1845. He held a clerkship under the Empire, but lost it at the Restoration (1815), and afterward devoted himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. He was especially successful in his sketches of children and military incidents. His drawings numbered about 2,000.

Charleville, shär-lē-vēl, France, a town in the department of Ardennes, on the left bank of the Meuse, opposite Mézières, with which it communicates by a suspension bridge. It is regularly built, has straight, wide, and clean streets, and a public square and fountain, surrounded by arcades, from which the four principal streets diverge. It carries on various industries: and the Meuse affords facilities for a large traffic. Charleville was built in 1606 by Charles, Duke of Nevers and Mantua, and named after himself. Pop. (1891) 17,390.

Charlevoix, Pierre François Xavier de, pē-ār fräṅ-swä ksăv-ē-ā dė shär-lē-vwä

French Jesuit traveler: b. St. Quentin 29 Oct. 1682; d. La Flèche 1 Feb. 1761. He twice visited Canada, and voyaged down the Mississippi to New Orleans. He published his journal, histories of San Domingo, Japan, and Paraguay, and a 'History of New France.' He wrote also a 'Life of Blessed Mary of the Incarnation,' the foundress of the Ursuline nuns in America.

Charley, SIR **William Thomas,** English jurist (retired since 1892): b. Woodbourne 5 March 1833. He has published 'The Judicature Acts' (1873–5); 'The Real Property Acts' (1874-7); 'The Crusade Against the Constitution, an Historical Vindication of the House of Lords' (1895); 'Mending and Ending of the House of Lords' (1900).

Char'lock, a small, cruciferous plant with yellow flowers, commonly called wild mustard. See MUSTARD.

Char'lotte Augusta, Princess, daughter of Queen Caroline and George IV.: b. Carlton House 7 Jan. 1796; d. 5 Nov. 1817. She was carefully educated and highly accomplished. In 1816 she married Prince Leopold of Coburg, afterward King of the Belgians.

Charlotte, shär'lŏt, N. C., a city and county-seat of Mecklenburg County, on Sugar Creek, the Southern and the Seaboard A. L. R.R.'s, 226 miles northeast of Atlanta, Ga. It is the trade centre of Mecklenburg and surrounding counties, and also the centre of the Southern cotton-mill industry, having 100 mills within a radius of 200 miles; is the seat of Biddle University and a military institute; has several churches, parks, opera houses, public library, four national banks, and several weekly newspapers. The Mecklenburg Declaration of Independence was adopted here in 1775, and the city was occupied by the British in 1780; assessed property valuation, about $5,000,000. Pop. (1900) 18,091.

Charlotte Amalie, shär-lŏt' ä-mä'lē-ē, Danish West Indies, capital city of the island of St. Thomas. It has an excellent harbor, landlocked from all winds, contains several churches, and is an entrepôt for goods for the neighboring islands. Pop. 9,000.

Charlotte Harbor, Florida, the mouth of the Peace River, in De Soto County, in the southwestern part of the State. This harbor is very shallow, not exceeding in depth more than 10 feet; it extends inland 24 miles. It is protected on the west side by a long chain of islands.

Charlottenburg, shär-lŏt'tĕn-boorg, Prussia, adjoining Berlin on the west, and now practically forming part of it, on the banks of the river Spree. It contains a palace built for Sophia Charlotte, the first queen of Prussia, which was begun at the end of the 17th century — hence the name of the place. The town was founded soon after, but made little progress until the middle of the 19th century. Since then it has made extraordinary progress, having shared in the prosperity and extension which the capital has experienced. The town contains various important educational and other institutions, including a school of artillery and engineering, and a technical high school. Among the churches is the Kaiser Wilhelm Memorial Church, consecrated in 1895. A beautiful walk starting from the Brandenburg gate, at the head of the famous Berlin Street, *Unter den Linden,* and passing through the park known as the *Thiergarten,* ends here. Charlottenburg is a favorite resort and residence of the Berlinese. In the garden adjoining the castle is the tomb of Frederick William III. and his consort Queen Louisa, by Rauch. Here also their son, the Emperor William I., was buried in 1888. Pop. (1900) 189,290.

Charlottesville, shär'lŏts-vĭl, Va., the county-seat of Albemarle County, is on the Chesapeake & O. and the Southern R.R.'s, 96 miles southwest of Washington. It is the seat of the University of Virginia and of Monticello, the home of Thomas Jefferson; is a popular summer resort; has important manufactures, electric lights and street railways, a national bank, several daily and weekly newspapers, and an assessed property valuation of over $1,500,000. Pop. (1900) 6,449.

Charlottetown, shär'lŏt-town, Prince Edward Island, Canada, capital of the province, situated in Queen's County, on Hillsborough Bay, at the confluence of three rivers, and on the Prince E. I. R.R. The city is well laid out, and has an excellent harbor, a fine colonial building, post-office, Y. M. C. A. building, and an insane asylum. It is the seat of Prince of Wales College, St. Dunstan's College, and a Methodist college; has a high school, a business college, and several common schools, and many industries, including foundries, machine shops, carriage and furniture factories, breweries, etc. Charlottetown is connected with various parts of the Dominion by steamship lines. It is lighted by gas and electricity; has an extensive waterworks system, several daily and weekly newspapers, and banks, and is the see of a Roman Catholic bishop. Pop. (1901) 12,080.

Charlton, chärl'tŏn, **John,** Canadian statesman: b. near Caledonia, N. Y., 3 Feb. 1829. He was in early life a clerk, but removed to Canada in 1849, and entered business and political life. He was elected as a Liberal to the Canadian House of Commons in 1872, and has held his seat continuously since then. He is best known as a promoter of moral legislation. He has published 'Parliamentary Recollections.'

Charlton, John, English artist: b. Bamborough, Northumberland, England, 28 June 1849. He studied art at Newcastle and South Kensington, and beginning to exhibit at the Royal Academy in 1870 has exhibited there regularly since that date. Among important works of his are 'Stag at Bay'; 'Reynard's Requiem'; 'God Save the Queen'; 'The Funeral of Queen Victoria.'

Charm, anything believed to possess some occult or supernatural power, such as an amulet, spell, etc., but properly applied (as the name, derived from Lat. *carmen,* a song, indicates) to spells couched in formulas of words or verses.

Among celebrated charms the Danish Danebrog, or national banner, stands prominent. This banner was said to have been woven in a

day and a night by three daughters of a celebrated Norse chieftain, of the race of Ynglings, said to be descended from the god Odin. These girls were deeply versed in the lore of the gods, giants, dwarfs, and norns, and in the centre of the banner they placed a raven, the bird of Odin, wonderfully lifelike and realistic. The superstition was that the result of a battle was foretold by this raven, which if victory was to fall to the possessors of the banner, held its head and bill in an upright position.

By observing this banner the Danes in three years' time had won 27 important battles, going into action only when the raven looked skyward. If the bird looked droopy and held its head low, they remained in camp, or, if in action, and the attitude of the raven suddenly changed, they withdrew from the field.

Alfred, the king of the English Saxons, noting the enthusiasm which this banner inspired in the Danes, determined to capture it, and succeeded after a savage battle in which the Danes fought desperately for three hours. When, however, it fell into the hands of the Saxons, and the head and wings of the raven drooped, there was a general rout. The Danes were models of courage and bravery as long as superstition fanned the fire of faith in their hearts, but they were arrant cowards the minute they realized that their idol was powerless to protect them.

Another curious charm is to be seen in the National Museum at Washington. This is a necklace of human fingers which was captured from the Sioux Indians in 1876, the loss of which brought about the subjection of the Indians.

Charmian, kär'mĭ-ạn, an attendant on Cleopatra in Shakespeare's 'Antony and Cleopatra.' After Cleopatra's suicide, Charmian also made away with herself.

Charnay, Claude Joseph Désiré, klōd zhō zĕf dā-zē-rā shär-nā, French traveler: b. Fleuieux 2 May 1828. In 1857–61 he traveled in Mexico in behalf of the French ministry of education; from 1863 to 1878 he went on a number of expeditions to North and South America, Australia, and other countries. In 1880 he conducted an expedition to the ruined cities of Mexico, the expense of which was borne by Pierre Lorillard; and in 1886 again visited Yucatan. He has written 'Le Mexique, Souvenirs et Impressions de Voyage'; and 'Les Anciennes Villes du Nouveau Monde' (translated into English).

Char'nel-house, a chamber or building under or near churches, where the bones of the dead are deposited. In England the crypts of some churches were formerly used as charnel-houses.

Charon, kā'rŏn, in mythology, the son of Erebus and Night. It was his office to ferry the dead in his crazy boat over the dark waters of Acheron, over Cocytus resounding with the doleful lamentations of the dead, and finally over the Styx, dreaded even by the immortals. The shades were each obliged to pay him an obolus, which was put, at the time of the burial, into the mouth of the deceased. Those who could not pay the fare, or had been so unfortunate as to find no grave in the upper world, were compelled to wander on the desolate banks of the Acheron till Charon was pleased to carry them over to their final resting-place. He was represented as an old man, with a gloomy aspect, matted beard, and tattered garments. The traditions relative to Charon are posterior to the Homeric age, and it is thought by some of the learned that the myth was imported into Greece from Egypt.

Charost, Armand Joseph de Bethune, ärmäṅ zhō-zĕf dė bā-toon shä-rōst, Duke of: b. Versailles 1728; d. 27 Oct. 1800. He was a descendant of Sully, and distinguished himself on many occasions in the military service of his country. He was particularly active in the promotion of agriculture and public institutions. Long before the Revolution he abolished the feudal services on his estates, and wrote against feudal institutions. He established charitable institutions in sundry parishes, provided for the support and instruction of orphans, employed physicians and midwives, founded and liberally endowed a hospital. In a year of dearth he imported grain into Calais at his own expense. In the provincial assemblies he spoke against the *corvées.* In the assembly of the notables he declared himself for an equal distribution of the public burdens. During the Reign of Terror he retired to Meillant, where he was arrested, and did not obtain his liberty until after the 9th Thermidor. In the testimonies given in his behalf by the revolutionary committees he was called the father and benefactor of suffering humanity. He returned to Meillant, where he established an agricultural society. No sacrifice was too great for him, and his vast fortune was scarcely sufficient for his enterprises.

Charpentier, François Philippe, fräṅ-swä fē-lēp shär-päṅ-tē-ā, French engraver and mechanic: b. Blois 3 Oct. 1734; d. there 22 July 1817. He studied copper engraving in Paris, and invented the aquatint process in engraving. Among his engravings by this process are 'Perseus and Andromeda'; 'The Beheading of John the Baptist'; 'A Shepherd'; 'The Italian Concert'; and 'The Children's Bacchanal' after De Witt. On account of his invention he was given the position of royal mechanic; in this capacity he perfected the lamps of lighthouses and devised a number of improvements in cannon and other firearms.

Charpentier, Gustave, French composer: b. Dieuze 1860. He was a pupil of Pessard and Massenet at the Paris conservatory; and won the grand prix de Rome in 1887. He has written a number of songs: 'Napoli,' a symphony; 'The Life of a Poet,' a symphonic drama; and an opera, 'Louise.' For the two latter he wrote both words and music.

Charpentier, Johann Friedrich Wilhelm Toussaint, German mining engineer: b. Dresden 24 June 1738; d. Freiberg 27 July 1805. He studied law and mathematics at Leipsic, then took a position as instructor in mathematics at the mining school of Freiberg, where he devoted himself to the study of mining methods. He investigated the improved process of amalgamation used in Hungary and introduced it in Germany, besides furthering a number of other improvements. He wrote

'Mineralogische Geographie der Kursächsischen Lande' (1778); 'Beiträge zur Geognostischen Kenntnis des Riesengebirges Slesischen Anteils' (1804).

Charpentier, Louis Eugène, loo-ē ė-zhān, French painter: b. Paris 1 June 1811; d. 7 Dec. 1890. He was a pupil of Gerard and Cogniet, and was professor of design at the Lycee at Versailles for over 20 years. He was best known as a military painter. His first picture of importance was 'Bivouac of the Cuirassiers'; among other of his works are 'Halt of the French Army on the Saint Bernard'; 'Battle of Tchernaia'; 'Imperial Guard of Magenta'; 'Retreat from Inkermann'; 'Wellington in Spain'; 'Charge of Cuirassiers at Waterloo.'

Charpentier, Marc Antoine, French composer: b. Paris 1634; d. there March 1702. He went to Rome with the intention of studying painting, but turned his attention to music and became a pupil of Carissimi. Returning to Paris he held the position of chapel-master at several places, finally at the Sainte Chapelle. He was the most prominent rival of Lully. He wrote several operas, 'Tragédies Spirituelles' for the Jesuit order, and a number of pastorales.

Charpie, shär-pē. See LINT.

Charpoy, chär'poi, in the East Indies, a small, portable bed, consisting of a wooden frame resting on four legs, with bands across to support the bedding.

Charqui, chär'kē, jerked beef, the Chilean name of which the English term is a corruption.

Charras, shär-rä, **Jean Baptiste Adolphe,** a French republican soldier and statesman: b. Pfalzburg, Lorraine, 7 June 1810; d. Basel, Switzerland, 23 Jan. 1865. He took part in the revolution of 1830, was promoted in 1833 to the rank of lieutenant, wrote a series of able articles in the 'National' on military affairs, which gave umbrage to the government and caused him to be sent to Algeria; distinguished himself there on the battlefield as well as in the training of native troops and the colonization of the country. After the revolution of 1848 he became under-secretary of state and representative for the department of Puy de Dôme. He was one of the victims of the *coup d'état* of 2 Dec. 1851. First detained at Ham, he was transported to Belgium in 1852, but expelled from that country in November 1854, at the request of Louis Napoleon, whom Charras had denounced on many occasions, but most effectively in a letter of which 50,000 copies were printed in Belgium alone. A remarkable work from his pen, 'Histoire de la campagne de 1815,' appeared in 1857.

Charras, chär'ras or chŭr'ras, a resinous substance which exudes from the Indian hemp and is collected for use as a narcotic or intoxicant, forming a considerable article of trade in Asia. See HEMP.

Charriere, shär-rē-är, **Madame St. Hyacinthe de,** French authoress, well known under the assumed name of the ABBÉ DE LA TOUR: b. Holland about 1740; d. 20 Dec. 1805. In early life she became a maid of honor at the court of the Stadtholder. Her affection for her brother's tutor, M. de Charrière, a worthy but decayed nobleman, led her to forego her rank and family, and shortly after her marriage she retired with him to a small property at Neufchâtel. Her lively temperament was ill suited for the monotony of a rustic life, and accordingly seeking amusement in literary recreations she soon acquired a considerable reputation. Having lost the greater part of her fortune in the French Revolution, she reduced her expenditure to the lowest possible amount, that she might be able to continue her various acts of benevolence. Her works belong chiefly to the class of light literature. Among others may be mentioned 'Les Trois Femmes'; and the favorite dramas of 'Le Toi et le Vous'; 'L'Emigré'; 'L'Enfant Gâté'; and 'Comment le nomme-t-on.' All these productions not only display much wit, truth, and powerful description, but also breathe a spirit of philosophy, and have a strong moral tendency. Most of them were translated into German by her friend Herder.

Charron, Pierre, pē-ār shä-rôn, French preacher and writer: b. Paris 1541; d. 16 Nov. 1603. He studied law at Orleans and Bourges, and had practised for six years as a parliamentary advocate when he turned his attention to theology, and gained so much fame by his sermons that he was presented in rapid succession with several benefices in Gascogny and Languedoc, and appointed court chaplain to Queen Margaret. In 1588 he returned to Paris with the view of fulfilling a vow he had made to enter the Carthusian order, but owing to his age the prior of the order refused him admission, and the Celestines also declining to receive him, he continued a secular priest. In 1589 he went to Bordeaux and became very intimate with Montaigne, whom he tried to imitate, though he failed to catch his ease of style, and original, piquant wit. His principal works are 'Traité des Trois Vérités,' and 'Traité de la Sagesse.' The Roman Catholic zeal of the former drew down upon him the rebuke of Duplessis-Mornay; and the extreme liberalism of the latter exposed him to a charge of atheism, the treatise being condemned both by Parliament and the University.

Chart, a representation of a portion of the earth's surface projected on a plane. The term is commonly restricted to those intended for navigators' use, on which merely the outlines of coasts, islands, etc., are represented. A globular chart is a chart constructed on a globular projection. A Mercator's chart is a chart on the projection of Mercator. A plane chart is a representation of some part of the superficies of the earth, in which the spherical form is disregarded, the meridians drawn parallel, the parallels of latitude at equal distances, and the degrees of latitude and longitude equal. A selengraphical chart is a chart representing the surface of the moon; and a topographical chart is a chart of a particular place, or of a small part of the earth.

Charts are designed to assist the navigator and to subserve the interests of commerce. For purposes of navigation they may embrace large areas, like one of the great oceans or seas, delineating the conformation of the shores and outlying dangers, and perhaps indicating the principal currents and winds that may be utilized

in determining the most advantageous routes between specified localities. Charts may also embrace much smaller areas, but on larger scales, permitting greater fullness of detail, and thus presenting graphically the channels that can be followed, with the depths of water, the position of lights, beacons, spindles, buoys, and other objects provided to indicate the way to the stranger. Charts of these classes are usually designated "Navigation charts," although they may also be useful for other purposes.

Nearly all civilized nations have published charts of their coast lines in greater or less detail, and the principal maritime nations copy those issued by other nations, and thus maintain for the use of their own seamen charts of all parts of the world to which their commerce may extend. Great Britain maintains the most extensive establishment for the purpose, and issues the most complete series of charts; she has also made the most extensive surveys of uncivilized coasts for cartographic purposes.

The United States Coast Survey, a vast undertaking, was begun in 1807, carried on intermittently till 1845, and since then more systematically, save during the Civil War, under Prof. Bache, Prof. Pierce, and their successors. The coasts of the United States are surveyed and the charts produced by the Coast and Geodetic Survey attached to the Treasury Department, which also makes researches to determine the origin and courses of the Gulf Stream (q.v.). Unsurveyed foreign coasts are surveyed by the Bureau of Navigation, the charts being produced by the Hydrographic Office of the Navy Department. This bureau also duplicates charts and plans issued by other nations. The Coast and Geodetic charts are sold at from 10 cents to $1 each, being the cost of printing and paper. Naval vessels are supplied free. The charts are obtainable at Coast and Geodetic Survey agencies at all seaports of the United States. They exhibit accurate and minute topography as far inland as will supply landmarks for the navigator or serve for purposes of defense; the shore line at high water, and sanding to mean low water; soundings, contours, and material of bottom at different depths; bars, channels, sailing ranges and directions; true meridian and compass variation; rocks, reefs, buoys, beacons, lights; tide establishment; detailed explanation of lighthouses and signal stations. They are carefully corrected for every substantial change in any of those features. They range in scale from $\frac{1}{2400}$ (30.401 inches to the nautical mile) to $\frac{1}{1200000}$ ($\frac{61}{1000}$ of an inch to the nautical mile). The Coast and Geodetic Survey issues four series of charts on the Atlantic and Gulf coasts of the United States, and three series on the Pacific coast, designed to subserve the purposes the surveys were established to meet. The first series includes "sailing charts," which embrace long stretches of coast, as from the Bay of Fundy to Cape Hatteras, Chesapeake Bay to the Bahamas, etc., and are intended to serve for offshore navigation, or between the greater headlands, as Cape Cod, Cape Hatteras, etc., and between distant harbors, as Boston to Chesapeake Bay, Charleston, etc. They show only the outline of the continent, the seacoast lights, and geographic information that will be useful for the purposes intended. The second series includes "general charts of the coast," also designed for purposes of navigation. They are on a scale three times as large as that of the first series, and embrace more limited areas, as the Gulf of Maine, Gay Head to Cape Henlopen, Galveston to the Rio Grande, etc. These charts serve the navigator in coasting alongshore between headlands, and in approaching harbors. Those of the third series, called "coast charts," embrace the whole coast on a uniform scale five times as large as that of the second series. Such charts are necessarily confined to comparatively short stretches of coast, as Sandy Hook to Barnegat, the entrance to Chesapeake Bay, Mobile Bay, etc. One inch on the paper represents about 1¼ statute miles, a scale sufficiently large to give the features of the topography and hydrography with great clearness, portraying the appearance of the coast and the irregularities of the bottom with a detail quite close enough for the navigation of the principal harbors. The fourth series consists of "harbor charts" on large scales, intended to meet the needs of local navigation. On the Pacific coast the first series is similar to that on the Atlantic coast, and extends from San Diego, Cal., to Point Barrow, Alaska. The second series is on a scale six times as large as the first, and is suitable for alongshore navigation and inland passages of southeast Alaska. The third series includes charts on scales like those of the fourth series on the Atlantic coast.

All these series of charts are published from the same original surveys, the details of the original work being generalized or omitted to meet the requirements any particular series is intended to subserve. Various methods are available for producing charts of these classes, but experience has demonstrated that on coasts like large portions of those of the United States, which are subject to frequent changes from natural causes, necessitating extensive corrections, engravings upon copper are the most expedient and economical. The engravings afford the additional advantage of being readily duplicated by the electrotyping process. All the standard charts issued by the bureau are therefore copperplate engravings. Preliminary editions, however, are frequently issued by means of the photo-lithographic process, which affords a cheap and ready method for temporary purposes.

The Survey publishes about 500 charts, with an average annual issue of 70,000 copies.

Char'ta, Magna. See MAGNA CHARTA.

Charte, shärt, a term originally used to indicate the rights and privileges granted by the French kings to various towns and communities. The first such charter in France is known as the *Grande Charte,* or the Charter of King John (1355). At present by the Charte is meant the fundamental law of the French monarchy, as established on the restoration of Louis XVIII. in 1814. As is well known, it was the violation of an article of the Charte by the ministers of Charles X. that led to the revolution of 1830, the expulsion of that monarch from the throne, and the accession of Louis Philippe, who, on 29 Aug. 1830, swore to a new charter, sensibly modifying that of 1814 in a liberal sense. After 18 years' sway, Louis Philippe was himself expelled from France, 24 Feb. 1848, and therewith the Charte which he was called to support fell to the ground.

Charter, a document by which a superior power grants permanent or continuing rights and privileges to an inferior, either a person or persons, corporation or institution, colony, municipality, etc. Originally it had the broader sense, now obsolete, of a conveyance of land. The mediæval charters ranged from a grant of political rights by a sovereign to an entire people,— like the Great Charter of England or the Golden Bull of Hungary, or colonial instruments of government conferring the broadest rights of sovereignty,— down to permissive acts for abbeys and colleges or trading companies, or confirmations of rights already given (called confirmatory charters). The first-named class in modern usage is called a constitution. Thus, the agreements by which recent monarchs have deprived themselves or been deprived of absolute power and shared it with their people, as with Austria in 1866, Japan in 1868, etc., are essentially the same as Magna Charta. Charters in present usage are restricted to municipalities, corporations, and institutions.

The charters for the American colonies were usually distinguished from "patents" by granting specific privileges of jurisdiction and legislation, and in general the powers needed to establish and continue a self-regulating community, instead of mere general grants of land and rights of settlement; but the two were often loosely used as interchangeable. Thus, in the acknowledgment of receipt of their charter in 1662, the Connecticut officials acknowledge also the "old charter," meaning the Warwick Patent. Strictly, they were all patents, as granted by the king under letters patent; but in use, only the grants to individuals were commonly termed patents, the word charter being reserved for those to companies and to colonies already established. Of these three species, the first includes the patents to Lord Baltimore for Maryland in 1632, to Gorges for Maine in 1639, to the Duke of York (afterward James II.) for New York in 1664, and to William Penn for Pennsylvania in 1681. The second comprises those to the Virginia Company in 1606, 1609, and 1612, the Plymouth and London companies in 1606, the Council for New England in 1620, the Massachusetts Bay Company in 1629, the proprietors of Carolina (1663) and Georgia (1732). The third has the two exemplars of Rhode Island (1643, confirmed 1663), and Connecticut (1662): instruments of such complete self-government that those States made no change at the Revolution, the former living under its 17th-century charter till 1818, and the latter till it was forced to change it by the Dorr Rebellion of 1842. The legal nature and implications of these documents were keenly disputed in the age when their interpretation was vital, and have been argued with scarcely less heat for historical reasons since. According to the English view, they were concessions granted by the government for political reasons, and revocable at its pleasure for the same reasons; the title to the lands as well as to the political privileges lay with the government, and its right to vacate either was limited only by policy; and charter governments had only such powers as were specifically given them in the charters. James II. put some of these theories in practice in the union of New England in 1685, and others were acted upon generally. On the other hand the colonial view was set forth by Jeremiah Dummer in his 'Defense of the Charters' (1728); at least it was widely adopted. It was, that the charters were compacts between the government and the colonies, in consideration of the latter having cleared and taken possession of the territory and annexed it to the crown; and that the crown possessed only political rights there, the land title being derived from purchase and occupation and their own courage and labor. As to the powers of the charter governments, Judge Story holds that they possessed full sovereignty and power of legislation and taxation, subject only to not contradicting the laws of the mother country. The truth is that neither side had any very definite views on the matter at the outset, and both developed antagonistic ones under the stress of interest.

In the United States, charters (special or general) are granted by acts of the several State legislatures or by the national government. Thus, the national banking act, and the general railroad acts of most States prescribe the conditions under which corporations of those classes may organize without special permission, and their articles of association are their charter. The act by which a county or township is set off as an administrative division of a State is not termed a charter. On the other hand, that by which a municipality is organized, as a city or borough, is always so termed; but it has the vital distinction from a private charter that it is not a contract; the municipality has no vested rights, being a mere governmental agency and convenience; and the charter can be altered or repealed at any time by the legislature. A private charter, on the other hand, is a contract which cannot be repealed or modified by the public power unless such liberty has been expressly reserved in the charter itself. See DARTMOUTH COLLEGE CASE.

Charter-house, a celebrated school and charitable foundation in London, England. In 1370 Sir Walter Manny and Northburgh, Bishop of London, built and endowed it as a priory for Carthusian monks (hence the name, a corruption of *Chartreuse,* the celebrated Carthusian convent). After the dissolution of the monasteries it passed through several hands till it came into the possession of Thomas Sutton, who converted it into an hospital, richly endowed, consisting of a master, preacher, head schoolmaster, with 44 boys and 80 indigent gentlemen, together with a physician and other officers and servants of the house. Each boy is educated at a certain expense, and each pensioner receives food, clothing, lodging, and an allowance of about $150 a year. The pensioners, "poor brethren," must be over 50 years of age, and members of the Church of England. The Charter-house School has been removed to new buildings near Godalming, in Surrey, while the non-academic department of the Charter-house still remains in the old buildings. The school has a high reputation, and many lads are educated there other than the scholars properly so called. Several of the famous men who have received their education at the Charter-house are Isaac Barrow, Addison, Steele, John Wesley, Blackstone, Grote, Thirlwall, Havelock, John Leech and Thackeray.

Charter Oak, a tree nearly seven feet in diameter, formerly in Hartford, Conn.; it blew down in a storm, 21 Aug. 1856. A section of its trunk was preserved in the rooms of the Connecticut Historical Society; the remainder — currently believed to rival in miraculous powers of reproduction the loaves and fishes or the Mayflower furniture — was kept or sold for small souvenirs. It is thus venerated from a tradition, first accredited to it in 1789, that in a hollow of it was concealed the charter of Connecticut rescued from Andros in 1687; earlier ones specify an elm, others the houses of different persons. This is of little moment; but the adventures of the charter form a mystery which the latest investigations, instead of illuminating, render utterly insoluble. The contradiction of unquestionable facts is absolute. The story without these is sufficiently peculiar. James II., wishing to make Connecticut a part of his consolidated New England under Andros (q.v.), found its charter in the way; and as the colony declined to surrender it, he brought writs of quo warranto to vacate it, the last of which was returnable in February 1687. To delay or avoid voluntary surrender, yet escape forfeiture and entire outlawry of rights, they replied that they would much rather stay as they were, but if they could not, preferred a provincial union under Andros over annexation to any other province. The Council chose to consider this a formal waiver of charter rights, and dropped proceedings under the writ; and on 31 Oct. 1687 Andros rode over from Norwich to Hartford, under orders to assume the government. Calling the governor and council together, he demanded surrender of the charter according to their dutiful assurances. The meeting was secret; what happened we learn only from tradition, and the brief account of a later intimate of the actors. The colonial officials protested and debated till after dark; that this was prearranged is not only morally certain in itself, but Trumbull's account of a long speech by the governor, to no conceivable purpose otherwise, deepens the certainty. Candles were lighted; the charter was (or the charters were) at last brought in and laid on the table; suddenly some officious candle-snuffers put out all the lights, and when they were relighted no charter was to be seen. But if Andros had no longer a charter to suppress, equally the colony had no longer one to appeal to; the old government was just as effectually extinguished as if they had let him have the paper, they cannot have foreseen a revolution in England, and it is not evident what they intended to do with it. Most likely, from their previous actions, it was merely to save their "face" from the humiliation of a formal surrender. There was no outcry by Andros, no charge made against the officials, no appearance of ill-will to them, no report of the affair to England, seemingly no disclosure of it to the train of Massachusetts magnates who accompanied him (and may or may not have attended the meeting), or to any one else; and (perhaps the most curious of all the circumstances of this curious affair) both our informant and tradition stop short at the relighted candles and the missing document, and give no hint what Andros said or if he said anything, or whether he seemed puzzled or offended, or any of the immediate sequelæ of the business. The governor (Treat) had called a meeting of the General Court, which accepted the situation and the annexation; the secretary inscribed it on the colonial records and wrote "Finis" on them; and the next day Andros publicly proclaimed his commission. When James was overthrown and Andros with him, the colony resumed its government, appealed to its charter brought from hiding, and the English authorities admitted without trial that it had never been vacated. But that was chance and not foresight. This, however, is only the beginning of mystery. The charter, obtained by Gov. John Winthrop from Charles II.'s council in April 1662, was engrossed in duplicate, and the official fees are entered on the English records. No other copies were made, nor could have been unless both the others were lost; and neither was lost. The first copy was sent to the colonial government, which acknowledges receipt of "the charter, the duplicate and the old copy of the former charter" (that is, the Warwick Patent). Duplicate of what? It is usually assumed to mean, of the charter; but the facts to be cited prove that it was of the patent. Winthrop was to bring over the duplicate of the charter with him; and a legislative committee was appointed to receive it from him. That he did not, is conclusively shown by a letter from the colony to its agent, William Whiting, in 1686, instructing him to obtain it from James Porter in London, with whom Winthrop had left it, and use it in defending the colony's rights before the council. That Winthrop may have taken it across once more on official business, and left it there, is barred out by the fact that he never visited England again. That Whiting sent it back within the next year, is equally negatived by the fact that he continued to need it there and the colony did not need it at all, that he would not have sent it without orders and they gave him no such orders, and that in his correspondence there is no letter of transmittal. Furthermore, a legislative committee of 1715 voted a money acknowledgment to Joseph Wadsworth for safely preserving the "Duplicate Charter" when "our constitution was struck at": it is absurd to suppose they made him the grant for preserving a second copy when they had one safe already. Obviously, the one he preserved was the only one they had. On the other hand, Roger Wolcott, the first narrator (1759), distinctly says that "the charters were set on the table," and that when the candles were relighted the *charters were* gone. Still more specifically, President Stiles of Yale writes in his Itinerary, as from Wolcott, that Nathan Stanley took one copy and Gov. Talcott's father the other. Wolcott was only eight at the time; but by 1714 he was in the council, in 1715 was on the very committee which made the grant to Wadsworth, and was certainly intimate with many who were present at the scene and probably helped arrange it. We have, then, the certain fact that there was but one copy of the charter in America in 1687, set against the positive assertion of one who must have known, that two were abstracted. Still a third mystery is, that Wadsworth was not present at the meeting and could not have taken the paper; that Wolcott, who publicly honored Wadsworth as the savior of the charter, privately gives all the credit to others and does not even mention Wadsworth,

and that the names he cites are really those of members present; and that if one of the actual abstracters passed it to Wadsworth waiting outside, he and not they should receive the public acknowledgment. The writer can guess at solutions to these problems, but all solutions are guesses alike.

ALBERT C. BATES,
Librarian Connecticut Historical Society.

Charter-party, a contract executed by the freighter and the master or owner of a ship, containing the terms upon which the ship is hired to freight. The masters and owners usually bind themselves, the ship, tackle, and furniture, that the goods freighted shall be delivered (dangers of the sea excepted) well-conditioned at the place of the discharge; and they also covenant to equip the ship complete and adequate to the voyage. The charterer is bound to furnish the cargo at the place of lading, and to take delivery at the port of discharge within specified periods called lay days; and penalties are annexed to enforce the reciprocal covenants.

Char'teris, Archibald Hamilton, Scottish clergyman: b. Wamphay, Dumfriesshire, 13 Dec. 1835. He was educated in the University of Edinburgh, where in 1808, after holding two Presbyterian pastorates, he became professor of biblical criticism. In 1898 he was made professor emeritus. Since 1901 he has been chaplain-in-ordinary to King Edward VII. He has published 'Life of Professor James Robertson' (1863); 'Canonicity' (1881); 'The Christian Scripture' (1888).

Charters Towers, Australia, a mining township of Queensland, on the northern spurs of the Towers Mountain, 820 miles northwest of Brisbane. The place was first settled in 1871–2, when gold was discovered there. In 1877 it was incorporated as a town. Now it has railway connection with the coast by means of a railroad to Townsville. The yield from the gold fields, up to 1891, was 2,300,000 ounces. Pop. (1891) of the town, 4,597; of the field, 14,129.

Chartier, kär-tē-ā, **Alain,** French poet and moralist: b. Bayeux about 1392; d. about 1440. He was educated at the University of Paris, and was appointed by Charles VI. clerk, notary, and secretary of the royal household — posts which he held under Charles VII. His contemporaries considered him the father of French eloquence. Although far from handsome it is said that he received one day while asleep a kiss from Margaret of Scotland, wife of the dauphin, who explained her conduct to the surprised bystanders by saying that it was not the man she kissed, but the mouth whence flowed so many golden words. His poems are often graceful and nervous, and his vigorous prose contains many fine thoughts and prudent maxims. The first edition of his works which bears a date is that of 1489; the most esteemed that of 1617.

Chartism, a working-class movement in England, 1838–48, the primary purpose of which was the attainment of certain political reforms. The Reform Bill of 1832 had failed to bring the expected advantages to the working class; the new poor law of 1835 was unpopular; and a period of general commercial depression and a succession of bad harvests had increased the sufferings of the people. The discontent resulting found definite expression in the «Charter» or «People's Charter» prepared in 1838 by a committee of six members of Parliament and six working-men. It comprised six heads, (1) Universal suffrage, or a right of voting conferred on every male of 21 years of age, of sound mind, unconvicted of crime, and a native of the United Kingdom, as well as to every foreigner possessing the same qualifications, who had been resident in the United Kingdom for more than two years; (2) equal electoral districts; (3) vote by ballot; (4) annual parliaments; (5) no other qualification to be necessary for members of Parliament than the choice of the electors; (6) members of Parliament to be paid for their services.

At first a portion of the middle class supported the movement, but they became estranged, and the Chartists became more and more a distinctively working-class party. The movement was not purely political; it was of a distinctively social nature, and aimed at the improvement of general social conditions. Stephens, one of the leaders, is quoted as saying «Chartism is no political movement where the main point is gaining the ballot. . . . The Charter means a good house, good food, prosperity, and shorter working hours.» Immense meetings were held throughout the country, numbering sometimes upward of 100,000, and popular excitement was great. Physical force was advocated by some as the only effectual means for the masses to obtain their demands. An association called the National Convention was embodied, and commenced its sittings in Birmingham in May 1839. In June of the same year a petition in favor of the charter was presented to the House of Commons, which refused to take it into consideration. The feeling of exasperation among the Chartists increased, and in November a riot took place at Newport, in which 10 persons were killed and great numbers wounded. The year 1842 was the time of the most excitement; great riots took place in the northern and midland districts of England, and these, though not directly caused by the Chartists, were more or less connected with the movement, and the party was blamed for them. In 1848 a great demonstration took place in London, but the precautions taken by the government in enrolling special constables and making other preparations for defense frightened the leaders, and from that time Chartism rapidly declined.

Bibliography.— McCarthy, 'History of Our Own Times'; Carlyle, 'Chartism'; Gammage, 'History of the Chartist Movement'; Engels, 'Condition of the Working Class in England in 1844'; Hyndman, 'Historical Basis of Socialism in England.'

Chartran, shär-träṅ, **Théobald,** French painter: b. Besançon 21 Jan. 1849. He studied under Cabanel, and obtained the grand prix de Rome in 1877. He has painted mostly historical pictures or portraits; among his works are 'The Body of Monseigneur Darboy lying in state in the Palace of the Archbishop of Paris'; 'Angelica and Roger'; 'Vision of Saint Francis of Assisi'; 'Capture of Rome by the Gauls'; and several portraits of which the best are those of Mounet-Sully as Hamlet, Sadi Carnot, and Leo XIII.

Chartres, shärtr, **Robert Philippe Louis Eugène Ferdinand D'Orleans,** Duc de, grandson of Louis Philippe: b. Paris 9 Nov. 1840. When only two years old he lost his father, and six years later the Revolution drove him, along with his family, into exile. The young duke was brought up in England, and joined the Union army in the first campaign of the American Civil War, in 1862. He married, 11 June 1863, Françoise Marie Amelie d'Orleans, eldest daughter of the Prince de Joinville.

Chartres, shärtr (anciently Autricum, Civitas Carnutum), France, capital of the department Eure-et-Loire, 49 miles southwest of Paris, situated on the slope of a hill, at the foot of which flows the Eure, and partly enclosed by walls and ditches, surrounded by ramparts planted with trees, which form an agreeable promenade. Most of the houses are built of wood and plaster, and have their gables toward the street. The streets of the lower town are narrow and crooked, and so steep in some parts as to be inaccessible to carriages. There are several public squares, one of which is of great extent. The only public buildings of note are the cathedral, the church of St. Pierre, contiguous to a huge barrack, once a Benedictine abbey; and the obelisk to the memory of Gen. Marceau. The cathedral, one of the most magnificent in Europe, is rendered conspicuous by its two spires, one of which is 403 feet high, surmounting the hill on which the city stands. It has 130 windows filled with painted glass of admirable workmanship; and in its chair Henry IV. was crowned in 1594. Chartres is the seat of a bishopric, communal college, seminary, and agricultural society; and has two hospitals, a cabinet of natural history, botanical garden, and a public library. Toward the end of the 11th century it was fortified, and in 1145 St. Bernard preached, in its cathedral, the second crusade. Pop. (1896) 19,213.

Chartreuse, shär-trėz, the French term for a Carthusian monastery, corresponding to the Italian Certosa. The order of the Carthusians (q.v.) was not very ascetic in its rules, and each monk was allowed a decent cell and a garden of his own, so that the monasteries had often architectural character. The famous monastery called La Grande Chartreuse is the original and supreme monastery of the order, and exists in the mountains not far from Grenoble in eastern France. Of the monastic buildings still existing, none is architecturally noble, and nearly all are of date later than the middle of the 17th century. Therefore it does not rank with the great show-places of monasticism for the grandeur and splendor of its buildings, but has ever attracted travelers, curious or serious, as being the home of the most authentic exemplars of primitive monasticism in its rigor. At the Revolution the whole establishment was confiscated, the monks being driven out and secularized or banished. But in 1816 the order of Carthusians was permitted again to occupy the buildings, as tenants of the state, at a nominal rent. They were again expelled from their ancient home by the government of the French republic in 1903 under the laws for suppression of religious houses. When the monks were this time dispossessed the entire rural population of the vicinity, who had all their lives experienced the large, wise beneficence of the monks in supporting the local hospitals, schools, churches, and the like, with their lives would have defended their benefactors against the power of the government had not the Carthusians counseled patience and forbearance. Till this second ejection from their home the monks used to derive a revenue from the sale of certain medicinal agents prepared in their laboratories which enjoyed a high reputation; in particular, the cordial liqueur Chartreuse. The other preparations were an elixir and a salve.

Chartulary, kär'tū-lā-rĭ, a collection of charters. When any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, it has been customary for convenience and safety to have them classified and copied into a book or roll. Such book or roll has generally received the name of a Chartulary. Mabillon traces Chartularies in France as far back as the 10th century, and some authorities say that Chartularies were compiled even still earlier; but it was not till the 12th and 13th centuries that Chartularies became common. They were kept by all kinds of religious and civil corporations, but also by private families. Many of them have been printed, and their contents generally are of the greatest value in historical, archæological, and genealogical inquiries. The name is in Scotland applied to the record of feu-charters kept by the superior's law-agent. Copies of valuable historical documents, whose originals have been lost, have been found in chartularies.

Charybdis, kă-rĭb'dĭs, an eddy or whirlpool in the Straits of Messina, celebrated in ancient times, and regarded as the more dangerous to navigators because in endeavoring to escape it they ran the risk of being wrecked upon Scylla, a rock opposite to it. There are several whirlpools in this region which may have been dangerous enough to the undecked boats of the Greeks, but none which the modern navigator with due caution may not easily pass. The name comes from the mythological story of Charybdis, the daughter of Poseidon and Gæa, whom Zeus, on account of her anger, hurled into the sea, where she became a whirlpool and swallowed up every ship that approached. This whirlpool is now called Calofaro and La Rema.

Chas'ca, the name under which the ancient Peruvians adored the planet Veneus.

Chase, Ann, American patriot: b. Ireland 1809; d. Brooklyn 24 Dec. 1874. She came to the United States in 1818; settled in New Orleans in 1832; removed to Tampico, Mex., in the following year, where she married Franklin Chase, United States consul, in 1836. During the war with Mexico, in the absence of her husband, she remained at the consulate to protect the American records. On one occasion a mob attempted to pull down the American flag floating over the consulate, but she protected it with drawn revolver, and declared that the flag should not be touched except over her dead body. Later through her efforts the city of Tampico was taken.

Chase, F. H., English biblical scholar: b. 21 Feb. 1853. He was educated at Christ's College, Cambridge, took orders in the English Church and was successively curate of Sher-

borne, Dorset, 1876–9, and St. Michael's, Cambridge, 1879–84. He was lecturer in theology at Pembroke College 1881–90, and at Christ's College 1893–1901, and has been principal of the Clergy Training School at Cambridge from 1887, Norrisian professor of divinity from 1901, and president of Queen's College from the last named year, also. He has published 'Chrysostom' (1887); 'The Lord's Prayer in the Early Church' (1891); 'Old Syriac Element in Codex Bezæ' (1895); 'Syro-Latin Text of the Gospel' (1897); 'Credibility of the Book of Acts' (1901).

Chase, George, American lawyer: b. Portland, Me., 29 Dec. 1849. He graduated valedictorian at Yale in 1870, and at Columbia Law School in 1873. He was assistant professor of municipal law at Columbia University 1874–8; professor of criminal law, torts and procedure 1878–91; member of the university council 1890–1. In 1891 the New York Law School was chartered through his efforts, and he was chosen its dean, a position he still holds. Publications: 'The American Student's Blackstone' (1876); editor of 'Ready Legal Adviser' (1881); of Stephens' 'Digest of the Law of Evidence' (1886); 'N. Y. Code of Civil Procedure'; Chase's 'Cases on Torts.'

Chase, Philander, American Protestant Episcopal bishop: b. Cornish, N. H., 14 Dec. 1775; d. Jubilee College, Ill., 20 Sept. 1852. He graduated at Dartmouth College in 1795, and was ordained priest by Bishop Provoost 10 Nov. 1799. After missionary work in New York State, and rectorships at New Orleans, La., and Hartford, Conn., he set out as a missionary in districts west of the Alleghanies. In Ohio he organized various parishes, and in 1819 was consecrated the first bishop of Ohio. Between 1821 and 1831 he was for two years president of Cincinnati College, but chiefly engaged in perfecting plans for a theological seminary. He visited England, and through the influence of Lord Gambier and Lord Kenyon raised a large sum of money, $30,000, with which he founded the Theological Seminary and Kenyon College, at Gambier, Ohio. In 1831 he resigned his bishopric and the presidency of the college and seminary, removed to Michigan 1832, was chosen bishop of Illinois 1835; again visited England and raised $10,000 with which he founded Jubilee College, Peoria County, Ill. Upon the death of Bishop Griswold in 1843, Bishop Chase became presiding bishop of the Church. "He was abundant in labors; indefatigable in zeal." He wrote: 'A Plea for the West' (1826); 'The Star in the West, or Kenyon College' (1828); 'Defense of Kenyon College' (1831); 'A Plea for Jubilee' (1835); 'Reminiscences: An Autobiography' (1844).

Chase, Pliny Earle, American scientist: b. Worcester, Mass., 18 Aug. 1820; d. Haverford, Pa., 17 Dec. 1886. He graduated at Harvard, 1839; taught in Philadelphia and engaged in business for many years, but employed his leisure in physical and philological studies. In 1864 the Magellanic gold medal of the American Philosophical Society was awarded him for his 'Numerical Relations of Gravity and Magnetism.' The results of other mathematical and physical researches were published from time to time in the 'Proceedings' of the American Philosophical Society, and brought him a wide reputation, both in the United States and abroad, as a man of unusual scientific powers and attainments. In 1871 he became a member of the faculty of Haverford College, Pa., and for a long time was professor of philosophy and logic. He published 'Elements of Meteorology' (1884).

Chase, Salmon Portland, American jurist: b. Cornish, N. H., 13 Jan. 1808; d. New York 7 May 1873. He was the son of Ithamar Chase, a farmer, and was, on his mother's side, of Scotch descent. At the age of nine he lost his father and later came under the care of his uncle, Philander Chase (q.v.), Bishop of Ohio, attended his uncle's school and working on the farm in Worthington. In 1822 he removed with his uncle to Cincinnati, returning soon after to New Hampshire, where he entered Dartmouth College, graduating in 1826. For three years he taught school in Washington, D. C., studied law under William Wirt, and in 1830 went to Cincinnati, where he began the practice of law. He soon made his influence felt as a lecturer, as publisher of the laws of Ohio (a work which insured his standing as a lawyer even if it did not reward him financially) and as a historian. His historical work was only a sketch, but it called attention to the importance of the study of the Ordinance of 1787. In 1834 Chase was married; he had five children, most of whom died in youth. His daughter, Kate Chase Sprague, handsome, brilliant and of great force of character, is in some respects one of the most remarkable women in our history. She was, in a large sense, her father's political manager and used every effort to secure his nomination to the presidency in 1864. Neither she nor her father saw anything incongruous in this, although the latter was at the time President Lincoln's secretary of the treasury. Chase, early in his career, identified himself with the anti-slavery movement. His advice and aid as a lawyer were frequently asked and never refused, his defense of the fugitive slave, Matilda, being one of his most notable efforts in this direction. Another celebrated case was that of the Kentucky farmer, Van Zandt, the original Van Tromp in 'Uncle Tom's Cabin.' Chase appeared for the defendant in 1842, and after an appeal to the supreme court of the United States, the case was argued before that tribunal by Chase and William H. Seward. Chase was an abolitionist, not of the school of William Lloyd Garrison, but that of James G. Birney. He maintained that Congress could not rightfully place on State officials the obligation of enforcing the Fugitive Slave Law. His attitude toward slavery, by a strange combination of circumstances, made him United States senator, in 1849. In the legislature which elected Chase two Independents held the balance of power. They united with the Democrats, making the necessary 55 votes. This coalition did not compromise Chase in his subsequent career in the Senate, as his election was practically forced upon the Democrats. In the Senate he continued his opposition to slavery, during the stormy scenes of the period of compromise in 1850, and was severe in his attitude toward Clay's position.

During Chase's term of office the Republican party, composed largely of opponents of the

SAMUEL PORTLAND CHASE.

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1864-1873

Non

Kansas-Nebraska bill, was being formed, and Chase early identified himself with it. By this party he was nominated as governor of Ohio and in 1855 was elected, and re-elected in 1857. He was still the negro's friend, and some of his acts as governor in connection with this aspect of his administration have been freely criticised. Chase was a prominent candidate for the Republican nomination for the presidency in 1860, but was destined to see the votes of his own State nominate Abraham Lincoln. He became Lincoln's secretary of the treasury, a position which he filled during the four years of the Civil War. The national banking system, practically as it exists today, is to be attributed to his influence. On four or five different occasions Chase offered his resignation, but Lincoln repeatedly declined to relieve him of his post. Upon the death of Chief Justice Taney in 1864, President Lincoln appointed Chase to the vacant office, which he filled till the time of his death. When the question arose of a presidential nomination by the Democratic party, he defined his changed attitude in the following words: "I can not approve in general what the Republican party has done. I hold my old faith in universal suffrage, in universal amnesty, and in inviolate public faith; but I do not believe in military government for American States." His position was not altogether indefensible, for he was in all essentials, except his convictions on the slavery question, a Democrat of the school of Jackson and Benton. Chase loved his friends and aided them whenever opportunity offered. His only intimate personal friend among the public men of his own age, was Charles Sumner. Chase lacked that comprehension of the common people that so strongly characterized Lincoln. His attitude toward Lincoln doubtless accounts for some of his unpopularity, but in all his public acts he was honest and sincere. See Schucker's 'Life and Public Services Salmon P. Chase' (1874).

Chase, Samuel, American jurist: b. Somerset County, Md., 17 April 1741; d. 19 June 1811. His father, a learned clergyman, instructed him in the classics; later he studied law at Annapolis, being admitted to the bar at the age of 20. Having become a member of the colonial legislature, he distinguished himself by his bold opposition to the royal governor and the court party. He took the lead in denouncing and resisting the Stamp Act, and became a most active adversary of the British government in his State. The Maryland Convention of 22 June 1774 appointed him to attend the meeting of the General Congress at Philadelphia in September of that year. He was also present and conspicuous in the subsequent Congresses during the most critical periods of the Revolutionary War. That of 1776 deputed him on a mission to Canada along with Dr. Franklin, Charles Carroll of Carrollton, and the Rev. John Carroll. He signed the Declaration of Independence without hesitation. In June 1783 the legislature of Maryland sent him to London as a commissioner to recover stock of the Bank of England, and large sums of money which belonged to the State. In 1791 he accepted the appointment of chief justice of the general court of Maryland. Five years afterward President Washington made him an associate judge of the supreme court of the United States. Political cases of deep interest having been tried when he presided in the circuit courts, and his conduct having given much displeasure to the Democratic party, he was impeached by the national House of Representatives. The trial of the judge before the Senate is memorable on account of the excitement which it produced, the ability with which he was defended, and the nature of his acquittal. He continued to exercise his judicial functions with the highest reputation till 1811, in which year his health failed.

Chase, Thomas, American educator: b. Worcester, Mass., 16 June 1827; d. Providence, R. I., 5 Oct. 1892. He was a brother of Pliny E. Chase (q.v.). In 1855 he became professor of philology and classical literature at Haverford College, near Philadelphia; in 1875 its president. Among his publications are: 'Hellas: Her Monuments and Scenery' (1861); an address on 'Liberal Education: Its Aims and Methods.'

Chase, William Henry, American military officer: b. Massachusetts 1798; d. Pensacola, Fla., 8 Feb. 1870. He was graduated at the United States Military Academy, became first lieutenant of engineers in 1819, captain in 1825, and major in 1838. He was engaged in repairing Fort Niagara in 1817–18; as superintending engineer for many important works in 1819–28; and had charge of the defenses in Pensacola harbor, Fla., 1828–54. He superintended the improvements of Mobile Bay; as senior engineer officer had charge of all the fortifications and river and harbor improvements at the mouth of the Mississippi; and took an influential part in all projects connected with the development of the region around Pensacola. At the outbreak of the Civil War he entered the Confederate army, and was prominent in the seizure of the Pensacola navy yard.

Chase, William Merritt, American artist: b. Franklin, Ind., 1 Nov. 1849. He studied painting in oil at the National Academy in New York and subsequently in Europe with Piloty. He has made a specialty of portraits and figure pieces, winning celebrity with 'Ready for the Ride,' 'The Apprentice,' and 'The Court Jester,' and portraits of American ladies. He was appointed instructor at the Brooklyn Art School in 1881 and elected a National Academician in 1890. In 1896 he conducted an art class to Madrid.

Chasidim, kă-sē'dĭm, or **Pietists,** the name of a Jewish sect which appeared in the middle of the last century. Its adherents are strongly inclined to mysticism, depreciate the Old Testament and its ordinances, and deem themselves able to approach the Source of Light by means of a virtuous life, prayer, and secret meditation. They have a great esteem for the Hogadas of the Talmud, the books of the Cabbala, and the writings of their own teachers, which are full of tales, extraordinary cures, and mystic interpretations, but also contain excellent moral precepts. The founder of the sect was Israel of Podolia, surnamed Baalschem (contracted into Bescht), from his supposed influence with God and the spiritual hosts, whom he could move by his prayers and amulets to grant whatever he desired. At the head of the sect are three superiors or Zaddiks, each of whom has a particular diocese or district allotted to

him, and jurisdiction over all the Chasideans resident within it. They are most numerous in Russian Poland, Moldavia, Wallachia, and some parts of Galicia and Hungary, and are regarded with great antipathy by the orthodox Jews. Chasidim is also the name given to a sect which sprang up about the second century B.C. This party is credited with the origin of the revolt of the Maccabees, with combating the erroneous notions bred among the Jews by the study of Grecian philosophy, and with being the parent stock of the Pharisees. See JEWISH SECTS.

Chasing, the art of cutting artistic or ornamental designs on metals. Figures on metal are often produced in relief by being punched out from behind, and sculptured or finished on the front with small chisels and gravers. It is this latter process that is properly called chasing, and the same term is applied to designs produced by hand-tools on more or less flat surfaces.

Chasles, Michel, mē-shĕl shäl, French engineer: b. near Chartres 15 Nov. 1793; d. Paris 18 Dec. 1880. He entered the École Polytechnique in 1812, and on leaving was classed among the engineers; but with rare generosity he renounced his place as an officer in order to assure a career to one of his unsuccessful comrades. In December 1829 he addressed to the Brussels Academy a memoir on two general principles of geometry, duality and homography. The introduction to this memoir expanded into the well-known 'Historical View of the Origin and Development of Method in Geometry,' the first edition of which was published in 1837. In 1841 he was appointed to the chair of Machines and Geodesy at the École Polytechnique, and in 1846 to that of Higher Geometry, which had just been instituted at the Sorbonne. Some of his published works are: 'Treatise on Higher Geometry' (1852); 'The Three Books of Euclid's Porisms Re-established for the First Time' (1860); 'Treatise on Conic Sections' (1865); 'Reports on the Progress of Geometry' (1870). These, his principal works, are geometrical and historical. His contributions to the 'Comptes Rendus' of the Academy of Sciences and to other scientific publications are extremely numerous, and though in the main geometrical, are not exclusively so. In particular he treated in several memoirs the question of attraction, and gave the first synthetic demonstration of a celebrated theorem of Maclaurin on the attraction of ellipsoids. Two of his memoirs on the properties of cones of the second degree, and on the spherical conics, were translated into English, and published, with additions, by Charles Graves in 1841. During his long life he was the recipient of many scientific distinctions, and he will always be cited as one of the great geometers of the present century.

Chasles, Victor Euphémion Philarete, French critic: b. Mainvilliers, near Chartres, 8 Oct. 1798; d. Venice, 18 July 1873. The son of a Jacobin, and educated according to Rousseau, he acquired the point of view which, enlarged by life abroad, makes his essays so unique and instructive. He has written in every imaginable prose form, from a romance to a riddle; but his enduring work is contained in 'French Language and Literature from the Beginning of the Sixteenth Century to 1610' (1828); 'Studies of Antiquity' (1847); 'Studies of the Sixteenth Century in France' (1848); 'Journeys of a Critic Through Life and Books' (2d series, 2d ed., 1866-8); and 'Memoirs' (1876-8).

Chassaignac, shă-sān-yăk, **Charles Louis,** American physician: b. New Orleans, 5 Jan. 1862. He was graduated at the medical department of the University of Louisiana; and was president and Professor of Genito-Urinary Diseases at the New Orleans Polyclinic in 1902. He was editor of the 'New Orleans Medical and Surgical Journal'; president of the Orleans Parish Medical Society; vice-president of the Louisiana State Medical Society; one of the founders and president of the New Orleans Sanitarium and Training School for Nurses; etc.

Chassé, shä-sā', **David Hendrik,** BARON, Dutch soldier: b. Thiel in Guelders 18 March 1765; d. Breda 2 May 1849. He began his military career when but 10 years of age; became lieutenant in 1781, and captain in 1787. After the failure of the revolutionary movement he took French service; was appointed lieutenant-colonel in 1793; and two years later found himself marching toward the Netherlands under the command of Pichegru. He afterward fought with the French in Germany and Spain, gaining great distinction, and from Napoleon himself, because of his fondness for bayonet charges, the name of "Général Baïonette." He was made a baron by Louis Bonaparte in 1809. As lieutenant-general of the Dutch forces, in 1815, Chassé did good service at Waterloo against his old comrades, the French. As governor of Antwerp he covered himself with glory by his heroic three-weeks' defense of the citadel with 5,000 men against 60,000 Belgians and French (1832).

Chassepôt, Antoine Alphonse, äṅ twäṅ ăl-fôṅs shäs-pō, French inventor: b. 4 March 1833. He was an employee in the Paris arsenal of St. Thomas, where he became an official in 1858, and in 1863 brought before the government the model of his breech-loading rifle, adopted three years afterward, and subsequently abandoned. It was about four pounds lighter than the needle-gun and about one pound lighter than the Martini-Henry rifle.

Chassepot (shäs-pō) **Rifle,** a breech-loading rifle, named after its inventor, and adopted as the firearm of the French infantry in 1866, after the value of the Prussian needle-gun had been shown in the war between Prussia and Austria. It is not now in use, having been replaced in the French army by a much modified form of small-arms. It belonged to the same system as the needle-gun, but was believed to have sundry advantages over that weapon. It was considerably lighter than the needle-gun, the weight of the latter being 12 pounds, and that of the former less than nine pounds. In accuracy, penetrative power, length of range, lowness of trajectory, and rapidity of fire, it was inferior to the Martini-Henry. To the needle-gun it was superior in length of range and lowness of trajectory, as was shown in the war of 1870, in which the French could open fire at the distance of 1,500 paces, while the effective range of the needle-gun was only 400 to 500 paces. This superiority, however, was neutralized by the fact that its lightness and

its large charge had the effect of producing great recoil and of heating the barrel. At the commencement of an action the men would open fire at long ranges, but before closing with the enemy the barrel of their piece was so heated that the weapon could hardly be handled. From the recoil and heating combined, the soldier was obliged to fire from the hip, so that his aim was not accurate; while after much firing the breech became clogged.

Chasseur, shä-sėr, a male attendant upon persons of distinction, attired in a military dress, and wearing a sword. It is also the name given by the French to bodies of light infantry which act as skirmishers and sharpshooters. The name was originally given to some troops raised in 1815, in imitation of the Jägers of the Austrian army, who were chiefly Tyrolese chamois-hunters, and unerring marksmen. The French Chasseurs are of two kinds, light cavalry and infantry. Every battalion of infantry has a company of Chasseurs, but the term is more particularly applied to that body of men called the Chasseurs de Vincennes, who were enrolled and armed with rifles in 1833, and quartered at Vincennes. The Chasseurs of the Italian army are called Bersaglieri. Garibaldi's Chasseurs, that took a prominent part in the Italian war of 1859, and in the campaign against Francis II. of Naples, in 1860, were known as Cacciatori dei Alpi, or Alpine hunters.

Chastelard, Pierre de Boscobel de, pē ār dė bōs'kōbĕl shät-lär, French poet: b. Dauphiné 1540; d. 1563. He fell madly in love with Mary Stuart at the French court, and poured forth his admiration in innumerable poems. He figures as one of her escort on her return to Scotland after the death of her husband (1561). He had to return to France after this pleasing duty was performed, but on the first opportunity he was again in Scotland (1562). Mary gave him a very gracious welcome, answered, it is said, a poem dedicated to her, and allowed him to accompany her singing with his flute. Chastelard had the temerity one night to invade the royal bed-chamber. He was discovered, and ordered by the queen to quit the kingdom. Shortly after, however, he again concealed himself in a recess in her bedroom at Burntisland. For this offense he was tried publicly at St. Andrews and forthwith hanged, the queen resisting all appeals for pardon.

Chastelard, a tragedy published in 1869, by Algernon Charles Swinburne, the scene of which is laid at Holyrood Castle, during the reign of Mary Queen of Scots. The tragedy is conspicuously one to be read, not acted. It is too long, too much lacking in action, and of too sustained an intensity, for the stage. The style is essentially lyric, full of exquisite lines and phrases; and as a whole, the play presents an intense passion in a form of adequate beauty.

Chasteler, shät-lā, **Jean Gabriel,** MARQUIS OF: b. 1763; d. Venice 7 May 1825. He was grandee of Spain of the first rank, Austrian master of ordnance or general of artillery, military governor of Venice, and descended in a collateral line from the dukes of Lorraine. He received his first education at Metz in the Collége de Fort. In 1776 he entered the Austrian service. After having served against the Turks, by whom he was severely wounded, he displayed his zeal for the house of Austria in the disturbances in the Netherlands. In 1796–7 he was employed in the negotiations of his court in Poland and Russia; was afterward with Suwaroff in Italy, where he distinguished himself in several engagements with the French armies. In 1808, with Hormayr, he was the soul of the famous insurrection in the Tyrol, and all the political as well as military events which were connected with it. Napoleon, enraged at the surrender of 8,000 French and Bavarians at Innsbruck, issued a proclamation at Enns, in which "a certain Chasteler who calls himself a general in the Austrian service, but who is the leader of a band of robbers, and the author of the murders committed upon the French and Bavarian prisoners, as well as the instigator of the Tyrolese insurrection," is declared an outlaw, and ordered to be brought before a court-martial and shot within 24 hours. The Emperor Francis commanded that an order which violated all international laws, and which was the more censurable as Chasteler had taken particular care of the prisoners and the wounded, should be met by retaliation. The Bavarian army, under the command of the marshal-duke of Danzig, entered Tyrol. Chasteler fearlessly encountered it, but his army was routed 13 May. After the close of the war he received several appointments, and in December 1814 was made governor of Venice.

Chastelet, shät lā, **Gabrielle Emilie Breteuil,** brė-tė-yĕi, MARQUISE DU: b. Picardy 1706; d. Lunéville 1749. She was of an ancient family, was taught Latin by her father, Baron Breteuil, and was well acquainted with that language, but her favorite study was mathematics. She had a sound judgment and much taste, loved society and the amusements of her age and sex, but after the publication of the 'Philosophical Letters' by Voltaire had roused the Jesuits' criticism against him, she abandoned all these pleasures, and in 1733 retired with him to the dilapidated castle of Cirey, situated in a dreary region on the borders of Champagne and Lorraine. She embellished this residence, formed a library, collected instruments, etc. Cirey was often visited by the learned,—by Maupertuis, John Bernouilli, etc. Here the marchioness learned English of Voltaire in the space of three months, and read with him Newton, Locke, and Pope. She also wrote an analysis of the system of Leibnitz, and translated Newton's 'Principia' with an algebraic commentary. Voltaire lived six years with her at Cirey, where they employed their time in the study of science, and in getting up lovers' quarrels for the pleasure of patching them up again. At the end of this time she went to Brussels to prosecute a lawsuit, which was terminated by an advantageous compromise, brought about by Voltaire. She also carried on a correspondence with the German philosopher, Wolf, until her death. Her 'Traité de la Nature du Feu' obtained the prize of the Parisian Academy of Sciences, and is published in their collections. Her husband, the Marquis du Chastelet Lomont, was high-steward of King Stanislaus Lesczinsky at Lunéville.

Chastellux, François Jean, fräṅ swȧ zhŏṅ shät lüks, **Chevalier de,** French historian: b. Paris 1734; d. Paris 28 Oct. 1788. He entered the army in 1749; distinguished himself as colonel in the Seven years' war, and later served in the American Revolution as major-general under Rochambeau, and gained the friendship of Washington by his amiable character. He published numerous works relating to the United States, including 'Voyage dans l'Amerique septentrionale dans les annees, 1780–1782'; 'Discours sur les avantages et les dessavantages qui resultent pour l'Europe de la decouverte de l'Amerique'; and translated into French David Humphry's 'Address to the Army of the United States.'

Chasuble, chās'ū-bl, the outermost vestment worn by a priest in celebrating the mass: its name in Latin is *casula,* dim. of *casa,* house. In its original form it was a garment of circular or elliptical form like the South American *poncho,* with an opening in its centre through which the head of the wearer passes. But the form of chasuble now employed almost universally consists of a more or less oval front and back joined at the top, where is an opening to allow the head to pass through. The garment is usually of silk embroidered and decorated with gold or silver thread, and with a cross on the back. Chasubles of different colors, white (or cloth of gold) red, violet, green, black, are worn according to the occasion; as white on all high festivals, violet in penitential times, red on the anniversaries of martyrs, black in masses for the dead, etc. In the present form of the chasuble the priest's arms are free, whereas in the ancient form, the garment covered the person like a cloak.

Chat, a name given to various small passerine birds, chiefly of the genera *Saxicola* and *Icteria;* generally used with a prefix. The yellow-breasted chat (*Icteria virens,* with the western variety *longicauda*) is an aberrant member of the family of wood-warblers (*Mniotiltidæ*), from the typical members of which it differs in its large size, robust build and stout bill. The sexes are similarly colored, being bright olive-green above, brilliant yellow on the breast and white on the belly, the sides of the head black with white markings. It is an abundant bird in thickets in the United States as far north as the latitude of Massachusetts, is migratory, and chiefly remarkable for its exceeding volubility and the incongruous admixture of sounds, natural and mimicked, of which its song consists. During the mating season the males indulge in the most extravagant aërial antics while singing, and often sing at night. See STONE-CHAT.

Chatard, shä-tär, **Francis Silas Mareau,** American Roman Catholic prelate: b. Baltimore 1834. He was graduated at Mount Saint Mary's and at Saint Urban College, Rome, being ordained to the priesthood in 1863. He became rector of the American College in Rome and in 1878 bishop of Vincennes. He has written 'Christian Truths.'

Château-Gaillard, gī-yär, a feudal fortress in France, near Les Andelys (Eure), built by Richard Cœur de Lion in 1197. As late as the 15th century it was considered one of the strongest fortresses in Normandy. Its picturesque situation on a high cliff 300 feet above the Seine has made it a favorite subject for artists. Turner has represented it in two of his pictures. See ANDELYS, LES.

Chateau-Gontier, shä tō gŏṅ-tē-ā, France, a town in the department of Mayenne, 19 miles south-southeast of Laval, on the Mayenne, here crossed by a stone bridge, connecting the town with its principal suburb on the opposite side. Its houses are well built, but the streets are irregularly laid out. It has a court of first resort, an agricultural society, and communal college; and linen and serge manufactories, bleachfields, tanneries; with some trade in clover seed, linen, thread, iron, wood, wine, etc. Pop. (1896) 7,227.

Chateau-Lafitte, lä-fēt, **Chateau Latour,** and **Chateau Margaux,** famous vineyards, all in the department of the Gironde, France, furnishing the best of the red wines of Bordeaux. See BORDEAUX WINES.

Château-Thierry, tē-ȧr-rē, France, a town in the department of Aisne, on the right bank of the Marne, 38 miles south-southwest of Laon. It occupies the side of a hill, whose rocky summit is crowned by the ruins of the old castle of Thierry, said to have been built by Charles Martel, in 730. It is the birthplace of La Fontaine (to whom a fine marble statue has been erected), and was the scene of several conflicts during the campaign of 1814. On 9 Sept. 1870, it was occupied by the Germans, and became a few days later the temporary headquarters of the emperor. It possesses a court of primary resort and a communal college, and has manufactures of linen and cotton twist, and a trade in grain, wool, and cattle. Pop. (1891) 6,863.

Châteaubriand, François Auguste, fräṅ swä ō-güst shä-tō-brē-äṅ, VICOMTE DE, French author and politician: b. St. Malo, Brittany, 4 Sept. 1768; d. Paris 4 July 1848. He received a commission in the army in 1788, and at the commencement of the Revolution he hurried into Paris to witness the great commotions then taking place there. In the spring of 1791 his ardent and enthusiastic spirit led him to join an expedition to America for the purpose of exploring its Arctic regions, and discovering the northwest passage. He crossed the Atlantic, landed at Baltimore, and proceeded to Philadelphia, where he had an interview with Washington. Returning to France in 1792 and married. Out of his American experience largely grew his 'Les Natchez' (see NATCHEZ, LES). He returned shortly after he quitted France and joined with other emigrants the Prussian army on the Rhine. At the siege of Thionville he was wounded in the thigh, and subsequently became an exile in England. Here his health gave way, and friendless and penniless he continued for a time to wear out a miserable existence in London. He at last found means of earning a subsistence by giving lessons in French and executing translations for the booksellers. In 1797 he published his 'Essai historique, politique et moral sur les Révolutions anciennes et modernes, considérées dans leurs Rapports avec la Révolution Française.' It was not intended with much success in England, and attracted no notice whatever in France. The essay is pervaded by a strong sceptical spirit in religious matters, but its author's views on this subject were soon to

experience a sudden and important change. The death of his mother in prison, and the accounts of her last moments transmitted to him by his sister, who herself was no more by the time her letter reached her brother, made a lasting impression on the mind of Châteaubriand, and he became a firm believer in Christianity. In 1800 he ventured to return to France and take up his abode under an assumed name at Paris. Encouraged by the success of an essay on literature, contributed to the 'Mercure,' he published in 1801 his 'Atala,' which was afterward introduced as an episode into his 'Génie du Christianisme.' In the following year appeared his celebrated work 'Le Génie du Christianisme,' which may be said to have caused a religious reaction, and inaugurated a new period in the social history of France. The object of Châteaubriand was to demonstrate the superiority of Christianity over all other religions in a poetic and artistic, as well as moral and beneficial point of view. Though a work more brilliant than profound, it is unsurpassed for beauty of language and description and the eloquence of its impassioned appeals. The main charm indeed of the book may be said to lie in its beautiful imagery, drawn from external nature, and more especially from nature as exemplified in the glowing scenery of the New World. In this respect Châteaubriand may be said to have revived in French literature the description of natural scenery and objects which had long been almost unknown. His work attracted the attention and admiration of Bonaparte, and in 1803 he was appointed French minister for the Republic of the Valais. This office he resigned in 1804.

In order to give life and tangible form to the theories propounded in the 'Génie du Christianisme,' he commenced 'Les Martyrs,' and to qualify himself for describing accurately the scenes amid which the poem is laid, made a pilgrimage to the East. In 1809 'Les Martyrs' was published, and is considered by many the best of his works. Some of the descriptions, such as the ancient forests of Gaul, the assemblies of the Christians in the catacombs, and the picture of Rome under the emperors, are given with marvelous beauty and effect. In 1811 appeared his 'Itinéraire de Paris à Jerusalem.' The restoration of Louis XVIII. was hailed by him with enthusiasm, and a pamphlet entitled 'De Bonaparte et des Bourbons,' published by him in 1814, was said by the king to have been worth to him an army of 100,000 men. On the second restoration he preserved the title of minister of state, but refused to take office along with Fouché. On the accession of Villèle to power Châteaubriand was appointed ambassador to Berlin, then to London, and in September 1822, crossed the Alps to represent France at the congress of Verona. In 1824 he was summarily dismissed from office at the instance of Villèle, and the indignation which he felt at such treatment made him join the ranks of the opposition, where in the columns of the 'Journal des Débats' he fulminated attacks against government. On the accession of the Martignac ministry he again returned to office, and proceeded as ambassador to Rome, but resigned this appointment on Polignac becoming premier. On the revolution of 1830 he refused to take the oath of allegiance to Louis Philippe, and consequently forfeited his seat in the house of peers and a pension of 12,000 francs. In 1831 a new work appeared from his pen, entitled 'De la Restauration, et de la Monarchie élective,' in which occurs the following singular avowal: "I am a Bourbonist by honor, a royalist by reason and conviction, and a Republican by inclination and character." In the same year he published his 'Études ou Discours historiques sur la Chute de l'Empire Romain,' a work exhibiting more of the imagination of the poet than the critical acumen of the historian. Owing to several pamphlets of a legitimist tendency issued by him, he was arrested in 1832, but defended by M. Berryer, and acquitted. In the latter years of his life he published an 'Essay on English Literature,' a literal prose translation of 'Milton's Paradise Lost,' and other works. His memoirs appeared after his death, under the title of 'Mémories d'outre Tombe.' They possess a great interest, and contain many charming passages, but are at times disfigured by the ebullitions of personal vanity, which formed one of the principal weaknesses of Châteaubriand. He was an intimate friend of the celebrated Madame Récamier, whose feeling toward him amounted almost to worship, and up to his last days he reigned supreme in her salon of the Abbaye-au-Bois, where all that was illustrious then came together.

Châteaudun, shā tō dėń, France, a town in the department of Eure-et-Loire, 26 miles south-southwest of Chartres, near the right bank of the Loire. Its streets are straight and terminate in a square, from which a complete view of the town may be obtained. The hôtel de ville and college buildings are deserving of notice. The old castle of the counts of Dunois overlooks the town. Châteaudun has manufactures of blankets, and large tanneries, and some trade in agricultural produce. In the Franco-German war the town was captured by the Germans (18 Oct. 1870), who held it till 9 November, when they were driven out by the French; it was, however, recaptured some few days after. Pop. (1891) 7,147.

Chateauguay (shăt-ō-gā') **River,** Lower Canada: operations on in the War of 1812; and battle of 25 Oct. 1813. (For the previous operations in the campaign against Montreal, see CHRYSTLER'S FARM.) Gen. Wade Hampton had been for some months in command at Burlington, Vt., when Wilkinson ordered him to advance on Montreal; ostensibly to co-operate with himself, though he had not yet started down the St. Lawrence. Hampton moved to the Canada line; then, finding that a drought had impaired the water supply on the straight road, marched westward to Chateauguay, N. Y., some 50 miles from the mouth of the Chateauguay River, an affluent of the St. Lawrence. He remained there three weeks, menacing the British communications and opening up his own, building roads, getting up supplies and artillery, etc. On 16 October Armstrong ordered him to approach the river-mouth for convenient junction with Wilkinson; and on the 22d-24th he established himself at Spear's, about 15 miles from the mouth. He had some 4,000 raw troops and 200 dragoons. Prevost had about 15,000 around Montreal, and the river lined with gunboats and batteries, while Hampton had not even

transports, and was in the heart of a hostile country. Prevost could have captured his whole army without much trouble; but he was really alarmed that Hampton was excellently posted to threaten the communications and supplies on the river. When Hampton advanced to Spear's, the British militia there retired; but Lieut.-Col. de Salaberry with 800 regulars intrenched himself in front on the road to the St. Lawrence, and filled the road with abattis. Hampton felt it needful to restore his communication with the river, and on the night of the 25th sent a strong flanking party around, while he himself attacked Salaberry in front. The former lost his way, and on this account he did not press his own attack. He lost 50 men, the British 25. Just then he received a message to prepare winter quarters; and feeling sure the campaign was to be abandoned, fell slowly back to Chateauguay, unmolested by Prevost. A week later he received a request from Wilkinson to send supplies forward and march down the river: he replied that he had none to send, and as Wilkinson evidently had not enough to sustain a forward movement, he should fall back to Plattsburg. Wilkinson received the message the day after his defeat at Chrystler's, and at once went into winter quarters.

Chateauneuf de Randon, shä-tō-nėf-dė-räṅ-dōṅ, France, a small town in the department of Lozère, 12 miles northeast of Mende, on a hill. It was formerly fortified, and is celebrated for the four years' siege sustained by the English garrison in 1380, against the troops of Charles V., commanded by the chivalrous Duguesclin. During this siege the English governor, who had been hard pressed, promised to surrender to Duguesclin at the expiration of 15 days, if no succor arrived. Before the end of the time agreed upon Duguesclin died, when his successor summoned the governor, who replied that he had given his word to Duguesclin, and would yield to no other. Informed of the hero's death, he said, "Then I will carry the keys to his tomb." Accordingly the governor sallied forth with the garrison to Dugueścclin's tent, and on his bended knees laid his sword and the keys of the town on the bier. In 1820 a simple commemorative monument was erected at the hamlet of Bitareile, on the spot where this event occurred. Pop. 3,541.

Châteauroux, shä-tō-roo, France, capital of the department of Indre, 144 miles south-southwest of Paris, in an extensive plain, left bank of the Indre. It has straight, broad, and tolerably well-paved streets, and spacious squares, with a public garden, and some fine promenades. The cloth manufactures, in which the wools of Berry are almost exclusively used, are extensive, employing about 2,000 workmen. Cotton hosiery, woolen yarn, tiles, paper, and parchment are also made; and there are tanneries and dyeworks. There is likewise a considerable trade in grain, wine, iron, wool, poultry, and cattle. The town owes its origin to a castle built in 950 by Raoul le Large, of Déols, still in a tolerable state of preservation. It was considerably extended in the reign of Louis XIII., who constituted it a duchy in favor of the descendants of Henry II. of Bourbon, prince of Condé. Charles of Bourbon sold it to Louis XV., who conferred it on one of his mistresses, at whose death it returned to the crown. During the revolution of 1793 it was called Indreville. Pop. (1896) 23,863.

Chatelain, shä-tē-lān. See CASTELLAN.

Chatelard, shä-tē-lär. See CHASTELARD.

Châtelet, shä-tē-lā, Belgium, a manufacturing town in the province of Hainaut, on the Sambre, five miles east of Charleroi. Its chief industries are the manufacture of cotton-stuffs, knives, nails, and pottery. Pop. (1897) 11,255. Châtelineau, opposite to it, has a pop. of (1897) 11,519.

Châtelet was anciently a small chateau or fortress, and the officer who commanded it was called *châtelain.* The word is a diminutive of *château,* formed from *castellum,* a diminutive of *castrum;* or from *castellatum,* a diminutive of *castellum,* castle. The term, in later times, has been applied to certain courts of justice, established in several cities in France. The Grand Châtelet, in Paris, was the place where the presidial or ordinary court of justice of the prévôt of Paris was kept, consisting of a presidial, a civil chamber, a criminal chamber, and a chamber of police. The term signified the same at Montpellier, Orleans, etc. When Paris was confined to the limits of the old city (*cité*), it could be entered only by two bridges (Le Petit Pont and Le Pont au Change), each of which was fortified with two towers — a smaller one in the wall, facing the city, and a larger one before the bridge, toward the country. These two exterior turrets were the Grand and Petit Châtelet. The tradition that the Grand Châtelet was built by Julius Cæsar, though adopted by some, is not well supported; but it is certain that the great tower was standing as early as the siege of the city by the Normans (885). The Grand Châtelet was the castle of the counts of Paris, and therefore the seat of all the royal courts of justice within the city and county, and also of the feudal court. The city had no proper jurisdiction whatever; its bailiff or provost (*prévôt*) was appointed by the king, and was president of the court (though only nominally, because he had no voice in the judgments), and, by virtue of his office, leader of the nobility. The office of provost of the merchants (*prévôt des marchands;* in other cities *maire*), established before the former, and afterward united with it for a time, was finally separated from it in 1388. The business of the Châtelet was transacted by the deputies of the bailiff (*lieutenants*), of whom there were five, three for civil causes, one chief judge of criminal cases, and a lieutenant-general of police (*lieutenant-général de la police*). The latter, indeed, was minister of police for the whole kingdom, and at the extent of his functions and power, particularly after the new arrangement made by the celebrated d'Argenson under Louis XIV., rendered him one of the most important officers of the state. In the Châtelet, however, he held only the fourth place. The whole court of justice was composed of 57 counselors, with 13 state attorneys, and a multitude of subalterns, as 63 secretaries or *greffiers,* 113 notaries, 235 attorneys, etc. All these offices were sold. The place of the first officer of the civil chamber was rated at 500,000 livres; that of a notary at 40,000 livres. The Châtelet was first in rank after the supreme courts (*cours souveraines*).

Châtellerault, shä-tĕl-lē-rō, France, in the department Vienne, 20 miles north-northeast of Poitiers. It stands on the right bank of the Vienne, which here becomes navigable, and is a place of some antiquity, having once been the capital of a duchy which, in 1548, was bestowed by Henry II. on the Earl of Arran, regent of Scotland, and still gives a title to his descendant, the Duke of Hamilton. The old walls and fortifications of the town have been removed and the site converted into promenades. There are here manufactures of cutlery, hardware, jewelry, lace, etc., and a good trade. Pop. (1896) 20,014.

Chat'field-Taylor, Hobart Chatfield, American novelist: b. Chicago, Ill., 25 March 1865. He was graduated at Cornell University in 1886, and has written: 'With Edge Tools' (1891); 'An American Peeress' (1893); 'Two Women and a Fool' (1895); 'The Land of the Castanet' (1896); 'The Vice of Fools' (1898); 'The Idle Born' (1900).

Chatham, chăt-ăm, **William Pitt,** EARL OF, English statesman: b. Westminster 15 Nov. 1708; d. Hayes, Kent, 11 May 1778. He was educated at Eton and Oxford. On quitting the university he became a cornet in the blues, and in 1735 represented the borough of Old Sarum (the property of his family) in the House of Commons, where he attracted universal notice. He was a powerful opponent of Sir Robert Walpole, who revenged himself by taking away his commission. In January 1741, he delivered the speech reported by Johnson for the 'Gentleman's Magazine,' beginning, "The atrocious crime of being a young man, which the honorable gentleman has with such spirit and decency charged upon me, I shall neither attempt to palliate nor deny." But it is probable that there is more of Johnson than of Pitt in it. In 1744 he received, on account of his patriotism, a legacy of £10,000 from the Duchess of Marlborough; became in 1746 vice-treasurer of Ireland, paymaster-general of the army, and member of the privy council. In 1755 he resigned the paymaster's office. In 1756 he was appointed secretary of state, but was dismissed the same year on account of his opposition to the Hanoverian policy of George II. The nation, however, was enthusiastically attached to him, and the public discontent was so loudly manifested, that he was appointed secretary of state again in 1757. His great mind now revealed its full force. His ascendency was complete over the Parliament no less than in the ministry; he aroused the English nation to new activity. In 1760 he advised the declaration of war against Spain while she was unprepared for resistance, as he foresaw that she would assist France. The elevation of England on the ruins of the house of Bourbon was the great object of his policy. But his plans were suddenly interrupted by the death of George II. George III. was prejudiced against Pitt by his adversary, the Earl of Bute, a statesman of limited views. Pitt therefore resigned his post in 1761, only retaining his seat in the House of Commons. On his retirement his wife was created Baroness Chatham. In 1762, when Spain formally allied herself with France, Pitt urged the continuance of the war, by which both states would perhaps have been totally exhausted; but peace was concluded by the opposite party in 1763. Pitt uniformly supported the cause of the people. Foreseeing the separation of the American colonies from the mother country, if the arbitrary measures then adopted should be continued, he advocated, especially in 1766, a conciliatory policy, and the repeal of the Stamp Act. In the same year he was invited to assist in forming a new ministry, in which he took the office of privy-seal, and was created Viscount Burton, Baron Pensent, and Earl of Chatham. In 1768 he resigned, but in the House of Lords continued to recommend the abandonment of the coercive measures employed against America, particularly in 1774. His warning was rejected, and in 1776 the colonies declared themselves independent. In vain did he renew his motion for reconciliation in 1777; in vain did he declare the conquest of America impossible. On 7 April 1778, though laboring under a severe illness, he repaired to the House, to attack the unjust and impolitic proceedings of the ministers toward the colonies. At the close of his speech he fainted and fell backward; he was conveyed out of the House, and afterward removed to his country-seat at Hayes, in Kent, where he died a month later. The Parliament annexed an annuity of £4,000 to the earldom of Chatham, his debts were paid, and he was honored with a public funeral, and a magnificent monument in Westminster Abbey. Another was erected in 1782 in Guildhall. His popularity in America was very great and several localities were named Chatham in his honor, as well as Pittsburg, Pa., and Pittsfield, Mass.

Chatham, New Brunswick, Canada, at the mouth of the Miramichi, and on its right bank, 98 miles northeast of Fredericton. It has a good harbor, is an important port of entry, has a Roman Catholic cathedral and college, and a large trade in lumber. Pop. (1891) 5,644.

Chatham, chăt'am, Ontario, Canada, city on the Thames, 1½ miles north of Lake Erie, with manufactures of machinery, woolens, soap, and candle works. It is a trade centre, with good facilities for shipping the products of the surrounding country, and has a trade in lumber. Pop. (1901) 9,052.

Chatham, England, now a parliamentary and municipal borough, naval arsenal, and seaport, in county Kent, on the Medway, about 33 miles by rail from London, practically forming one town with Rochester. As a parliamentary borough it includes Gillingham and New Brompton, and returns one member. Until a recent period a great portion of the town was irregular and ill-built, but recently considerable improvements have been carried out, and are still in course of progress. The great features of Chatham are the naval and military establishments here or in the immediate vicinity. The dockyard was founded by Queen Elizabeth previous to the period of the Armada, and during this reign Upnor Castle, on the left bank of the Medway, was erected to protect the dock and shipping. Despite the fire from the castle, however, in 1667, Van Ghent, a vice-admiral of De Ruyter's, succeeded in breaking the chain stretched across the river, burned and sunk several ships, and retired bearing off the warship, the Royal Charles, as a prize. Subsequently the fortifications were greatly strengthened and enlarged, but the great increase in the power of

modern ordnance having rendered parts of the works of little value, a number of out-lying forts have had to be built. With its modern extensions the royal dockyard now extends for about two miles along the river, and is most thoroughly equipped for the building, fitting out, and repairing of war vessels. Among recent additions are three basins for iron-clad warships, with a total area of about 75 acres. One of these, the repairing basin, has an area of 22 acres, and is connected with four dry-docks. It has 3,500 feet of wharfage, is 80 feet wide at the entrance and about 30–32 feet deep at high water. The largest, or fitting-out basin, has a water area of 33 acres, with 5,800 feet of wharfage, and a depth of 30 feet. From it the heaviest war-ships fully equipped are able to proceed direct to sea. The factory basin (20 acres area) is intended for fitting vessels with their engines, etc. The engine factories and machine works on the south side of this basin are about 2,500 feet long, and occupy about 14 acres. The cost of these works was nearly $15,000,000. The largest class of iron-clads are built here. There are several covered slips for building ships upon, the iron roofs of some costing $50,000. The rope-house has a length of 1,200 feet; there are great saw-mills, and the forges turn out armor plates, anchors, and other articles required for the battle-ships of the present day. In short, all the requisites of a great naval station are here on the most complete scale. The military establishments include extensive infantry barracks, and barracks for the royal marines; the headquarters of the royal engineers, arsenal and park of artillery, hospitals, etc. The whole is surrounded by a very extensive system of fortified works, rendering Chatham a place of great strength. The old convict prison has been partly pulled down and replaced by naval barracks. The fortifications are regarded as a defense for London, a protection against an invasion from the south coast. Chatham is one of the chief ship-building towns of England; but the people do not forget the noted dead of the nation. A statue to Lord Waghorn reminds them of his work on the "overland route" to India, and a monument to Gordon represents him as an explorer. Charles Dickens lived some time in Ordnance Place, Chatham. Pop. (1901) 78,746. of the parliamentary borough.

Chatham Island, the most important of the Galapagos archipelago (q. v.); 600 miles from Ecuador, which owns the group, and uses Chatham, Charles, and Albemarle as penal settlements for political offenders. Its interest to Americans lies in the negotiations opened with Ecuador in March 1900, to buy it for a Pacific coaling station.

Chatham Islands, in south Pacific Ocean, belong to New Zealand. The group, three in number, are in lat. 44° 7′ S.; lon. about 176° 49′ E. The group is of volcanic origin. Chatham, the largest island, is about 38 miles long and 25 broad. The other islands are Pitt Island, 12 miles long by 8 broad; and Ranga Tira, a mere rock The harbor of Waitangi, on the west side of Chatham Island, is much frequented by whaling vessels, which there supply themselves with fuel, provisions, and water. There are few hills in the island, and the highest does not exceed 800 feet. In the interior of the largest island is a brackish lake. The soil is in many places fertile, and crops of potatoes and wheat have been successfully and extensively cultivated and exported. Turnips, cabbages, pumpkins, and tobacco are also successfully cultivated. The creeks and shores abound in fish, many of them excellent; sharks of formidable size are numerous. Stock raising and seal fishing are prominent industries. The original inhabitants, now nearly extinct, are a cheerful and good-natured race. About the year 1830 they amounted to some 1,200, but they now number little more than 30. The destruction of this unfortunate people is attributed to the cruelty and tyranny of the New Zealanders, a number of whom migrated to the island in 1836, and by the superior energy and ferocity of their character soon became masters of the inoffensive aborigines. The present population amounts to about 400, more than half of whom are Maoris. The Chatham Islands were discovered by Lieut. William Robert Broughton, of H.M. brig Chatham, and taken possession of by that officer in name of his Britannic majesty, 29 Nov. 1791.

Chati, chă-tē, a wildcat (*Felis mitis*) ranging from Mexico to Paraguay, in warm lowlands and woods. The body, including the head, is from 24 to 27 inches long, the tail about 14 to 18 inches. The fur is soft and tawny, spotted with black. This cat is by some naturalists considered a variety of the **margay** (q.v.).

Chatillon - sur - Seine, shä-tē-yôṅ-sûr-sān, France, department of Côte d'Or, 45 miles northwest of Dijon, on the Seine. Pop. (1896) 5,000.

Chat'moss, an extensive morass, area about 6,000 to 7,000 acres, situated chiefly in the parish of Eccles, Lancashire, England. It is remarkable as being the scene of operations for reclaiming bog-land, first successfully carried out on a large scale in the end of the 18th and beginning of the 19th century; also for offering one more field of triumph to George Stephenson, who carried the Liverpool & Manchester Railway over it after all other engineers had declared the feat impossible. Stephenson spread branches of trees and hurdles interwoven with heather on the surface of the bog, and placed a thin layer of gravel over all; upon thi sleepers and rails were laid in the ordinary way.

Chatoyancy, or **Change of Colors,** is the property possessed by a few minerals of displaying different colors by reflected light, when the specimen is revolved. Thus labradorite ordinarily has a dull gray color, but when revolved, a position will be reached in which the surface of the specimen will exhibit great sheets of gorgeous blue, green or copper-red colors. The cause of the phenomenon differs in the several minerals showing it. In the case of labradorite it is apparently due to interference, while in tiger-eye (q.v.) it is the result of the fibrous structure. The beautiful chatoyancy of cat's-eye (q.v.) usually due to enclosed fibers of asbestos or other fibrous minerals, is more properly regarded as opalescence. Compare also PLAY OF COLORS and SCHILLER.

Chatrian, shä-trē-äṅ, **Alexandre.** See ERCKMANN, EMILE.

Chats'worth, England, the celebrated estate of the Dukes of Devonshire, situated in the

parish of Edensor, in Derbyshire. It was among the domains given by the Conqueror to his natural son, William Peveril. It was purchased in the reign of Elizabeth by William Cavendish, who commenced to build a mansion on it, which was completed by his widow, the Countess of Shrewsbury. The present building was nearly completed by the first Duke of Devonshire, and a new wing was added by the sixth Duke. The façade is 720 feet long, or with the terraces, 1,200 feet. The mansion forms a square, with an inner court, and is remarkable for the collections of pictures and statues it contains. The park is about 11 miles in circumference. The grounds have been laid out by Loudon and Sir J. Paxton. The conservatory covers nearly an acre, and is 65 feet high. In the old building Mary Stuart was imprisoned for 13 years. Hobbes, the philosopher, lived for some time here.

Chattahoo'chee, a river in the northern part of Georgia, rising in the Appalachian Mountains, and flowing first west and then south, forming, for a considerable distance, the boundary between the above State and Alabama. In its lower course, after the junction of the Flint River from the east, it is named the Appalachiola, and is navigable to Columbus for steamboats. Total course, about 550 miles.

Chattahoo'chee Stage, in American geology, the lower rocks laid down in older Miocene time along the Atlantic coast of what was then the continent of North America. Strata of this stage probably extend, except for a break in Maryland and Virginia, from Cape Cod to Texas, and in the north are clays and uncompacted sand, changing to limestones in the south. The typical exposures of the Chattahoochee stage are on the Chattahoochee River in southwest Georgia and northwest Florida. Here are beds of clay, marl, and limestone about 200 feet thick. The Chattahoochee stage corresponds in age to the John Day beds in Oregon, and to some of the Miocene gold-bearing gravels of the Sierra Nevada. See MIOCENE SERIES; TERTIARY SYSTEM.

Chattanooga, Tenn., a city and county-seat of Hamilton County, an important railroad, trade, and manufacturing centre, on the south bank of the Tennessee River, and on the Southern, Central of G., Nashville, C. & St. L., Cincinnati, N. O. & T. P., Alabama G. S., and other R.R.'s. It is situated near the Georgia and Alabama boundaries, at the base of the Cumberland plateau, 698 feet above the level of the sea. It is the centre of, and the largest place in, the quadrangle formed by Nashville, and Knoxville, Tenn., Birmingham, Ala., and Atlanta, Ga., distant respectively 151, 112, 143 and 137 miles. The district around as the gateway of the Cumberland range between the three States, was one of the greatest strategic points during the Civil War, and is historic for many bloody and famous battle-fields. To the southwest is Lookout Mountain, commanding a superb view of six or seven States; on the east is Missionary Ridge; and south by east, a few miles away in Georgia, is the field of Chickamauga, now turned by the government into a national military park — to be also the seat of a permanent army post, where several thousand State militia are to be exercised yearly in evolution by regular army officers. The Seventh United States Cavalry is stationed there, and barracks are under construction. At the southeast corner of the city itself is a national cemetery, one of the largest in the country, containing 13,362 graves. The whole region is a noted tourist resort, for historic and scenic reasons. The finest structures in the city are the custom-house of marble, and the *Times* building. The Baroness Erlanger Hospital is the most noted charitable institution. For higher education, it contains the U. S. Grant University, the Chattanooga Medical College, and the Chattanooga Normal University. There is also a public library, to which Mr. Andrew Carnegie has donated $50,000 for a library building.

Trade and Manufactures.— The river here is navigable eight months in the year, and the Muscle Shoals Canal gives unbroken passage to its mouth by the Chattanooga & Tennessee River Packet Company; while northeastward, steamers run to Kingston, and at high water to Knoxville, 200 miles, by water. But the great and growing importance of Chattanooga is in manufacturing, which it owes to the adjacent deposits of coal, iron, clays, and many other minerals, and the forests. It has a larger variety of small manufactures than any other Southern city, and some of great magnitude. The chief are iron and iron goods, flouring and grist-milling, lumber and furniture, and patent medicine. The first of these in 1900 produced $2,553,422 worth of goods; the second $2,287,268; the third $922,000. It has the largest manufacture of steam boilers in the United States, next to Erie, Pa.; the largest steel-roofing, wagon, furniture, refrigerator, hosiery, and patent-medicine works in the South; the largest oak-bark tanning and metallic paint works in the United States, and the largest manufacture of kitchen furniture, iron soil-pipes, acetylene gas-burners, slate-pencils, and curtain poles in the world. In 1900 there were 332 plants, producing goods to the total value of $12,033,780; there are now 370; and the increase of employees is said to have been 20 per cent since 1900. There are seven banks in the city, with deposits of over $6,250,000, and five of them are in a clearing-house.

Government and Finances.— There is a two-years' mayor and a bicameral council. The annual outlay is about $300,000, the heaviest item in 1902 being $48,500 for schools. In 1902 the assessed valuation was $14,000,000, the debt $931,000, and the municipal tax-rate $14.50 on a thousand.

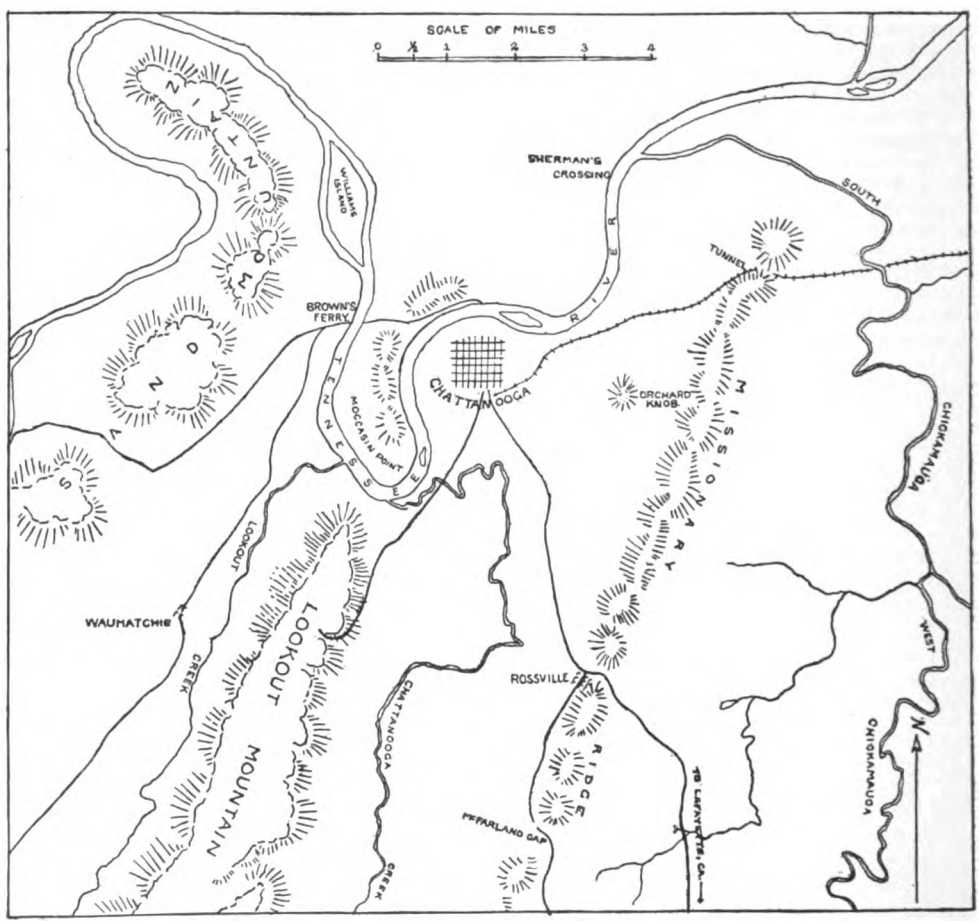
Population and History.— Chattanooga, originally called Ross Landing, first appears in the census in 1860 with 2,545 people. In the War, being a storm centre, it was nearly destroyed; but as in the case of some other southern cities, the War was its making. It was an important military post, and the iron industry started in a rolling-mill opened in order that the ruined railroads might be rebuilt. The attention of capital had also been called to its great advantages of situation. In 1870 it had a population of 6,093; in 1880, 12,892; and in 1890, 29,100. The growth of the city was retarded by the general business depression which followed the financial reverses of 1893; but a revival came with the concentration of some 70,000 soldiers there in 1898, and the consequent immense disbursements. Since then it has been rapidly moving forward; and though the Federal census of

1900 shows 30,154, it is claimed that the corporate limits, which are less than four square miles, are too restricted, and that the addition of the 22 suburbs belonging to it would raise the population to nearer 55,000. The increase in school attendance, in post-office receipts, etc., has been very large in the past three years.

B. L. GOULDING,
Vice-President Chattanooga Library Association.

Chattanoo'ga, Battle of. At the close of the battle of Chickamauga, Ga., 20 September, the Union army, in withdrawing from the field, having interposed at Rossville, Ga., between Missionary Ridge the same distance east of it, the mountain and the ridge being parallel, running nearly north and south and about four miles apart. The Tennessee River touches the base of Lookout. The city lies to the northeast in a great bend of the river. The advance line of the Confederates was half way between the ridge and the city, upon a low intermediate ridge, at the right of which was Orchard Knob, an isolated knoll rising some 60 feet above the plain.

Lookout Mountain commanded the river line to Bridgeport and Stevenson, the main depots



CHATTANOOGA, TENN.
AND VICINITY.

Bragg and Chattanooga, advanced into that city the night of the 21st and morning of the 22d, and immediately began to fortify it. Bragg followed on the 22d, and his lines were soon established in front of the place, his left resting on the Tennessee River and Lookout Mountain, below the city, his centre extending across the plain to the foot of Missionary Ridge, his right being established at the foot of the ridge and reaching toward the Tennessee River above. The north point of the Lookout Mountain range is three miles southwest of Chattanooga, and of supply. This necessitated a wagon-haul of 60 miles over the Cumberlands and the adjacent range of Walden's Ridge, all precipitous and barren mountains. The Union army was soon running short of supplies, the fall rains rendering the roads almost impassable. On 19 October, the day that Rosecrans had perfected the general features of a plan for regaining the river line of supplies, he was relieved from command and Gen. Geo. H. Thomas assigned, who at once ordered the preparations inaugurated by Rosecrans to go forward.

Immediately after the battle of Chickamauga Gen. Hooker with the Eleventh and Twelfth corps was sent from the army of the Potomac and arrived at Bridgeport, Tennessee, 30 September. Sherman, in camp east of Vicksburg, had been ordered up with four divisions. Grant was sent to take general command. Upon arriving, 23 October, he approved the plans for opening the river, and directed their execution. Gen. Hooker was to advance into Lookout Valley, and a co-operating force from Chattanooga under Gen. W. F. Smith was to seize Brown's Ferry below Lookout Mountain, throw a bridge there and form a junction with Hooker. These movements were successfully executed during 27 and 28 October. The Eleventh corps (two divisions) and Geary's division of the Twelfth corps entered Lookout Valley the afternoon of 28 October, the Eleventh corps proceeding to Brown's Ferry and formed a junction with Gen. Smith's troops from Chattanooga. Geary, with six regiments of his division, halted near Wauhatchie Station. At midnight of the 28th Geary was attacked by Jenkins' (Hood's) division, six regiments, of Longstreet's corps, supported by Law's division. Schurz's division coming to Geary's support, Longstreet's troops after three hours' fighting withdrew to the east side of Lookout, and the Wauhatchie or Lookout Valley remained thereafter in Union control. Abundant supplies by the river then reached Chattanooga by a short wagon-haul from Brown's Ferry. On 4 November, shortly after the battle of Wauhatchie, Longstreet's corps was detached by Bragg and sent to Knoxville.

The battle of Chattanooga, which occurred three weeks later, embraced three days' operations, 23, 24, and 25 November. At the opening Bragg's lines were as already described. Hooker, with Geary's division and Cruft's from the Fourth corps of the Army of the Cumberland, occupied Lookout Valley, the Army of the Cumberland and the Eleventh corps were on the lines about Chattanooga, and Sherman with three divisions had crossed at Brown's Ferry and was concealed behind the hills above Chattanooga and on the opposite side of the river from the city.

Gen. Grant's force for his firing lines was about 60,000, and the Confederates' a little less than 40,000. The formidable natural positions of the latter were held to give them superior advantages.

Grant's plan of battle was for Hooker to hold Lookout Valley against Bragg's left. Sherman was to cross the Tennessee opposite the north end of Missionary Ridge, which was unoccupied, and carry it to the railroad tunnel about half a mile south of its northern end. Sherman, then, astride of the ridge, was to move south; while Thomas, with the Army of the Cumberland before the city, was to connect its left with Sherman's right, and together sweeping south they were to clear the ridge and the valley. As the engagement progressed, every feature of this plan was changed by unexpected developments.

At noon, 23 November, Gen. Thomas, being directed by Grant to ascertain if the Confederates still occupied their lines and camps between the city and Missionary Ridge, paraded five divisions in full view of the Confederate positions, which, as was afterward ascertained, was at first supposed to be a review. Wood's division was in the centre advanced, Schurz's and Steinwehr's divisions of the Eleventh corps were refused on the left, and Sheridan's and Baird's on the right. At a bugle signal at 1:30 P.M. the centre advanced rapidly, and, after a sharp contest, captured Orchard Knob, and forced the abandonment of the entire line of the Confederates through the centre of the plain, reversed the works at and near the Knob and held them. This was the first day's battle.

The night of the 23d Sherman with three of his four divisions which had reached his concealed camps opposite the city and north of it, marched to the North Chickamauga, where 116 pontoon boats awaited him. These were filled with soldiers, floated down the creek to the river, and thence to the opposite shore, and by daylight of the 24th 8,000 of Sherman's troops were in line fronting Missionary Ridge, two miles from it, and opposite its northern extremity, which point was not occupied by the Confederates until 2:30 in the afternoon. At 1 o'clock the three divisions, and one from the army of the Cumberland which had covered the movement having crossed, the lines were advanced, and at 4 o'clock a range of unoccupied hills north of and overlooking the north end of Missionary Ridge was occupied without resistance, and strongly intrenched under the supposition that these formed the north end of the ridge contemplated in the order of battle. The mistake was due mainly to the misty weather, and the omission of any reconnoissance.

At 2:30 P.M. Cleburne's division arrived at the north point of the ridge and entrenched.

Gen. Thomas, having obtained Grant's permission to make a demonstration against the Confederate position on Lookout, Hooker made ready to move at an early hour on the 24th.

The Confederates held the top of the mountain, which was a narrow plateau 1,700 feet above the valley, protected by perpendicular palisades varying from 75 to 250 feet high. From the foot of these walls of rock the mountain sloped westward to Hooker's position in Lookout Valley eastward to the plain south of Chattanooga, while its north slope descended to the Tennessee River opposite Moccasin Point. It was approximately a mile and a half from the foot of the palisades to the valley. The battle took place on these slopes. No Union troops reached the top of the mountain during the engagement. The morning of the 24th, Brown's and Pettus' brigades of Stevenson's Confederate division, with a battery of four Napoleons, occupied the summit, and Walthall's and Moore's brigades of Cheatham's division the slopes of the mountain, Walthall's holding the western slope and Moore's the northern.

Hooker's forces consisted of three brigades of Geary's division of the Twelfth corps, two brigades of Cruft's division of the Fourth corps, and two brigades of Osterhaus' division of Sherman's army. This latter division had been prevented from following Sherman over the river by the breaking of the pontoon bridge at Brown's Ferry. Hooker's aggregate strength was something over 9,000. Walthall's brigade, which sustained almost the entire attack until the western and northern slopes had been carried, did not number over 1,700. There were 250 men of Moore's brigade on picket, which were mostly captured early in the engagement.

The head of Hooker's column crossed Lookout Creek at Light's Mill near Wauhatchie, at 8 o'clock in the morning, and, concealed by the fog which hung over the mountain, marched directly up the western slope until the head of the line reached the base of the palisades. His line then faced toward the north point of the mountain, distant about two miles.

After an advance of a mile and a half with Geary's brigades, Cobham's, Ireland's, and Candy's, in advance, and Whitaker's of Cruft's division in reserve, the troops struck the left flank of Walthall's line protected by slashed timber. This was carried, and in the face of stout resistance the Confederates were driven around the north point of the mountain, and across its northern slope. As Geary's attack opened, first Grose of Cruft's division and next Wood and Williamson of Osterhaus', successively joined the left of the lines, and advanced with the swinging movement on the slopes of the mountain. Until the northern slope had been carried to the Craven House, Walthall had no assistance. Moore advanced as he was being pushed back from the Craven House, but was immediately repulsed. Pettus arrived at one o'clock and relieved Walthall after he had withdrawn some 400 yards from the Craven House. This enabled Walthall to procure ammunition, re-form, and take his place on the line again. This position was held until three o'clock in the morning, when, the troops and supplies from the top having been withdrawn and safely started across the plain for the Missionary Ridge line, this final line was also withdrawn, and the mountain abandoned. The troops on the summit, on account of the fog, could do little damage to the Union lines. Hooker was materially assisted by batteries on the elevated points in Lookout Valley, and those across the river on Moccasin Point, which swept the northern slope. The next morning the Union forces occupied the summit.

The capturing of Lookout Mountain decided Gen. Bragg to withdraw his whole army from the plain to the crest of Missionary Ridge, except as heavy picket forces were left in the entrenchments at the base of the ridge.

Hooker's losses at Lookout, and the next day at Missionary Ridge, which were small but not definitely reported, were: Killed, 81; wounded, 390. The Confederate loss was: Killed, 21; wounded, 177. Walthall lost 845 captured, mostly from his long picket line at the base of the mountain. Moore's missing were 199, and Pettus' 9.

During the night of the 24th and the early morning of the 25th, Bragg concentrated his army on Missionary Ridge, and in the earthworks at its base. This was his first occupation of the crest of the ridge in force. His new line extended from Rossville, a distance of eight miles to the north end of the ridge, his divisions from Rossville northward being Stewart's, Breckinridge's (Bate's), Hindman's (Patton Anderson's), Cheatham's, Walker's, Stevenson's, and Cleburne's.

The battle of the 25th opened soon after seven o'clock by an assault of Sherman upon the north end of the ridge, defended by Cleburne. Sherman's force consisted of his own divisions of Morgan L. Smith, Hugh Ewing, and John E. Smith, with the divisions of Jeff. C. Davis from the Army of the Cumberland, and Schurz and Steinwehr of the Eleventh corps. While the four brigades of Corse, Matthies, Raum, and Giles A. Smith reached the crest at different periods, none was able to maintain position there, though Corse and Smith held on stubbornly under the crest until toward evening, when all were driven from the slopes. The fighting of the troops sent in was persistent and most courageous, but Cleburne, at first alone, and later supported by Stevenson's division and a part of Walker's, repulsed all assaults. The last one, about 3:30 P.M., was especially serious.

Grant, on Orchard Knob, observing this repulse, ordered Gen. Thomas to advance his four divisions at the centre against the earthworks at the foot of the ridge as a diversion in favor of Sherman, hoping thereby to cause the withdrawal of Confederate forces from his front. The four divisions which were ranged along the Orchard Knob line were, from left to right: Baird, Wood, Sheridan, and Johnson. The line was two and a half miles long, and faced the ridge at distances from three quarters of a mile to a mile from it. There were 11 brigades and 89 regiments in the lines as prepared for the assault. The formation was such as to present the appearance of being four lines deep. At a signal of six cannon shots from Orchard Knob the four divisions rushed for the earthworks at the foot of the ridge. On the summit opposed to this advance were 13 brigades and 16 batteries. The cannonading of nearly 100 guns from the crest was terrific, and the line was soon under rifle-fire from the works at the base, but the entire line of earthworks was captured as soon as the troops by running could reach them. Reforming their lines in the earthworks, Baird's division on the left and Johnson's on the right began the storming of the ridge without further orders. In Baird's division the horses of field officers had been left behind at the start, because as he announced he had intimations that the intention was to go to the summit, and it was easy to see that the slopes were too steep for mounted men to ascend. In the same way Johnson's men were informed at the start that the movement was to be an attack on the ridge. At the centre in Wood's and Sheridan's divisions the orders as understood by most were to stop at the rifle-pits, but the men ignored these and started forward, and soon orders were received to go to the top. The whole line of brigades gained the crest so nearly together that it has always been difficult to determine which, if any one, was the first.

The long lines of the storming party moved up the slopes with few checks, and in an hour had carried three miles of the crest and captured 37 guns and about 2,000 prisoners.

Just as the orders were given Thomas for this assault at the centre, Hooker, who had descended Lookout at one o'clock and started to attack the south end of the ridge in Rossville Gap, reached that position. He had been detained by the necessity of rebuilding a bridge over Chattanooga Creek. He at once sent Osterhaus' division through the gap and turned it north along the east side of Missionary Ridge. Cruft's division assaulted and carried the south end of the ridge in the gap while Geary moved along the western base of the ridge and finally ascended to the crest, reaching it soon after the right of Thomas' assault had occupied it.

As Baird's division reached the crest, it turned northward and became hotly engaged

GEOFFREY CHAUCER.

with Walthall's brigade, assisted by Jackson's and Moore's, of Cheatham's division. Darkness coming on, the fighting ceased. Walthall's stand across the ridge had made it possible for Cleburne's, Stevenson's, Walker's, and Cheatham's divisions to withdraw in order and unmolested. The centre and left retreated in general confusion, Bate's division, however, soon rallying for a stout resistance as rear guard.

Two myths of the battle have gained general currency. The movements of the Confederate troops which retired from Lookout Mountain and were early sent to confront Sherman gave rise to the report that Bragg was weakening his centre to concentrate against Sherman. But not a single soldier or gun was sent from the centre against Sherman during the day. On the contrary, three brigades, John C. Brown's, George Maney's, and Alfred Cummings', were hurried from Sherman's front to resist the assault of Gen. Thomas at the centre.

The second long perpetuated error is that when Gen. Sherman advanced to the unoccupied hills beyond the north end of Missionary Ridge he had carried the ridge to the tunnel as was contemplated in the order of battle. He did not secure any portion of the ridge during the battle, although those troops which were put in fought desperately. Eleven brigades of his force were held as reserves and were not engaged, Gen. Sherman thinking it necessary to guard against an attack upon his left.

Bragg was promptly pursued. His rear guard made a stubborn stand at Ringgold Gap, but his army was first rallied at Dalton, where it remained until the opening of the Atlanta campaign in the spring of 1864.

The losses at Chattanooga, including the three days' battles and the affairs in pursuit to Ringgold, were for Grant: Killed, 703; wounded, 4,722; missing, 349; total, 5,844; for Bragg: Killed 361; wounded, 2,180; missing, 4,146; total, 6,687. Consult 'War of the Rebellion Records,' Vols. XXX. and XXXI., Parts 1 and 2.

H. V. BOYNTON.

Chattel Mortgage, a transfer of personal property as security for a debt in such manner that upon default the chattel becomes the property of the mortgagee.

In the absence of statute no special form is necessary, the terms depending to a great extent on the intention of the parties. Between the parties to a mortgage, a delivery is not necessary, but to be binding on creditor's delivery to the mortgagee or notice to the creditors is necessary. In mortgage, title, and possession passes; in pledge, possession passes, but title remains in the pledgor.

At common law it was necessary for the chattel to be in possession of the mortgagor at the time the mortgage was given, so as to be binding against creditors; but if the mortgagor acquired title after the mortgage had been given, it was good as between the parties, but not as to creditors. In equity a chattel mortgage is considered in the nature of an executory agreement.

Chattels, property movable and immovable, not being freehold. The word chattels is originally the same word with cattle, all property being reckoned in early periods by the number of heads of cattle possessed, or their equivalent. From the fact that cattle were reckoned by the head, it appears probable that they were called *capitalia* (from the Latin *caput,* the head), which became contracted by syncope into *captalia,* and then *catalia,* whence the legal term *catalla,* and our "chattels" and "cattle." Hence the word chattels signified originally only movable property, but in course of time came to be applied to all property not held in feudal tenure. Chattels are divided into real and personal. Chattels real are such as belong not to the person immediately, but dependently upon something. Any interest in land or tenements, for example, is a real chattel; so also is a lease, a rent for a term of years, an interest in advowsons, etc. Chattels personal are goods which belong immediately to the person of the owner, and include all movable property. Chattels usually pass to the executor, except such, for instance, as trees, which may not be severed from the freehold, and therefore pass to the heir.

Chatterers, the popular name of certain insessorial birds of the family *Ampelidæ,* genus *Ampelis,* as the Bohemian chatterer or waxwing (*A. garrula*) and the chatterer of Carolina (*A. cedrorum*).

Chat'terton, Thomas, English poet: b. Bristol 20 Nov. 1752; d. there 24 Aug. 1770. At about 10 years of age he acquired a taste for reading, which became, from that period, a kind of ruling passion. His former melancholy gave way to vivacity and vanity, and dreams of glory, fortune, and immortality. His father had accidentally obtained possession of a number of old parchments of the 15th century. Many of these were consumed in the family, but several fell into the hands of Chatterton, who after a few days declared that he had discovered a treasure. He then procured glossaries of the old dialects of the country, and in 1768, when the new bridge at Bristol was completed, he inserted a paper in the Bristol 'Journal,' entitled 'A Description of the Friar's First Passing Over the Old Bridge, Taken from an Ancient Manuscript.' He was then but 16 years old. Upon being questioned as to the manner in which he had obtained it, he finally asserted that he was in the possession of several valuable old manuscripts, taken from an old chest in Redcliffe Church. He had been engaged for a year in the composition of several poems, which he attributed to different ancient writers, particularly to one Rowley. In 1769 he ventured to write to Horace Walpole, who was then engaged upon his 'Anecdotes of Painters,' giving him an account of a number of painters who had flourished in Bristol, which Chatterton pretended to have discovered along with several ancient poems in that city, and received a polite answer. Discontented with his situation, he went to London. The favorable reception which he there met with from the booksellers inspired him with new hopes. He wrote for several journals on the side of the opposition and indulged the hope of effecting a revolution, boasting that he was destined to restore the rights of the nation. Failing to procure the rewards which he had expected, his situation daily became worse. Although extremely temperate, and often voluntarily confining himself to bread and water, he was frequently destitute even of these necessaries. At last, after having been several days without food, he poisoned himself in 1770, when not yet 18 years old. His works were more extensively read as

the public became acquainted with the history of his misfortunes. The most remarkable are the poems published under the name of Rowley, which he composed at the age of 15 years. They display a vigorous and brilliant imagination, fertility of invention, and often a deep sensibility. Among the poems which he published under his own name his satires deserve the preference. His prose writings are spirited. Prof. Skeat's edition of his poems is one of the best. See biographies by Dix (1837), Wilson (1869), and Masson.

Chaucer, châ'sėr, **Geoffrey,** English poet, «the father of English poetry»: b. London probably about 1340; d. there 25 Oct. 1400. The date commonly assigned till lately for his birth was 1328, but all the evidence that there is to show on this matter points to a date considerably later. He was the son of a vintner named John Chaucer, but nothing is known of his education, and the earliest fact of his career that has been ascertained is that he is mentioned in the household book of the wife of Prince Lionel, second son of Edward III., in 1357. In 1359 he bore arms in France, and was taken prisoner at Retiers in Brittany, but he was ransomed the following year. The next mention of him occurs in 1367, when he is described as a *valettus* of the king, and from 1372 he is styled esquire. It is supposed that the marriage of Chaucer belongs to this period, but the whole circumstances are obscure. What alone is certain is that he received in 1374 a grant of £10 a year for life from the Duke of Lancaster in consideration of the good service which he and his wife, Philippa, had rendered the said Duke. It is thought that this Philippa was one of the ladies-in-waiting to Queen Philippa. She may have been, as some think, a cousin of the poet, but there is good reason to believe that she was the daughter of Sir Payne Roet. These connections increased his favor at court, and in 1367 he received from the king a pension of 20 marks. In 1372 he was sent to Genoa as a commissioner to negotiate a commercial treaty. On returning after a year he was appointed in 1374 comptroller of the customs on wool, skins, and tanned hides in the port of London, an office which was sufficiently lucrative. He was now in tolerably affluent circumstances, was employed by the court in various services, and in 1382 was appointed comptroller of the petty customs in the port of London. In 1386 he was returned to Parliament as knight of the shire of Kent, but in the same year his fortunes fell with those of his patron, John of Gaunt. He was deprived of both his comptrollerships, and thus reduced to a condition of comparative want. Three years later he was again in favor. Though not restored to the offices he had formerly held, he became clerk of the king's works at Westminster Palace and elsewhere, with permission to appoint a deputy. In 1391 he lost this place, but about the same time became a forester of North Petherton Park, Somersetshire. In 1394 he was granted an annuity of £20 for life by the king, and five years later Henry IV. added 40 marks to this, so that at his death his circumstances should have been quite comfortable. Chaucer's most celebrated work, which, although possibly begun in his earlier years, was certainly not all written till near the end of his life, is the 'Canterbury Tales.' These are all in verse, except the 'Tale of Melibœus' and the 'Parson's Tale.' The work remains unfortunately incomplete. The 'Tales' are distinguished for variety of character-painting and liveliness of description, and are marked alike by humor and pathos. In them, as in others of his works, Italian influence is clearly seen; and that Chaucer borrowed from Boccaccio is well known; yet, as Prof. Hales remarks, "For what is best in his best works he is debtor to no man." Chaucer's principal works besides the 'Canterbury Tales' (first printed by Caxton in 1475) are: 'The Boke of the Duchesse' (1369); 'The Assembly of Foules' (1374); 'Troylus and Cryseyde' (1380–2); 'The Legende of Good Women' (1385); 'The House of Fame' (1386). He also translated Boethius, and wrote a treatise on the Astrolabe (1391). He was buried in Westminster Abbey. See Nicolas, 'Life of Chaucer'; Ten Brink, 'Chaucer: Studien zur Geschichte seiner Schriften' (1870); Lounsbury, 'Studies in Chaucer' (1872); Skeat, 'The Chaucer Canon' (1900).

Chaucer, The Student's, a complete edition of the poet, edited by Walter W. Skeat (1895). In addition to the complete text of all the writings of Chaucer, the volume has a Glossarial Index fully adequate to explain words not known to the English reader to-day.

Chauci, kâ'sī, an ancient Teutonic tribe, dwelling between the Ems and Elbe on the shore of the German Ocean. They were a peaceful people and lovers of justice. Nothing is said of them in history after the 5th century.

Chaudesaigues, shōdz-āg ("warm waters"), France, a watering-place in the department of Cantal, 28 miles east-southeast of Aurillac. The warm springs have their rise in a volcanic mountain, and are so copious that the water is used from November to April in heating the town. Besides the five hot springs there are three cold springs. Pop. (1901) 1,070.

Chaudet, Antoine Denis, äṅ-twäṅ dŭ-nē shō-dā, French sculptor: b. Paris 31 March 1763; d. there 19 April 1810. In his 21st year he obtained the first prize of the Academy, and went to Rome, where he studied the masterpieces of the ancients. On his return he became a member of the Academy. His first work was a bas-relief under the peristyle of the Pantheon. Among his other works are 'La Sensibilité,' a young girl astonished at the motion of the sensitive plant, which shrinks from her touch; the statue of Cyparissa, etc. Chaudet also excelled as a painter.

Chaudfontaine, shō-fŏn-tān, Belgium, a village in the province and four miles from Liége, on the Vesdre, with hot springs much frequented in summer. Pop. (1897) 1,811.

Chaudière, shō-dē-ār, a river of Canada, which has its rise in Maine, near the source of the Kennebec, and flows north for 120 miles and joins the St. Lawrence about six miles above Quebec. Between two and three miles above its mouth it forms the Chaudière Falls. Chaudière Lake is an expansion of the Ottawa River just above the city of Ottawa.

Chauffeur, shō-fėr (Fr. a "stoker"). This term has recently come into use in the English language to designate at first the engineer or motorman of a steam-driven road carriage; but

by extension it is now applied to any professional machinist who operates an automobile, electrically or otherwise propelled.

Chauffeurs, shō-fėr, or **Garrotteurs,** gă-rŏt-tėr, an organization of brigands during the Reign of Terror in France. Their headquarters were first in the forest of Orgères, near the city of Chartres, and afterward they infested other parts of the country in bands organized under the leadership of Johann Buckler, surnamed Schinderhannes, until 1803, when the measures adopted under the consulate put a stop to their depredations. They garrotted their victims, and tortured and burned (*chauffé*) their feet to make them disgorge their treasures. While engaged in burglaries they put a black veil over their faces or painted them with soot.

Chaulmugra, châl-mŭg'ra (*Gynocardia odorata*), a tree of the order *Bixaceæ*, which grows in eastern countries, and from the seeds of which an oil is obtained that has been long known and highly valued in India and China as a remedy in skin diseases. The oil has been introduced into Great Britain, and is said to be useful in rheumatism, sprains, etc.

Chaumette, Pierre Gaspard, pē ār găs-pār shō-mĕt, French revolutionist: b. Nevers 24 May 1763; d. 13 April 1794. The opening of the Revolution found him a clerk at Paris. He attached himself to Camille Desmoulins, and soon gained such popularity by his extravagant sansculottism that he was appointed procurator of the commune of Paris. In his zeal he rejected his own Christian name, Pierre, as having been sullied by saintly associations, and styled himself "Anaxagoras." The institution of the tribunal of the Revolution, the decree for a revolutionary army, and the law against suspected aristocrats, were largely due to his efforts. One of his proposals was that all Parisians should wear sabots, another that the Tuileries and Luxembourg gardens should be planted with potatoes. His antics in connection with the "worship of reason" excited the disgust of Robespierre, who devised measures for bringing the whole company of actors under Hébert to the scaffold.

Chaumont, shō-mōn, France, the capital of the department of Haute Marne, on a height between the Marne and the Suize, 145 miles southeast of Paris by rail. It is well built, has a fine town-hall, court-house, communal college, public library, church dating from the 13th century, the ruins of a castle belonging to the counts of Champagne, and an iron bridge of 50 arches on which the railway crosses the Suize. There are manufactures of gloves, cutlery, leather, woolens, sugar, etc.; and a trade in the iron and iron goods of the department. Here was signed, March 1814, a treaty between Great Britain, Russia, Austria, and Prussia, in which these powers pledged themselves to accomplish the overthrow of Napoleon and restore peace to Europe. Philip Le Bon, the first who advocated the use of gas for illumination, in France, was a native, and his memory is honored by a bronze statute. Pop. (1901) town 11,697.

Chauncy, chân'sĭ, **Charles,** Puritan clergyman: b. Yardleybury, Hertfordshire, November 1592; d. 19 Feb. 1672. He was the second president of Harvard College, and the ancestor of all who bear the name of Chauncy (or Chauncey) in the United States. Educated at Westminster and Cambridge, he made the acquaintance of Archbishop Usher, and was appointed professor of Greek at Cambridge. Leaving that position soon after, he took the vicarage of Ware, Hertfordshire. His stern Puritanism involved him in a difficulty with the ecclesiastical judicatories on the publication of the 'Book of Sports,' and the railing out of the communion table. He was imprisoned and fined for his denunciation of these acts of the Church, and recanted, but soon repented of his recantation. He therefore determined to embark for New England, where he arrived a few days before the great earthquake, 1 June 1638. Here he was reordained, and for three years remained in Plymouth as assistant pastor, and then took the pastoral charge of the church in Scituate, Mass. There he remained until the change in the ecclesiastical polity of England, when he resolved to return to his vicarage in Ware, which had invited him home. But the first president of Harvard College, Mr. Dunster, resigning just at that time, the office was offered to Mr. Chauncy and accepted (1654), which station he held until his death. He was not a voluminous writer, and a few theological works and a number of sermons are all that remain of him. He was zealous against wearing long hair, and baptizing the children of non-communicants.

Chauncy, Charles, American minister, descendant of the preceding: b. 1 Jan. 1705; d. 10 Feb. 1787. He graduated at Harvard College in 1721, and was ordained pastor of the First Church in Boston in 1727. He was a copious writer, and published many works; among the rest, a 'Complete View of the Episcopacy,' being the substance of a discussion with Dr. Chandler, of New Jersey; 'Seasonable Thoughts on the State of Religion in New England'; 'Discourse on Enthusiasm'; 'Remarks on the Bishop of Llandaff's Sermon'; 'Mystery Hid from Ages, or the Salvation of all Men'; 'The Benevolence of the Deity.' He was for 60 years the minister of one parish.

Chauncey, Isaac, American commodore: b. Black Rock, Conn., 20 Feb. 1772; d. Washington 27 Jan. 1840. He commenced his career in the merchant service, in which he became distinguished for seamanship, enterprise, and energy. He entered the navy as lieutenant in 1799, and early in 1802 was appointed acting captain of the frigate Chesapeake, the flag-ship of a squadron ordered to the Mediterranean to operate against Tripoli. In the brilliant operations before Tripoli in 1804 he bore a distinguished part. In April 1806 he was promoted to the rank of captain. In the War of 1812 the naval superiority on the lakes became an object of high importance, and Commodore Chauncey, then in command of the navy yard at New York, was appointed to command on all the lakes except Champlain, winning the highest honors in this position. He commanded the Mediterranean squadron 1816–18 and at the time of his death was president of the navy commission.

Chauny, shō-nē, France, a town in the department of Aisne, on the right bank of the Oise, 19 miles west by north of Laon. It has manufactures of glass, sugar, chemicals. etc. Pop. 9,927.

Chaus, kā'us, the native name for the East Indian jungle-cat (q.v.).

Chautauqua, sha-tâ'kwä, a popular educational centre on Chautauqua Lake in the southwestern part of New York State. It is an incorporated town, 165 acres in extent, on the upland terraces of the lake, at a high elevation, although lying in a lowland corner of the State. Chautauqua is 70 miles south of Buffalo, 200 miles north of Pittsburg, and 450 miles west from New York. It is reached by the Pennsylvania and Erie railways. Chautauqua has numerous large and commodious school buildings; several thousand cottages in the woods; an hotel called "The Athenæum"; a few shops or "stores"; a plain college building on a hilltop, with a beautiful lake-environment; a so-called "hall of philosophy," which is a wooden temple with supporting pillars, open to the summer breeze, and seating 3,000 people; and a vast amphitheatre, like a Greek theatre dug out of a hillside, but well roofed, well lighted by electricity, and capable of seating 5,000 or 6,000. For nine months of the year it is a town of 1,000, but during the summer, while the classes are being held, has a population ranging from 30,000 to 60,000.

As an educational institution Chautauqua has become a centre of great importance. It may be considered primarily as an unconscious educational adaptation of the open-air public assembly such as the American mass-meeting or town-meeting, or the religious camp-meeting. The Chautauqua Assembly was established by Lewis Miller in 1874 at Fairpoint, for Bible study and the training of Sunday-school teachers. But the ideal and purpose of the assembly were gradually broadened; and to the specifically religious study a great variety of subjects were added. The religious spirit, however, pervades the work of the assembly. The best exponent of the spirit of the institution was its chancellor, Dr. John H. Vincent. He infused into it the idea that all sound learning is sacred, and that the secular life may be pervaded by religion.

The work done at Chautauqua has been thus summarized in one of the New York State bulletins: "For the many there are popular lectures, concerts, entertainments; for a somewhat less number there are philosophical, scientific, and literary lectures in progressive courses; for the comparatively few are provided means for careful study under able and well-known instructors." The work may be further classified as follows: (1) the college of liberal arts, instruction in languages, mathematics, psychology, political economy, science, etc., by well-known men, continued during the winter by correspondence; (2) school of pedagogy; (3) schools of sacred literature; (4) classes in art, music, physical education, etc.; (5) lecture courses, similar to the university extension lectures, without extra fee; (6) public lectures and addresses by those prominent in various departments; (7) recreative entertainments, concerts, recitals, stereopticon exhibitions, etc.

An important part of Chautauqua's influence is made effective through classes and courses for home study; prominent among these being the Chautauqua Literary and Scientific Circle (C. L. S. C.), founded in 1878. The C. L. S. C. is a well-directed system of home reading in literature and science, carried on in connection with local reading circles, and practically aided by many good suggestions in a monthly magazine called 'The Chautauquan.' The course of reading occupies four years, which are called respectively the Greek year, the Roman, the English, and the American, from the relative prominence given to the history and literature of those four peoples. The text-books on England and the United States, Greece and Rome, and other subjects, social and economic, are prepared by good writers representing American colleges and universities. With the regular courses in history are combined corresponding literary courses and studies in art, religion, and natural science. In the American year, the special subjects are religion, American history, literature, government, diplomacy, social institutions, and physiology.

The entire expense for the required books and the illustrated magazine is about $5 per annum. The text-books are now written by Chautauqua specialists, and published by the assembly. The course of reading is carried on by Chautauquans at home, but once a week they meet in local circles in neighborhoods and villages all over the country and, under the best local guidance they can find, devote an evening to the discussion of topics suggested by 'The Chautauquan' and other private reading. The number of these local reading circles during the past 20 years has been about 10,000, and the total enrollment of Chautauqua readers has been about 250,000. By far the larger number fail to complete the four years' course, but it is estimated that about a half have done consecutive reading for two years. A "saving remnant" of about 40,000 continue to the end and win a simple certificate. The graduates are also encouraged to form local educational clubs and continue special study.

Next in importance to the C. L. S. C. are the "schools," wherein definite class instruction, begun under competent direction at Chautauqua, is continued by correspondence with the professor or representative of the "school" throughout the year. This combined work done in residence and by correspondence may, in a few rare cases, lead to the degree of bachelor of arts or bachelor of science, conferred, however, only after searching tests. The degree-giving power is vested in the regents of the University of the State of New York, whose academic honors are, by State examinations, better guarded than are those of some academic corporations in America. A great variety of regular and advanced work is offered; including courses in history, science, pedagogy, and theology (for which the degree B.D. is given).

The "Chautauqua idea," of which much has been said and written, is best expressed by Bishop Vincent, who says: "Chautauqua pleads for universal education; for plans of reading and study; for all legitimate enticements and incitements to ambition; for all necessary adaptations as to time and topics; for ideal associations, which shall at once excite the imagination and set the heart aglow. . . . A college is possible in every-day life if one choose to use it; a college in house, shop, street, farm, market, for rich and poor, the curriculum of which runs through all of life, a college which trains men

and women everywhere to read and think and talk and do; . . . this is the 'Chautauqua idea.' »

Chautauqua Lake, a beautiful lake situated in Chautauqua County, N. Y. It is 18 miles long and from one to three miles wide, the highest navigable water on the continent, 730 feet higher than Lake Erie and 1,400 feet above the sea-level. Chautauqua was the Indian name for this lake, the shores of which are a natural «divide» between waters which flow northeastward with the St. Lawrence from the Great Lake district and waters which flow southwestward to the Mississippi River and the Gulf of Mexico. On its banks is the village and summer resort of Chautauqua, the centre of a religious and educational movement of large and growing interest. See CHAUTAUQUA.

Chauveau, shō-vō, **Pierre Joseph Olivier,** Canadian statesman and writer: b. Quebec 30 May 1820; d. there 4 April 1890. Among his contributions to literature were many popular poems, including 'Simple Joys,' 'Donnaconna,' 'Letters to M. de Puibusque,' also 'Tour of H. R. H. Prince of Wales in America' (1861), 'Souvenirs and Legends' (in prose and verse) (1877), and 'François Xavier Garneau, His Life and Works' (1883).

Chauveau-Lagarde, lä gärd, **Claude François,** klōd fräṅ-swä, French advocate: b. Chartres 1756; d. 1841. He studied law in his native town and began to practice in Paris shortly before the outbreak of the Revolution. He became celebrated for his eloquent defense of those on trial in the Reign of Terror. He was the advocate of Marie Antoinette at her trial and also of Charlotte Corday. Others of his clients were Brissot and Madame Elizabeth of France. His defense of Mirandola saved the latter from the scaffold. In 1814 he was ennobled by the government of the Restoration and two years later he published an account of the trial of Marie Antoinette and Princess Elizabeth.

Chauvenet, shō-vē-nā', **William,** American astronomer and mathematician: b. Milford, Pa., 24 May 1819; d. St. Paul, Minn., 13 Dec. 1870. He was graduated at Yale in 1839, and became instructor in mathematics at the Philadelphia Naval Asylum in 1841, professor of mathematics and astronomy at the United States Naval Academy in 1845, and professor of astronomy at Washington University, St. Louis, in 1859. In 1862 he became chancellor of the last institution. He wrote 'Spherical and Practical Astronomy,' 'Elementary Geometry,' and similar works.

Chauvinism, shō'vĭn-ĭzm, a French word derived from Nicolas Chauvin, a soldier of the French Republic and of the First Empire. His name became a synonym for a passionate admirer of Napoleon, and the word Chauvinism was formed to signify the almost idolatrous respect entertained by many for the First Emperor, and generally any feeling of exaggerated devotion, especially of patriotism. A vaudeville, 'La Coquarde Tricolore,' in which there was a character named Chauvin, with a song that became immensely popular, fixed the word in the French language. The word is now used to express exaggerated patriotism of an aggressive type, jingoism, etc.

Chaux-de-Fonds, shō-dė-fôṅ, **La,** Switzerland, a town in the canton of Neuchâtel, and nine miles northwest of the town of Neuchâtel, in a deep valley of the Jura. Chaux-de-Fonds and the neighboring village of Locle are the chief centres of watch-making in Switzerland. Pop. 35,971.

Chaves, Francisco de, fräṅ-thēs'kō dā shä'vĕs, Spanish soldier of the 16th century: d. Lima, Peru, 26 June 1541. He was a trusted companion of Pizarro in the conquest of Peru, but disapproved of the execution of the Inca, Atahualpa. About 1539 he was sent out by Pizarro to settle Conchucas, but within a few months was assassinated at the same time as his leader.

Chaves, Brazil, a small town in the province of Para, on the north coast of the island of Marajo, at the mouth of the Amazon. Pop. 8,500.

Chaves, shä'vĕsh, Portugal, the ancient AQUÆ FLAVIÆ, a town of the province of Tras-os-Montes. The fortifications which once defended it are now in ruins. It is situated on the Tamega River, here crossed by a Roman bridge, 12 arches of which remain out of the original 18, and has hot saline springs and baths. It has an interesting church, the burial place of Alfonso I., Duke of Braganza. Linen manufacture is carried on in the town. In 1811, after a violent conflict, Soult obtained possession of the place; and after the defeat of the Cartistas, 18 Sept. 1837, the famous Convention of Chaves was signed here. Pop. 7,500.

Chavica, kăv'ĭ-kạ, a genus of plants, of the natural order *Piperaceæ,* including the common long pepper, Java long pepper, and betel-pepper. The plants of this genus are shrubs very closely resembling those of the nearly allied genus *Piper,* and by some included in it. The leaves of the betel-pepper (*C.* or *P. betel*) form one of the ingredients of the masticatory called betel (q.v.).

Chay-root, chā-, or **Choy-root,** choi-, the roots of a small cinchonaceous plant of Hindustan, the *Oldenlandia umbellata,* extensively cultivated on the Coromandel coast. The roots yield a dye which is used as madder.

Chayote, chī-ō'tā, a climbing vine (*Sechium edule* or *Chayota edulis*), belonging to the *Cucurbitaceæ,* or gourd family. The leaves are strongly three-angled or -lobed, with the broadly cordate base also showing two or four sharp corners. They are deeply concave, have a rough surface with whitish veins, and in color are of a deep fresh green. The pistillate flowers are solitary; the much more numerous staminate flowers are borne on special branches. Pollination takes place through the agency of insects. The ovary is always one-celled, with a single ovule. It is mealy-pubescent when young, becoming spiny with maturity in some varieties. The mature fruits are always more or less compressed, as though built over the large flat seed. In general they are pear-shaped, but vary in their proportions. They weigh from eight ounces to a pound each, and fruits weighing three pounds have been reported. In flavor they resemble summer squash or vegetable marrow.

The chayote is produced in large quantities in Porto Rico for domestic consumption, and it

has recently attained popularity in Australia and Algeria, from which latter country many hundreds of tons are annually shipped to Paris and London. It bears shipment well, an eight- or ten-day journey not affecting its condition. It is in common use as a vegetable in Madeira, Mexico, Central America, the West Indies, California, and Louisiana. It was first reported in Europe by Francisco Hernandez, who found the plant in Mexico about 1560, and described the fruit as suggesting the flavor of roasted oysters, sweet potatoes, or chestnuts. It produces tuberous roots which resemble the yam or cassava. In Mexico the young shoots are sometimes boiled and eaten like asparagus. Both the fruit and the vine are used as fodder for cattle and hogs, and the vines are sometimes used for fancy basket-work and the manufacture of women's hats. The flowers yield an abundance of nectar, and are said to be of value to bees. As an ornamental vine the chayote takes high rank, a single vine being reported as covering a fence 6 feet high and 50 feet long in a few months.

The fruit is eaten in a variety of ways,—boiled and seasoned with pepper and salt; parboiled and fried; stuffed and baked: in puddings, tarts, or fritters, etc.

The name appears to be a form of the Aztec word *chayotl,* meaning "a head bristling with spines" or "a squash covered with thorns." The popular names are in many cases corruptions of the Aztec term, as the Porto Rican *tayote;* but in the West Indies and Australia it is known as *chocho;* in Louisiana as *mirliton;* and as "vegetable pear" in some parts of the British West Indies.

Chazars, chä'zärz, or **Khazars,** a people of the Finnic stock known in the 7th century on the shores of the Caspian; in the 9th century their kingdom occupied the southeast part of Russia from the Caspian and the Volga to the Dnieper. Their capital was long at Astrakhan, called by them Balandshar. They were singularly tolerant of all religions, Jewish, Christian, and Moslem; and a large part of the nation formally adopted the Jewish faith from Jews who fled from the persecutions of the Emperor Leo. It is not improbable that the modern Jews of Russia have at least an admixture of Chazar blood. Cyril converted many to Christianity in the 9th century. The power of the Chazars was broken in 965 by Sviatoslav. In the early part of the next century the destruction was completed by the Byzantine emperors and the Russians.

Chazy (shā-zē) **Stage,** in American geology, the limestone beds, 725 feet thick, typically developed at Chazy, N. Y. The name was first applied by the New York Geological Survey. The Grenville limestone of the Ottawa region in Canada corresponds to it. The Chazy limestone was laid down around the border of the old Pre-Cambrian land in Canada and New York in older Ordovician time. It succeeds the Calciferous and is succeeded by the Trenton. Though a well-marked division in New York and Canada it is not determined farther west, but the St. Peter's sandstone, which underlies the Trenton limestone in Iowa, Michigan, and Wisconsin, may be of Chazy age. See ORDOVICIAN.

Che-Kiang, chē-kē-ăng', or **Che-Chiang,** China, a maritime province lying north of Fu-kian and south of Kiang-se and including the Chusan archipelago; area, 39,150 square miles. The province is of great commercial importance, containing three treaty ports, Ning-Po, Wan-Chau (Wen-Chow), and Hang-Chau (Hang-Chow) all of which are to be connected with Shanghai by a projected railway under British control. The surface is mountainous and traversed by rivers, notably the Tsien-Tang and Ta-Kia, which run down to the Eastern sea. The Grand Canal, which has its gateway in Che-Kiang, affords the only means of internal communication apart from an extensive system of narrow foot roads. Trade in silk and tea is well developed, this province being, with Chiang-Su and Fu-Shien, the first to contain a treaty port, that of Ning-Po, opened in 1844. Beside tea and silk the province produces cotton and sedge for hats and mats. It imports opium, cotton and woolen goods, tin and iron, kerosene oil, indigo and sugar. Coal is found in the north and iron ore in the south.

Che-Kiang is famed for its native system of education. It contains the great religious and literary centre of China, Hang-Chow (not to be confused with Hang-Kow or Han-Kow), where thousands of candidates yearly resort for the public examinations. Hang-Chow is also the capital of the province, which is ruled by a viceroy. Marco Polo visited Che-Kiang in the 14th century, when it contained beautiful temples, now in ruins. The most magnificent architectural feature of the province is the temple of the Queen of Heaven, dating from 1680. Che-Kiang suffered severely during the Tai-ping rebellion in 1861. The Italians in 1900 laid claim to part of Che-Kiang as a sphere of influence, and demanded the privilege of establishing a port on the coast to be called San Mun. There are thousands of native Christians. The last census (1882) gave a population of 11,588,692. The population in 1900 was estimated at 15,000,000. The foreign population is estimated (1900) at 2,750.

Cheap'side (M. E. *chepe,* market) a thoroughfare of London, running east and west through a part of the city that was in former times a large, open common. In the Middle Ages Chepe was the chief seat of the London retail trade.

Cheat. See BROME GRASS.

Cheat River, a river rising in the Alleghanies in West Virginia, and after the union of its four forks, flowing north and then northwest to empty into the Monongahela a few miles beyond the boundary line of Pennsylvania. Its length is about 150 miles.

Cheboygan, Mich., city and county-seat of Cheboygan County, on Lake Huron, and on the Michigan Central and the Detroit & M. R.R.'s, at the eastern end of the Straits of Mackinaw. It became a city in 1886 and is governed by a board of 10 aldermen. It is an agricultural centre, a popular summer resort, and manufactures lumber, paper, leather, and furniture. It has nine churches and an excellent public school system. Pop. (1900) 6,489.

Check, or Cheque, a draft or bill on a bank, payable on presentation. A check may be drawn payable to the bearer, or to the order of someone named; the first form is transferable

without endorsement and payable to any one who presents it; the second must be endorsed, that is the person in whose favor it is drawn must write his name on the back of it. Checks are a very important species of mercantile currency wherever there is a well-organized system of banking. The regular use of them for all payments, except of small amount, makes the transfer of funds a mere matter of cross-entries and transferring of balances among bankers, and tends greatly to economize the use of the precious metals as a currency.

Check'erberry. See GAULTHERIA; PARTRIDGE BERRY.

Checkers, Chequers, or Draughts, a game of skill played by two persons with a checkered board divided into 64 squares, which are alternately colored black and white or black and red, and with 24 small disks of wood or bone technically termed "men," 12 being usually colored black, and the others white or red. At the beginning of the game each player places his men on alternate squares (of the color agreed on) of the first three rows of his side of the board, which is so placed between the two players that each one has at his right hand one diagonal line of two squares of the color chosen to play on (the rule being technically known as "double corners at the right hand"). This leaves the two middle rows of the board unoccupied. The privilege of the first move is determined by lot or in any manner agreed upon; after the first game of a series the first move passes alternately.

The first player advances any one man in his foremost row one square diagonally; his opponent likewise moves a man; and so on alternately until one player exposes a man to capture by leaving a vacant space behind him on a diagonal line on which stands next him a man of the opponent. Capture is effected by the leaping of such "enemy" over the man so exposed and occupying the vacant space, on which the man so taken is removed from the board. For failure to seize the opportunity to take a man prisoner, the opponent may compel the capture of the piece, or he may remove the delinquent from the board,—an operation known as "huffing." (Under certain rules of the game, the "huff" carried with it the privilege of the next move. This is not in common use at the present day. The player who first puts out of action all his opponent's men wins the game. Putting out of action may be accomplished either by capture or by so hemming in the opponent's men that they cannot move. If a player succeeds in getting a man across the whole board into the enemy's rear line of squares, it thereby becomes a "king," with the privilege of moving diagonally in either a backward or forward direction. A "king" is usually distinguished or "crowned" by placing a disk of the same color on its top. More than one man can be captured at a time if they stand in such order on the board that the series consists of a man and a vacant square alternately, and this series may be in a straight diagonal, or in any branching diagonal therefrom, provided the progress of the capturing man be never retrograde,—always toward the king line.

Checkers is a very ancient game. A form of it, of great antiquity in China, is known by the appropriate name of "the game of circumvention." It was well known by the Egyptians, Greeks, and Romans, and antiquarians have recognized it as one of the games indulged in by the, practically, recently discovered New Zealanders, who for thousands of years must have been cut off from all Asiatic or European influences. The first English publication relating to it was published in 1566, but the most important early book was Wallet's, published in Paris in 1668. The leading authority is Joshua Sturgis, 'Guide to the Game of Draughts.'

For laws, hints, and diagrams of the American game, as well as for references to the Polish and Spanish varieties, see A. Howard Cady, 'Checkers, a Treatise on the Game.'

Cheddar, chĕd dẽr, England, a village in Somerset County, at the foot of the Mendip Hills, 18 miles southwest of Bristol. The dairies in the neighborhood have long been famous for the excellence of their cheese, which is made from the whole milk, and the whey skimmed off, heated, and added to the curd. Pop. about 2,000.

Cheddar Cheese. See CHEESE.

Chedorlaomer, kĕd-ôr-lā-ō'mẽr, a king of Elam, mentioned in the 16th chapter of Genesis as one of the confederates of Tidal, "King of Nations," in the expedition against the king of Sodom and other rebellious tributaries. See ABRAHAM.

Cheduba, chĕ-doo'ba or chĕd'oo-ba, or **Man-aung,** Burma, an island in the Bay of Bengal, about 25 miles off the coast of Aracan, forming a township of Kyauk-pyu district; area, 240 square miles. On the island is a town of the same name. Cheduba is well wooded and fertile, but unhealthy. On the northwest coast inflammable gasses are discharged in some quantity. The principal product is an excellent tobacco. Rice, indigo, pepper, are also produced; and petroleum is found. Pop. 24,000.

Chee-foo, chē-foo', or **Chafoo** (properly the name of the European colony of the Chinese town of Yen-Tai), a treaty port on the north side of the peninsula of Shan-tung, at the entrance to the Gulf of Pechili, in which it is the only port that remains open throughout the winter. The foreign quarter is in some sense a colony of Shanghai, and, having the best climate of all the treaty ports, it is much resorted to by convalescents. The Chinese town has fortifications and a signal-station. As a market for foreign manufactured goods, particularly English cotton yarn and American sheetings, Chee-foo is of great importance. The other principal articles of import are sugar, paper, iron, edible seaweed, matches, and opium. The chief exports are silk, straw-braid, bean-cake, beans, and vermicelli. The Chee-foo Convention, which settled several disputed points between China and Great Britain, and extended certain commercial advantages to the latter country, besides throwing open four new treaty ports, was signed 13 Sept. 1876. Since then the "open door" policy of the United States has tended to widen the relations of this port with the rest of the commercial world. In 1899 American merchandise found a market in Chee-foo to the extent of over $3,000,000. The port was the scene of a naval demonstration in 1900, when British and American warships threatened to bombard the forts if their hostile attitude was

not abandoned. There were 150 missionaries in the city, whose rescue from peril was thus effected. Pop. about 32,000.

Cheecha, chē'chä. See GECKO.

Cheer'yble Brothers, two merchants introduced in Charles Dickens' novel 'Nicholas Nickleby.' They are twin brothers of a very genial and liberal disposition and become staunch friends of the hero. It is said that the novelist reproduced in these characters two cotton-spinners of Manchester.

Cheese and Cheese-making. Cheese is the curd of milk, including principally the casein and fat, coagulated, cooked, drained, and pressed into solid form. Nearly all cheese is made from cows' milk, and originally it was a product of the farm. Now by far the greater portion is made in factories especially fitted for the purpose. The standard factory-made American cheese is practically identical with the English Cheddar cheese, and is often so called.

In the manufacture of cheese a milk rich in fat is preferred, the cheese being nearly all fat and casein. By artificial souring of the milk coagulation is produced, so that the whey or watery part may be separated from the curd. The curd is the raw material operated on; the casein is a proteid substance that may be compared to lean meat, and is coagulated by acid. It is that part of the curd that remains when the fat, sugar, and ash are extracted. The first process of manufacture is to heat the milk (preferably sweet milk) to about 84° F. It is then tested with rennet for ripeness. A graduated cup provided with a fine hole in the bottom is filled with milk and a little rennet added. Rennet, in its commercial form, is a preserved extract from the fourth stomach of a calf. Being of a peptic character it tends to coagulate the milk, and if the milk in the cup coagulates in from 17 to 20 seconds it is sufficiently ripe for treatment. Enough rennet is then added to the supply of milk to coagulate the whole in 25 or 30 minutes. The proportions vary with conditions, but about four ounces of rennet extract to 100 gallons of milk is perhaps an average quantity. When the milk is coagulated, the solid portion or curd in the vat is separated from the watery portion, by allowing the latter to drain off. This waste usually become food for pigs. Gang knives are then brought into use, to cut the curd into cubes of a third of an inch or more, the knives being set a little less than half an inch apart and passed through the curd horizontally and perpendicularly. After cutting, the curd is gently agitated to prevent settling. This allows the curd to shrink, and tends to expel a portion of the whey. The stirring may be done with a curd-rake, but factories more commonly employ what is termed an automatic curd-agitator, which is attached to the vat and driven by steam power.

The mass of curd is next heated very slowly to about 92° F. This cooking process may continue several hours, lasting until the operator finds that the curd will string about a quarter to a third of an inch on a hot iron. The whey is then drawn off. The curd is next turned and piled, to rid it of the excess of moisture. When deemed sufficiently solid it is ground and salted. The grinding may be done in one of several kinds of mills, a common form having two cylinders with teeth rotating toward each other, which operation picks the curd to pieces.

After grinding, the curd — or cheese, as it may now be called,— is dipped and put into hoops to give it form for pressing. Common sizes of hoops are 14½ × 10 and 13½ × 6 inches. An iron bandage or rim is placed about the hoop to give it solidity, and a cloth wrapped about it to keep the cheese together and secure cleanliness. Pressure is then applied, at first lightly, and then increased, the cheese being usually turned over during the operation. The pressure is maintained for 16 to 18 hours, after which the cheese is ready to be cured.

Curing-rooms are built both above and below ground, the latter being preferred as being easier to maintain at a cool temperature. High temperature is very deleterious to cheese, diminishing its value by melting and leaking of fat, while the texture and flavor are also impaired. A temperature below 65° F. should always be maintained in the curing-room, and 40° is better. Ventilation must be provided, and the usual arrangement is an upright draft-pipe, run high enough to catch the wind, and with a vane at the top to turn the mouth of the funnel to the wind. The process called ripening takes place in the curing-room, determining the particular flavor of the cheese. The ripening is caused by bacteria, as is proven by making cheese from sterilized milk, in which case it retains the flavor of new-made cheese for a very long period. Dairy bacteriologists are endeavoring to isolate the different species of cheese bacteria, that they may be cultured, and incorporated with the milk in starting the cheese-making. In this way the maker would be certain of securing a particular flavor for his cheese, whereas now it is a matter largely of chance as to what bacteria predominate.

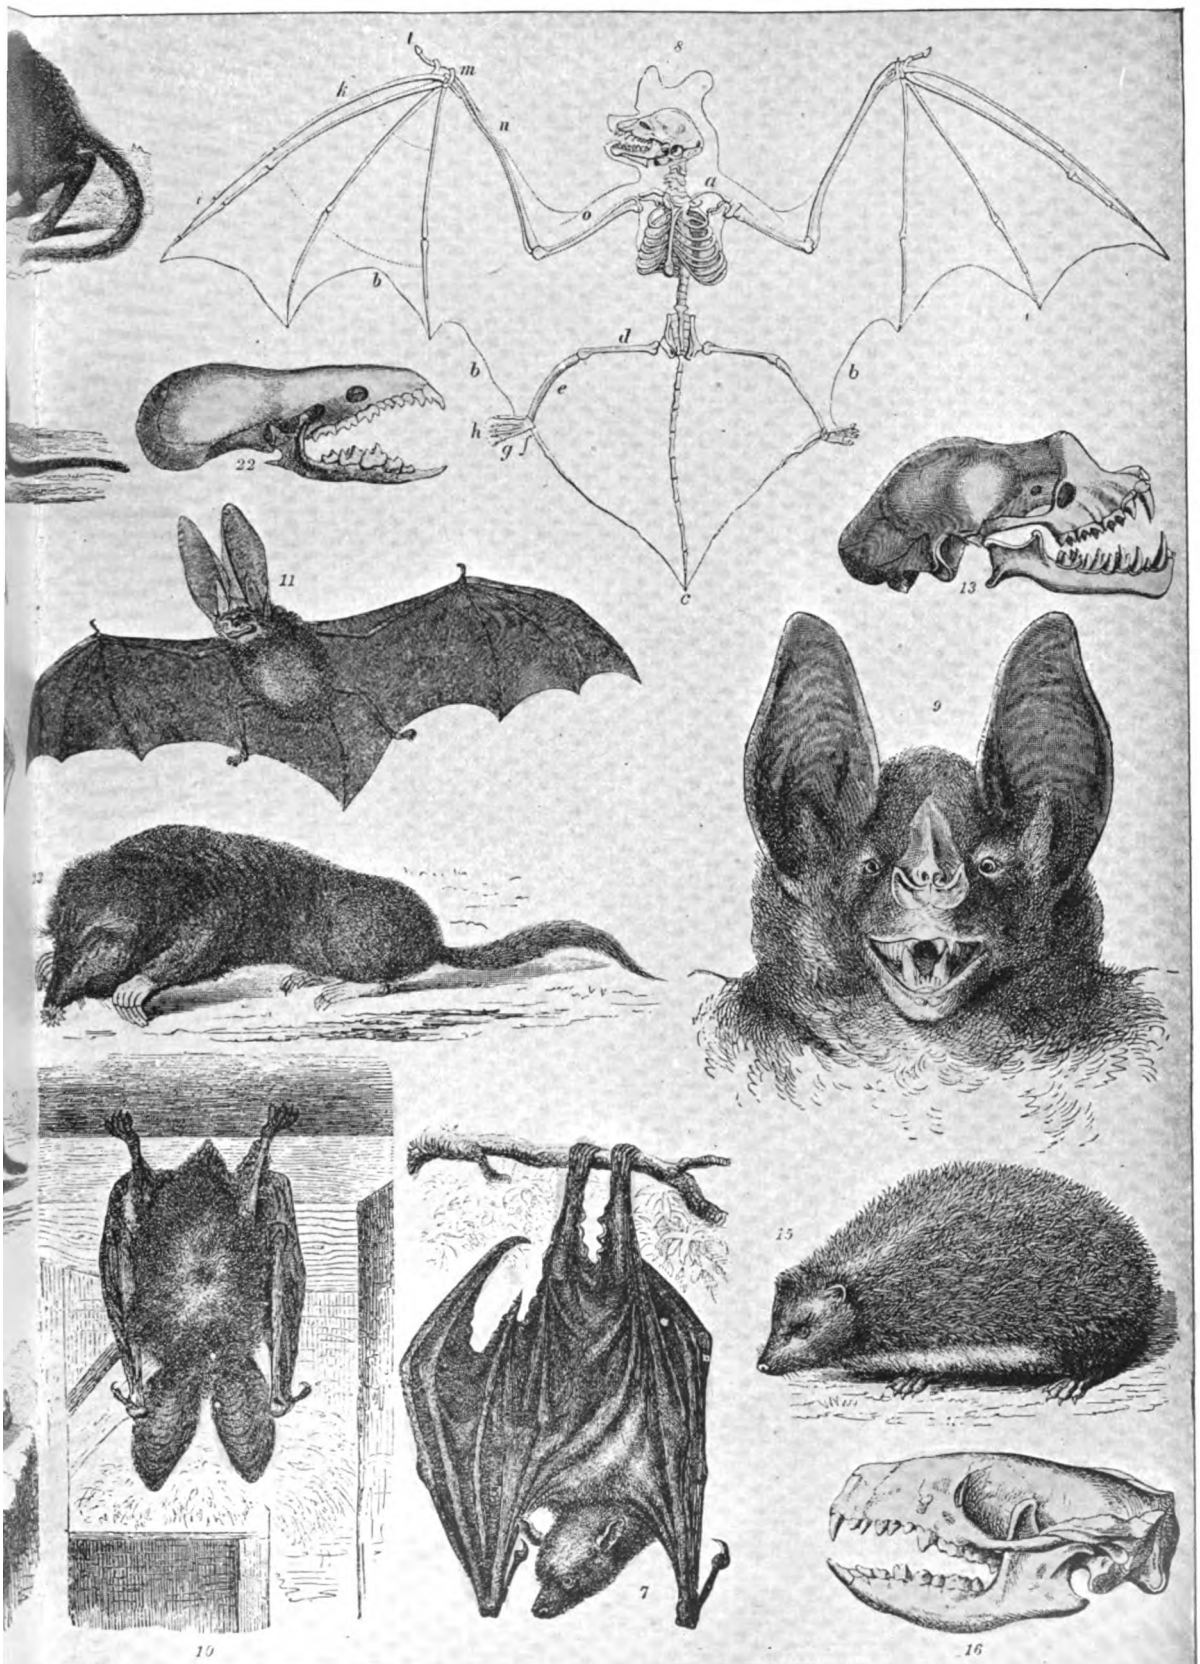
The method described above is that followed in practically all the factories of the United States and Canada. More than four fifths of the cheese manufactured is of this character. The remainder is farm-made, or made in urban dairies, or else is manufactured by some other process in imitation of some foreign cheese, as the Swiss Gruyère or Emmenthal, Limburger, Neuchâtel, Brie, etc.

The constituents of milk which determine its value for cheese-making are the fat and casein. Milk may contain from three to eight per cent of fat and from two to five per cent of casein, the average proportion being about a pound of fat to two thirds of a pound of casein. Since the cheese yield increases with the fat in the milk, managers of cheese factories have encouraged the production of milk rich in fat, and perhaps this knowledge is largely responsible for the fact that in 1900, in the factories of the United States, 100 pounds of milk made almost 17 per cent more cheese than it did in 1890.

The analysis of cheese is largely a matter of securing a correct average, as a cheese varies in properties at the centre or at the circumference. A wedge is generally taken as a sample, cut from the centre to the rind, or sometimes a plug, taken at one third the distance from the rind to the centre. The usual test of cheese is to find the proportion of fat. For this purpose the Association of Official Agricultural Chemists of the United States Department of Agriculture have adopted the following method:

Fig. [1] Slender Lori. [2] Foot of do. [3] Skull of do. [4] Black-fronted Lemur. [5] Skull of Flying Lemur. [6] Aye-Aye. [7] Flying
[13] Skull of Horse-shoe Bat. [14] Skull of common Bat. [15] Hedge-hog. [16] Skull of do. [17] Mole. [18] Skull of do.

U of M



Flying Fox. [8] Skeleton of a Bat. [9] Head of Vampire Bat. [10] Long-eared Bat hanging. [11] The same flying. [12] Common Bat crawling.
[13] do. [19] Common Shrew. [20] Skull of Water Shrew. [21] Elephant Shrew. [22] Skull of Alpine Shrew. [23] Canadian Mole.

Mau

For the estimation of fat in cheese about 5 grams should be carefully weighed, and transferred as completely as possible to a test bottle. From 12 to 15 c.c. of hot water are then added and the bottle shaken at intervals, keeping it warm until the cheese has become softened and converted into a creamy emulsion. This may be greatly facilitated by the addition of a few drops of strong ammonia to the contents of the bottle. After the contents of the bottle have become cold the usual amount of acid should be added and the bottle shaken until the lumps of cheese have entirely dissolved. The bottles are then placed in the machine and whirled, the test being completed in the same manner as with milk. To obtain the percentage of fat the reading should be multiplied by 18 and divided by the weight in grams of cheese taken.

Some cheese is colored by the makers, though the best requires no coloring. Saffron and arnotto are used for this purpose. Various herbs are also incorporated with the milk at the time of making the curd, to alter the appearance or flavor of the cheese. Common among these are sage leaves, marigold, and parsley.

A small proportion of the cheese used in the United States is imported. From 5,000,000 to 7,000,000 pounds a year of Swiss cheese are brought in, also some from France, Germany, and England. Such cheese is usually named from the locality whence it comes, though sometimes the name becomes distinctive of a special make, as the Roquefort, which is made from the milk of sheep, mainly the Larzac breed; the Kachkaval (Bulgarian), a white cheese made of sheep's milk; the Parmesan (Italian), which is kept three or four years and polished with linseed oil and charcoal till it shines like ebony; the Limburger (German), characterized by its strong odor; and the Brie (French), which is also odoriferous.

In 1900 there were 3,299 cheese factories in the United States, and 571 factories making both butter and cheese. New York and Wisconsin are the greatest cheese-producing States, their aggregate product being over two thirds the total of the whole country. In 1900 the 1,314 cheese factories of New York produced 127,795,195 pounds, and the 1,286 factories of Wisconsin 77,748,680 pounds. Ohio has 320 factories; Pennsylvania, 140; Michigan, 136; Illinois, 123; Iowa, 89; Vermont, 71; Minnesota, 53, while no other State has as many as 40. The total factory product of the whole United States in 1900 was 281,972,324 pounds; to this should be added 16,372,330 pounds made on farms, and 662,164 made in urban dairies, making a total cheese product for the year of 299,006,816 pounds. Valued at 10 cents a pound, which is an average wholesale price, it was worth nearly $30,000,000.

Previous to 1850 practically all the cheese made in this county was a farm product. During the period from 1850 to 1860 factories were established in New York State at the rate of three or four a year, and from the latter date the growth of the industry in New York was rapid, as follows: 1860, 17 new factories; 1861, 18 more; 1862, 25; 1863, 111; 1864, 210; 1865, 52; 1866, 46. Since that date the growth has been a normal one. A comparison of census figures for 1890 and 1900 affords a fair idea of the development. In 1890 the milk consumed by the factories of the United States amounted to 2,684,550,517 pounds, and in 1900 it was 2,741,898,114, an increase of only 2.1 per cent. The cheese made from this milk, however, showed a gain in quantity of 18.5 per cent, the product of 1890 being 238,035,065 pounds, against 281,972,324 for 1900. The cost of production increased more than the product, being 30.3 per cent, or $16,320,590 for 1890, and $21,258,712 for 1900. The value of the cheese product for the years named showed the greatest increase in percentage, namely, 33.9, the totals being $19,802,957 for 1890, and $26,519,829 for 1900.

The average cheese factory product, as shown by the United States census of 1900 is 72,842 pounds, representing about 730,000 pounds of milk, from about 290 cows. The milk from 1,130,000 cows for a little more than half the year supplies the total for the factories of the country.

During the decade from 1890 to 1900 only three States showed an increase in the farm-made cheese product,— Wisconsin, Pennsylvania, and California. The latter State produced 4,249,388 pounds of farm-made cheese in 1900, as against 2,676,543 pounds of factory make.

Cheese is lower in price during the summer months than at other seasons. Following are the wholesale quotations during the year 1901:

Month	New York		Cincinnati		Chicago		St. Louis	
	high	low	high	low	high	low	high	low
January	11¼	12	11	12	10½	11½	11⅛	11½
February	12	12½	11½	12	11½	11½	11	11½
March	12	12½	11½	12	11	11¾	12	12
April	11½	12½	11	12	11½	11¾	11	12
May	8½	9½	8½	12	10½	11¾	10	11
June	9	9¾	8½	9½	9	10½	10	10¾
July	9	9½	8½	9½	9½	10¼	10	11¼
August	9⅜	9⅞	9	10	10	10¾	11	11½
September	9½	10¼	9½	10	10	10¾	10½	11½
October	10¼	10¾	9½	10½	10	10¾	10½	11½
November	10¼	10¾	10	10½	9¾	10¾	10¾	11¼
December	10	11¼	10	10½	10	10¾	10¾	11¼

For further information regarding cheese see the United States Census reports, and reports of the New York State Agricultural Experiment Station and the Wisconsin Agricultural Experiment Station; also the year-books of the Department of Agriculture.

CHAS. H. COCHRANE.

Cheese-fly, a small, black, dipterous insect (*Piophila casei*) bred in cheese, of the same family to which the house-fly, blow-fly, etc., belong. It has a very extensible ovipositor, which it can sink to a great depth in the cracks of cheese, and lay its eggs there. The maggot, well known as the cheese-hopper, is furnished with two horny claw-shaped mandibles, which it uses both for digging into the cheese and for moving itself, having no feet. Its leaps are performed by a jerk, first bringing itself into a circular attitude, when it can project itself 20 to 30 times its own length.

Cheese-hopper. See CHEESE-FLY.

Cheese-rennet. See BEDSTRAW.

Cheeta, Cheta, Cheetah, or **Hunting-Leopard,** a large tropical cat (*Cynælurus jubata*) forming an offshoot of the *Felidæ*. Its length and slenderness of limb give it a fleetness in running short distances, such as is probably attained by no other large mammal. Its claws are short, blunt, and practically non-

retractile. It pursues its prey by chase rather than by stealth; and ordinarily exhibits more dog-like than cat-like qualities, among these being great docility. It can, however, stealthily come upon its prey if occasion demands. It is about the length of a leopard, but stands much higher, is rufous or tawny in color, spotted with black, except on the throat. It is commonest in the African jungles, and thence is more sparsely distributed to India. In India it is tamed and trained by the natives as a hunter. It is treated like a falcon, leashed, hooded, and kept blindfolded until the game is in sight, when it is loosed and darts upon the quarry, which it drags down and holds until the huntsman comes. The ancient monuments show that this leopard was employed by the Assyrian and Egyptian sportsmen of remote antiquity; and it is known that in the 14th century the returning Crusaders introduced the cheeta into Europe where it was used for some centuries.

Cheever, Ezekiel, American school teacher: b. London, Eng., 25 Jan. 1614; d. Boston, Mass., 21 Aug. 1708. He received a good classical education and emigrated to America in June 1637, in order to enjoy religious freedom. With Davenport and Eaton he was one of the founders of New Haven, Conn., where he married and taught school in his own house, Michael Wigglesworth being one of his pupils. About 1650 he removed to Ipswich, Mass., where he was the first master of its Free, or Grammar School; in 1661 he went to Charlestown in a similar capacity, and in 1670 was called to Boston as head master of its free school, and remained there the rest of his life. His 'Latin Accidence: an Elementary Grammar of the Latin Language,' was for a century the most popular introductory Latin text-book used in New England, 18 editions having been printed before the Revolution (10th ed. 1767; 20th ed. Salem 1785). He also wrote 'Scripture Prophecies Explained, in Three Short Essays,' an edition of which was printed at Boston 1757. His funeral sermon was preached by his pupil and friend, Cotton Mather.

Cheever, George Barrell, American clergyman: b. Hallowell, Me., 17 April 1807; d. Englewood, N. J., 1 Oct. 1890. He was editor of the New York 'Evangelist' from 1845 to 1846, and at different times connected with the New York 'Observer' and 'Independent.' He was an able and vigorous writer and speaker, and the author of a large number of works in prose and verse. Among his publications are: 'Studies in Poetry' (1830); 'God's Hand in America' (1841); 'Poets of America' (1847); 'Windings of the River of the Water of Life' (1849); 'The Voice of Nature to Her Foster-Child, the Soul of Man' (1852); 'Lectures on the Life, Genius, and Insanity of Cowper' (1856), arguing that Cowper's religious terrors proved him sane instead of insane; and 'God Against Slavery, and the Freedom and Duty of the Pulpit to Rebuke It' (1857). One of his most effective works was 'Deacon Giles' Distillery.'

Cheever, Henry Theodore, American prose writer and clergyman, brother of the preceding: b. Hallowell, Me., 6 Feb. 1814; d. Worcester, Mass., 13 Feb. 1897. His writings were popular, and include: 'The Island World of the Pacific' (1852); 'Short Yarns for Long Voyages' (1855); and 'Correspondences of Faith and Views of Madame Guyon' (1886).

Chehalis (chē-hā'lĭs) **River,** Washington, in the southwestern part of the State. It has its rise in Lewis County, flows north-northwest and through Chehalis County, into Gray's Harbor. Its length is 125 miles, and is navigable for light steamers some distance from the mouth.

Cheilognatha, or **Chilognatha,** kī-lŏg'na-tha, one of the two orders of *Myriapoda,* including the millipeds and other forms. See MYRIAPODA.

Cheilopoda, or **Chilopoda,** kī-lŏp'ō-da, one of the two orders of *Myriapoda,* represented by the centipeds. See MYRIAPODA.

Cheiromancy, or **Chiromancy,** kī'rō-măn-sĭ. See PALMISTRY.

Cheiromys, kī-rō'mĭs. See AYE-AYE.

Cheiroptera, an order of mammals, the bats, closely related to the insectivores, and characterized by the immense extension of the forelimbs so as to form wings, and by other adaptations of the skeleton for an aërial life. The order is divided into two groups: *Megacheiroptera* and *Microcheiroptera.* The former consists wholly of the great fruit-eating bats of the Old World tropics; the latter contains all the remaining families. They are separated principally by dental features. See also BATS.

Cheirotherium, kī-rō-thē'rĭ-ŭm. See LABYRINTHODONTA.

Cheke, chēk, SIR **John,** English scholar: b. Cambridge 16 June 1514; d. London 13 Sept. 1557. He was educated at St. John's College, Cambridge, and made regius professor of Greek. In 1544 he was appointed tutor to the future Edward VI., and appears likewise to have assisted in the education of the Princess Elizabeth. On the accession of Edward he was knighted, became secretary of state in 1553, and was also a privy-councilor. On the king's death he supported Lady Jane Grey, and was committed to the Tower. After a few months, however, he was set at liberty and settled in Strasburg; but his connection with the English Protestant Church there gave offense to the Roman Catholics in England, and his estates were confiscated. He supported himself by teaching Greek, but in 1556, having been induced to visit Brussels, he was arrested by order of Philip II. and sent prisoner to England. Under threat of the stake he recanted, and received the equivalent of his forfeited estates. His chief distinction was the impulse given by him to the study of Greek.

Chel-ab-ku-kil, or **Ab-ku-kil-chel,** an Indian priest of Yucatan who flourished in the 15th century. His name is mentioned in almost every Yucatanic legend, and fragments of history composed by him are found in documents of the missions of Yucatan and Central America.

Chelan (chē'lăn) **Lake,** Washington, in the mountains of Okanogan County, 70 miles long, about 3 miles wide, and the largest lake in the Northwest. Its chief inlet is Stehekin or Pierce River, on which, about three miles distant from the lakes, are the famous Rainbow Falls, 300 feet high. The outlet is Columbia River. Chelan, Moore, Stehekin, and Johns, towns on its banks, are summer resorts.

CHELONE (TURTLE-HEAD).

May

Chelard, shĕ-lär, **Hippolyte André Jean Baptiste,** French musician and composer: b. Paris 1 Feb. 1789; d. Weimar, Germany, 12 Feb. 1861. After studying in the various musical centres of Europe, he brought out his first comic opera, 'Casa da Vendere,' in Naples in 1815. In 1816 he settled in Paris as a teacher of music and violinist. In 1827 his lyrical opera, 'Macbeth' (with words by Rouget de Lisle) was very successful, and procured for him the place of chapel master to the king of Bavaria. He produced other operas, cantatas, etc.

Chelléan, shĕl-lā-ăn, this name is given by French archæologists to certain leaf-shaped flint implements found near Chelles in the department of Seine-et-Marne, and supposed to be the oldest relics of prehistoric man in Europe. The name is also given to the epoch, early Pleistocene, in which the makers, who were of the Neanderthal, lived. The climate then was warmer and more moist than now, so much so that the hippopotamus and rhinoceros inhabited Europe. It is impossible to say what was the equivalent of the Chelléan epoch in the United States, though, perhaps, it was equivalent to one of the earlier retreats of the continental ice sheet in the glacial period. See GLACIAL PERIOD; MAN; PLEISTOCENE.

Chelles, Jean de, zhŏn dė shĕl, French architect and sculptor of the 13th century. He is best known for his work on the southern portal of Notre Dame in Paris. This beautiful entrance remains as it was constructed in 1257.

Chelmonski, chĕl-mŏn'skē, **Joseph,** Russian painter: b. Varsovia. He studied in Paris under Gerson, and has made a reputation by his landscapes and figures.

Chelmsford, chĕmz'fėrd, **Frederic Augustus Thesiger,** 2D BARON, English general: b. 31 May 1827. Entering the army in 1844, he served in the Crimea and through the Indian mutiny. As deputy adjutant-general he served in the Abyssinian campaign, was made aide-de-camp to her Majesty, and adjutant-general to the forces in India (1868–76), and in 1877 was appointed commander of the forces and lieutenant-governor of Cape Colony. He restored Kaffraria to tranquillity, and was given the chief command in the Zulu war of 1879. After great difficulties with the transport, and some disasters, such as those of Isandhlwana and Intombi, he gained the decisive victory of Ulundi on 4 July, before the arrival of Sir Garnet Wolseley, who had been sent to supersede him. On his return to England he became lieutenant of the Tower, a post which he held till 1889. He was promoted to the rank of lieutenant-general in 1882, and in 1888 was created a general. In 1893 he went on the retired list.

Chelmsford, England, a municipal borough and capital of the county of Essex, 29 miles northeast of London, situated at the confluence of the Chelmer and Cann. There is a good municipal water supply, and the streets are lighted by electricity. The church of St. Mary is a fine old building of the 14th or 15th century. Among the public buildings are the corn-exchange and the shire-hall containing the courts of assize. There are manufactories of agricultural implements, electric lighting, and wireless telegraphy works; and a considerable trade in corn and malt is carried on. On the banks of the Chelmer are several large flour-mills. The town gives name to a parliamentary division of the county. The Romans had a station on the site of Chelmsford, and Roman remains have been found in the neighborhood. Pop. (1901) 12,580.

Chelone, kē-lō'nē, in Grecian mythology, a nymph who, having failed to be present at the marriage of Zeus and Hera, and having ridiculed their nuptials, was plunged with her house by Hermes into the river on whose banks she dwelt, changed into a tortoise, and thus condemned for ever to carry her house upon her back.

Chelonia, kę-lō'nĭ-ą, or **Testudinata,** tĕs-tū-dĭ-nā'tą, an order or sub-class of *Reptilia* (q.v.) containing the turtles and tortoises, and one of the most sharply defined groups of vertebrates. The body is enclosed in a more or less well developed bony box, from which the head, neck, tail, and two pairs of limbs protrude, and into which they may be completely retracted in some tortoises and terrapins. This box is a unique feature among reptiles and is divided into a dorsal shield or carapace composed of numerous dermal bones usually arranged regularly and supported on the ribs and vertebral spines, and a ventral shield or plastron likewise composed of dermal bones, among which are incorporated the clavicles and interclavicle. Both carapace and plastron are usually encased in horny plates, which do not correspond to the bony pieces. Except for the head and neck, which are flexible, the vertebræ are immovably ankylosed with the carapace. The skull is very compact, with a small brain cavity, and exhibits many structural peculiarities, of which two of the most apparent are the complete fixation of the quadrate bone, and the substitution of horny cutting plates for teeth on the margins of the jaws. Both shoulder and pelvic girdles are permanently enclosed within the shell, and the latter is often firmly united to both carapace and plastron. The limbs may be flattened paddles in the sea turtles, or true walking legs with free toes in the other groups. All chelonians have well developed lungs; but some aquatic forms have additional respiratory organs in the form of vascular areas and papillæ in the pharynx and œsophagus. Without any known exceptions, they are oviparous, and, after burying the eggs in the earth, allow them to be hatched by the warmth of the sun. Except in the colder regions turtles are found throughout the world, and are mostly inhabitants of fresh water, though a considerable number are terrestrial and a few marine. Between 200 and 300 living, and a great many extinct species are known, many of the latter belonging to families not represented in the recent fauna. The chelonia are divided into four sub-orders:

1. *Athecæ,* in which the carapace is of leathery consistency and is supported by numerous small, irregular, separate bones free from the ribs. There is one family (*Dermatochelydidæ*), containing the leather-turtle (q.v.).

2. *Trionychoidea,* with a true carapace composed of dermal bones united to the ribs, but covered by a leathery skin, and lacking the marginal bones; the pelvis is free from the plastron. There is one family (*Trionychidæ*), the soft-shelled turtles (q.v.).

3. *Cryptodira,* in which the carapace is covered with horny plates and provided with marginal bones, and the pelvis is free from the plastron. It embraces the following families: *Chelonidæ,* including marine turtles, as the green, loggerhead and tortoise-shell turtles (qq.v.); *Testudinidæ,* land-tortoises and gopher tortoise (qq.v.); *Chelydridæ,* snapping-turtles and alligator-turtles (qq.v.); *Cinosternidæ,* terrapins and box-turtles (qq.v.); and several others confined to the tropics of both hemispheres.

4. *Pleurodira,* in which the carapace is similar to that of the *Cryptodira,* but the pelvis is ankylosed to the plastron, and the neck folds in a horizontal instead of a vertical plane. They are all inhabitants of fresh waters in the tropical parts of both the Old and New Worlds. Representative families are the *Pelomedusidæ,* tartaruga (q.v.) and *Chelydidæ,* matamata (q.v.).

Consult Gadow, 'Amphibia and Reptiles,' and Baur, in a bulletin of the United States National Museum.

Chelsea, chĕl'sē, England, a parliamentary borough in Middlesex and western suburb of London, on the north side of the Thames, chiefly distinguished for containing a royal military hospital. A building was originally commenced here by James I. as a theological college, but was never finished. In the reign of Charles II. the erection of the present hospital for sick, maimed, and superannuated soldiers was begun. It was carried on during the reign of King James II., and finished in that of William and Mary by Sir Christopher Wren, in 1692. The whole expense of this structure amounted to £150,000, and the extent of the grounds is now about 66 acres. The pensioners maintained here number about 550, and consist of soldiers maimed or disabled in the military service, or who have served for 21 years. All pensions are granted by the commissioners of Chelsea Hospital, but most of the recipients are known as out-pensioners. Their number amounts to about 80,000. It is from them that the in-pensioners are selected. Not far from the hospital is a royal military asylum for the education and maintenance of the children of soldiers. George Eliot, Dante, Rossetti, and Carlyle were once residents of this borough. Carlyle is known as "the Sage of Chelsea." Pop. (1901) 93,841.

Chelsea, Mass., a city of Suffolk County, separated from East Boston by Chelsea Creek, and from Charlestown by the Mystic River. It is a suburb of Boston, and is connected with it by ferries, electric, and steam railroads; and the Mystic River is crossed here by a bridge 3,000 feet long. Chelsea has a United States Marine Hospital, United States naval powder magazine, Soldiers' Home, Fitz Public Library, and Odd Fellows' and Masonic halls. It has extensive manufactories of rubber goods, foundry and machine-shop products, leather, cordage, brass goods, pottery, iron and steel, etc. In 1900 there were 308 manufacturing establishments, with $8,211,682 capital and 3,332 hands and an annual output valued at $10,333,549. It has numerous churches, high and graded public schools, weekly newspapers, two national banks, and an assessed property valuation of over $23,000,000. Chelsea was settled at Winnisimmet in 1630; was a part of Boston until it was organized as a town in 1738, and was incorporated as a city in 1857. Pop. (1900) 34,072.

Chelsea Hospital. See CHELSEA.

Chelsea Village, now a part of New York. The name is still preserved in Chelsea Square between Ninth and Tenth Avenues and Twentieth and Seventy-first Streets. Clement C. Moore, the author of 'Twas the Night Before Christmas,' owned here a farm in the early part of the last century. He sold it off in lots, and the place was called Chelsea Village.

Cheltenham, chĕl'tĕn-ăm, England, a municipal and parliamentary borough, and popular watering-place, in the county of Gloucester, seven miles northeast of the city of Gloucester, on the river Chelt, a short tributary of the Severn, 120 miles from London by rail. It is a city of gardens, protected by hills, and surrounded with beautiful scenery. Cheltenham spas first occasioned the rapid growth of the town, but the baths and springs are less frequented than formerly. The springs were discovered in 1716 by accident, but became famous in 1788 through a visit paid to them by George III. The parish church is a fine old Gothic structure, and the Roman Catholic and Congregational churches are two of the finest in England. The town is an educational centre. There is a college for boys (founded in 1843), with an attendance of 700 scholars; and the ladies' college, with 500 pupils. There are also two training colleges for teachers. Among the other public institutions may be mentioned its libraries, assembly rooms, the college museum, pump-rooms, theatre, and numerous places of fashionable resort. There are hospitals, orphanages, etc. Cheltenham returns one member to Parliament. The town has a large brewery and ironworks. Pop. parliamentary borough (1901) 52,858; municipal borough 49,439.

Chelyuskin, chĕl-yoos'kĭn, Cape (formerly Northeast Cape, and sometimes called Cape Severo), the extreme northern point of Asia, on a peninsula of the same name, which forms the western arm of the eastern half of the Taimyr Peninsula. It is named after a Russian officer who led an expedition thus far in 1742, and here succumbed, with his wife, to the fatigues of the journey; it was not revisited till 1878, when Nordenskjöld, in the Vega, spent 19 and 20 August here. Lat of the west is 77° 36′ 37″ N., that of the east 77° 41′ N.

Chemical Affinity, the force which causes two or more dissimilar substances to combine in definite proportions to form a new substance, whose properties are distinct from those of any of the constituents. The word "affinity" was originally employed in this sense because it was believed that a kind of relationship exists between substances that are capable of combining with one another. No such idea as this is entertained in modern times, and it might even be said that the tendency toward combination is (in general) stronger, in proportion to the dissimilarity, or lack of obvious relationship, between the substances combining. In the time of Aristotle the constituent particles of bodies were conceived to be endowed with qualities somewhat akin to love and hate. After the advent of Galileo, these notions were exchanged for equally erroneous but more mechanical ones, and the ultimate particles were represented, in thought, as provided with hooks and other similar devices, by means of which their com-

binations were conceived to be effected. Later, when the law of universal gravitation was propounded by Newton, the force impelling the atoms toward one another, and holding them in their combinations, was naturally enough pictured as a special form, or manifestation, of gravitative action. This latter view may possibly be true, but if so we must modify our present views with regard to gravitation somewhat, and assume that it follows different laws, when acting at molecular distances, from what it does when acting at distances that are appreciable to the senses. The modern tendency appears to be rather in favor of viewing chemical affinity as an electrical manifestation, though no really defensible, intelligible, and definite form has yet been given to this notion.

It was formerly thought possible to arrange the elements in the order of their chemical affinity, so that each element in the array would expel all those that preceded it from their combinations, and tables of this sort were published nearly two centuries ago (in 1718) by Geoffroy. Later, it was found that no such definite law exists; and Claude Louis Berthollet, in his famous 'Essai de Statique Chimique' (Paris, 1803), pointed out that the combination of substances depends not only upon the affinity that such substances have for each other, but also upon the relative quantities in which they are present. For example, if barium sulphate and potassium carbonate are melted together, the former is always partially converted into carbonate; but in order to effect its total conversion into carbonate, it is necessary that the quantity of carbonate of potassium present shall be at least six or seven times as great as the equation $BaSO_4 + K_2CO_3 = BaCO_3 + K_2SO_4$ would appear to require. In recent times the necessity of taking account of the relative masses of the combining substances has been fully recognized, and a good idea of the important results that have followed may be had from Nernst's 'Theoretical Chemistry from the Standpoint of Avogadro's Rule and Thermodynamics' (translated into English by Prof. C. S. Palmer). Numerical estimates of the "affinity"of various substances have been obtained by many methods, but the results are not always in as good accord with one another as could be wished, and a discussion of the differences would require a volume. For a brief but excellent review of the different methods consult W. C. D. Whetham, 'Solution and Electrolysis.' See DISSOCIATION; EQUILIBRIUM (*Chemical*), and SOLUTION.

Chemical Analysis is the art of determining the constituents of which a given substance is composed. The analysis is "qualitative" if it is made solely for the purpose of discovering what those constituents are. It is "quantitative" if the object is to ascertain the quantity of each that is present. It is hardly necessary to say that in the examination of an unknown substance a qualitative analysis must be made before a quantitative examination is attempted. because the methods that must be employed in quantitative work depend altogether upon the nature of the constituents that are to be determined. An analysis is said to be "ultimate" when its object is merely to discover what elements are present, and in what quantity each occurs. It is said to be "proximate" when it is made for the purpose of learning how these elements are combined with each other, and what radicals or other proximate constituents are present. General methods are known, which suffice for the ultimate analysis of any compound that may be proposed; but chemical science has not yet been developed sufficiently to formulate equally general methods for proximate analyses. Methods are indeed known for the recognition of certain of the organic radicals, but most of the problems that arise in proximate analyses are of such a nature that special means must be devised to fit each special case.

QUALITATIVE ANALYSIS OF INORGANIC SUBSTANCES.

In the qualitative analysis of inorganic substances, the color that the proposed compound communicates to the flame of a Bunsen burner often affords useful information as to the nature of the compound, and a systematic examination of the substance in the flame of the blowpipe may afford much additional information. (See BLOWPIPE ANALYSIS.) When the substance is partially volatilized in the flame of the Bunsen burner, or by the electric spark from an induction coil, and the light of the flame (or the spark) is examined through the spectroscope, many of the elements can be recognized, even when present in exceedingly small quantities, by the occurrence, in the spectrum, of certain characteristic bright lines, or groups of such lines. (See SPECTROSCOPE.) The usual method employed, however, for the detection of the commoner bases and acids, is known as the "wet process," and consists in bringing the substance into solution, and noting the behavior of this solution when certain reagents are added to it. Even in the analysis of inorganic substances (which are alone considered in the present section) troublesome combinations sometimes occur, and in such cases the reaction that might naturally be expected at a certain stage in the examination may be modified to a considerable extent, or even be suppressed altogether. An adequate account of conditions of this sort cannot be given in the present article, and they are not stated with any degree of completeness in the more elementary manuals on inorganic analysis. Good accounts of the various difficulties of this sort will be found, however, in Douglas and Prescott's 'Qualitative Chemical Analysis,' to which the reader is referred. The existence of difficulties and limitations being recognized, a general scheme for the detection of the commoner metallic elements may be given, which will be found to work satisfactorily in the majority of cases.

The first step in making an analysis in the wet way is to ensure the absence of organic matter, which might seriously interfere with the subsequent reactions. If organic matter be present, it may usually be detected by heating a part of the compound in a closed tube. If it blackens, or gives off a characteristic empyreumatic odor, organic matter is probably present, and it must be destroyed either by the continued application of heat, or (if there appears to be danger of losing any essential part of the inorganic substance by volatilization) by warming it with strong sulphuric acid. The organic matter being destroyed by either of these methods, the next step is to bring the substance into a state of solution. Water, either cold or hot, should first be tried as a solvent. If this does

not suffice, hydrochloric acid or nitric acid may be tried. If these reagents fail to dissolve it, one part (by weight) of the substance may be mixed with five parts of sodium carbonate and five of potassium carbonate, and the whole heated in a porcelain crucible until quiet fusion is attained. (This may take 30 minutes.) The crucible and its contents are then allowed to cool, and are immersed in dilute hydrochloric acid, or (if silver is suspected to be present) in dilute nitric acid. In this way most of the commoner insoluble substances may be brought into a state of solution. For methods that are applicable to substances that resist this mode of treatment, the more advanced treatises on analysis must be consulted. In case a part of the substance to be analyzed dissolves in water or in one of the other solvents, a separate examination of the solution so obtained should be made, the insoluble part being reserved for subsequent treatment, by the method indicated above.

The metals that will be considered in the present article may be divided into seven general groups, according to their behavior when treated with certain reagents that are known as "group reagents." These classes or groups are as follows:

1. Metals forming chlorids that are insoluble in water, and which are precipitated as chlorids upon adding hydrochloric acid to their solutions. (Silver, lead, and mercurous mercury.)

2. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphids that are insoluble in ammonium sulphid, $(NH_4)_2S$. (Mercury, lead, bismuth, cadmium, copper, and silver.)

3. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphids that are soluble in ammonium sulphid. (Arsenic, antimony, and tin.)

4. Metals whose sulphids are insoluble in water, and which are precipitated from neutral solutions, by ammonium sulphid, either as sulphids or as hydrates. (Iron, manganese, cobalt, nickel, and zinc are precipitated as sulphids; aluminum and chromium as hydrates.)

5. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are insoluble in ammonium chlorid. (Barium, strontium, and calcium.)

6. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are soluble in ammonium chlorid. (This group contains the single metal magnesium.)

7. Metals which remain in solution when treated by any or all of the foregoing reagents, and all of whose important compounds are soluble. (Potassium, sodium, lithium, and ammonium.)

It will be observed that none but the commoner metals are included in the foregoing list. For the relations of the rarer ones, and for their detection, reference may be had to the manual of Douglas and Prescott, referred to above.

The separation of the groups that are defined above may be effected as follows: Hydrochloric acid is added to the solution under examination, drop by drop, until no further precipitation takes place. The white precipitate consists of the chlorids of the metals of Group 1, and is to be preserved for further examination. The solution is filtered, and a drop or two of hydrochloric acid is added to the clear filtrate, to make sure that this reagent is incapable of inducing further precipitation. Sulphuretted hydrogen gas is then passed through the filtrate until the liquid smells strongly of the gas. If a precipitate is formed, it will consist of the sulphids of the metals of the second and third groups. Silver, however, will not (in general) be present, because it is ordinarily completely precipitated in the first group, and has therefore been already removed by filtration. Lead may not be completely precipitated in the first group, and hence its sulphid may occur in the present precipitate. The mercury in the present precipitate represents mercuric mercury in the original solution. The mixed sulphids of Groups 2 and 3 are removed by filtration, and are washed until the wash water is no longer acid. They are then boiled with ammonium sulphid. This reagent leaves the sulphids of Group 2 undissolved, but dissolves those of Group 3. Filtration then leaves the sulphids of Group 2 on the filter paper; and when the filtrate is acidified by the addition of hydrochloric acid, the sulphids of Group 3 are thrown down again.

The clear filtrate from which Groups 2 and 3 were removed by sulphuretted hydrogen gas is next made slightly alkaline by the addition of ammonia, and heated almost to boiling. Ammonium sulphid is then added, and the whole is kept warm for some time. The sulphids (or hydrates) of Group 4 are thus precipitated, and may be isolated by filtration. The filtrate from this operation is next boiled to expel all the sulphuretted hydrogen, and ammonia and ammonium chlorid are added. The solution is then heated to the boiling point, and treated with a solution of ammonium carbonate, $(NH_4)_2CO_3$. This causes the precipitation of the carbonates of Group 5, which are removed by filtration. The filtrate is boiled, and then treated with a solution of sodium phosphate, Na_2HPO_4, to which one sixth of its volume of ammonia has been added. Magnesium, the metal of the sixth group, is thrown down (if present) in the form of a white crystalline precipitate having the formula $Mg_2(NH_4)_2P_2O_8$. This is again removed by filtration, and the filtrate will contain, in solution, the metals of Group 7.

The several groups being thus separated, it remains to examine each group by itself, to see how its components may be isolated or otherwise recognized.

Group 1. The chlorids of this group, as obtained in pursuing the general scheme outlined above, may be separated very readily. Thus if the precipitate of mixed chlorids be treated with boiling water, the chlorids of silver and mercury will be unaffected; but the chlorid of lead will dissolve, and may therefore be isolated by filtration. The mixed chlorids of silver and mercury may be separated by treatment with hot ammonia. This reagent dissolves silver chlorid, which is again precipitated in the form of chlorid upon neutralizing its solution with nitric acid. The hot ammonia does not dissolve mercurous chlorid, but transforms it into a black substance that contains mercury, chlorine, nitrogen, and hydrogen, and remains behind upon the filter paper.

Group 2. All the silver present being assumed to be removed in the first group, the mixed sulphids of Group 2 are washed until the wash water ceases to redden blue litmus paper, and are then boiled with a small quantity of nitric acid. Lead, bismuth, cadmium, and copper pass into solution in the form of nitrates, while mercury sulphid remains unchanged, and may be isolated by filtration. The filtrate, containing the mixed nitrates, is evaporated to a small volume, and sulphuric acid is added. This precipitates lead sulphate, which appears as a whitish precipitate, removable by filtration. The filtrate from this last operation may contain the nitrates of bismuth, cadmium, and copper. If it is made alkaline by the addition of ammonia water, any bismuth that it contains will be thrown down in the form of the hydrate. The cadmium and copper nitrates are simultaneously reduced to the form of hydrates, which, however, remain in solution. Upon passing sulphuretted hydrogen through the solution containing them, a precipitate consisting of cadmium sulphid and copper sulphid is thrown down. If this is boiled with dilute sulphuric acid the copper sulphid remains unaffected, while the cadmium sulphid passes into solution. From the solution, sulphid of cadmium may be again thrown down by adding ammonia till the reaction is alkaline, and then passing sulphuretted hydrogen through the solution. If cadmium is present, its sulphid is thrown down as a bright yellow precipitate.

Group 3. When the sulphids of Group 3 have been isolated, some information may be had at once from the color of the precipitate. Thus arsenic sulphid is yellow, antimony sulphid is red, and tin sulphid is black. If only one of these elements is present, it may therefore be detected by the color of its sulphid. If more than one are present, the mixed sulphids are treated with a solution of ammonium carbonate $(NH_4)_2CO_3$. The sulphids of antimony and tin are unaffected, but the sulphid of arsenic passes into solution, and after filtration it may be again thrown down by the addition of hydrochloric acid. The mixed sulphids of antimony and tin are transferred to a porcelain dish, and heated with a small quantity of hydrochloric acid, to which a few crystals of chlorate of potash have been added. By this treatment they are reduced to the form of chlorids. The solution containing the mixed chlorids of antimony and tin should then be somewhat diluted, and a piece of platinum foil wrapped in zinc should be added. By the electrolytic action so set up, antimony and tin are thrown down, in the metallic state, upon the platinum foil; and the foil will be blackened in spots, if antimony be present. In any case the foil should be washed and boiled with hydrochloric acid diluted with its own bulk of water. In this way any tin that may be present is brought into the form of the chlorid, which dissolves; the antimony remaining unaffected. The presence of tin chlorid in solution may be readily demonstrated by the addition of a solution of corrosive sublimate. The tin is thereby reduced to the form of a higher chlorid, and a precipitate of Hg_2Cl_2 (calomel) is thrown down. If no tin is present, this precipitate is not formed.

Group 4. The metals of Group 4 are obtained, in the general scheme of separation outlined above, in the form of sulphids and hydrates. The precipitate containing them is to be treated in a porcelain dish with cold dilute nitro-hydrochloric acid. The sulphids of nickel and cobalt remain unaffected, and may be removed by filtration, since the other metals pass into solution. The precipitate that is undissolved should be tested in a borax bead before the blowpipe. (See BLOWPIPE ANALYSIS.) Cobalt gives a blue bead, while nickel gives a reddish-brown one. If both metals are present, the color is intermediate between these two. In the reducing flame the reddish-brown color due to nickel changes to a gray, while the blue of the cobalt remains unaltered; hence the reducing flame should be tried, if no decided indication of cobalt is obtained in the oxidizing flame. For other and more exact tests for distinguishing cobalt from nickel, special treatises on qualitative analysis should be consulted; see, for example, the treatise of Douglas and Prescott, and also Eliot and Storer, 'A Compendious Manual of Qualitative Chemical Analysis.' Nickel and cobalt being removed from the metals of Group 4 by the means indicated above, the filtrate containing the remaining members of the group is boiled until all the sulphuretted hydrogen is expelled. A little nitric acid is then added, and the solution is again boiled until the greater part of the acid is driven off, when the remaining solution is diluted with water. The small amount of free acid that is still present is neutralized with sodium carbonate, care being taken that no permanent precipitate is formed. The solution is allowed to cool, barium carbonate is added in the cold, and the whole is allowed to stand for fifteen minutes. The precipitate contains the aluminum, chromium, and iron in the form of hydrates, and also the excess of barium carbonate. The filtrate contains manganese and zinc. The precipitate is removed by filtration, dissolved in dilute hydrochloric acid, gently warmed, and made alkaline by ammonia. By this process the hydrates of aluminum, chromium, and iron are thrown down, free from barium. This precipitate of the hydrates is collected on a filter, dried, transferred to a porcelain dish, and dissolved in concentrated nitric acid. A few crystals of potassium chlorate are then added, and the solution is boiled for several minutes. Upon adding sodium hydrate in excess, the iron is thrown down in the form of hydrate, the aluminum and chromium remaining in solution. The iron being removed by filtration, the filtrate is divided into two portions. One of these portions is made acid with nitric acid, and ammonia is added in excess. Aluminum hydrate is thrown down, if aluminum is present. The other portion of the filtrate is made acid with acetic acid, and lead acetate is added. If chromium is present, a yellow precipitate of chromate of lead, $PbCrO_4$, is thrown down. The filtrate from the treatment with barium carbonate, which may contain zinc and magnesium, is heated to boiling, and the barium that it contains is completely precipitated with dilute sulphuric acid. The precipitate of barium sulphate is removed by filtration, and the filtrate is boiled, after addition of sodium hydrate in excess. If manganese is present, it is precipitated in the form of the hydrate, and may be removed by filtration. The filtrate from this operation is

acidified with acetic acid, and treated with sulphuretted hydrogen gas. If zinc is present, it is thrown down in the form of a white precipitate of zinc sulphid, ZnS.

Group 5. The metals of this group (barium, strontium, and calcium) are isolated, in the general scheme, in the form of carbonates. To separate them from one another, the mixed carbonates are dissolved in dilute acetic acid, and a portion of the solution is tested for barium by the addition of potassium chromate, K_2CrO_4 (not the bichromate, $K_2Cr_2O_8$). If barium is present, a straw-yellow precipitate of barium chromate, $BaCrO_4$, is thrown down. If barium is not present, we may proceed at once to the tests for calcium and strontium; but if it is present, it must first be removed from the solution by cautiously adding potassium chromate until no further precipitate is formed, and then filtering. In this case it is necessary to remove the excess of chromate of potassium before testing for calcium and strontium, because these two metals cannot be separated in the presence of that reagent. For this purpose the filtrate containing the strontium and calcium (which must be perfectly free from barium chromate, even though several successive filtrations may be necessary in order to make it so,) is made alkaline by ammonia, and ammonium carbonate is then added until the carbonates of strontium and calcium are all precipitated, the potassium chromate remaining in solution. After filtration and thorough washing, the mixed carbonates of strontium and calcium are dissolved in hot acetic acid, and the solution is boiled. Dilute sulphuric acid is then added; and if the acid is sufficiently dilute, a white precipitate of sulphate of strontium is thrown down, while the sulphate of calcium (which is formed at the same time) remains in solution. After standing for fifteen minutes or more, in order that the precipitation of strontium sulphate may be complete, the solution is filtered, and the clear filtrate is tested for calcium by first adding ammonia until an alkaline reaction is obtained, and then adding a solution of oxalate of ammonia. If calcium is present, a white precipitate of calcium oxalate is obtained.

Group 6. This "group" contains magnesium only. Hence the presence of magnesium will be made apparent at once in the course of the preliminary separation into groups.

Group 7. Potassium, sodium, lithium, and ammonium belong to this class. These metals are characterized by the high solubility of all their important salts. Ammonia, being used in the separation of the groups as a reagent, is sure to be present in the final solution that has been designated as containing the metals of "Group 7." Hence if it is desired to test for that substance, the test should be made upon a specimen of the original solution, before any ammoniacal reagent has been added. The test is very simple, and consists merely in heating some of the proposed solution with milk of lime (calcium hydrate in suspension). All salts of ammonia are decomposed in this way, with the liberation of ammonia gas, which may be recognized by its smell or by its turning moist red litmus paper blue. The general nature of the reaction involved in the liberation of ammonia gas may be illustrated by the case of ammonium sulphate. We have $(NH_4)_2SO_4 + Ca(OH)_2 = CaSO_4 + 2NH_3 + 2H_2O$. Sodium, potassium, and lithium may be sought for in the final filtrate obtained in the separation of the fundamental groups, since no compounds of those metals have been used as "group reagents." They are best identified by means of the colors that they communicate to the flame of a Bunsen burner. For performing a test of this sort, the filtrate containing these metals should be evaporated to dryness in a porcelain dish, and the residue ignited until any ammoniacal salts present are eliminated by volatilization. The dish is then allowed to cool, and its contents are moistened with a few drops of distilled water. A piece of platinum wire is next thoroughly cleaned, moistened with hydrochloric acid, and held in the Bunsen flame until it ceases to communicate any color. The wire is then dipped into the solution in the dish, and again held in the flame. Potassium salts give a fine blue color, lithium salts a red, and sodium salts an orange yellow. Unless sodium is present in very small amount, its strong, brilliant flame-color is almost certain to obscure the colors due to any other elements present. Chemists therefore make use of colored glasses that are practically opaque to sodium light, using them as screens through which to view the Bunsen flame. The commonest glass of this kind is the "cobalt-blue" glass, which is used for the detection of potassium, since it is quite transparent to the flame-color of that metal.

For methods of examination adapted to the detection of gold, platinum, and other of the less common metals, reference must be made to books on chemical analysis.

The metals that exist in a proposed substance being known, it remains to discover in what chemical combinations they are present. It is usually impossible to learn, by mere qualitative analysis, which of the acid radicals that may be present is combined with any given one of the metals; but it is possible to ascertain that certain kinds of compounds (such as sulphates, chlorids, and the like), are present, and a chemist of experience, who is familiar with the kind of work in hand, can often infer, with considerable probability, how the bases and acids are associated with one another. In the present article it is not possible to discuss this difficult phase of analysis, but a few of the more common tests for the presence of acid radicals may be given.

There is no general scheme for the detection of these radicals, by which they are separated into groups like the metals, and eventually isolated singly. In examining a substance for them, all that can be done is to apply certain tests, largely independent of one another, and best carried out by dividing the original solution into a number of parts, each of which is to be examined for a single class of acid radicals, and then thrown away.

When a solution of barium chlorid is added to a neutral or slightly alkaline solution, a precipitate of the corresponding barium compounds is thrown down if the solution tested contains sulphates, phosphates, borates, oxalates, fluorides, carbonates, silicates, tartrates, sulphites, hyposulphites, arseniates, arsenites, or chromates. (If the original solution contains lead, silver, or mercury, nitrate of barium is used as a reagent in the place of the chlorid, because otherwise a precipitate of the chlorids of those metals would also be obtained.) The mixed pre-

cipitate just obtained is isolated by filtration, washed, and treated with dilute hydrochloric acid. All of the compounds named pass into solution, with the single exception of the sulphate; and if a white, insoluble precipitate remains after treatment with dilute hydrochloric acid, the presence of sulphates in the original solution is demonstrated. The hydrochloric acid solution is next made alkaline by ammonia, when a precipitate will again be thrown down, if the original solution contained oxalates or phosphates. Certain other salts also may be thrown down at this point; and, therefore, if any precipitate is obtained, confirmatory tests for oxalic and phosphoric acids should be applied to the original solution before the presence of those substances can be regarded as really proved.

If the original solution contains a carbonate, it will effervesce upon the addition of hydrochloric acid, owing to the liberation of carbon dioxid. If it contains a sulphite, the addition of hydrochloric acid will liberate sulphur dioxid, which is readily recognized by smell. If it contains a hyposulphite, sulphur dioxid will also be liberated, but the solution will at the same time become turbid from the liberation of free sulphur. If it contains an alkaline silicate (other silicates are not soluble in water) in considerable quantity, the addition of hydrochloric acid will cause the silicic acid to separate in the form of a gelatinous precipitate, which, when dried and ignited, is gritty. The presence of the arsenic acids may be established by Marsh's test for arsenic. (See ARSENIC.) If a tartrate is present, the original compound, when obtained in the solid state by evaporation or otherwise, is blackened by heat, with a characteristic odor suggestive of burnt sugar. The presence of a fluoride in the original substance is established by the liberation of hydrofluoric acid (see FLUORIN) when that substance is heated gently with concentrated sulphuric acid. The presence of a chromate is indicated by the precipitate from the addition of barium chlorid exhibiting a yellow color. As a confirmatory test, a solution of lead acetate may be added to a neutralized sample of the liquid under examination. If a chromate is present, a yellow precipitate of chromate of lead is thrown down, which is soluble in caustic soda, but insoluble in acetic acid. To test for the presence of borates, a sample of the original liquid is acidified with hydrochloric acid, and a piece of turmeric paper is wetted with it, thoroughly dried before a flame, and finally moistened with a solution of sodium carbonate. If a borate is present, the color of the paper, where wetted with the sodium carbonate, changes to a greenish black.

To test for chlorids and certain other salts, a fresh specimen of the original solution should be chosen, and if it is not already acid, it should be made so with nitric acid. A solution of nitrate of silver is then added, whereupon a precipitate will be thrown down if chlorids, bromides, iodides, cyanides, or sulphids are present. (Cyanid of mercury, however, gives no precipitate at this point.) The precipitate should be removed by filtration, thoroughly washed, and then treated with hot ammonia. The chlorid, bromide, and cyanide of silver dissolve, while the sulphid and iodide remain behind, unchanged. The sulphid is black, while the iodide is yellowish. For methods of distinguishing between the chlorid, bromide, and cyanide precipitates, reference must be made to the works on chemical analysis. It may be said, however, that the cyanide, when heated is reduced to metallic silver, with the liberation of cyanogen gas. The presence of an iodide, when this is made doubtful by the black precipitate due to a sulphid, may be further investigated by the iodide of starch test. (See IODINE.)

Nearly all of the nitrates and acetates are soluble, and hence precipitation tests are not commonly used for the detection of nitric and acetic acids. Color tests are usually employed instead. To test for acetic acid, the original solution may be made neutral, and a few drops of ferric chlorid added. If acetates are present, the solution takes on a dark red color, owing to the formation of ferric acetate. To test for nitrates, a portion of the original solution is mixed with a solution of ferrous sulphate in a test tube, and strong sulphuric acid is poured down the side of the inclined tube, in such a manner as not to mix with the contents, but to form a layer at the bottom of the tube. If nitrates are present, a purplish or reddish ring, changing to a dark brown, will be observed at the surface of separation of the two liquids.

QUANTITATIVE ANALYSIS OF INORGANIC SUBSTANCES.

Quantitative analysis is far more difficult than mere qualitative analysis, and cannot be treated adequately in a popular encyclopædia. As has been said, unless the nature of the substance is known in some other manner, a preliminary qualitative analysis must be made. Several usual methods of making quantitative analyses will be described below.

Electrolytic Method.— When the substance to be analyzed is an alloy, or a simple mixture of metallic salts, its metallic components may often be readily separated by the electrolysis of its solution, the separation of the metals being based upon the known fact that in electrolysis the nature of the deposit depends largely upon the nature and degree of concentration of the solution, the sizes of the electrodes, and the strength of the electric current that is employed. By systematic study of the effect of these conditions in the electrolysis of mixtures of metallic salts, it is found to be possible to deposit one metal upon the cathode, while the others remain in solution. The electrolytic method has been developed to a considerable extent, and promises to be of great value. Thus far, however, it is not in extensive general use. For details concerning it, consult Classen, 'Quantitative Analysis by Electrolysis,' and the various papers that have been published by Prof. Edgar F. Smith, for some years past, in the Journal of the Franklin Institute. See also the article ELECTROLYSIS in this encyclopædia.

Gravimetric Methods.— Strictly, any method of analysis in which the quantity of each constituent is determined by weighing is a gravimetric method; but the term is usually understood to exclude the electrolytic method just mentioned. In gravimetric work the components that are to be weighed may be separated by fire-methods, or by selective precipitation from solutions, as in the scheme of qualitative analysis outlined above. The fire-methods are commonly used in the estimation of gold and silver,

and are described in the article ASSAYING. The wet methods do not differ in general theory from the method given above for qualitative analysis; for it is evident that any precipitate which contains only one base may be isolated and weighed, and that the quantity of the base present may be calculated from the observed weight of the precipitate, and its known chemical formula. But the practical case is by no means as simple as this statement would indicate; for certain matters of detail, that are not of the slightest importance in qualitative work, must be attended to with great care in quantitative analysis. For example, the substance that is to be determined must be isolated by a method that will ensure its perfect separation from every other substance that may be present; the precipitate that is to be weighed must be granular enough to be filtered easily and without loss; the precipitate must not be liable to oxidation nor other change upon exposure to air for such time as its manipulation may demand; it must be of such nature that it can be thoroughly dried; and it must not be hygroscopic enough to absorb sensible quantities of water from the air, from the time it is dried until the weighing has been completed. Thus in qualitative analysis aluminum may be recognized by the precipitation of the hydrate; but in quantitative analysis it is necessary to reduce the metal to the form of the oxid. The hydrate is usually gelatinous when freshly precipitated, and it retains traces of the acid with which the metal was previously combined, and also traces of the alkali that was used in the precipitation of the hydrate. These facts are of no consequence in qualitative work, but their importance in quantitative investigation is evident.

Volumetric Methods.— In volumetric analysis the quantities that are to be measured are determined by the measurement of volumes, and weighings are resorted to only in the preparation of the standard reagents that are to be used. The reagents are made up in certain standard strengths, according to the purposes for which they are wanted; but the usual strengths are those designated as "normal" and "decinormal" solutions. A "normal" solution is one having such a strength that one litre of the solution contains as many grams of the reagent as there are units in the reagent's chemical equivalent. Thus the chemical equivalent of sodium hydrate, NaOH, is (in round numbers) $23 + 16 + 1 = 40$; and hence a "normal" solution of sodium hydrate is one which contains 40 grams of that substance to the litre. A "decinormal" solution of this reagent contains 4 grams of it per litre, and a "centinormal" solution contains 0.4 gram per litre. If the reagent is a bivalent acid, or a salt of a bivalent base, the number of grams of it present in each litre of solution must be equal to half the molecular weight. Thus sulphuric acid, H_2SO_4, contains two atoms of replaceable hydrogen, and its molecular weight is $2 + 32 + 64 = 98$. Hence a normal solution of sulphuric acid contains 49 grams of the anhydrous acid, per litre of solution. The general idea is to have all of the reagents of such a strength that if one cubic centimeter of any "normal" acid solution be added to one cubic centimeter of any "normal" alkaline solution, the mixture will be precisely neutral. As an illustration of the method that is followed, let it be assumed that a manufacturer buys a carboy of oil of vitriol, and wishes to know what proportion of pure sulphuric acid it contains. If the acid were quite free from water, 49 grams of it would be exactly neutralized by 1,000 cubic centimeters (that is, one litre) of any normal alkali solution. It is more convenient to work with one tenth of this quantity of acid and reagent; so that the experiment will consist in weighing out 4.9 grams of the oil of vitriol, diluting it with water, adding a piece of litmus paper, and letting a normal alkali solution pass into it (preferably from a graduated burette) until the acid is precisely neutralized. If 100 cubic centimetres of the alkali were required to effect the neutralization, the given sample of oil of vitriol would be known to contain 100 per cent of its weight of sulphuric acid,— or to be entirely free from water. On the other hand, if only 53.9 cubic centimetres of the normal alkali solution were required to effect neutralization, the sample would be known to contain 53.9 per cent of its own weight of sulphuric acid. As a further example, suppose it is desired to ascertain the percentage of sodium oxid present in a given sample of crude soda ash, without raising the question as to whether the sodium actually occurs as oxid, hydrate, or carbonate. The formula of sodium oxid is Na_2O, and its molecular weight is $46 + 16 = 62$. As it contains two atoms of sodium to the molecule, we weigh out 3.1 grams (not 6.2 grams) of it, dissolve in water, and dilute and add litmus paper as before. Then into the solution we pass a normal acid solution until neutralization is effected. If 46.7 cubic centimetres of the normal acid solution are required, the alkali present in the sample, when computed as sodium oxid, constitutes 46.7 per cent of the weight of the whole. This process is called "acidimetry" when it is used for estimating the strengths of acids, and "alkalimetry" when it is used in estimating the strengths of alkalis. As a further illustration of volumetric methods the estimation of chlorine (known as "chlorimetry") may be considered. If the substance to be examined for chlorine is bleaching powder, 10 grams of the powder are dissolved by rubbing with water in a mortar, and the solution is diluted till it occupies a litre. It is then well shaken, and 100 cubic centimetres are drawn off into a beaker, by means of a pipette, and treated with a decinormal solution of arsenious acid (As_2O_3) until a drop of the mixture, when withdrawn by a glass rod, gives no blue stain upon filter paper that has been soaked in starch liquor and iodide of potassium. The number of cubic centimetres of decinormal arsenious acid solution required is to be multiplied by the constant multiplier 0.00355, and the product is the weight of available chlorine, in grams, contained in each gram of the original powder. (For explanation of the multiplier 0.00355, and for full details of this process and of volumetric analysis generally, consult Francis Sutton, 'Systematic Handbook of Volumetric Analysis.')

The analysis of gases is of so special a character that it is treated under a separate heading. See GASOMETRIC ANALYSIS.

ORGANIC ANALYSIS.

In the analysis of organic compounds, no general scheme can be given, corresponding to

that which is used in the systematic examination of inorganic substances. The number of possible organic compounds is so great, that practically nothing can be done in the way of effecting a "proximate" analysis of a compound concerning whose general nature we have no preliminary information. For the more or less general methods that have been developed for the examination of special classes of organic substances, advanced books on organic analysis must be consulted. The ultimate analysis of an organic substance consisting of oxygen, hydrogen, and carbon, may be effected by burning the substance in a glass tube in a current of oxygen gas. The carbon is converted into carbon dioxid, which is absorbed by potash and estimated quantitatively by observing the gain in weight of the potash; and the hydrogen is converted into water, which is similarly estimated by absorption by calcium chlorid. The oxygen of the original compound is then estimated by difference. When nitrogen is also present, the process is somewhat more complicated. In this case the gases of combustion may be pased over red-hot metallic copper to absorb the oxygen, and the nitrogen may be measured in the free state, the oxygen being finally concluded by difference, as before.

Consult (in addition to the works mentioned above), Fresenius, 'Manual of Qualitative Chemical Analysis' and 'System of Instruction in Quantitative Chemical Analysis'; Thorpe, 'Quantitative Chemical Analysis'; Prescott, 'Outlines of Proximate Organic Analysis.'

Editorial Staff 'Encyclopedia Americana.'

Chemical Industry, The. Labor is a combined effort of the animal kingdom, led by mankind, to overcome and subdue, to subject and utilize, the forces of nature. Labor, in its various relations, assumes forms that are both psychical and physical in character. Groups, combinations, and subdivisions of these forms exist in the great war of the animal kingdom on the solid, fluid, and gaseous conditions of matter. Hence it is that the chemist and chemical manufacturer are called on to organize and array the final attack on all known productions of the earth, of the water, and of the atmosphere.

The chemical industry of the United States may be considered to have been in existence, at this time, about 100 years. In common with other leading manufactures, it has reached large proportions. Almost every State of the Union has chemical establishments of some kind. The industry is affected for good or bad in quick response to the rise and fall of other manufactures.

Before the Revolution no chemicals were made here. From such reports as are obtainable it appears that 8,000 pounds of copperas were made in Vermont in 1810, and a smaller quantity in Maryland in the same year. In 1813 alum was made in the latter State. Oil of vitriol was manufactured in Philadelphia in 1793. At Baltimore, the manufacture of chemicals, paints, and medicine began in 1816. In the census of 1820, two chemical establishments were reported from New York.

By 1830 the industry was firmly established in the United States, Philadelphia being the centre. There were then 30 firms in the business in the entire country, having a capital of $1,158,000, and producing articles valued at $1,000,000 per annum. Alum, copperas, and some other articles were manufactured to the almost entire exclusion of the foreign product. The list of productions included calomel and various other mercurial preparations, Glauber's and Rochelle salts, tartar emetic, ammonia, sulphate of quinine, oil of vitriol, tartaric, nitric, muriatic, oxalic, and acetic acids, aqua fortis, Prussian blue, chrome yellow, chrome green, refined saltpetre, refined borax, refined camphor, acetate and nitrate of lead, prussiate of potash, and bichromate of potash.

COMPARISON OF THE QUANTITIES AND VALUES OF THE PRINCIPAL PRODUCTS REPORTED: 1890 AND 1900

Products	1890		1900	
	Quantity	Value	Quantity	Value
Total	.....	$163,547,685	.....	$221,217,217
Alum, pounds	93,998,008	1,616,710	179,467,471	2,446,576
Coal-tar products	.....	687,591	.....	1,421,720
Dyeing and tanning extracts and sumac, pounds	187,906,911	8,857,084	169,525,536	7,767,226
Gunpowder and other explosives, pounds	125,645,912	10,993,131	215,590,719	16,950,976
Fertilizers, tons	1,898,806	35,519,841	3,091,717	45,911,382
Paints, colors, and varnishes	.....	52,908,252	.....	71,313,392
Potash and pearlash, pounds	5,106,939	197,507	3,864,766	178,180
Sodas, pounds	333,124,375	5,432,400	1,279,082,000	10,237,944
Sulphuric acid, 50°, pounds	1,009,863,407	4,307,067	1,906,878,903	7,965,832
Sulphuric acid, 60°, pounds	20,379,908	122,940	34,023,131	246,284
Sulphuric acid, 66°, pounds	354,533,657	3,249,466	754,558,455	6,035,069
Wood alcohol and acetate of lime	.....	1,885,469	.....	5,775,290
Chemicals (including all acids, bases, and salts not heretofore enumerated)	.....	24,751,974	.....	40,791,690
All other products	.....	13,018,253	.....	4,175,656

The totals for the chemical industry, as reported in last census, are shown in the following summary:

CHEMICAL INDUSTRY IN 1900

Number of establishments reporting	1,740
Capital:	
Direct investment	$238,529,641
Officers, firm members, and clerks:	
Total number	8,605
Total wages	$ 11,340,385
All other employees:	
Total number	61,553
Total wages	$ 21,799,251
Cost of materials used	124,043,837
Value of products	221,217,217

The principal products reported, and their quantity and value, are shown in the table above.

The most important of all chemical products

is sulphuric acid, which maintains its supremacy over any other known article in promoting the manufacturing interests of the world. The large increase in the quantity produced, together with the reduction in price, indicates the advance that has been made in general manufactures in the United States during the decade intervening.

From technical considerations, manufactured manures are the next in importance to sulphuric acid in the category of chemical productions. The total of 2,887,004 tons of these materials produced, indicates, by no inaccurate measure, the extent of the farming interests of the country. When we consider that about 300 pounds of artificial fertilizer are commonly used to one acre of land, it is seen that nearly 20,000,000 acres were enriched by its use. The increase in manufacture over 1890 is 1,023,398 tons. These figures show that large areas of our country are becoming unprofitable to farm without the use of these aids to fertilization; and the existence of factories in the States of California, Illinois, Indiana, Michigan, Minnesota, and Wisconsin is indicative of the gradual exhaustion of soil that was virgin in character less than 30 years ago. These facts tend to show that the time is approaching when none of our unmanured soils will yield in remunerative quantity. They prove that economies are coming into practice in the utilization of material that formerly ran to waste.

The farmer occupies a reversed position to that of the manufacturer of artificial manures. By prodigal wastefulness and culpable ignorance, he permits immense quantities of manurial matter to find their way to the sea, while bemoaning his lot and sighing over the yield of virgin lands in comparison with that of his own; whereas the manufacturer, by the aid of chemical skill and mechanical devices, converts refuse matter into valuable merchandise.

The figures presented here yield consolation to the farmers of the Atlantic slope. When the not distant time arrives for the extinguishment of an agriculture that is based on primordial soil, the lands of these regions will recover their lost value; for the facts herein submitted tend to show how closely fertility is allied to the production of manufactured manures, and this manufacture can be carried on most profitably at those points where supplies of foreign crude material can be obtained, and where seaboard transportation can be made available.

The States of the Union often provide chemical manufactures relatively to their natural products; but the markets for chemicals are situated chiefly at such attractive points as the great centres of textile manufacturing, of dyeing and bleaching works, and of the oil-refineries and artificial-manure works; hence chemical works are to be found principally at or near these points.

The leading articles of raw material and their derivatives used in chemical manufactures, briefly stated, are as follows:

RAW AND MANUFACTURED CHEMICALS

Raw Material	Manufactured Articles or Derivatives
Brimstone or sulphur; pyrites containing sulphur.	Oil of vitriol, or sulphuric acid, the most important of all chemicals.
Nitrate of soda.	Nitric acid and all nitrates.
Salt (common).	Soda; muriatic acid.
Potash salts.	Bichromate of potash, prussiate of potash, and many other combinations.
Nickel ores.	Salts of nickel, for plating.
Chromic-iron ores.	Chromates of potash and soda.
Antimony ores.	Alloys; medicinal salts.
Bismuth ores.	Alloys; medicinal salts.
Copper ores.	Sulphate of copper, or blue vitriol.
Cobalt ores.	Oxide of cobalt.
Iron ores.	Sulphate of iron, or copperas.
Lead ores.	White and red lead; litharge.
Manganese ores.	Disinfectants; chlorine.
Mercury ores.	Calomel; white and red precipitate; vermilion.
Zinc ores.	Oxide of zinc.
Gold.	Chloride of gold.
Silver.	Nitrate of silver.
Innumerable vegetable productions.	Dyeing extracts; alkaloids; acids; and pharmaceutical preparations.
Linseed.	Paints.
Cotton-seed.	Soap; oils used in cooking.
Cotton.	Guncotton.
Corn and all cereals.	Glucose; alcohol; starch.
Wood.	Explosives; oxalic acid; potash; acetic acid; paper.
Argol or tartar.	Tartaric acid; cream of tartar.
Borate of lime.	Borax.
Barytes.	Paints.
Chalk.	Whiting.
Iodine.	Sublimed iodine; all iodides.
Limestone.	Lime; carbonic acid.
Magnesia.	Carbonate and sulphate of magnesia.
Ochres.	Paints.
Crude phosphates.	Phosphorus.
Fats.	Soap; glycerine.
Animal matter, such as horns, hoofs, and leather.	Prussiate of potash; artificial manures.
Oils.	Soap; Perfumes.
Coal (bituminous).	Ammonia; coal-tar colors; cyanide of potash.
Clays.	Alum.
Corundum.	Aluminum.
Cryolite.	Alum; soda.
Silica or sand.	Silicate of soda; glass.
Tin.	Tin-salts, for dyeing purposes.
Atmospheric air.	Oxygen.
Water.	Gas; hydrogen; oxygen.

The innumerable variety of combinations made of the raw materials named renders it impossible to state them in any limited space. The variety of raw materials, and of the numberless combinations thereof, gives to the chemical industry a unique position. No other branch of manufacture can approach it in scope, in the necessity for its existence, or in the knowledge required for its prosecution.

The merchandising in chemicals is of a complex character, and is based chiefly on chemical tests, both of the raw materials and of the manufactured articles. The markets of all quarters of the globe are scanned, and supplies, in many instances, are carried in large quantities, owing to the remote points of their production. The chemical industry affords one of the largest sources of transportation to railroad and water carriers, in raw materials as well as in partly finished and wholly manufactured stuffs. In many articles the competition of countries enjoying low prices for labor is difficult to meet. On the other hand, through advantages not enjoyed by foreign manufacturers, considerable exportation of certain chemicals is going on at this time.

The industries or trades dependent upon the manufacture of chemicals may be enumerated as follows:

INDUSTRIES USING CHEMICAL PRODUCTS

Woolen manufacture.	Tanning.
Cotton manufacture.	Glass manufacture.
Silk manufacture.	Soap manufacture.
Oil-cloth manufacture.	Artificial ice manufacture.
Explosives manufacture.	Pharmaceutical manufact'r.
Pyroxylin manufacture.	Pyrotechnic manufacture.
Paint manufacture.	Electrical or galvanic manufacture.
Glucose manufacture.	
Artificial manures.	Printing-inks manufacture.
Oil refining.	Paper manufacture.
Bleaching-works.	

The plant of a chemical works involves the use of a larger area of land than is necessary in other manufactures as the buildings adaptable to the operations are usually only one story high, nearly all the work being done on the ground floor, where large furnaces, grinding-mills, and engines can be placed. This is one reason that the capital required for the conduct of these manufactures seems disproportionate to the value of the products, in comparison with other branches of industry. In the eyes of one unversed in the art, a chemical works may appear to be only a mass of rude furnaces, old pots, and rough machinery; yet the establishment may contain appliances of the most costly description, such as underground flues; furnaces of the most modern construction; iron castings fashioned in innumerable forms and weights; copper vessels, coils, and stills; thousands of fire-bricks and other forms of refractory material; steam boilers of the most economical pattern; lofty chimneys; powerful engines; expensive pumps; mills of different kinds for the grinding and powdering of a great variety of materials; leaden chambers for acid making, with tanks, towers, and accessories of the same metal; platinum apparatus and stills for concentrating sulphuric acid; and chemical earthenware, vitrified to resist the action of acids. Indeed, it may be stated that a chemical works of any magnitude contains and requires every manufacturing appliance used or known, excepting those adapted especially to weaving and printing.

Skill and scientific knowledge are needed in the successful conduct of manufacturing chemistry at this time to an extent unthought of by the men who were good workers 20 years ago. The competition of scientific Germany in many departments of chemical manufacture has forced the progress of an industry that was yet in its infancy two decades ago. The laboratory, well equipped with careful workers and good apparatus, has become the pulse of the whole establishment. Each step in the processes is indicated in the unerring results obtained by the analyst and tester, while the huge and costly machinery of the factory is the counterpart, to a great extent, of the miniature equipment of the laboratory. Chemical engineering is an important factor in the adjustment of plant to the exigencies of the difficult and tortuous operations. Some institutions of learning have recognized this fact by adding to their curriculum a course of chemical engineering. The advance in the manufacture of chemicals in the United States during the past 20 years has been marked, not by many changes of processes, but essentially by the new appliances furnished by engineering skill.

The processes used in making chemicals are almost as varied as are the articles produced, but certain leading steps are essential to all, as grinding, furnacing, dissolving, separating, evaporation, filtration, and crystallization. The laws governing chemical constitution are closely followed at each step, and the processes improved and revised, from time to time, by the aid of mechanical contrivances. These changes are rendered more and more necessary as the strong competition of the age sweeps away old and unsuitable appliances.

Many chemical operations demand a long time for the production of finished material. Crystallization is of slow growth in many instances, and decomposition takes place very gradually in others; therefore another reason presents itself for the abnormal amount of capital required to carry on this branch of industry. Both crystallization and decomposition are hastened or retarded by many physical conditions; heat and cold, intense motion, and absolute quietude are in their turn called to the aid of the chemist. When we speak of crystallization we should bear in mind the fact that by this process the great purity of commercial chemical salts is obtained — sometimes, it may be, by frequent dissolvings and as many distinct crystallizations.

The chemical industry takes rank as the fourth among the great manufacturing divisions of the country, the three preceding it being (1) iron and steel, (2) woolen goods, and (3) cotton. (It may be well to explain that cattle-killing, the making of clothing, and of boots and shoes, and any other assembling industries are not considered manufacture proper.) The chemical industry represents a diversity of interests such as centre in no other department, and it affords to the United States a source of activity for labor, skill, and capital that is highly encouraging.

HENRY BOWER,
Henry Bower & Son, Manuf'g Chemists.

Chemical Mineralogy. See MINERALOGY.

Chemical Rays, a not very appropriate name given to the rays of higher refrangibility in the spectrum (q.v.). The blue and violet rays of the spectrum, and also the non-luminous rays at the violet end of the spectrum, have a peculiarly powerful chemical effect on silver compounds,— on photographic paper, for instance, which is prepared by moistening soft paper with solution of common salt, and then steeping it in solution of nitrate of silver. The blue, violet, and non-luminous rays at that end of the spectrum quickly blacken such paper when it is exposed to their influence. The remainder of the spectrum has not this power; for example, paper sensitized with silver salts is not attacked at all by yellow light. Hence the name "chemical rays" is given to those above mentioned. The term is, however, misleading, for there are other chemical compounds that are acted on by other parts of the spectrum; and the truth seems to be that for each particular sensitive compound there is one particular part, or sometimes two or three particular parts of the spectrum with maximum chemical influence for the decomposition of it.

CHEMISTRY

Chemistry, the science which deals with the composition and transformations of matter, had its origin in remote antiquity. In its earliest form it was purely empirical, a mass of disconnected facts which were brought to light in the natural course of development of various industries. In the extraction of metals from their ores, in the preparation of drugs and medicines, in the processes of dyeing, and the like, many chemical data were discovered; and of such facts a large number were known to the ancient Egyptians. Indeed, one plausible derivation of the word "chemistry" is from Khem, an early name for Egypt, which has reference to the blackness of its soil. With this name the Arabic word *chema,* to hide, seems to have some relation; and when we remember that much ancient learning was preserved for us by Arabian scholars, the descriptions of chemistry as the Egyptian science, or as the hidden or occult art, become intelligible. Secrecy was a characteristic of its early practitioners.

The one fundamental fact of chemistry is, that matter can undergo apparent transformations of kind, one substance being converted into another. For instance, wood becomes charcoal, and iron is changed to rust; and facts like these were evident even to the most primitive observers. As philosophy developed, these data were necessarily considered, the nature of matter was discussed, and attempts were made to correlate and explain the phenomena. Much of the early speculation was vague and mystical, and has little significance to-day; but a part of it was intensely practical, and gave a definite purpose to investigation. If matter can be transformed from one substance to another, why should not the possibility of change be universal? All metals, it was seen, had certain properties in common, and so transmutability between them was almost taken for granted. Thus alchemy arose, with its search for the philosopher's stone and its attempts to convert base metals into gold; and from alchemy the chemistry of to-day is lineally descended. The discoveries, even the failures of the alchemists laid the foundations of our modern science, and pointed out the best paths for investigation to follow.

The Greek philosophers, and especially Aristotle, in their attempts to interpret matter, assumed the existence of four elements, namely, earth, water, air, and fire. These names, however, denoted properties rather than things, and implied the attributes of coldness, wetness, dryness, and heat. The properties of matter were determined by these conditions, and could be expressed by the varying degrees under which the latter were displayed. Of chemical combination, as we understand it, the ancients seem to have had no clear conception; they sought to solve the problems of the universe by reasoning alone; the experimental method as a test of truth had not become a court of last appeal. To the alchemists, on the other hand, and to their successors, the iatrochemists, who applied chemistry to medical uses, experiment was the essential thing; and in their hands true knowledge rapidly increased. The alchemical elements, salt, sulphur, and mercury, were still names of properties; but they represented conceptions which stood closer to reality than the earlier ideas, since they were based upon more exact observations. Speculation had not been dethroned, but it was no longer an absolute ruler.

To trace the history of chemistry during its formative period would be impracticable in an article of the present scope. It is enough to say that the modern distinction between elements and compounds was first clearly stated by Robert Boyle in 1661. An element is a substance that cannot be further decomposed, but which is obtainable from a compound body, and from which the latter can again be prepared. He also held that chemical combination consisted in an approximation of the smallest particles of matter, thus adopting the atomic hypothesis which had been current in philosophy from the very earliest times. With these teachings of Boyle modern chemical theory practically began.

The chemical researches of the 18th century were many and varied, but most of them, at least during the earlier decades, were essentially qualitative in character. The fundamental importance of exact weight and measure came into recognition with extreme slowness. Throughout the greater part of the century one theory dominated chemical thought, the theory of *phlogiston,* proposed by Becher, but developed and completed by Stahl. The phenomena of combustion had always attracted the attention of chemists, and the new theory was devised to explain them. Every combustible body was supposed to contain a peculiar non-isolable substance, *phlogiston;* and when combustion took place this substance was thought to be expelled. Thus lead, when heated in the air, undergoes a change analogous to that produced by combustion, and yields a calx, or, as we call it now, an oxide. This calx, combined with phlogiston, was thought to exist in the original metal, and to be freed from phlogiston when calcination occurred. In this speculation no account was taken of the weight of the several bodies, and the fact that the calx was heavier than the metal, that a gain, not a loss was observed, seemed to offer no difficulty to the believers in the phlogistic doctrine. To phlogiston a negative weight was ascribed, and by this device the real difficulties of the problem were comfortably laid aside.

In 1774 Joseph Priestly, himself a believer in phlogiston, discovered oxygen; and so made, though unwittingly, the true interpretation of combustion possible. In 1766 Cavendish had discovered hydrogen; and in 1781 he proved that water was produced by the union of the two new gases. Cavendish also determined the composition of the atmosphere, and in these researches the foundations of a new chemistry were laid. The two chief architects to build upon the foundation were a Frenchman, Lavoisier, and an Englishman, Dalton.

Lavoisier, by careful use of the balance as an instrument of research, proved that matter was constant in weight, and could neither be created nor destroyed. In any chemical change the weight of the substances engaged in the reaction remained unaltered. Studying combustion he showed that it was merely combination with oxygen; and he pointed out that respiration was a phenomenon of the same character. He also gave greater precision to the idea of an element, and announced the elementary nature of the metals; and, in conjunction with

other chemists, did much toward the establishment of a rational system of chemical nomenclature. Hitherto the names of compounds had been arbitrary and often meaningless; now they were made to express with more or less accuracy the composition of the substances described.

Lavoisier died in 1794, a victim of the French Revolution; and it was not until 1803 that the next really great forward step in chemistry was taken by Dalton, who then first announced his famous atomic theory. To support this doctrine, which, being quantitative in form, had little in common with the atomistic speculations of the philosophers, Dalton established two laws, the laws of definite and multiple proportions. That every chemical compound has a fixed and definite composition was recognized by Lavoisier and by other writers before him, but the fact was disputed by Berthollet, and it remained for Dalton to give its statement a precise form. Dalton then went further, and found that to every element a definite combining number could be assigned, and that when two elements united in more than one proportion, even multiples of that number appeared. Thus, taking the hydrogen weight as unity, the standard of comparison, oxygen always combines with other elements in the proportion of eight parts or some simple multiple thereof, and so on through the entire list of elementary bodies. Each one has its own distinct combining weight, and this was a condition which Dalton sought to explain. Fractions of the weights did not occur, fractional atoms could not exist, and the two thoughts were connected by Dalton. Chemical union, to his mind, became a juxtaposition of atoms, whose *relative* weights were indicated by their combining numbers; and so the atomic conception was for the first time given a clear, quantitative expression. First, every element is composed of similar atoms which have constant weight. Secondly, chemical compounds are formed by the union of these atoms in simple numerical relations. Upon these fundamental statements the entire system of chemical philosophy rests, so that for a hundred years the history of chemistry has been the history of the atomic theory. All chemical calculations are based upon the atomic weights of the elements, and in all chemical formulæ they are implied.

Since Dalton's time great labor has been expended upon the exact determination of atomic weights, and in the discovery and description of new elements and compounds. The general conclusions which have been established by this class of researches may be summarized as follows: Every chemical substance is either an element or a compound. The elements, which are not separable into any simpler bodies, at least by no means yet discovered, are comparatively few in number; the compounds are innumerable. More than a hundred thousand compounds are already known. A compound may be separated into its elements or built up from them; and its composition is absolutely invariable. In this respect compounds differ from mechanical mixtures, in which any proportion may occur. Flour and sugar may be mixed together, but they still remain flour and sugar, each with its properties unchanged; no combination here takes place. In combination, as when *gaseous* hydrogen and *gaseous* oxygen unite to form *liquid* water, they do so only in one fixed proportion and the characteristics of the original substances disappear. This fact of combination, the union of two or more bodies to form others which are widely different from them, is clear; but its mechanism is not yet understood. The elementary atoms of the compound are drawn and held together by some form of attraction, but its precise nature is unknown. The object of chemistry is to discover the laws which govern the union or the decomposition of substances, and to determine the limits within which such changes are possible. For the study of compounds, at least for the purpose of ascertaining their composition, two methods are employed. First, *analysis*, in which the component parts of the compound are separated, and individually identified. Secondly, *synthesis*, in which the parts are forced to unite, and to form the compound which happens to be under investigation. Furthermore, analysis may be either *qualitative* or *quantitative*. In one case we merely ascertain what substances are present, in the other we determine their exact quantity. The elements now known, about 80 in number, are given in the following table, together with their atomic or combining weights and their symbols. The latter are abbreviations whose use will be explained presently.

ELEMENTS, SYMBOLS, AND ATOMIC WEIGHTS.

Element	Symbol	Atomic Weight
Aluminum	Al	26.9
Antimony	Sb	119.3
Argon	A	39.6
Arsenic	As	74.4
Barium	Ba	136.4
Bismuth	Bi	206.9
Boron	B	10.9
Bromine	Br	79.36
Cadmium	Cd	111.6
Cæsium	Cs	132.0
Calcium	Ca	39.8
Carbon	C	11.91
Cerium	Ce	139.0
Chlorine	Cl	35.18
Chromium	Cr	51.7
Cobalt	Co	58.56
Columbium	Cb	93.3
Copper	Cu	63.1
Erbium	Er	164.8
Fluorine	F	18.9
Gadolinium	Gd	155.0
Gallium	Ga	69.5
Germanium	Ge	71.9
Glucinum	Gl	9.03
Gold	Au	195.7
Helium	He	4.0
Hydrogen	H	1.0
Indium	In	113.1
Iodine	I	125.90
Iridium	Ir	191.5
Iron	Fe	55.5
Krypton	Kr	81.2
Lanthanum	La	137.9
Lead	Pb	205.35
Lithium	Li	6.98
Magnesium	Mg	24.18
Manganese	Mn	54.6
Mercury	Hg	198.5
Molybdenum	Mo	95.3
Neodymium	Nd	142.5
Neon	Ne	19.9
Nickel	Ni	58.3
Nitrogen	N	13.93
Osmium	Os	189.6
Oxygen	O	15.88
Palladium	Pd	105.7
Phosphorus	P	30.77
Platinum	Pt	193.3
Potassium	K	38.86
Praseodymium	Pr	139.4
Radium	Ra	223.3

Element	Symbol	Atomic Weight
Rhodium	Rh	102.2
Rubidium	Rb	84.8
Ruthenium	Ru	100.9
Samarium	Sm	148.9
Scandium	Sc	43.8
Selenium	Se	78.6
Silicon	Si	28.2
Silver	Ag	107.12
Sodium	Na	22.88
Strontium	Sr	86.94
Sulphur	S	31.83
Tantalum	Ta	181.6
Tellurium	Te	126.6
Terbium	Tb	158.8
Thallium	Tl	202.6
Thorium	Th	230.8
Thulium	Tm	169.7
Tin	Sn	118.1
Titanium	Ti	47.7
Tungsten	W	182.6
Uranium	U	236.7
Vanadium	V	50.8
Xenon	Xe	127.0
Ytterbium	Yb	171.7
Yttrium	Yt	88.3
Zinc	Zn	64.9
Zirconium	Zr	89.9

In addition to these elements there are several others which are as yet imperfectly known and uncertain. Among them, polonium, actinium, holmium, europium, and dysprosium may be named. New elements are not infrequently discovered, and argon, helium, neon, xenon, krypton, and radium have all been brought to light within the last decade.

With the help of the elementary symbols, chemical formulæ can be constructed, and these are of great help in chemical calculations and reasoning. Some of the symbols are initial letters only, as H, O, N, C, for hydrogen, oxygen, nitrogen, and carbon; others are formed of two letters, like Ca for calcium and Zn for zinc. Still others are derived from the Latin names of the metals, such as Ag from *argentum*, silver, Fe from *ferrum*, iron, etc. The formula of a compound is made by writing the proper symbols in juxtaposition, so that NO means a compound of nitrogen and oxygen, HI a compound of hydrogen and iodine, and so on. When two elements form more than one compound, these are distinguished by subscript numerals, as in the examples PCl_3 and PCl_5. In these substances one atom of phosphorus unites with three and five atoms of chlorine respectively. In every case the symbol of an element means one atom of the element, and therefore that relative quantity of it which is indicated by its atomic weight. In water, H_2O, two atoms of hydrogen weighing two units, combine with one atom of oxygen weighing in round numbers sixteen units; and thus the formula tells us in shorthand that the compound contains two parts of one element to sixteen of the other. No matter how complex a formula may be, this simple rule invariably applies, and by its means the composition of the substance represented can be calculated. The symbols, moreover, can be combined into equations, from which we may compute the outcome of a given chemical process. This subject, however, is much too abstruse for discussion here. Its details are developed logically from the atomic theory.

To the philosophers who preceded Dalton an atom was the smallest particle of any substance which could possibly exist. Thus water might be subdivided and subdivided until, in theory, a limit was attained, and an atom of water was the result. By chemical means a new order of divisibility had now to be recognized, and the supposed «atom» of water was itself found to be complex, and separable into still smaller particles of oxygen and hydrogen. The latter are the atoms of the chemist; the former clusters of atoms are known as *molecules*. This distinction was not developed immediately; its full recognition came slowly, and it derived its importance from certain laws relative to gases which were discovered, partly by Boyle, partly by Gay Lussac, and generalized in 1811 by Avogadro. Avogadro's law may be concisely stated as follows: Equal volumes of gases under like conditions of temperature and pressure, contain equal numbers of molecules. A molecule is now defined as the smallest particle of any substance which can separately exist; an atom as the smallest particle which can take part in chemical change. Another law, discovered by Dulong and Petit in 1819, was also highly important, for it was shown that the specific heat of an element was inversely proportional to its atomic weight. In other words, the elementary atoms have all the same capacity for heat, and this rule gave us an important check in ascertaining the true weights of the atoms. The law of Avogadro and the law of Dulong and Petit were brought together by Cannizzaro in 1858, and the system of atomic weights and chemical formulæ now in use, which differ in certain essential particulars from those that were first adopted, was the result of the combination.

In the early days of scientific chemistry the science was divided into two great sections, organic and inorganic, the one dealing with animal and vegetable products, the products of life, and the latter with substances derived from the mineral kingdom. Inorganic chemistry, the chemistry of the metals, the earths, the commoner oxides, bases, and salts, was for the time being the simpler, and during the first half of the 19th century it received the lion's share of attention. At first it was supposed that the two fields of research were absolutely distinct, and that no organic compound could be derived by artificial means from inorganic sources. This belief was overthrown by Woehler, in 1827, who showed that urea, an organic body, was easily prepared from inorganic ammonium cyanate, and since then a vast number of organic syntheses have been effected. Curiously enough, urea and ammonium cyanate, although very different substances, have the same percentage composition, containing the same elements in exactly the same proportions. Later it was found that *isomerism*, as this semi-identity is called, was exceedingly common, and here was a noteworthy phenomenon which called for explanation. Different molecules could be constructed from the same set of atoms, and the simplest interpretation of the fact was that the latter were differently arranged. Out of the same bricks different houses may be erected. The conception of *chemical structure*, therefore, came into being. What is the arrangement or grouping of the atoms within any given molecule?

The earlier attempts at the solution of this

problem have now only historical interest, and their consideration is of value to professional students of chemistry alone. If we were to trace the successive stages we should find evidence of a systematic growth in chemical theory; but definiteness was hardly possible until after Cannizzaro had established the true system of atomic weights, and formulæ had been adjusted in accordance with them. Between 1850 and 1860, however, a new property of the atoms began to be recognized, and this, taken in connection with the formulæ based on Avogadro's law, was the key to the problem. The theory of *valence,* which is the expression of the newly discovered property, is as follows. Every atom, as regards its union with other atoms, has a certain atom-fixing power, which is known as its *valency,* or *valence.*

Let us take hydrogen as our standard of reference and consider some of its simplest compounds. In HCl, hydrochloric acid, one atom of hydrogen is united to one of chlorine. So also we have HBr, and HI, KCl, and NaCl, AgBr, etc. These elementary atoms, which combine only in the ratio of one to one, at least to form permanent compounds, are *univalent,* that is, their power of fixing or uniting with other atoms is unity. In water, on the other hand, H_2O, a single oxygen atom holds two of hydrogen in combination, and so oxygen is called a *bivalent* element. In H_2S, $CaCl_2$, ZnI_2, we have illustrations of still other compounds in which a bivalent atom is united with two of the univalent type. Nitrogen, phosphorus, arsenic, aluminum, and some other elements go still farther, and are *trivalent,* so that the compounds formed by them have such formulæ as NH_3, PH_3, AsH_3, $AlCl_3$, and so on. Carbon, a *quadrivalent* substance, forms normally compounds of still more complex type, such as CH_4, CCl_4, or, when it unites with two *dyad* or bivalent atoms, CO_2 and CS_2. For brevity, the valency of the various elementary atoms may be indicated by speaking of them as *monads, dyads, triads, tetrads,* etc. The rare metal vanadium is a *pentad,* having a valency of five, and *sexivalent* tungsten is a *hexad.* In many cases valency seems to be a variable property of the atom, as, for example, when we consider the two chlorides of phosphorus, PCl_3 and PCl_5. In cases like these the higher figure may be taken as showing the maximum atom fixing power of the element, a power which is only partially exercised in the lower compounds.

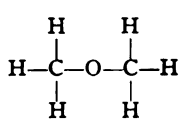
In the theory as thus stated there is no mere speculation; it is a statement of definitely observed facts. It tells us that the atoms unite, not arbitrarily, but in accordance with certain rules; and these help us in our comprehension of known compounds and the discovery of new ones. Indeed, an enormous advance in chemical discovery followed the application of these principles: an advance not only of scientific importance, but of economic and commercial value also. It was in the domain of organic chemistry that the growth became most immediately evident, and to this branch of the science we may now turn our attention. It is here that we find the best illustrations of what is meant by chemical constitution or structure, and the best examples of isomerism.

It has already been pointed out that organic chemistry, in its beginnings, dealt with animal and vegetable substances, the products of living organisms. Other artificial bodies, derived from these, were also included in its territory. All organic compounds were characterized by the presence in them of carbon, this element being ordinarily combined with hydrogen, oxygen, nitrogen, or all three, and sometimes with other elements also. Organic chemistry, as its domain was enlarged, in time received a new definition, and to-day the term broadly signifies *the chemistry of carbon compounds.* It is true that some compounds, such as the metallic carbonates, are more conveniently described as inorganic in character; but these minor exceptions affect the definition but slightly.

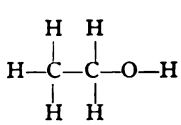
At first sight the almost innumerable organic substances appear to be hopelessly complex, and some, indeed, such as albumen, are so; but a closer inspection reveals order among them, and, in general, an ultimate simplicity. Their great number is due to the fundamental properties of the carbon atom, which, being quadrivalent, can unite with four other atoms simultaneously; and which, moreover, may combine with other atoms of its own kind to form rings or chains that serve as nuclei for the development of long series of substances. Most of the latter are derived from *hydrocarbons,* compounds of carbon and hydrogen, and these are exceedingly numerous. Marsh gas or methane, CH_4, contains the largest proportion of hydrogen, and is the type upon which the quadrivalency of carbon is predicated; it is, furthermore, the first member of a series of hydrocarbons, CH_4, C_2H_6, C_3H_8, and so on up to $C_{35}H_{72}$, and perhaps even farther. In this series each compound contains one atom of carbon and two of hydrogen more than the hydrocarbon preceding it, and this regular difference establishes what is known as an *homologous* series. Nearly all organic substances can be arranged in series of this kind, so that the chemist is able to master a great number of details by a single effort of the memory. Moreover, the members of each homologous series vary regularly, step by step, in their physical properties. Thus CH_4 is a gas, C_2H_6 a heavier gas, C_5H_{12} a volatile liquid, the following terms are liquids which grow less and less volatile, while above $C_{16}H_{38}$ the hydrocarbons are waxy solids. Ordinary paraffin is a mixture of these higher hydrocarbons, and the whole group, therefore, is known as the paraffin series. Common petroleum consists chiefly of its liquid members. From these hydrocarbons, with oxygen, a parallel series of *alcohols* is derived: such as CH_4O, methyl or wood alcohol, C_2H_6O, ethyl or ordinary alcohol, $C_5H_{12}O$, amyl alcohol or fusel oil, etc. By further oxidation the alcohols yield a set of acids, among which acetic acid, the acid of vinegar, is the one most familiarly known. This single series of hydrocarbons is the key to thousands of other substances which are directly producible from them. Some of these products illustrate very simply a mode of derivation which is known as *substitution,* as when, from CH_4, hydrogen atoms may be successively withdrawn and replaced by univalent atoms of chlorine. Thus we get the following compounds: CH_4, CH_3Cl, CH_2Cl_2, $CHCl_3$, and finally CCl_4; the fourth one being the familiar body chloroform. So also acetic acid, $C_2H_4O_2$, by substitution with chlorine, gives $C_2H_3ClO_2$, $C_2H_2Cl_2O_2$, and $C_2HCl_3O_2$; but here

the process stops and cannot be carried further. The one remaining atom of hydrogen in acetic acid is differently combined from the others, and here we begin to see the sort of evidence by which differences of chemical structure may be determined. When we study great numbers of organic compounds, especially with regard to their possibilities of chemical change, we find that certain combined atoms behave differently from other combined atoms of like kind. We also discover groups of atoms which can be shifted collectively from compound to compound; clusters which act almost like elements and are perfectly definite in their nature. The group NH_4 is so much like a metal in its compounds that it is given a distinct name, *ammonium*, and is conventionally treated as if it were really a metallic body. CN, cyanogen, resembles chlorine in some of its relations, and such groups as CH_3, methyl, and C_2H_5, ethyl, are encountered at every turn. They do not exist separately, but only in combination, and are known as *compound radicles*. Every such radicle has valency, and this is essentially residual in its nature. Thus in methyl, CH_3, three of the four units of affinity belonging to the carbon atom are satisfied by hydrogen, leaving one unit unemployed. Methyl, therefore, is a univalent radicle, and acts almost as if it were an independent element.

The chemical formulæ which we have so far considered belong to the class known as *empirical formulæ;* they give the number and kind of atoms in a molecule, but tell nothing as to their arrangement or mode of union. With the conception of valency and a knowledge of radicles we are now prepared to construct *rational* or *constitutional* formulæ, and from these it is possible to infer what sort of changes a given molecule can undergo, and to understand wherein isomeric bodies differ. For example, there are two bodies having the empirical formula C_2H_6O; one, methyl ether, is a gas; the other, common alcohol, is liquid; the great difference between them is evident at a glance. Their rational or structural formulæ exhibit the cause of difference as follows:

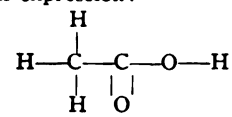


Methyl ether.



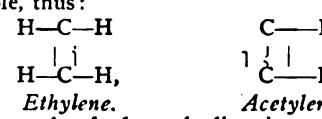
Ethyl alcohol.

In the first, two methyl groups appear united by an atom of oxygen; in the other, the carbon atoms are directly combined, and the bivalent oxygen connects carbon and hydrogen. The lines which connect the symbols represent units of valency, and the groups CH_3 in one case and C_2H_5 in the other stand for well-known radicles. For further illustration we may recur to the case of acetic acid, in which, as we have seen, three hydrogen atoms behave differently from the fourth. This condition is shown in the following structural expression:



Here we see the three replaceable atoms directly connected with carbon, while the fourth is linked to oxygen; the latter element also being combined in two ways. The known facts are clearly and simply presented to the eye by a convenient symbolism, a method of formulation which has been of immense value as a guide to practical research. In order to succeed, an experiment upon any of these compounds must be in accord with the facts of molecular structure, for the latter indicate limitations which cannot be disregarded.

In two of the foregoing formulæ the linking of carbon with carbon is clearly indicated, but only by single units of valency, or *bonds* as they are sometimes called. In other cases, however, more complex unions occur, and double or triple linkages are common. The formulæ for two hydrocarbons may be cited to illustrate this principle, thus:



Ethylene. *Acetylene.*

The second of these bodies is now widely known as an illuminating gas. Each compound is the starting point of an homologous series, exactly as with the paraffins; but the ethylene series exhibits a striking peculiarity. If we add to ethylene successive CH_2 groups, which characterize chemical homology, we get a sequence represented by such formulæ as C_2H_4, C_3H_6, C_4H_8, and so on indefinitely. In all of these compounds the ratio between carbon and hydrogen is the same, and their percentage composition is identical; such a series is called *polymeric*. The different members of the series, however, yield different derivatives, and they are further distinguished from one another by their *molecular weights*, the weight of the molecule being the sum of the weights of the atoms contained in it. These molecular weights can be directly measured by ascertaining the actual weight of definite bulks of the several substances in the condition of gas or vapor. According to Avogadro's law, equal volumes of gases contain equal numbers of molecules; if, therefore, a litre of one gas is twice as heavy as a litre of another, the weight of its molecule must be double that of the latter. By experiment, then, we can determine the relative weights of molecules, and so discover whether a compound is formed from a larger or smaller group of atoms.

One other class of organic substances demands attention here, the so-called *aromatic bodies*, which start from the hydrocarbon C_6H_6, benzene. In the compounds previously considered the carbon atoms are united in a chain-like manner, but in benzene there is good reason to assume that they form something like a ring. Around this ring of carbon atoms the hydrogen atoms are grouped, and by successively replacing them with other atoms or radicles, a myriad of substances may be generated.

The details of this theory, which was put forth by Kekulé in 1866, are too abstruse for full development here, but its influence upon chemical research and chemical industry has been overwhelming. From benzene, which is a product of coal-tar, aniline is produced; and the derivatives of aniline give us a perfect rainbow of artificial dyes. To benzene, other hydrocarbons are closely related, and their derivatives are often curiously interesting. Among them we have artificial indigo and artificial alizarin, the latter being the coloring principle of madder. Both compounds are identical with the natural substances, and both are important commercial products. Medicines, like saccharin, antipyrin, acetanilid, and phenacetin; perfumes, like musk and violet; and flavoring substances, such as vanillin, are now prepared by synthesis from the hydrocarbons of coal-tar, and thousands of workmen find employment in the new industries which are based upon these processes. The investigations which created these new sources of wealth have been in great part guided by theoretical considerations, and at the very foundation of all this work we find the conception of chemical structure, and Kekulé's interpretation of the constitution of benzene. The atomic groupings represented by the structural or rational formulæ are not visionary, and their study has led to the greater material well-being of mankind.

It must not be supposed that the rational formulæ represent the arrangement of the atoms in space, for that is not their purpose. It is not likely that the atoms of a molecule all lie in one plane, and yet these formulæ suggest no other mode of grouping. The tridimensional structure of molecules is, generally speaking, almost entirely unknown; and yet, in certain cases, there are clues to a partial solution of the problem. Various organic substances have optical properties which are easiest explained by assuming that the atom of carbon is essentially a tetrahedron in form, and that its four valencies are forces exerted from the centre toward the four solid angles of the body. By means of this hypothesis many curious facts are interpreted, and many new discoveries have been made. Formulæ based upon the tetrahedral carbon atom are called *stereochemical* formulæ, and the study of their space relations is named *stereochemistry*. This subject is quite modern and does not admit of detailed discussion here.

That the elements are connected with one another by various relationships is a fact which was early recognized; they were therefore soon classified into groups according to their likenesses. Thus chlorine, bromine, and iodine are closely allied, and form strikingly similar compounds; lithium, sodium, and potassium resemble one another very clearly, and so too do the metals, calcium, strontium, and barium. Such a grouping was of great service in classifying many chemical facts, and in due time it was seen to be related to the property of valency. A general law connecting all the elements was, however, not discovered until the decade ending in 1870, during which time three investigators, Newlands, Mendeleéf, and Lothar Meyer, working independently, developed the *periodic system*. Upon arranging the elements in the order of their atomic weights, a regular periodic variation in their properties appeared, and the fullest interpretation of it was due to Mendeleéf. The nature of his work may be partly shown as follows:

Beginning with lithium and arranging the elements in the order above indicated, a table of the following form can be constructed, although only three lines of it are given here:

I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Li.	Gl.	B.	C.	N.	O.	F.	Ne.
7.	9.	10.9	11.9	13.93	15.88	18.9	19.9
Na.	Mg.	Al.	Si.	P.	S.	Cl.	A.
22.88	24.18	26.9	28.2	30.8	31.8	35.2	39.6
K.	Ca.	—	Ti.	V.	Cr.	Mn.	etc.
38.9	39.8	—	47.7	50.8	51.7	54.6	

Under the symbol of each element its atomic weight is written, rounded-off, in some cases, for convenience. Let us now consider the first line. Lithium, which begins the scheme, is univalent, glucinum bivalent, and carbon quadrivalent, a regular increase in valency. Nitrogen is in its stablest compounds trivalent, oxygen bivalent, and fluorine univalent; thus showing a steady decrease. Neon, which was not known in Mendeleéf's time, and argon, which falls just below it, are elements of *no* valency, and these form no compounds. These elements, with their regular rise in valency to carbon and fall to neon, form a single period. In the next line, beginning with sodium (Na), the process is repeated; and this happens again in the third line; so that all of the elements in the same vertical column are alike in valency and intimately related in their properties and their compounds. Regular step-by-step variation horizontally, and likewise vertically, characterizes the table, which may, with certain qualifications, be extended so as to include all the elements known.

At the third place in the third line of the table, as given above, a blank appears. This place, when Mendeleéf developed his *periodic law*, was occupied by no known element; and in the fourth period of the completed scheme two similar gaps occurred. These indicated unknown elements, and Mendeleéf, from the properties of the adjacent elements, predicted what their properties should be. Since then the prediction has been verified; and three new metals, having all the properties which Mendeleéf foresaw, fill the vacant places. They are scandium, gallium, and germanium. The connection between the elements was more intimate than anyone had supposed, so much so that the unknown could be accurately prophesied. All physical properties appear to rise and fall from element to element in this regular periodic way; and we can now see what sort of elements are likely to be discovered in the future, and where they will stand in the tabular arrangement. The properties of an atom, thermal, electrical, optical, etc., seem to be in great measure dependent upon its weight. The distinctly chemical property of the atom, its valency, may be related to its form, as stereochemical evidence would seem to indicate; but here we have few facts to go upon, and speculation would be premature.

The wonderful regularities of the periodic law, with its verified predictions, lead us at once to reiterate the old question as to the ultimate nature of matter. Is it really various in kind, or is it at bottom only one? Are the elements, in the last analysis, elementary? To

such questions no final answer can yet be given, but they cannot be silenced; and one of the most marvelous discoveries of science has some bearing upon the problem.

When a beam of white light passes through a glass prism, it is broken up into a bundle of rays which give to the eye the so-called seven primary colors. If this phenomenon be observed through the form of instrument called a *spectroscope,* a continuous band of color is seen ranging from red at one end to violet at the other. Suppose, now, that instead of examining white light, we repeat the experiment with a colored flame and see what will happen. Sodium compounds, for instance, when introduced into a non-luminous gas flame, give out an intense yellow light; and this, viewed through a spectroscope of low power yields a *spectrum* consisting of a single, narrow, yellow line. Lithium, under similar conditions, exhibits a red line; barium, a group of several green and yellow lines; and, in short, every substance which is capable of coloring a flame gives a spectrum which is not continuous. Each spectrum is made up of bright, colored lines, with dark spaces between; and every line is absolutely characteristic of its source. Every element, provided it be first heated hot enough to be converted into vapor, yields its own definite spectrum of one or many lines, which can be recognized in a spectroscope. The vapor of iron, as obtained in an electric spark between iron terminals, gives a spectrum containing a multitude of bright lines, and every one of them belongs only to iron. The process by which substances are thus identified is known as *spectrum analysis;* and it was discovered by Bunsen and Kirchhoff a little over 40 years ago. Bunsen applied the method to the analysis of the salts contained in a mineral water, and saw lines which belonged to no known element. He was thus led to find two new metals, rubidium and caesium, and soon afterward, by similar means, other chemists discovered thallium and indium.

Shortly after its invention the spectroscope was turned toward the heavenly bodies, in order to see what tales their light had to tell. It was at once found that they are all composed of matter like that with which we are familiar on the earth, although varying in complexity. The sun was proved to be an intensely heated body, containing a large number of our chemical elements in gaseous form, and the fixed stars were similar in character. The whiter and hotter stars contain comparatively few substances, the colored and cooler stars contain more. The nebulæ, those bodies which represent the first step in the formation of planets and systems, were found to be vast clouds of incandescent gaseous matter, in which hydrogen and nitrogen predominated; chemically, therefore, they were extremely simple. From the simplest nebula to the complexity of our earth there was regular chemical gradation, suggesting that the evolution of the one from the other had been accompanied by an evolution of the so-called elements also. A strong argument in favor of the unity of matter was thus brought to light, even though absolute proof was wanting. The general opinion now is that our elements are really complex, although our present resources are not adequate to decompose them.

Very recently this opinion has been strengthened by a group of remarkable discoveries connected with the rare metals, thorium and uranium. These elements and their compounds were found to emit invisible radiations, or emanations, which affect the photographic plate, and also possess certain measurable electric properties. This trait of *radioactivity,* as it is called, led to the discovery of two or three new metals, which are associated in the mineral kingdom with uranium, and one of these, radium, has the new power to an extraordinary degree. The radiations are of several kinds; and are still the subject of active investigation; but one or two of the conclusions so far reached are pertinent to the present discussion. In the case of thorium, according to Rutherford, the emanation consists of chemically inert gaseous particles which are continually being generated and given off from the parent material. The element thorium seems to contain something which is not thorium. So also J. J. Thomson, studying electrified gases, is led to the conclusion that the negative charge resides upon certain *corpuscles,* as he terms them, which are not more than the thousandth part of an atom of hydrogen in magnitude, and which are the same for all substances. Particles smaller than the chemical atom are thus being identified, and so the belief in the actual complexity of the elements is receiving close attention.

Although the principles of valency and the conception of chemical structure are best developed and exemplified in the study of organic compounds, the inorganic side of chemistry is by no means to be neglected. Here we find the simplest illustrations of chemical nomenclature, and some of the greatest fields of industrial activity. Sulphuric acid, soda, bleaching powder, and many other inorganic substances are of immense commercial importance; and the processes by which metals are extracted from their ores all fall within this department of chemistry. Information upon these practical subjects will be found elsewhere, under the proper headings, such as IRON; PHOSPHORUS; SALT; SODA; etc.; but a few general notions belong here.

The nomenclature of inorganic chemistry is quite simple. Compounds of two elements are described by giving their names and adding the termination *ide* to part of the second title. For example, copper unites with oxygen to form copper *oxide;* zinc and chlorine give zinc *chloride,* and so on, the names thus expressing the composition of the substances. When multiple proportions appear a numeral prefix is added to the class name, so that we have such combinations as iodine *mono*chloride, ICl, iodine *tri*chloride, ICl_3, and the like. In some cases this mode of nomenclature is varied, as when certain well-defined classes of compounds are to be described. Thus we have the iron compounds $FeCl_2$ and $FeCl_3$ (the symbol Fe from ferrum), which are commonly called *ferrous* and *ferric* chloride respectively. The terminations *ous* and *ic* denote lower and higher stages of union and are used for convenience or euphony when the regular nomenclature might be awkward. Such compounds as PCl_3 and PCl_5 may be named either phosphor*ous* and

phosphor*ic* chloride, or phosphorous trichloride and pentachloride, according to preference; but the latter form is the more precise and clear. Any compound of a metal with oxygen, then, is an *oxide;* with chlorine, a *chloride;* with sulphur, a *sulphide,* etc.

Three of the largest and most important classes of compounds are *acids, bases,* and *salts.* In order to define these rigorously, some previous knowledge of chemistry is required; but an indication of their character is easily given. The acids, as their name implies, are usually sour in taste, but not invariably so, and the stronger members of the class are violently corrosive and able to dissolve metals. They are most commonly derived from the non-metallic elements, and several acids may be formed from one of the latter. Here again we have the *ous* and *ic* nomenclature, as in sulphur*ous* acid, H_2SO_3, and sulphur*ic* acid, H_2SO_4; the latter containing the higher proportion of oxygen. From nitrogen we get nitr*ous* and nitr*ic* acids, HNO_2 and HNO_3, and so on with simple descriptive names throughout the long list of these compounds.

The *bases* are the direct opposite of the acids in their properties, and have, when soluble in water, an alkaline or soapy taste. The taste of ordinary kitchen soda is a good example of this peculiarity. Certain vegetable coloring matters are changed in hue by acids and alkalies, the latter name being applied to the stronger soluble bases. Blue litmus, for instance, becomes red in contact with an acid, but an alkali restores its original tint. When acid and base are mingled in proper proportions, they *neutralize* each other, and a *salt* is produced which no longer affects litmus. To illustrate further: soda is a base, and when it is mixed with sulphuric acid it generates sodium *sulphate.* With sulphurous acid it yields sodium sulph*ite;* and the two terminations *ate* and *ite* correspond to the other terminations *ous* and *ic.* Nitric acid, with bases, forms nitrates; acetic acid, acetates, etc., the nomenclature being simple and easy. Many of the salts are important commercial articles.

From one point of view an acid is a substance which contains hydrogen replaceable by a metal, and a salt is the compound so produced. Zinc, for instance, dissolves in sulphuric acid to form zinc sulphate, and free, gaseous hydrogen, is liberated. An acid, then, contains hydrogen plus something else, and the latter is a distinct radicle in each case which exhibits a definite valency. The subjoined formulæ may help to make this point clear:

Nitric acid.	*Sulphuric acid.*	*Phosphoric acid.*
HNO_3.	H_2SO_4.	H_3PO_4.
Potassium nitrate.	*Potassium sulphate.*	*Potassium phosphate.*
KNO_3.	K_2SO_4.	K_3PO_4.

That is, potassium (symbol K from kalium) replaces hydrogen atom for atom; and the radicles NO_3, SO_4, and PO_4 are univalent, bivalent, and trivalent respectively. A knowledge of these simple principles enables the chemist to classify the facts in his mind, and to write numberless formulæ without overloading his memory with details. Learning these principles is like learning a language, only the grammar is easy of acquisition. Fluency in its use can only be gained by practice.

Between allied departments of science no sharp dividing line can be drawn, and this is peculiarly true with respect to chemistry and physics. The two sciences merge one into the other by imperceptible gradations, and neither can be fully understood separately. Physics treats primarily of the different forms of energy, light, heat, electricity, mechanical force, etc., and all of these appear in the phenomena of chemical change. Furthermore, chemical substances are described in physical terms, and are identified by physical properties such as weight, color, specific heat, melting point, boiling point, electrical conductivity, and the like. Considerations of this kind have received much attention during recent years, more than ever before; and so a great department of knowledge has been developed, known as *physical chemistry.* Avogadro's law, the periodic law, and the revelations of the spectroscope all fall partly within this field, but other important portions of it deserve some notice here.

Between chemical change and heat the relation is exceedingly intimate. No chemical change takes place without either the liberation or the absorption of heat, and every one is in some measure dependent upon temperature. At very low temperatures, like the temperature of liquid air, all chemical action ceases, and the most oppositely energetic substances lie side by side indifferent to one another. At very high temperatures all unions are broken up, and here again the chemical forces cease to be operative. Most of the changes which we observe are effected at ordinary temperatures, and a slight warming may rouse an apparently inert mixture to chemical activity. The application of heat, then, may either instigate or prevent chemical union, according to circumstances.

As a general rule, with some apparent exceptions, every chemical union develops heat and every decomposition absorbs it; and the study of these relations has received the special name of *thermochemistry.* Furthermore, every chemical change is attended by its own special, definite quantity of heat, and these quantities vary from substance to substance. Hydrogen, burning, that is, combining with oxygen, gives out the largest amount of heat of any substance known; carbon yields much less, phosphorus or sulphur less still, weight for weight being consumed. For such reasons the heat value of any fuel depends upon its chemical composition, and hence careful analyses of coal, which is a variable mixture containing chiefly carbon and hydrocarbons, have great practical importance. From the composition of a coal its *calorific value* may be calculated, although a direct experimental measurement of it is to be preferred. In general laws, however, thermochemistry is still rather deficient, and its larger meanings are yet to be discovered.

Like heat, radiant energy, the energy of light, may cause either chemical union or chemical decomposition. Hydrogen and chlorine, mingled in cold and darkness, do not readily unite, but upon sudden exposure to strong sunlight they combine with explosive violence. On the other hand, silver salts, under suitable conditions, are broken up by light, and upon this fact the art of photography is founded. The

photographic film is a laboratory in which light is the chemist. We have already seen, in considering spectrum analysis, that every substance, when intensely heated in the form of gas or vapor, emits light which is peculiar to itself; but there are still other relations between matter and light that have chemical importance. Color is merely the capacity for selecting or absorbing certain rays, and rejecting or transmitting others; and this is often a characteristic distinction between various classes of compounds. For example, salts of cobalt are commonly red, of nickel green, of copper blue or green, and so on. Many of the optical properties of substances seem to depend upon their chemical composition, and in one set of phenomena this fact has economic importance. Certain bodies have the power of twisting or rotating a ray of polarized light, and among carbon compounds this property is directly connected with stereochemical structure. Sugar is one of these optically *active* compounds, and by measuring the amount of rotation which a sample can produce its degree of purity may be determined. This process is practically applied in all sugar refineries for estimating the value of raw sugars or syrups, and also in assessing customs duties. The polariscope used for such purposes is often called a saccharimeter.

Of late years chemistry has been greatly developed upon its electrical side, both theoretically and practically. Electricity may be generated by chemical change, and this happens in all forms of the galvanic battery. For many years, previous to the perfecting of the dynamo, batteries of that class supplied all the electrical power that had any industrial significance. Electricity may also produce chemical change, and it is especially effective in bringing about decompositions. Indeed, many thinkers have sought to identify chemical attraction or affinity with electricity, and even the property of valency is often ascribed to electrical charges carried by the atoms.

From a purely chemical point of view, probably the most important electrical phenomena are those of *electrolysis.* When a current of electricity passes through a compound solution, the latter undergoes decomposition, and the dissolved substance, acid, base, or salt, is separated into two parts which move with unequal velocities in opposite directions. The conducting liquid is called an *electrolyte,* and the separated parts, or rather particles of the compound in solution, are termed its *ions.* One ion is positively, the other negatively electrified, and hence they tend to accumulate around the opposite poles. Under suitable conditions, the separation can be made permanent, and this fact is the basis of all our processes in electrometallurgy. From solutions of gold, silver, copper, nickel, etc., the metal is electrically set free, to be deposited upon properly arranged surfaces. Electroplating and electrotyping are operations of this kind. In the electric furnace, however, the electricity acts as a source of heat, and the latter is the effective decomposing agent. In manufacturing chemical preparations many electrolytic processes are now employed. In liquids which do not conduct a current electrolysis does not take place.

Suppose, now, we employ several precisely similar currents to effect a variety of electrolytic changes. Let one current liberate hydrogen from water, another deposit silver, another copper, and so on. Then, upon measuring the quantities of the different substances which have been set free, we shall find them to be exactly proportional to their *chemical equivalents,* an equivalent being the ratio between the atomic weight of an element and its valency. For univalent elements the atomic weights and equivalents are identical, for bivalent elements the equivalent is half the atomic weight, and so on through the list. If, then, one gram of hydrogen is liberated, the same current in the same time will deposit 107.11 grams of univalent silver, or one half of 63.1 grams of bivalent copper, etc. This fundamental proposition of electrolysis is known as Faraday's law. Furthermore, the separated ions all carry equal electrical charges per unit of valency, 96,500 coulombs for a univalent ion, and twice that for a bivalent ion. The relation between electrical and chemical phenomena is of the very closest kind, and Faraday's law is absolutely general.

When two or more substances act upon one another chemically, the entire process is termed a *reaction.* Very many of the reactions which are observed in the laboratory take place between bodies in solution, and hence the study of solutions has received and is still receiving a great deal of attention. No complete theory of solutions has so far been developed; why one substance should dissolve easily in water, another slightly, and a third not at all, remains unexplained; but some generalizations have been reached, and these are of the most suggestive character. Some of the phenomena are electrolytic in their nature, and others go to prove a remarkable parallelism between bodies in solution and bodies in the gaseous condition.

In Avogadro's law the volume of a gas is defined by conditions of temperature and pressure, and equal numbers of molecules occupy equal spaces. The power of exerting pressure is one of the distinct properties possessed by all gases, and this is a consequence of the fact that the molecules are in rapid and continuous motion. Substances in solution are also found to exert pressure, and the latter can be measured by various means. The pressure is proportional to the strength of the solution, and although it is not easily detected, it is often very great. The movement of the sap in a plant is due to the *osmotic pressure* of the dissolved substances that it contains. In 1887 Van t'Hoff, studying these phenomena, deduced from them the simple law that equal volumes of solutions, at equal osmotic pressures, contain equal numbers of molecules, and Avogadro's law was directly paralleled. A body in solution and a gas obey precisely similar laws. We have already seen that from the actual weight of a gas its molecular weight can be determined. Now, from the behavior of substances in solution their molecular weights can also be ascertained. A saline solution does not freeze so easily as pure water, and its boiling point is higher; the depression in one case and the elevation in the other being proportional to the molecular weight of the dissolved substance. These facts are directly connected with Van t'Hoff's generalization, and they are now of almost daily application in scientific research. The actual measurement of

molecular weights has been enormously extended by means of the new laws.

Both gases and solutions, however, sometimes exhibit apparent anomalies. Certain compounds, when vaporized, seem not to agree with Avogadro's law, and such facts require explanation. The seemingly anomalous substances, as such, do not exist in the state of vapor, but are split up, or *dissociated,* into other things, For example, ammonium chloride, NH_4Cl, above a certain temperature, is decomposed into a mixture of two gases, hydrochloric acid and ammonia, $NH_3 + HCl$, which, on cooling, reunite and reproduce the original compound. Twice as much vapor as is required by theory, and specifically half as heavy, is produced by this transformation, which is but one of a large class, all well understood.

In the case of solutions it was found that many compounds, especially the acids, bases, and metallic salts, caused a lowering of the freezing point that was twice as great as should be expected. Here again a splitting up of molecules, a true dissociation, exactly like that observed in gases, had occurred. Furthermore, the anomalous compounds were all electrolytes; that is, their solutions conducted electricity and were electrolytically decomposed; while normal substances, like sugar, were not. Solutions, then, were to be divided into two classes, differing electrically, and also dissimilar in their relations to Van t'Hoff's law. The explanation of these differences is given by Arrhenius in his theory of *electrolytic dissociation.*

As interpreted by this theory, an electrolyte, when dissolved, is dissociated into its *ions,* partially in a strong solution, and entirely in one which is infinitely dilute; a statement which leads to some remarkable conclusions. For instance, the ions of common salt, sodium chloride, are atoms of sodium and chlorine. In a dilute solution the salt itself ceases to exist as such, while atoms of sodium and of chlorine wander about, chemically separated, but still in equilibrium with each other. Sodium sulphate may be regarded as made up of two parts, sodium ions and ions of an acid radicle, SO_4, and these are severed apart during solution to move about independently. According to this view electrolysis is not primarily a decomposition of the salt: it is rather a sorting out of the already uncombined ions, which receive different electrical charges and concentrate separately at the two electrical poles. Some ions are single atoms, others are more or less complicated groups such as CO_3, SO_4, NO_3, PO_4, etc., which cannot be, or at least have not been, independently isolated.

In the study of chemical reactions the ionic theory of Arrhenius has been fruitfully applied. By means of it we are now able to better discriminate between acids and bases, and to interpret more rationally the phenomena of neutralization. Acids are all characterized by the presence in their solutions of hydrogen ions, single atoms with a univalent radicle two atoms for each bivalent radicle, etc. Thus in hydrochloric acid the ions are H and Cl; in sulphuric acid $2H$ and SO_4, and in phosphoric acid $3H$ and PO_4. In bases, on the other hand, ions of *hydroxyl* exist, and this is a radicle of the formula HO, in which the bivalent oxygen is only half combined. Caustic soda, NaOH, for example, dissociates in solution into the ions Na and HO; caustic lime, CaO_2H_2, into Ca and $2HO$, and so on. When a dissolved base and a dissolved acid are brought together, the H ions of the latter and the HO ions of the former combine to form water, H_2O, and vanish from the reaction. The salt which is produced is represented by the remaining ions, and as the characteristic features of acid and base are gone, the result is neutral. Nearly all reactions in solution, but not quite all, are reactions between ions rather than between the actual compounds with which we originally began.

In the time of Lavoisier chemistry was hardly more than a minor subdivision of natural philosophy. It was just coming into recognition as a true science, and its votaries were few. Its great development has taken place in little more than a century, and now it touches many other branches of knowledge, affects all departments of industry, and gives employment to tens of thousands of men. In every part of it there is intense activity, and discovery follows discovery faster than they can be assimilated. Mineralogy is to all intents and purposes a branch of chemistry, for minerals are classified upon the basis of their chemical composition, and the first step toward the establishment of a new species is its chemical analysis. Physiology is in great part a chemical science; respiration, assimilation, and excretion are chemical processes; within the living organism, plant or animal, substances are undergoing transformations which only the chemist can follow or identify. The chemistry of vital processes, *biochemistry,* is almost a science by itself, so large is its field and so varied are the problems with which it has to deal. Medicine is indebted to chemistry for almost a new pharmacopœia, for not only have new remedies been created, but in place of old drugs, crude and bulky, the compact and more elegant active principles are now employed. Anæsthetics, such as ether, chloroform, and nitrous oxide; hypnotics like chloral; the remedies derived from coal-tar; and alkaloids like quinine, morphine, and cocaine, are a few of the contributions with which chemistry has enriched medical practice. Even antiseptic surgery depends upon chemical preparations for its success.

The chemistry of agriculture is separately treated elsewhere, but a word may fairly be said upon the relations between chemical science and the arts. Every manufacturing industry is directly and profoundly affected by the results of chemical research. A century ago probably no manufacturing establishment in the world even thought of maintaining a chemical laboratory; to-day hundreds are in operation for the benefit of the intelligent manufacturer. Coal gas is a chemical product; its by-products are ammonia and coal-tar; and from the latter, as we have already seen, hundreds of useful substances, discovered within the last half century, are prepared. Better and cheaper soap and glass owe their existence to chemical improvements in the making of alkalies; chemical bleaching has replaced the slow action of sunlight and dew; chemical dyestuffs give our modern fabrics nearly all their hues. In metallurgy every metal is extracted from its ores by methods which rest on chemical foundations, and analyses of fuel, flux, and product go side by

side with the smelting. The cyanide and chlorination processes for gold, the Bessemer process for steel, are good examples of the advance in chemical metallurgy; but before they can be applied the dynamite of the miner, another chemical invention, must have done its work underground. Waste products are made useful, and new applications of old materials are discovered by the chemist; even curiosities like the rare mineral monazite are brought into play. Monazite furnishes the oxides of thorium and cerium, from which the mantles of the Welsbach burners are made. Every year brings its improvements, and chemical patents by the hundred are annually issued to inventors.

The facilities for chemical training have increased side by side with the demand for chemical services, and in every university or technical school chemistry has become a leading study. Even the preparatory schools are now equipped with chemical laboratories, and the science has come to be recognized as an important part of a liberal education. Apart from its practical bearings its disciplinary value is very great, and this consideration is now given due weight by teachers.

One more phase of chemical activity remains to be noticed, the organization of chemical societies. Of the larger national organizations the English society is the oldest, the French next, then comes the German, and then the American. The German society is the largest; but the American Chemical Society numbers over 2,200 members, and has sixteen local sections in continuous operation. In its journal it publishes over 1,500 octavo pages each year. There are also many smaller organizations devoted to chemistry, and some to special subdivisions of it, such as electrochemistry. Applied science is represented by the Society for Chemical Industry, an Anglo-American association of great strength.

F. W. CLARKE,
Chemist for U. S. Geological Survey.

Chemistry in Human Progress. Running over some of the great chemical developments to find a starting point, agriculture appears to be a good field to begin in. As agriculture is the oldest industry on the face of the earth, it is not strange that many facts should have been discovered during the centuries of its practice. But, before chemistry was developed, there could be no science of agriculture. What was known was purely empirical, and no reason could be assigned for the result. Many may be surprised to know that scientific agriculture dates from 1862, 39 years ago, the date of the publication of Liebig's great work on 'The Chemical Process of Vegetable Nutrition and the Laws of Agriculture.' Liebig's first work appeared in 1840, and was met with a storm of abuse and criticism. But then the world usually treats a new idea in that way. Abuse by the world often means that one has evolved an idea having some claim to originality. It seemed particularly to vex the public that a chemist should meddle with agriculture, and dare to assail the views of practical farmers. The book went through many editions and then dropped out of notice, for, although founded on correct principles, Liebig had erred in his inferences, and his ideas when put into practice failed entirely. Liebig stated that the plant lived on, or assimilated, the simple or inorganic constituents of the soil and converted them into complicated organic substances such as cellulose, sugar, albumen, etc., and that the animals lived on the plant; that the plant built up complicated substances out of simple ones, and that the animal consumed these complex substances, and then converted them back into simple substances. In other words, the plant was a synthetic organism, and the animal an analytic. To establish this, and to found upon it a practical method of agriculture and physiology, was a work so colossal that it is no wonder that even the mighty intellect of Liebig should have failed at first to grasp all of the details. Liebig examined an immense number of plants from all parts of the world, and found that while the plants all contained the same ash constituents, different kinds contained different proportions of these mineral ingredients; even different parts of the same plant, as the leaves, the stalks or the seeds, contained varying relations of ash constituents. As a result, Liebig was able to state that every plant takes from the soil a certain amount of mineral substances as a definite mixture, and that these substances will be found again in the ash, and that the carbonic acid and ammonia which the plant requires to form its combustible parts are taken up through its leaves and roots from the atmosphere. If wheat, or corn, is grown on a field, year after year, in time the mineral food of the soil will become exhausted and the plants will not thrive, but will be dwarfed and puny and incapable of enduring the weather, or will die of starvation. Now, if the proper amount of mineral nutriment be added to the soil, the plants will grow, and the atmosphere and mechanical nature of the soil will look after the rest.

A factory was established to manufacture artificial fertilizers according to Liebig's idea, but after several years of trial it was found that they were a complete failure. Liebig knew that his theory was right, but was unable to explain why it failed in practice. He worked and thought, and thought and worked. After several years he noticed that certain fields which he had treated with his fertilizers, and which had not been bettered by them, began to show slight but marked and increasing signs of fertility. In the meantime, the English farmer, Lawes, working with a chemist named Gilbert, showed that fertilizers would produce effects if added in a soluble form, and further that ammonia and forms of nitrogen were not taken

up by the plants from the air alone, but that they must be added to the soil. If these conditions were followed, the yield of a field was enormously increased. Liebig had supposed that if his fertilizers were easily soluble in water they would soak through the earth before the plant could assimilate them, and had hence made them as difficultly soluble in water as he could. But Thompson and Way long ago proved that surface soil had the power to retain certain substances when in solution. The scales fell from Liebig's eyes. The mineral food of the plant must be placed on the soil in soluble form; the soil would hold it and the roots would absorb it. In 1862 appeared the new edition of his great work, and agriculture became a science. It was easy to find out what was the proper food of any plant, and no farm need suffer from exhaustion. Since then the progress in this branch of science has been so rapid that it is hard to follow it. The striking facts of this discovery have been merely touched upon; there are many minor ones, and the conditions necessary for the successful application of the results are numerous, but every day shows advance in our ability to understand and apply them.

What are the effects of this discovery upon civilization? We find that agriculture as a livelihood, indeed, as a profession, has enormously increased. The vast deposits of fossil bones, phosphate rock, and of guano have been opened, and have developed a great industry, as well as have increased the resources of the world many fold. Stations have been established in many places for the examination of fertilizers and the determination of their value by chemical analysis, and employ a small army of trained chemists. The education and protection of the farmer have become a matter of national importance. Instead of farming land until it is used up, or relying on an empirical rotation of crops, the nutrients taken from the soil are systematically put back. Careful study of the chemical composition of a plant and the effect of chemical fertilizers enable us to develop certain products formed by the plant. Thus the beet root, by careful treatment, has been compelled to produce a far greater amount of sugar than formerly, and Germany has been freed from her dependence on other countries for her supply of sugar. Certain substances have been found to increase the specific functions of a plant, and so a plant can be developed into leaves, roots, stalk, or seed. In fact, we are getting to be more and more masters of the vegetable kingdom, or in other words, we can make two or even ten spears of grass grow where there was but one, and each will be bigger than the original one.

No man who has brains and muscle, and who is not afraid of work, need ever starve in this country, where land is so plentiful. Let us note one fact here, which is often overlooked. The great wave of agricultural development has swept over the West and is rolling toward the Pacific. These pioneers skim the cream. When the soil gets exhausted they move on to new ground. This is not an entirely beneficial production. We are sending, it is true, vast amounts of grain and foodstuffs to Europe, and money is coming back, but in what proportion? The mineral ingredients of these breadstuffs are lost to us, and soon we shall have to replace them, which will cost us more, perhaps, than we have received. In 1883 we exported:

Of wheat	$120,000,000
Of corn	28,700,000
In all	$148,700,000

The cost of production of this was $60,400,000, so that one might think that there was a profit of $88,300,000.

According to Prof. Voorhees, of the New Jersey Experiment Station, however, there were in this exported wheat and corn 70,000 tons of nitrogen, 40,000 tons of phosphoric acid, and 21,000 tons of potash, which are worth, at market rates, $33,000,000. Hence our real profit is only $55,300,000, and a corresponding decrease in the capital stock of the West. This amount in time must be replaced, or our soil will become exhausted. So long as we can draw on our native supplies, well and good, but the time may come when we may have to buy them back, and at an advanced price.

In a word, then, Liebig's great discovery has done much to develop the prosperity and independence of nations, for the independence of a nation will be based largely on how well it can feed its inhabitants, that is, its power of endurance. No better result of the wonders that scientific agriculture can accomplish may be seen than in the States of Connecticut and New Jersey. Look at the thousands of acres reclaimed from stone and sterility and now yielding bountiful crops under scientific treatment. Nor forget what honor is due to the men who, by dint of sheer persistence, grit and brains, introduced Liebig's work into this country, and who have educated the plain agricultural workers to such an extent that these States can compete with others better adapted by nature for agricultural production, who established the first agricultural stations, after which all of our others have been modeled, and to whom not only these States but our whole country owes a debt of millions of dollars, if prosperity can be repaid in cash. I mean Prof. Samuel W. Johnson, of New Haven, and Prof. George H. Cook, of New Brunswick.

Let us now look into the subject of live-stock and see what chemistry has done there. Lavoisier had shown that animal warmth was due to processes of oxidation, a kind of burning of the carbonaceous and hydrogenous substances in the body, just as the heat of burning wood is caused by the oxidation of the carbon, its chemical union with oxygen. Dulong and Despretz proved that nine tenths of the heat produced in the body was owing to this cause. The heat of our bodies appears to be a kind of flameless fire. Bodily heat is very much like steam heat, and to produce it fuel must be constantly kept burning under what may be termed the boilers of our organisms.

In the subject of animal nutrition the mighty mind of Liebig again found a vast field to till. In many ways this was no new and untrodden ground. Physiologists had accumulated hundreds of interesting facts, but the great question, how is it that although the nutrition of the various animals is so different, the composition of their bodies is so nearly the same, had not been answered. The flesh of the ox, the bird, and the man is about the same thing. The

change of substance in a hungry herbivorous animal is about the same as in a carnivorous one. From the day of Hippocrates to 1840, this question had been becoming more clearly defined, but the answers to it were conflicting and unsatisfactory. Suddenly, like a flash of lightning, the darkness was dispelled. The essential facts had all been found, but a chemist was needed to translate and explain them. It was like the old story of the writing on the wall. It was there, but no one could read it. It would take me too far from my subject to attempt to explain the details of Liebig's views of physiological chemistry, to relate the fierce polemic wars waged on these questions; for the dictum of Ranke is as true in the history of science as in the history of nations: "All progress is through conflict." Suffice it to say that Liebig was the first to definitely assert that the animal must find the chief constituents of its blood, which form and nourish its whole body, ready formed in its food, and these substances originate and are found in the plants. Following this up, we find that the animal is a kind of chemical factory in which many chemical processes are carried out. The machinery belongs to physiology; the processes, however, are largely chemical.

Chemical statistics in relation to animal life were collated and increased. Animals were analyzed wholesale, and their chemical composition determined. For instance, Lawes and Gilbert found that the analysis of 348 whole sheep gave an average of 2.34 per cent of ash, 7.13 per cent of protein, 70.4 per cent of fat, and 20.1 per cent of water. All kinds of animals were examined, and the composition of entire specimens and of the various organs and fluids determined. Foods were examined chemically, and, in fact, not only the body of the animal, but all that went into it and came out of it was analyzed by the chemists. The result of all this was that chemists found the animal to be as susceptible of experiment as the plant. Live stock can now be fed, for instance, to make flesh, to make fat, to yield milk, to produce work, or to simply maintain life. The nutritive elements of food can be determined and their digestibility estimated. The economy of foods can be calculated, and, in fact, the whole subject of animal-raising has passed from empirical management to scientific organization, and in this field, too, the progress has been rapid, and is still wonderfully rapid.

The animal is now studied very much like a steam engine; in the one case we feed coal and get steam, power, or heat, in the other, we feed fodder and get milk, flesh, or power, as the case may be. A "ration" can now be made in which the digestible proteine, the fat and carbohydrates can be obtained from the most various sources, and the fluctuations of the markets taken advantage of to produce the raw materials. The nutritive value and digestibility are carefully adjusted, and, as a result, for instance, we are able to produce milk at a total expense of 2½ cents a quart. In this country the science of live-stock feeding is as yet in its infancy. We are, at least in the West, gathering the bloom of the land. Our cheap beef and our cheap corn can be produced only for a time. Sooner or later the riches taken from the soil must be put back again. It would be hard, indeed, to trace all the effects of these discoveries on the gradual progress of civilization. Cheaper food and more economical and profitable agriculture strengthen the great tap-root of all civilization and human relations on this earth.

As a result of all this great advance in our knowledge of scientific agriculture farming has become a profitable profession, and I predict that more and more we shall see educated young men entering it.

The chemical study of foods has been carried up to the feeding of men. Prof. Atwater, of Wesleyan College, has published the results of his investigation on the cost of supporting workmen, and finds that the amount of food necessary to support a man and enable him to do his daily work, can be obtained at a cost of 12 cents a day. For 45 cents a man can live sumptuously. When meals are provided for a number at once the cost is ridiculously small. It might be well for some of the knights of labor and serfs of capital to look into these matters. What a frightful waste there must be in our household economy of to-day.

What a future looms up in this field of study. Think of the suffering and want that this accurate chemical work will alleviate when it is understood and appreciated. The German government supplies the people in certain districts with plainly written tracts explaining what are the most valuable nutriments in foods and about what amount of each is needed to make a daily ration which shall neither want nor waste valuable substance. Our own government is doing the same. Chemical knowledge gives an enormous increase in the purchasing power of a country, and greatly ameliorates the environment by making it more favorable to the people.

In the days of old, people supposed that every object was a particular kind of matter. It is true that Aristotle believed in four elements, earth, air, fire, and water, but these were used largely in a figurative sense. Wood was a substance, so was coal, so was water, so was air. They were supposed to be different kinds of matter. As chemistry began to develop, during the last 100 years, it was found that all the different kinds of matter about us could be resolved into a certain number of simpler substances, and that these simple substances could not be further altered. They were hence called elements. So far, about 75 of these elements have been found. All of the material objects about us are compounds of these elements; some, of course, being very common, and others more or less rare. Oxygen, for instance, a colorless gas, but when in combination, giving rise to compounds of the most various properties, constituting one half of the earth's crust, nearly one quarter of the air, and about one half of clay, sand and limestone. At first, methods of ascertaining the percentage composition of substances were very crude, but during the last 50 years they have, by means of the exquisite delicacy of the chemical balance and our increased knowledge of the chemical behavior of substances, been brought to a very satisfactory state of exactness. A student can now analyze with ease substances that would have perplexed the professor of 50 years ago. Aside from the immense advance in our knowledge of chemical causes and effects made by this powerful lever placed at our disposal, the public has been afforded a most marked protection

against fraud and imposition. No matter how high-sounding and laudatory the announcement of certain articles may appear, the cold-blooded analysis of the chemist at once dispels the illusion. There is no lack of unscrupulous persons who take advantage of many a chemical discovery to fill their own pockets at the expense of the public. The extent to which adulteration is carried to-day cannot be conceived of by one who is not conversant with the results of the analysis of commercial articles. Indeed, the popular ignorance on this subject is astounding. The continual demand by the public for cheap articles drives the manufacturers to all sorts of ways and means to adulterate. To counteract this, boards of health are continually analyzing articles of food. But commercial articles, however, are, as a rule, examined only by those who know how a chemical analysis can protect the buyer. Some years ago New York paid $10,000 a day for the water added to the milk sold in that city. In every city one will find many articles of daily use are systematically adulterated. The time will come when every city will have to have its board of public analysts, who shall analyze all articles free of charge. Such boards now exist in France and Germany, and the results of their work throws a sombre light on the strivings of human cupidity. Cream of tartar often contains as high as 80 per cent of adulteration, illuminating oils are not seldom about as safe as gunpowder, soaps may be one-half water, borax is sometimes mostly baking soda. In the matter of fertilizers, the State experiment stations examine free of charge all articles, and determine their true value, but hundreds of other articles should also be tested by the government that the public may be protected. Slowly but surely the keen weapon of chemical analysis is lopping off all these unsightly side-shoots of our civilization. As long as food and drink consist of chemical substances and so many of the articles bought and sold are chemical compounds, it should be known to what extent they are what they are claimed to be.

What is the effect of the increasing accuracy in chemical analysis upon our civilization? It places every article on its true basis of intrinsic worth. Metals, ores and articles of commerce, have a certain value depending on the nature and amount of their valuable constituents. This is determined by analysis, and business is at once placed upon a solid foundation, and insecurity in values ceases. Chemical analysis is the balance wheel of trade. It establishes responsibility. It says to the cheat, honored and respected though he may be in the community — and there are thousands of them — "Thou art the man." It compels accuracy of statement — rigid truth. There is no effervescent sentiment in a chemical analysis. It makes honesty compulsory. Articles of food and drink must be what they claim to be, no more, or less. A man who adulterates is a liar and a thief, if not also a coward. He may cause ruin, disaster and death. A man who buys adulterated articles is a fool. Chemical analysis is one of the greatest agents for the protection of a community that there is, and its power is increasing every day. Again note: Chemical analysis shows clearly which of several articles are the best. Then we buy the article that we know to be the best. And so chemical analysis, disclosing to the world where true worth is to be found, develops countries and gives them resources which may enable them to compete with greater nations. It shows us the relations between the material objects about us, and our own relations to them. For instance, the atmosphere, which is necessary to our existence, is composed of ogygen and nitrogen. The oxygen is being continually consumed and appears again as carbonic acid, the results of fires, fermentation and the respiration of animals. The plants consume the carbonic acid and give back the oxygen again to a great extent. There are thousands of these agents at work to change the composition of the air. And yet its composition does not practically vary. Should it, however, then life would feel the change at once. An increase of the percentage of oxygen in the air we breathe would produce a marked effect upon us. It is wonderful that the balance of these conditions is kept in such equilibrium on such a scale.

And still again, chemical analysis showing how all the objects about us are composed of but a few different kinds of matter, how, indeed, we ourselves consist of little more than a dozen elementary forms of matter, compels us to gape in bewilderment at the evolution of a universe, with its endless variety of detail, out of less than a hundred different kinds of matter.

For a number of years chemists have been laboring to produce substances and study their properties. In this way a vast number of compounds have been produced, and the list is now yearly added to at a rate that makes one's head ache. The chemist interests himself chiefly with their chemical and physical properties, and as to their proper position in the particular classes to which they belong. Thousands and thousands of such substances have been created, or discovered, by the chemist, and but a very small number of them have as yet been applied. The study of their physiological properties will afford work for a legion of physiologists. Take ether and chloroform as instances. How hard it is to imagine a time when anæsthesia was unknown. Think of being unable to overcome pain! Of course the introduction of these agents met with opposition. Some said it was wrong to prevent pain, as others thought it a sin to use an umbrella because the rain was intended to wet us, or to insure one's life because it was flying in the face of Providence. But in time the clouds of ignorance were dispelled and the world came to know one of the greatest blessings that science has bestowed upon humanity. The pain and suffering that these agents have saved humanity is incalculable. Operations, which years ago would have been regarded as madness, are now, by their use, of common occurrence. There are thousands of substances whose physiological properties have not yet been tested. It may be that among all these substances we may find ones that will directly affect each function and organ in our bodies. Physicians have as yet but barely entered this field of physiological research; and unfortunately their labors are hampered in certain places by the attacks of the so-called Bestarians, who would not permit vivisection. Strange how little compunction these people seem to feel in allowing the results obtained by vivisection to be applied in the treatment of their own families when sick. The law of

atonement is nowhere more strikingly exhibited than in scientific research. If certain diseases are to be controlled, their causes discovered, and stamped out, cats and dogs may have to be sacrificed. We may wish all of our friends, all the babies and all of the cats and dogs to live, but like many other things we would like to have, we may have to suffer disappointment. Perhaps, after all, the fair sex is responsible to some extent for the destruction of animals. Think of what an indiscriminate slaughter of birds is continually going on that our fair friends may be able to carry fragments of the remains on their heads. Even if the tortures ascribed to vivisection existed, they would pale beside the horrors that follow the sportsman. The animals and birds dying in fevered agony of peritonitis and being eaten alive by ants and beetles are fully as heart rending as anything that has been ascribed to vivisection by the wildest imagination.

Look at the advance in our knowledge of the action of disinfectants. And here again, but an absurdly small number of the vast array of substances at our disposal have been tried. Many diseases are communicated by a kind of seeds, spores, or germs. If these seeds can be killed it is impossible for the disease to get a foothold. Just as when the seeds of a plant are killed they will not sprout. The following instance of what can be done in this direction is interesting.

Some years ago the whole city of Detroit was disinfected by Dr. Oscar W. Wight, health officer of that city. All the receiving basins, sewers, etc., were disinfected by copperas, and the atmosphere of the sewers was purified by hanging in the manholes iron pails filled with burning sulphur. In all, the amount of copperas used by officials and citizens was 280,000 pounds. The gaseous disinfection of the sewers requires about three tons of roll brimstone. The total expense for the complete disinfection of the sewers (75,000 pounds of copperas and 6,000 pounds of sulphur); was less than $1,300.

After the first disinfection of the city, there followed a great abatement of diphtheria, and an almost entire cessation of scarlet fever. The second experiment was followed by an almost complete cessation of diphtheria. Some years ago I kept the gutters of New Brunswick, N. J., disinfected with a solution of bromine, and obtained a marked improvement in them. These facts make one stop and ponder. If, then, instead of spending the money of a community in supporting inefficient officials, ward heelers and political quacks, a portion of it were expended in the systematic purification of the town, the death rate would be decreased; there would be fewer little graves to dig. But think of the astonishment of even a not unusually common council if asked to appropriate, several times a year, a sum of money to buy materials to throw into the sewers. Diphtheria, scarlet fever, and, for all we know, many other diseases, are the punishment of infractions of laws ordained for our benefit. Official cupidity, negligence and ignorance mean more than bankrupt towns, business depression, and loss of confidence. They mean broken hearts and bleak graves. The money received from political deals, or from the sale of a vote, is but poor recompense for the loss of a child. The increase in personal responsibility caused by the increase in scientific knowledge is a vast one. It will be the great lever of the future.

The time is fast coming when the good old-fashioned phrase "dispensation of Providence," as so often used, will have to be replaced by the more easily understood but less pleasant, although entirely synonymous words, "the effect of ignorance," or "the punishment of incapacity," or again "the result of neglect," or yet again, "the spew of dishonesty." In fact, the object lessons of nature are so plain that a philosopher might think them to have been especially designed for the intelligence of an average politician. Take, for instance, the cases at Plymouth. The discharges of a typhoid patient were thrown into a brook, and the brook ran into the reservoir of the town. Soon there were 2,000 cases of typhoid. About the same thing occurred in the village of Lausanne, Switzerland. Such are the object lessons of nature.

As chemical knowledge advances and chemists analyze minerals and the substances found in plants and animals, determining their relations and properties, classification of many compounds becomes possible. Many substances, exclusive of those found in animals, have been produced by the chemist. Thus ordinary salt is the same substance, whether extracted from seawater or produced by mixing muriatic acid and soda. But the substances found in animals, that is in organized objects, while they were analyzed and their composition accurately determined, were supposed to owe their formation to the action of some mysterious vital power, usually called "vital force." It was assumed, with really no other apparent reason than it had not yet been done, that it could not be possible to make an organic substance artificially. The animal by reason of its mysterious, inherent vital forces must do that.

There is a certain compound called urea which is formed in the animal system, and which in many ways is of extreme importance. It was described in 1773 by Rouelle, and determined in 1790 by Fourcroy and Vauquelin. In every way it was then considered as an organic substance par excellence. In 1828 the great master, Woehler, of Göttingen, made urea artificially by heating ammonium cyanate, and the vast field of organic chemistry was opened to investigators. In 1832 Liebig and Woehler published the results of their labors on benzoic acid and the oil of bitter almonds, letting in a flood of light upon the subject of chemical constitution. The great Berzelius in his excitement proposes to call the new radical "pröin," from *Proi,* the beginning of the day. Since this time, the truly marvelous structure of organic chemistry has grown at a rate unequaled in the history of the development of any science. I wish there were some way of explaining organic chemistry to the general reader, for it is a wonderfully interesting subject. We can appreciate its results although unable in all cases to follow the methods by which they are obtained.

There have been so many remarkable victories achieved in the field of organic chemistry that it is hard to decide which to mention. Prominent among them are aniline colors. A more uninviting substance than coal-tar is not often found, yet in the hands of the chemist it has yielded compounds which, by profound study and skilful manipulation, supply the world with colors surpassing in beauty anything

produced by nature. In a few years a great industry has sprung up, employing thousands of men and an enormous capital; and all this founded on a waste product which manufacturers were once at their wits' end to find means to dispose of.

And, then, to what an extent is the fair sex indebted to the humble chemist! We have given them the wonderful aniline colors, which would put Solomon in all his glory to shame, and compel the peacock to hide his head and his tail in bedazzled desuetude. We can make velvet out of cotton and sealskin out of silk. We can supply perfumes surpassing the distilled refinements of the spices of Araby. We can make artificial blushes, heart palpitations, inflated rubber bosoms, and alabaster complexions. We can make imitation feathers, or whole birds if necessary, as well as all kinds of floral and animal remnants for personal decoration. We can change raven locks to tresses of glinting gold, or *vice versa*. We can supply eyes of any shade of color, as well as any number or kind of teeth. In fact the chemist is to the girl of the epoch what the lamp was to Aladdin — only more so.

Indeed, many of our so-called necessities of life are of quite recent introduction. Sugar, for instance, as late as 150 A.D. was prescribed by Galen as a medicine, and in 1455 was still a rarity. In 1775 all England consumed only 20,000,000 pounds in the course of the year against 20,000,000 hundred weight in 1885. And now comes the new sweet substance, saccharine, which is so sweet that a pinch of it will sweeten a barrel of water.

It is strange to note what a power may be exerted by a chemist working in some small and but little known laboratory. Graebe and Liebermann undertook the study of alizarine, the coloring matter of madder, and soon found out its chemical nature, and were able to produce it artificially from a substance found in coal-tar. A manufacture was founded and madder growing is slowly but surely dying out. Lately Baeyer has untangled the complications of indigo blue, and it is now but a matter of time when indigo growing will cease to be an industry. Salicylic acid, formerly a rare and costly product, has become an article of commerce, through the labors of Kolbe, who showed how it could be made cheaply from carbolic acid. And now a nation can send its armies out to battle in a region where rheumatic complaints would cripple them and leave them helpless at the mercy of their foes, had they not this power at their control to subdue these diseases. It is true, the diplomat utilizes to their full worth the powers at his disposal, but it must not be overlooked that the chemist furnishes him with many of his most efficacious agents.

I could go on with a long list of triumphs in organic chemistry and show how much we are indebted to the labors of certain diligent investigators in this field. In the matter of the processes of digestion our knowledge of organic chemistry has enabled us to make important progress in the last years. We are now able to produce many new and valuable forms of food, especially for children and invalids. Thousands of lives are saved every day by the use of chemical foods, and the application of chemical discoveries.

Let us glance for a moment at iron and steel. If iron contains even very small amounts of certain substances, as phosphorus, for instance, it has but little value, for its properties are injured. Within a few years a young English chemist after patient experiments discovered a method by which the phosphorus could be easily removed from iron. This appears to be a simple matter, yet how much it means. Immense deposits of iron ore which could not be used because they contained phosphorus became at once of value. The material wealth of the country was immensely increased. The uses of iron and the simplicity of its production were increased. It has been well said that this untitled, almost unknown young man (Walter Weldon, q.v.), has done as much or more for England than all her kings, queens, and aristocracy put together have accomplished for her.

And again, now that we are coming to live in an age of steel, note that steel is a chemical industry. To make steel, we must decarbonize iron to a certain point, and to do this economically Bessemer introduced a method which revolutionized the whole industry. Can any one tell what the debt of the world is to cheap steel? Any one who will bear it in mind will find himself giving hundreds of answers to it. Try to trace out for how many of what are called the necessities of daily life we are indebted to cheap steel, and one cannot but be surprised.

The subject of the metals in general is worth attention. Chemistry has brought our means of extracting them from their ores and their subsequent refinement to a remarkable degree of perfection. We have numerous alloys which are of daily service, as phosphorus-bronze, friction-metal, gun-metal, and a thousand other useful inventions, all tending to cheapen articles and, indeed, in many cases to beautify common objects. Compare the doorknobs and hinges tastefully made of bronze with the common ones in use only 20 years ago. This all means the art education of the people, and we must never underestimate the power of this. And now we have cheap aluminum. It looks as if this may be the metal of the future. Brilliant, wonderful in its many properties, and more remarkable still in the fact that every clay-bed is a mine of it. How irritating this has been to chemists for years can well be imagined. Incalculable stores of this beautiful metal all about us and no means to extract it. If aluminum can be modified as iron now is, and given the properties akin to wrought iron and steel, then the future will be the age of aluminum.

If one were to ask how the state of civilization of a country should be judged one would probably be told how many churches there were, attention would be drawn to the volume of business done, the fine hospitals, the excellence of the police, the commodious jail, the tax rate and many other prominent features of the place. The chemist, however, would simply determine the amount of sulphuric acid used, directly or indirectly. In other words, almost all of the articles we use involve either directly or indirectly in their manufacture the use of sulphuric acid. This manufacture is carried on a scale so vast that a fair idea can hardly be given of it. Every detail has been studied and studied by scores of chemists. Each reduction in the cost of making it has cheapened thousands of articles. In the manufacture of bleaching powder

there was once a great waste. The acute mind of Walter Weldon turned this loss into a source of profit and the price of chloride of lime was reduced. Every time that we buy a piece of white paper and admire its whiteness and cheapness, we must remember that we are indebted to Walter Weldon.

Indeed, in the matter of paper, note how striking has been the progress. Cheap paper means cheap books, cheap newspapers, cheap knowledge, education of the public. Good paper means preserved eyesight. I need not say that paper is really a chemical manufacture. But little progress would be made in turning wood into paper without the chemist. And note again the future of paper. We have paper car wheels, paper gas pipes, paper water pipes, paper pails, paper stoves, paper chimneys, paper boats, paper forts, etc., etc.

One of the very important results of the study of chemistry has been the gradual change of empirical and wasteful processes of manufacture into rational and profitable methods. Every year shows progress in increasing the yields of manufactured products, and also increase in purity. Wastes are utilized, manufacturing costs are decreased, labor is made more efficient, trade expands and profits increase.

In 1739 Dr. Clayton, dean of Kildare, first distilled coal. But it was the end of the century before gas was practically introduced as an illuminating agent. Imagine one's sensation on first being asked to put a network of piping into one's house to convey a combustible and poisonous gas. The joints might not be tight, the cocks might leak; we might be poisoned by the thoughtlessness of any one who might not shut them off, or, indeed, the house might be blown to bits should the gas escape and ignite after it had become mixed with air. Yet it does not worry us now, even though all these things do come to pass not infrequently. From Dr. Clayton's experiments has arisen a vast industry with complicated side branches. Gas, coke, colors, medicines, disinfectants, delicate flavoring essences and a host of other inventions have followed in a steady stream. There has been no end to the discoveries in this field. In Europe gas has become almost a waste product, so valuable have its by-products become.

The invention of artificial light has extended the available term of man's life; by giving the night to his use it has, by the social intercourse it encourages, polished his manners and refined his tastes, perhaps as much as anything has aided in his intellectual progress.

It is very interesting to trace the development of many manufactures, as for instance the introduction and perfection of glass-making, which allows us to avail ourselves of the best medicine there is, sunshine. What a world of happiness lies in that word "sunshine!" Disease germs are paralyzed by it. Plenty of it prevents dark deeds. If we ever feel like being thankful, let us remember the abundance of windows in our houses, and that our little ones can play in the sunshine, and that we can have sunshine in our houses free of cost and without tax. How little one realizes the convenience in the use of glass and china articles. That hard, smooth surface which can be so readily cleansed, and which makes our tables so attractive and our food so palatable. We shall find that much of our pleasure, and, indeed, a good deal of our health, is dependent on glass and porcelain. The chemist has done hard work for us on these articles, for there have been many neat chemical problems involved. We can now give glass some valuable properties. We make wool of it, spin it into yarn and weave wonderful dresses of it; make wigs of it, cover steam pipes and fill floors with it, make railroad sleepers out of it. Perhaps, in time, we shall be able to turn it on a lathe, or even to live in a glass house without fear. Who knows? Does not the illustrious Hofmann say, "With the gods and the chemist all things are possible"?

There are many interesting applications of chemistry which have been forceful factors in the development of civilization. The manufacture of soap, for instance, the use of which has also been taken as an index of civilization, has been immensely improved by the labors of the chemist, and it would be easy to trace the beneficial effects of it on the health of a nation. It is true that we have not the public baths of the Romans, or places where all the poor may bathe, but we have the next best thing — cheap soap.

Then there are remarkable chemical improvements in the arts of dyeing and printing textiles, by which good clothing has been made accessible to the poorer classes. Cleanliness and good clothing are no small factors in civilization. There have been astonishing discoveries in the field of fermentation, the middle ground between biology and chemistry, from which our ideas about disease germs and ptomaine poisons have arisen, and due to which treatment of many diseases has been radically altered for the better. In fact, the whole of antiseptic surgery, which allows of operations never dreamed of in past years, has become not only possible but of daily occurrence. Thousands and thousands of useful lives have been saved by the application of these discoveries.

And so our increasing knowledge of the relations of things will enable us in time to prevent disease. The average death rate in our cities is far too high. The average duration of life is about ten years too short. There are over 100,000 unnecessary deaths every year in the United States. In time we shall see more of true death, Euthanasia, or old age. How well Richardson describes this: "Without pain, anger, or sorrow, the intellectual faculties of the fated man lose their brightness. Ambition ceases or sinks into desire for repose; ideas of time, of space, of duty, languidly pass away. To sleep and not to dream is the pressing, and step by step, and still pressing need, until at length it whiles nearly all the hours. The awakenings are shorter and shorter, painless, careless, happy awakenings to him of a busy world, to the merry sounds of children at play, to the sounds of voices offering aid, to the efforts of talking on simple topics and recalling events that have dwelt longest on the memory, and then again the overpowering sleep. Thus on and on, until at length the animal nature is lost; the intuitive and merely animal functions now no longer required to sustain the higher faculties, in their turn, succumb and fall into inertia. This is death by nature, and when mankind has learned the truth, when the time shall come — as come it will — that 'there shall be no more an infant of days, nor an old man who hath not filled his days,' this act of death

now, as a rule, so dreaded because so premature, shall, arriving only at its appointed hour, suggest no terror, inflict no agony."

Chemistry has even dared to make the study of life a matter of investigation. Dr. Oscar Loew has indicated that in live albumen there is an atomic complex known as the aldehyde group, and in dead albumen it is not present. A striking inference of this fact is that substances which are known to have an energetic action on the aldehyde group exert also an intensely poisonous action on living protoplasm, and certain substances have on this induction been examined and really found to be violent poisons. Could we reconstruct the aldehyde group in a dead protoplasm? And if so would the protoplasm again be alive? Who can say? It is a mysterious subject and the discoveries but make it more mysterious. But then it is darkest before daybreak.

Even such a little matter as a match represents quite a number of chemical phenomena and ingenious applications of chemical discoveries. It is curious to think of what added power has been given to man by his ability to make fire so easily. The idea of fire leads me to speak of explosives, for there are some very interesting facts to be derived from the study of this subject. If we had time to investigate the effects of gunpowder in history we should note some striking results. Ancient history is largely a history of war. Disputes were settled by force of arms — physical force. Rulers ruled by force. Blood flowed on slight provocation. Might, not right, was the rule. Weapons were of the crudest kind, and wars often lasted for years. Later on the ruling classes clad themselves in armor and then as McElroy has so well explained in his article on 'The Musket as a Social Force,' for many years the world was at the mercy of the 'Man on Horseback.' He was invulnerable in his armor, and with sword and spear tyrannized, brutalized and slaughtered as his humor struck him. The serfs fared badly in the early days. In the "war of the Jacquerie," in 1348, there was an exciting serf-hunt conducted in one of the French towns, and after three weeks over 20,000 miserable men were run to earth and killed. The man who could strike the heaviest blow was ruler in those days.

Then in the 14th century someone invented gunpowder, and then a queer sort of gun, a kind of two-inch gaspipe with a touchhole. This gun was fastened to a stick, which one man held, while a second applied the fire. The ball weighed a pound and traveled scarcely 200 feet, so weak was the powder. Crude as the whole contrivance was, and tedious as it was to fire off, it curled up the man on horseback in the dust and left him a waste product on the land. Those who had robbed the farmer of the fruits of his hard labors, now went to fertilize the crops, a most admirable adjustment of nature, even though it was somewhat belated. Soon gunpowder and the gun were improved, and by their aid the robbed man "re-clothed himself with the rights that had been torn from him by a thousand years of the despotism of the 'Man on Horseback!' »

During the last 50 years explosives have been brought to a high state of perfection. Chemistry has placed in the hands of men agents that are so powerful that they cannot be resisted. Trace the progress of a nation by the record of its conquests, and note how chemistry has given it, perhaps, the majority of its tools, its explosives, its system of feeding, its medicines, and so on through a long list. It will not be long before war will be impossible; in fact all conflicts impossible. The dynamite gun will blow a fort to dust, the submarine boat or the electric torpedo, guided by an unseen hand miles away, will send a ship into the clouds. The balloon, dropping explosives and inflammables, will wipe a city from the face of the earth as a child rubs a picture from the face of a slate. An explosive shell, filled with the proper chemicals, will poison a whole army. The prick of a needle, coated with virus, will sow incurable disease, and you may select from a catalogue nauseatingly long. A gill of typhoid germs dropped into the water reservoir of an ordinary town will leave few to tell of the horrors that followed. War will in time mean simply extermination of both parties. Pure arbitration, intellectual investigation of the question, the discovery of the principles and laws involved in the matter, and careful adjustment must come in time. Oppression, tyranny, and bossism are to pass away. Knowledge is the possession of humanity, not of the rich alone, or of the powerful, but it is to be the birthright of the citizen. An irresistible power has been placed in the hands of the oppressed. First we have the slave, then the serf, now it is the wage-worker, the laborer. The capitalist has money, the laborer has dynamite. It is about as hard to know what to do with one as with the other. Neither can ever rule, and this phase, like the preceding ones, will slowly pass away. Any attempt to control others selfishly and wrongfully will be defeated by the irresistible power of knowledge of right.

Look abroad and notice how much nations take from each other without fighting. They slap each other's face and call each other bad names, but they don't fight. It is true that they support immense armies and armaments, but the time is coming when these armaments will cost so much for their support that to avoid bankruptcy they must be given up. The swords must be turned into plowshares and the men must go to work to aid in supporting instead of being supported by others. A peace of nations, a bankruptcy of nations, or an extermination of nations are the three alternatives to-day for Europe. So much Bismarck saw.

Force being neutralized, the conflict is to be one of intellect, reasoning based on an exact knowledge of facts. Physical force is already at a considerable discount. Educated brains are the important factors of success to-day.

PETER T. AUSTEN,
Late Professor Chemistry Rutgers College.

Chem'itype, a term used in engraving to include various relief processes by which a drawing or impression from an engraved plate may be produced in relief to fit it for printing on an ordinary printing press.

Chemnitz, kĕm'nĭts, or **Kemnitz, Martin,** German Protestant theologian: b. Treuenbrietzen, Brandenburg, 9 Nov. 1522; d. Brunswick 8 April 1586. He was the son of poor parents; received his education at Magdeburg and Frankfort on the Oder, and in 1544, to obtain the means of continuing his studies at Wittenberg,

became a schoolmaster in Wriezen. In 1550 he became librarian to Duke Albert of Prussia. He then wrote his 'Loci Theologici,' a valuable commentary on Melanchthon's system of dogmatics. Being invited to Brunswick, as minister, he attacked the Jesuits in his 'Theologiæ Jesuitarum Præcipua Capita' (1562), and, when the Council of Trent thought itself assailed in this work, he wrote his 'Examen Concilii Tridentini,' a work of great historical value. He gradually became attached to the Lutheran doctrines as distinguished from those of Melanchthon.

Chemnitz, Saxony, a town at the base of the Ezrgebirge, and at the confluence of the Chemnitz River with three other streams, 51 miles south-southeast of Leipsic. It is the principal manufacturing town of the kingdom — the "Saxon Manchester" its townsfolk call it — its industry consisting in weaving cottons, woolens, and silks, and in printing calicoes, chiefly for German consumption. It supplies the world with cheap hosiery, and makes mixed fabrics of wool, cotton, and jute for the markets of Europe and the United States. It has several extensive machine-factories, producing locomotives and other steam-engines, with machinery for flax and wool spinning, weaving, and mining industry. Created a free imperial city as early as 1125, Chemnitz suffered much during the Thirty Years' war. Pop (1900) 206,584.

Chemnitzia, kĕm-nĭt'sē-a (named after Chemnitz, a distinguished conchologist of Nuremberg), a genus of gasteropodous mollusks, family *Pyramidellidæ.* The shell, which is slender, is many-whorled with a simple aperture closed by a horny subspiral operculum. The animal has a very short head, with a long proboscis. Recent species 32; fossil 240, from the Silurian Period onward.

Chemosh, kē'mŏsh, the national god of the Moabites, who were on that account called "the people of Chemosh" (Num. xxi. 29; Jer. xlviii. 46). In Judg. xi. 24 Chemosh is mentioned as the god of the Ammonites, but the whole narrative here applies to Moab, and not to Ammon. Milcom was the national deity of the Ammonites. The Moabite Stone was erected to commemorate victories achieved by the aid of Chemosh. In the inscription upon it Ashtar-Chemosh is mentioned, apparently a goddess associated with Chemosh. Human sacrifices seem to have been occasionally offered up to Chemosh (2 Kings iii. 26, 27). The worship of Chemosh was introduced among the Hebrews by Solomon, who "built an high place for Chemosh, the abomination of Moab, in the hill that is before Jerusalem" (1 Kings xi. 7). Some have identified Chemosh with the sun, others with Saturn, while still others have regarded him as a war-god.

Chemotropism, kē-mŏt'rō-pĭsm, orientation (q.v.) by diffusing molecules, as where animals are attracted to their food by the sense of smell. Odoriferous particles are diffused or radiate from a centre; chemotropism is thus analogous to heliotropism (q.v.). The chemical effects of the diffusing molecules on certain elements of the skin, says Loeb, influence the tension of the muscles, just as the rays of light influence the tension of the muscles on heliotropic animals. Thus maggots of flies are positively chemotropic toward certain chemical substances which are formed, for instance, in decaying meat and cheese. The blow-fly (q.v.) has the same positive chemotropism for these substances as its larva, and is accordingly led to the meat. This explains the instinct of the blow-fly and similar insects, which compels them to lay their eggs on the food appropriate for their young, neither experience nor will playing any part in their processes. Consult: Loeb, 'Comparative Physiology of the Brain and Comparative Psychology.'

Chemulpo, chĕ-mŭl'pō, Corea, a town on the western coast, 25 miles by road west-southwest of the capital, Seoul. It is one of the three treaty ports opened in 1883 to foreign commerce, the volume of which has since steadily advanced, in spite of the drawbacks resulting from the great difference between high and low water here (33 feet), and the want of wharves. The imports attain a value of $3,500,000 in some years; the exports, $1,500,000. The chief imports are cotton and woolen goods, railway machinery, metals, oils, and timber; the chief exports are rice, beans, millet, ginseng, and cowhides. The majority of the 3,000 foreigners are Japanese. Small steamers owned by Japanese run to Seoul in summer, and Chemulpo is connected by telegraph both with China and Japan.

Chemung, shē-mŭng', **Battle of the,** in the Revolution, 29 Aug. 1779, the decisive engagement of Sullivan's campaign (q.v.), to harry the Iroquois country. The Indians and their Tory allies made a stand in force at the Chemung River, about a mile southeast of Newtown (Elmira), N. Y. They had five companies of British troops and rangers, numbering about 250; and the entire fighting strength of the Six Nations. These Indians the Tory authorities state as 550; but this seems impossibly small, and Sullivan and his officers, from a careful estimate of various factors, place it at 1,200 or 1,300. Sullivan had about 5,000. The Indians were led by their Napoleon, Brant (Thayendanegea); the Tories by Col. John Butler, with Sir John Johnson, and perhaps Guy Johnson, Major Walter N. Butler, and Capt. MacDonald. Their line was in advance of the river, resting on a bend at the right. From the bend ran a breastwork half a mile long, flanked by bastions and having a dwelling in front turned into a blockhouse; it was concealed by a mass of pines and scrub-oaks, some of them cut from other places and stuck down to make a seemingly thick virgin forest. From their left a thin line was continued about a mile and a half to a steep ridge parallel to the river, where a strong detachment was posted; and a mile further east was another ridge parallel to the first, with a breastwork and another company, the two advance detachments designed to take the Americans in flank and rear. Along the front of the main breastwork ran the road to Newtown, exposing the whole American flank to a raking fire. The entire works formed a magnificent ambuscade; but Sullivan, who was no Braddock, guessed the utility of the ridges, and knew what scouting parties were for. About 11 A.M. of the 29th Major Poor beat up the position; and Gen. Hand formed his infantry in a wood 400 yards from the works and waited for the rest of the army. Sullivan ordered Poor to carry the hill at his right and take the British in rear, while the main body with artillery attacked the front.

Steadied by Brant, a warrior of great force and sagacity, the Indians not only made a stubborn resistance for two hours, yielding inch by inch, but even stood up against the bayonet, something almost unknown in Indian history. At first thrown into a panic by the artillery, Brant rallied them to a fresh and tenacious fight; and noting Poor's turning movement, threw a strong detachment with a battalion of rangers to the hill to oppose it. But at length Poor, having cleared the crest, burst on the rear with a bayonet charge; and both Indians and whites fled across the river in rout, the Indians leaving their packs and weapons behind, and eleven dead, though they usually carry all these away with them. Fourteen other dead Indians were in fact found under the leaves, two canoes were found covered with blood, and the Indians told their western villages that they had many killed and vast numbers wounded. The Americans had six killed and 40 or 50 wounded.

Chemung Series, in American geology, the great series of shoal-water sediments, mostly light gray shales and ripple-marked sandstones, that were laid down in Upper Devonian time in the great northeastern bay of the interior sea that covered much of what is now the Mississippi valley. This northeastern bay stretched across lower Michigan, Ontario, and central New York, reaching nearly to the Hudson River. The Chemung Series includes the Catskill Group and is divided into the Chemung and Portage Stages. It is typically developed on the Chemung River in New York. It reaches its maximum thickness of 8,000 feet in eastern Pennsylvania, but thins out and disappears to the south and west. The "oil sands" of Pennsylvania from which have been taken many millions of barrels of petroleum, are of Chemung age.

The Chemung corresponds to part of the series of shales and limestones laid down in the Northwest Territory and Manitoba, Canada, probably to part of the Devonian strata that extend along the main range of the Rocky Mountains in Canada and to an unknown fraction of the great thickness of Devonian strata in Nevada. In Europe the Old Red Sandstone, a series of sandstones and shales estimated as possibly 10,000 feet thick, is in many respects like the Catskill group of the Chemung, and contains similar fossils. This great sandstone formation is found in South Wales, England, and Scotland, near the Baltic Sea in Russia, in Spitzbergen, and in Greenland.

The characteristic fossils of the Chemung Series in New York and Pennsylvania include, among land plants, tree-fern (*Caulopteris*), and lepidodendrons. The fauna includes, among mollusks, brachiopods and lamellibranchs in great number and variety, no less than 252 species of lamellibranchs having been described from New York. Gasteropods are rare. Of vertebrates the Chemung contains remains of *Pterichthys* and other ancestors of the true fishes, including *Cocosteus.* The *Dipnoi,* or lung-fishes, a connecting link between fishes and amphibions, are represented by species of large size (*Dinicthys*). Of selachians or sharks, but few remains are found. See CATSKILL GROUP; DEVONIAN SYSTEM; OLD RED SANDSTONE.

Chenab, chē-nŏb′, in Hindustan, one of the five rivers of the Punjab. It rises in the Himalayan ranges of Cashmere, and entering the Punjab near Sialkot, flows in a southwestern direction till it unites with the Jhelum; length about 800 miles. At Wazirabad it is crossed by a great iron railway bridge more than a mile long.

Chenavard, Paul Joseph, pōl zhō-zĕf chā-na-vär′, French historical painter: b. Lyons 9 Dec. 1808; d. 12 April 1895. He studied some years in Italy, and acquired a reputation by his picture of 'Mirabeau Replying to the Marquis de Dreux-Brezé.' After the revolution of 1848 he received a commission to paint large compositions for the decoration of the Pantheon. Among these are 'The Deluge' and 'The Passage of the Rubicon.' The Pantheon having been restored to the Roman Catholic worship, he was not permitted to finish the task.

Che'nery, Thomas, English journalist and Orientalist: b. Barbadoes 1826; d. 11 Feb. 1884. He was educated at Eton and Cambridge. He was called to the bar, but was soon after sent out as *Times* correspondent to Constantinople, where he remained during the Crimean war. Afterward he was constantly employed on the *Times* staff until 1877, when he became its editor, a post which he filled till within 10 days of his death. As a singularly thorough Hebrew and Arabic scholar he had few equals among his contemporaries, and his translation of the Arabic classic, the 'Assemblies of Al Hariri' (1867), led to his appointment to a chair of Arabic at Oxford in 1868. He was one of the company of Old Testament revisers, and besides other works published an edition of the 'Machberoth Ithiel' (1872), a Hebrew version of the 'Assemblies.'

Che'ney, Charles Edward, American clergyman: b. Canandaigua, N. Y., 12 Feb. 1836. He was graduated at Hobart College in 1857, and, after a course at the Theological Seminary of Virginia, was ordained a clergyman of the Protestant Episcopal Church in 1858. Becoming rector of Christ Church, Chicago, he incurred censure for heterodoxy and was tried on that charge and deposed from the priesthood. He at once became a leader in the Reformed Episcopal movement, and was consecrated bishop of the new denomination in 1873, a post he has since held, as well as the rectorship of Christ Church.

Cheney, Ednah Dow (LITTLEHALE), American writer: b. Boston 1824. She was married to Seth Wells Cheney (q.v.) in 1853. She has been president of the New England Woman's Club and the Massachusetts Suffrage Association. She has written 'Handbook of American History for Colored People' (1866); 'Gleanings in the Field of Art' (1881); 'Life of Louisa M. Alcott' (1889); and several stories, including 'Nora's Return,' a sequel to Ibsen's 'A Doll's House'; 'Sally Williams, the Mountain Girl' (1872); etc.

Cheney, John Vance, American poet and essayist: b. Groveland, N. Y., 29 Dec. 1848. He was librarian of the public library at San Francisco, 1887–94, and of the Newberry Library, Chicago, from 1894. He has published 'The Old Doctor' (1885); 'Thistle-Drift,' poems (1887); 'Wood Blooms' (1888); 'The Golden Guess,' a volume of essays (1893); 'That Dome in Air,' essays (1895); 'Queen Helen' (1895); 'Out of the Silence' (1897).

Cheney, Seth Wells, American engraver: b. South Manchester, Conn., 26 Nov. 1810; d. there 10 Sept. 1856. Upon the death of his father in 1829 he joined his brother John in Boston, where he entered the latter's profession, that of an engraver. A position in the Athenæum enabled him to study and work from casts and drawings, and he copied and engraved in 1832 Washington Allston's picture, 'Mother and Child,' which was afterward burned. In 1833 he studied in Paris in the atelier of De la Roche. His great power was in the expression of character in individual heads. He never attempted historical or genre subjects, and only rarely grouped two or more heads together. Engravings by him may be found in the following annuals. 'Gift of Friendship' (1848); 'Religious Keepsake' (1846); 'Religious Offering' (1840); 'The Token' (1832. 1836, 1837); 'Youth's Keepsake' (1831). See 'Memoir of Seth W. Cheney, by E. D. Cheney' (Bost. 1881), and S. R. Koehler's 'Catalogue of the Works of John and S. W. Cheney.' He was married to Ednah Dow Littlehale in 1853.

Cheney, Theseus Apoleon, American historical writer: b. Leon, N. Y., 16 March 1830; d. Starkey, N. Y., 2 Aug. 1878. His publications include 'Historical Sketch of the Chemung Valley' (1866); 'Historical Sketch of 18 Counties of Central and Southern New York' (1868); 'Laron'; 'Relations of Government to Science'; and 'Antiquarian Researches.'

Chénier, shā-nyā', **Andre Marie de,** French poet: b. Constantinople 30 Oct. 1762; d. Paris 20 July 1794. He went to France when very young, and entered the army, but left six months after to devote himself to literary pursuits. He was for about three years secretary to the French embassy at London, but in 1790 returned to Paris. Advocating the doctrine of a limited monarchy, he made himself equally offensive to the Royalist and the Jacobinical party. In consequence of his attacks on the Jacobins he was condemned by the revolutionary tribunal, and executed. Although but little known in his own day, Chénier has long been regarded as one of the finest French poets of his century, his chief characteristics being purity of form combined with vigor of thought and diction. He wrote idyls, elegies, odes (including one to Charlotte Corday), dithyrambs, philosophic pieces, etc. The maturity, breadth and soundness of his judgment in poetical composition are demonstrated by his poem on 'Invention.' Of the same year is his fine idyl 'Liberty.' Similar in spirit to this, and of perfect Pindaric form, is the 'Dithyrambic on the Tennis Play' (1791). In his prison of St. Lazare he composed a beautiful elegy, 'The Girl Captive.'

Chénier, Marie Joseph de, a French dramatist, younger brother of André M. Chénier (q.v.): b. 11 Feb. 1764; d. 10 Jan. 1811. He was a Jacobin, and member of the Legislative Assembly in the Revolution. His tragedies — 'Charles IX.' (1789); 'Henry VIII.' and 'Calas' (both 1791); 'Caius Gracchus' (1793); and others — brought him fame and success by the accordance of their republican and revolutionary sentiments with the public opinion of the time, rather than by their merits as compositions. His national songs were approved by the best test of such productions,— popularity: one of them, 'The Parting Song' (*Partant pour la Syrie*), is hardly less famous than the 'Marseillaise.' His satires are full of spirit, point and wit, but often rancorous and unjust.

Chenille, shę-nēl', a round fabric or trimming, made by uniting with two or more sets of warps, either by weaving or twisting, a fine filling or weft, which is allowed to project beyond the warps. This filling is cut at its outer edges, and the fabric is then twisted, assuming a cylindrical shape with weft projecting radically from the central line of warps. The name is applied, also, to lace, carpets, and cloth made wholly or in part from silk threads twisted or woven to resemble the tufted trimming of the same name.

Chenomorphæ, kē-nō-môr'fē, an order of desmognathous birds, first proposed by Huxley and nearly equivalent to the *Lamellirostres* and *Anseres* (q.v.) of other authors. The palate is closed anteriorly by a thick bony bridge, but the vomer is well developed; the margins of the beak are more or less toothed; the tongue is thick and fleshy; and the down is uniformly distributed over the skin. All of the species are more or less aquatic; most of them are web-footed; and the young are precocial, or able to run from birth. Three very distinct families are recognized: the *Anatidæ*, or ducks, geese, and swans (qq.v.); the *Palamedeidæ*, or screamers (q.v.); and the *Phœnicopteridæ*, or flamingoes (q.v.).

Chenonceaux, shĕ-nôñ-sō. See BLÉRÉ.

Chenopodiaceæ, kē-nō-pō-dī-ā'sē-ē, a natural order of apetalous dicotyledons, consisting of more or less succulent herbs or shrubs, belonging to about 80 genera and 600 species. They are mostly innocent weeds, but several, as spinach and beet, are employed as pot-herbs; others for the manufacture of soda. See CHENOPODIUM.

Chenopodium, kē-nō-pō'dĭ-ŭm, or Goosefoot, a genus of plants belonging to the natural order *Chenopodiaceæ* (q.v.), of which it is the type, and distinguished by its hermaphrodite flowers, having five small green scales for the calyx, about five stamens, no corolla, and a fruit consisting of a membranous skin enclosing one black, flat, and shining seed. A number of the species have received the name of goosefoots, from a fancied resemblance to the webbed foot of the goose. The best-known or more remarkable species are:

1. *C. rubrum* (red goosefoot), a common annual, generally found in muddy ground. It has a leafy angular stem, which, as well as the whole plant, is often red. It bears a great number of black seeds, not larger than grains of sand, which are much fed on by birds, and seem to be relished by poultry.

2. *C. bonus henricus* (good King Henry, or wild spinach), a perennial, not uncommon in country churchyards, and places seldom disturbed. It has bright-green, broad, succulent leaves, which were in common use as spinach before the introduction of the present cultivated plant. The early shoots are sometimes used as a substitute for asparagus.

3. *C. quinoa*, the quinoa of Peru, a perennial inhabiting the high table-land of the Cordilleras, where, at the conquest of the Spaniards, it was the only farinaceous grain used as food. It is still

largely cultivated for its nutritious seeds, which are made into soup and bread, and, when fermented with millet, make a kind of beer. The plant is from four to six feet high, and has many angular branches, dull glaucous leaves, of a jagged triangular outline, on long narrow stalks, and flowers forming large compact branched heads, and succeeded by minute strong flat seeds, of a black, white, or red color. The quinoa has been introduced into Europe and is perfectly suited to the climate of England; but the grain has an unpleasant acrid taste, and will not be used as human food when anything better can be got. It is, however, an excellent grain for poultry, makes good green food for cattle, and, being of easy cultivation, may not be without economical value. Very large crops of seed have been grown in France.

In medicine *Chenopodium, ambrosioides,* var. *anthelminticum* is used very extensively as a remedy for the round worm as well as the tapeworm. The oil is the official part used, in doses of 5 to 15 drops, and it is a very efficient anthelmintic, particularly for the round worm, *Ascaris lumbricoides.*

Chen'owith, Caroline van Dusen, American writer: b. Louisville, Ky., 29 Dec. 1846. She has lectured on English literature and history, and is the author of 'Stories of the Saints' (1880); 'Child Life in China' (1882); 'School History of Worcester, Mass.' (1899).

Cheops, kē'ŏps, the name given by Herodotus to the Egyptian despot whom the Egyptians themselves called Khufu. He belonged to the rulers who had for their capital Memphis; lived about 2800–2700 B.C., and built the largest of the pyramids. According to Herodotus he employed 100,000 men on this work constantly for 20 years.

Chephren, kĕf'rĕn, or **Cephren,** king of Egypt, the successor of Cheops and the builder of the second pyramid. The former is the form of his name as it is found in Herodotus, the latter is the name given to him by Diodorus. Herodotus informs us that his reign was in all respects as tyrannical as that of his predecessor, and that the Egyptians, animated by a feeling of hatred against these two kings, under whom they had suffered all kinds of oppression, and during whose reigns the temples had never been opened, avoided even the mention of their names; and hence, instead of naming the pyramids after their builders, named them after a shepherd called Philition, who used the land in the neighborhood of the pyramids for pasturage. Diodorus adds that the pyramids were intended to serve as tombs for their builders, but as the people threatened to break them open and remove the bodies both the kings desired their friends to bury them in some spot where their bodies might remain undisturbed. Herodotus makes Chephren the brother of Cheops; but Diodorus says that Chembes, who is the Cheops of Herodotus, was succeeded by his son, Chabryis, who may perhaps be the same with the Chephren of Herodotus. His reign lasted 56 years.

Chepstow, chĕp'stō, a town and port in England, county of Monmouth, on the Wye River, 14 miles north by west of Bristol. It is pleasantly situated on a slope descending gradually to the river, and has spacious, well-paved, and well-lighted streets. The principal edifices are the church, a fine specimen of Norman architecture, and the old castle, the ruins of which crown a lofty cliff overhanging the Wye. The ruins of Tintern Abbey are in the vicinity. The building of iron steamships is actively carried on. The beauty of the environs is an attraction to visitors. Both the town and the castle are referred to in 'Domesday Book,' and the castle was the last English fortress to be besieged. Pop. (1901) 3,067.

Cheque. See CHECK.

Chequen, chĕk'wĕn, the leaves of *Eugenia chequen,* of the family *Myrtaceæ.* A shrub of Chile and Bolivia, whose leaves are rich in volatile oil, and are used as a tonic expectorant in much the same manner as Eucalyptus.

Chequy, Checky, or **Chequered,** in heraldry, applied to a field or charge when it is divided into squares like those of a chessboard.

Cher, shār, France, an inland department having on the north Loiret, east Nièvre, south Allier, west Indre and Loiret-Cher, between lat. 46° 26′ and 47° 38′ N., and lon. 1° 50′ and 3° 3′ E., and formed of parts of Berry and Bourbonnais. It is named from the river Cher, which traverses it southeast to northwest. Area, 7,199.34 square kilometres, or 2,779 square miles; capital, Bourges. This department is included in the basin of the Loire, which forms the greater part of its eastern boundary. The surface is in general flat, but is diversified in the north by chains of inconsiderable hills. Soil various, but fertile in the neighborhood of the Loire and Allier. Heath and sand prevail in the northern districts. The forests occupy above a sixth of the area, and furnish large quantities of fuel for the iron-works, and timber for ship-building. Pastures extensive, and sheep very numerous. Grains, chestnuts, hemp, and wine are among the important products. The best wines are those of Chanignol and Sancerre. Beets, buckwheat, and flax are also grown. The minerals consist of iron, lithographic stones, good building and grind-stones, flint, marble, ochre, and potter's earth. The preparation and manufacture of iron, called Berry-iron, is the principal branch of industry. The manufactured articles are metal goods, fine and common cloth, woolen goods, porcelain and earthen-ware, sacking, beet-sugar, nut-oil, paper, and glass. The department is divided into three arrondissements, 29 cantons, and 290 communes. Pop. 347,725.

Cher, a river of central France, rising in Auvergne in the department of Creuse, and joining the Loire from the left near Tours; length, 220 miles. It is navigable to Vierzon. This river gives name to the department of Cher.

Cherasco, kā-räs'kō, (ancient CLARASCUM), Italy, a town in Piedmont, in the province of Cuneo, near the confluence of the Stura and Tanaro, 22 miles northeast of Coni. Its fortifications, once of great strength, were demolished by the French in 1801. It was repeatedly the object of contest between the French and Austrians in the wars of Italy, terminated in 1631 by a peace concluded here; and in 1796 Napoleon, by what is called the Armistice of Cherasco, obtained a free passage for his troops through the Sardinian states. The town is well built, and has several silk-mills. Pop. 3,500.

Cherbourg, shär-boor, France, a seaport in the department of La Manche (The Channel), 196 miles west-northwest of Paris; on the north coast of the peninsula of Cotentin, and nearly due south of Southampton. It has a strongly fortified arsenal, and consists of the old or civil town, and the new or military (Port Militaire), the latter quite distinct from the former, and separated from it by the fortifications with which it is surrounded. Apart from its consideration as a naval station, Cherbourg is unimportant; it is the works by which it has been converted into a great naval fortress and place of arms that give it its special importance. These altogether have cost £8,000,000, and were chiefly carried out under Napoleon I., Louis Philippe, and Napoleon III. Foremost among them must be mentioned the *digue,* or breakwater, stretching across the entrance to the roadstead, which was formerly open to heavy seas from the north. It is more than two miles in length, of very massive construction, and consists of a western or longer and an eastern or shorter portion, forming at their junction a very obtuse angle pointing toward the north. There are a fort and lighthouse there, and, also, at either end. The breakwater alone cost about £2,700,000. The eastern entrance to the harbor, between the breakwater and the island of Pelée, is about 500 yards wide; the western entrance, between the breakwater and Fort Chavagnac (on a rocky islet), is about 1,000 yards, with a depth of 36 feet. It is the latter that large ships of war make use of.

The Port Militaire has three great basins for war vessels — an outer accessible at all states of the tide for vessels of the largest class; a floating basin communicating with this by gates; and a third communicating with both by similar gates. The aggregate water area of the three basins is about 56 acres, the depth of water being from about 30 to 50 feet. They have been excavated from the solid slate rock which forms the foundation of the entire dockyard, much of the excavated material being used in the construction of the breakwater. There are also slips for vessels of the largest dimensions, dry docks, building sheds, mast-houses, boiler-works, and in short everything necessary for the building and fitting out of ships of war. The numerous forts and other works with which Cherbourg is defended render it, if not impregnable from the sea, at least very difficult of attack. The commercial town has quite a modern aspect, the streets being generally wide, regular, well paved, and clean, but it is rather dull and uninteresting. There is an outer harbor, entered from the sea by a passage between two jetties, and an inner harbor or floating dock. The principal industry of Cherbourg is centred in the works of the dockyard, the commercial trade and manufactures being comparatively small.

Cherbourg is supposed to occupy the site of a Roman station, which is said to have borne the name of Cæsaris Burgum. Aigrold, king of Denmark, we are told, resided here about 945 A.D. William the Conqueror founded a hospital in it, and built the castle church. The English held possession of the place till about 1200. The castle, in which Henry II. frequently resided, was one of the strongholds of Normandy, and escaped the fate of the town, which, about 1295, was pillaged by an English fleet from Yarmouth; but it sustained afterward three memorable sieges, in 1378, 1418, and 1450. In 1758 the town was taken by the English without opposition, notwithstanding that the garrison was large. They kept possession of it eight days, destroyed the fortifications, carried off the artillery and the bells, and only retired after having exacted a heavy ransom from the inhabitants. The completion of the fortifications was celebrated by Napoleon III. in 1858, the festivities being graced by the presence of Queen Victoria. A statue of Napoleon I. was unveiled on the occasion. Pop. (1901) 42,952.

Cherbuliez, Charles Victor, shärl vēk-tōr shär-bü-lē-ā, French writer: b. Geneva 19 July 1829; d. Melun 1 July 1899. He belonged to a family noted for literary attainments. Having studied in the universities of Geneva, Paris, Bonn, and Berlin, he was for a time an educator at Geneva; but in 1864 became one of the editors of 'Revue des Deux Mondes.' He first gained distinction as art critic and observer of public affairs, as also by his writings, under the pseudonym G. VALBERT. He wrote a volume of art travels in Greece; 'A Horse by Phidias'; 'Political Spain'; 'Foreign Profiles'; 'Art and Nature'; etc. His works are characterized by clever treatment of the problems of domestic and social life and a fine psychological analysis, with a marked bias for description of odd characters. Among his most successful novels — and their success has hardly been less abroad than at home — are: 'Romance of a Respectable Woman' (1866); 'Ladislas Bolski's Adventure' (1869); 'Samuel Brohl & Company' (1877). The last two were dramatized, but won little popular favor on the stage. He was made a member of the French Academy in December 1881.

Cheribon, shĕr'ĭ-bŏn, Java, a province or residency on the coast toward the northwest of the island, between Krawang and Tegal. It was formerly an independent kingdom. It has a population of about 1,500,000. The productions are coffee, timber, cotton, areca-nuts, indigo, sugar, and also a little pepper. The rhinoceros is native here. The capital of the province, of the same name, is on the north coast, at the mouth of the river Cheribon. The houses are mostly of bamboo. The finest tomb in Java, that of Mulano, who introduced Mohammedism into the island, 1406 A.D., is near here. Population of the city, about 15,000.

Cherimoyer, chĕr-ĭ-moi'ẽr, the fruit of the *Anona cherimolia,* a plant of the order *Anonaceæ,* native of South and Central America, allied to the custard-apple. It is a heart-shaped fruit with a scaly exterior, and numerous seeds buried in a delicious pulp. Both flowers and fruit emit a pleasant fragrance. This fruit is now cultivated in various tropical regions.

Cherith, kē'rĭth, the name of a brook to which Elijah was sent during a portion of the years of famine (1 Kings xvii. 3–7), but the locality of which is no further designated than that it was before or on the face of Jordan. The most probable opinion is that it is to be sought for on the east side of the Jordan.

Cherkask, chĕr'kask, or **Tcherkask,** two towns of Russia, in the government of the Don Cossacks, called Old and New Cherkask, or Staro-Cherkask and Novo-Cherkask. The former is on the right bank of the Don; the latter

is 11 miles farther north, on a hill above the Aksai. Old Cherkask, a very ancient place, the foundation of which is attributed to a Greek colony, is situated on an island formed by the Don, the Aksai, and one of its branches, and is built on piles, as a protection from the inundations which continue from the beginning of April till the end of June. New Cherkask, founded in 1805, has a large cathedral and various other churches, elementary and higher schools, etc., and carries on a considerable trade. It is the seat of government of the Don Cossacks. Pop. 38,476.

Cherm'side, Sir **Herbert Charles,** English general: b. Wilton, Wiltshire, 31 July 1850. He was educated at Eton and entered the army in 1868, and after successive promotions attained the rank of major-general in 1898. He was with the Egyptian army, 1883–8; consul for Kurdistan, 1888–9; military attaché at Constantinople, 1889–96; and has been governor of Queensland from 1902.

Cher'okee («uplanders,» their own name; also rendered Tsaraki, Tsalaki, and Tsanaghi), the largest and most important Indian tribe originally east of the Alleghanies, perhaps the highest in culture and intellectual receptivity north of Mexico. They are of Iroquoian stock, though remotely, and are believed to be identical with the Tallagewi of Delaware tradition, a large tribe once occupying the Ohio and Alleghany valleys, till driven south by the Delawares and Iroquois. Their own tradition, that they came from the west and exterminated a certain «moon-eyed people,» does not contradict this. The first white men who encountered them were those of De Soto's expedition in 1540. Our first definite information finds them located along the south — Alleghany and Appalachian ranges and the Piedmont region adjoining, from Virginia to Georgia and Alabama, a range about 120 miles square — and divided into two main branches speaking different dialects: the Otari Tsaraki or Atali Tsalaki (Upper Cherokees), whose main settlements were around the headwaters of the Tennessee and Cumberland; and the Erati Tsaraki or Elati Tsalaki (Lower Cherokee), centred in northern Georgia and southern North Carolina, around the head-waters of the Savannah and Chattahoochee. These location names, however, had become fixed tribal names, and persisted after the Upper Cherokee had been forced south into the region of the others. They were further divided into seven clans, forbidden to intermarry. Lying close to the stream of immigration in the southern colonies, they fill the most conspicuous place in the Indian wars, trade, and treaties of that section in the 17th and 18th centuries; and their chief southernmost town, Etowah, gave a name to the famous frontier fortress Ninety-Six (96 miles from it). At the beginning of the 17th century they are said to have had 64 towns and 6,000 warriors, the latter declining to 3,000 in 1769 and 1,500 in 1793; but the figures are very dubious. At any rate, they had many villages of well-built log-houses, and the Upper Cherokee were agriculturists, raising large crops of corn, beans, and pumpkins; the Lower were chiefly huntsmen. They sided with the English in the early colonial struggles, and in 1730 formally recognized the supremacy of the English king (though it may be doubted if they attached that interpretation to their marks). In 1755 they ceded a large tract of land to South Carolina under Gov. Glenn, and Fort Loudoun was built in their territory, it is said by their own request. But after the reduction of Fort Duquesne in 1758, the slaughter of some Cherokees for horse-stealing set the whole tribe aflame, and they requited the massacre ten-fold. The folly of the then governor of South Carolina (Littleton) prevented an arrangement from being made, and a fearful Indian war desolated the borders till 1761, when the harrying of their lands for a month and the burning of 14 villages caused them to sue for peace. Their principal chiefs at this time were Attakullakulla or Little Carpenter, and Oconostota. In 1773 they made a large cession to Georgia.

In the Revolution, like most other Indians, they joined the English, their natural interests being against the Americans; and also like the others, their alliance won no victories for England, but helped lose her the country from the immeasurable odium it excited. Gen. Pickens at last subjugated them; and by a treaty at Hopewell, 28 Nov. 1785, they acknowledged the sovereignty of the United States. This was confirmed by that of Holston, in 1791, with a cession of territory; and other treaties and cessions followed in 1793, 1804, 1816, etc., ending 27 Feb. 1819. The United States on its part solemnly guaranteed to the Cherokees the possession of all lands not ceded by them, recognized their autonomy, and on 30 March 1802, authorized the President to expel trespassers, especially surveyors, by force. In 1790 a portion of the tribe emigrated to Louisiana; and others, mainly Lower huntsmen, later removed from time to time beyond the Mississippi, till in 1817 there were some 3,000 north of the Arkansas in the present Indian Territory. But the remainder showed an adaptability not equaled by any other Indians, and began a vigorous civilized career, which however only postponed their evil day for a few years. Two influences conduced to this besides their character,— the missionaries and the half-breeds: for almost alone among Indians, the mixture of white blood has prospered with the Cherokees. This blood, however, was singularly fine — that of the best Scotch families, in some cases noble: the Rosses, Adairs, McLeods, McDonalds, etc. After the rising of 1745 a number of these, irreconcilable or «wanted,» emigrated to the Carolinas; in the Revolution, not unnaturally, they became loyalists; when it ended and a fresh outlawry menaced them, some of them and their sons pushed on into the Cherokee country, settled there, and intermarried with the native women. The Moravian missionaries had been working among the Cherokees from 1740, and had baptized a considerable number before the Revolution. In 1799 some of the tribe earnestly requested teachers and clergy. A great council was held at Tellico on the Tennessee, at which the Upper chiefs agreed to the plan, but the Lower dissented. In 1804, however, schools and missions were opened, a large part of the tribe were soon Christianized, and the sons of the chiefs attended the schools. The American Board worked successfully among them later.

The Cherokees were now perfectly peaceable, industrious, and rapidly growing civilized in the genuine sense; and they did good service to the United States in the War of 1812. In 1810 they

abolished the clan system and blood-feuds. In 1820 they organized a regular civilized government, including a legislature with paid members, and adopted a code of laws. In 1827 they took the name of The Cherokee Nation, and framed a constitution. In 1825 the Cherokee Sequoyah (q.v.) invented an alphabet of 85 letters, one for each sound in Cherokee, and it was officially adopted by the Cherokee government. In 1827 the first Indian press north of Mexico was established, and on 21 Feb. 1828 the first number of the *Cherokee Phœnix* was issued at New Echota, one-half printed in the new alphabet. But the nation's time had come, hastened by the discovery of gold, which they worked successfully. Georgia, on 24 April 1802, as consideration for ceding western lands to the United States, had stipulated that the Indian titles to lands within the State should be extinguished "as soon as it could be done peaceably and on reasonable terms." The government did its best, but found that it had promised the impossible. In 1808 both the Lower (hunters) and the Upper (farmers) sent deputations to Washington. The former expressed a desire to remove to the virgin hunting-grounds of the West, the latter to retain their own. The former, therefore, on 8 July 1817, were granted an exchange of lands to the West. This left about 5,000,000 acres of Georgia in the hands of the Cherokees, and 4,000,000 in those of the Creeks, or about 14,000 square miles in all, nearly a quarter the present area of the State,—the whole northwestern triangle above the line of Atlanta (which was Cherokee land) and Gainesville. In 1819 Georgia began to grow impatient, and memorialized the President to carry out the agreement of 1802. But the remaining Cherokees loved their beautiful and salubrious country, which they had covered with improvements; they had not much more in that mountain country than they needed; and the reports from Indian Territory were that their brethren were being badly harassed by the wild tribes of the plains. They refused to sell as a nation; by all Indian law, confirmed by the United States, no individual could sell, as the land belonged to the tribe; and to prevent sales they dared not disallow, the Cherokees in 1820 passed a law making such sale a capital offense in any member of the tribe. The Creeks duplicated this action in 1824. There was therefore no way for Georgia to rid herself of these two huge Indian states within her borders except by naked violence in defiance of United States treaties. She did so first with the Creeks, 1826–32, openly defying the United States, and proclaiming the separate sovereignty of Georgia (see CREEKS; NULLIFICATION); then in 1828–30 (see title below) passed laws extinguishing the government of the Cherokees and parceling out their land. The President (Jackson) would give no help, the supreme court said it could not; but the Cherokees clung desperately to their land even under the new legislation. Finally, on 29 Dec. 1835, a small fraction of the tribe, headed by a few influential men, were induced by an emissary of the United States to sign a cession of all tribal lands, in exchange for others in Indian Territory and the sum of $5,700,000, and agree to entire removal within three years. This was of course perfectly invalid; the leaders were immediately assassinated, and were execrated as bribed traitors. There is, however, no reason to doubt their good faith to the nation. One of them was the still remembered Elias Boudinot, editor of the *Cherokee Phœnix,* who was educated at Cornwall, Conn., and married a Connecticut wife. They probably thought the nation could make better terms by yielding than by holding out. The bulk of the tribe, however, repudiated the treaty, and, refusing to go in 1838, were deported by an armed United States force, after a strong resistance and some bloodshed. Many hundreds, however, escaped on the march, lingered about in the woods, and finally concentrated near the Great Smoky Mountains in western North Carolina, where about 1,400, called the Eastern Band, still live, mainly in Swain, Graham, and Jackson counties. Of those who went, thousands are said to have died on the march or from resultant hardships. The number deported is unknown: probably between 10,000 and 20,000.

The chief of the tribe for nearly 40 years (1828–66) was the able John Ross (q.v.), or Kooweskoowee, a Scotch half-breed; and after fighting the removal to the last, when the crisis came he superintended it. When the tribe had gathered in Indian Territory it resumed its form of government and made Tahlequah the capital; and in 1845 resumed publication of a national paper, the *Cherokee Advocate* — which, however, was suspended in 1854, the present paper of the name dating only from 1870. The nation was doing well till the Civil War came for a blight. The Cherokees were almost equally divided in sentiment; their treatment by Georgia had been capped by that of the national government, and after all they were southerners by birth and industrial sympathies, and slaveholders. Each section furnished a large body of troops to its chosen side, and in consequence each side in turn ravaged the country as a hostile land, and with the consideration usually shown by whites to Indian property; and the land was almost swept bare. After the war they made a new treaty with the United States, freeing their slaves and admitting them to full citizenship in the tribe; and in 1866 they absorbed the remnant of the Delawares. Since then their land has been opened up by railroads, despite their protests. The case of Cherokee Nation v. Southern Kansas Railway, 1889, decided that the United States had right to grant eminent domain through their territory, and in fact four trunk lines traverse it. In 1892 they sold their great western extension, known as the Cherokee Outlet, and it forms the larger part of northern Oklahoma. Their region is the whole of Indian Territory north of the Arkansas. Their present government is by an elected principal chief, and a legislature with two chambers. But their long struggle for national existence is drawing to a speedy close. The open policy of the United States government is to substitute allotment in severalty for tribal ownership as fast as possible, and put an end to the anomaly of independent tribes with a figment of sovereignty which only makes hardship to government, tribe, and innocent outsiders alike. No tribe is better fitted for it than the Cherokee; generations of good living and civilization have not only tamed and elevated the Indian character in them, but greatly modified even the Indian physiognomy; there are scores of full-blooded Indian ladies in Tahlequah scarcely distinguishable from whites save for duskiness of

skin. A thorough system of public schools among them has been one of the chief instrumentalities in refining both face and character at once. Their number in Indian Territory in 1900 was 25,639; but the Cherokees proper in this enumeration are thought not to be much above 20,000.

Cherokee Nation v. Georgia, the classic case (1831) on the relations of the Indian tribes toward the United States government. (For the preliminary history, see CHEROKEE.) The means taken by Georgia to oust the Cherokees were as follows: By six successive acts, from 20 Dec. 1828 to 22 Dec. 1830, Georgia laws and jurisdiction were extended over all inhabitants of the Cherokee territory, and resistance to her writs made indictable; Cherokee laws, usages, legislative assemblies, and courts were abolished, and execution of their writs prohibited; Cherokees were declared incapable of testifying against or making contracts with white men, but the execution of the Cherokee laws against selling land to white men was punished as murder; their lands were ordered surveyed and distributed by lottery among the citizens of Georgia; their improvements and gold mines were confiscated; and white men were forbidden under penalty to enter their country, without a license from the governor and taking the oath of allegiance to Georgia. The Cherokees appealed at once (early in 1829) to President J. Q. Adams, to make good the government's treaty guarantees; but he, as his term was about to expire, left it to Jackson, who, as an old Indian fighter, sympathized with Georgia, refused to interfere, and advised the Cherokees to submit or remove. Their next resort was to the supreme court, but the Georgians took care not to let suits in the State courts come to a decision, and so give opportunity to appeal. At length, however, a case was found. When the Georgia authority over the Cherokee country became operative in 1830 a Cherokee named Corntassel or George Tassels killed an officer serving a writ of ouster, and was sentenced to be hanged; a writ of error was obtained from the supreme court 12 Dec. 1830, citing the State to appear; the legislature instructed the State officials to ignore it, and the sentence was carried out. The Cherokees' council then applied to the supreme court for an injunction to prevent Georgia from exercising her laws within the Cherokee country; the State put in no appearance, and the case was decided from the arguments on the other side: These were: that the supreme court has jurisdiction over cases between States of the Union and foreign countries; and that the Cherokee Nation, by repeated acknowledgment of the United States in solemn treaties, was such a foreign country, sovereign and independent. Chief Justice John Marshall for the court — Story and Thompson dissenting — decided that they were not a foreign nation in the meaning of the Constitution,— since, for example, an attempt by any other foreign nation to form a connection with them, or to trespass on their land, would be held an invasion of the rights or territory of the United States; that they were a domestic or dependent nation, in a state of pupilage, their relation to the United States being like that of a ward to its guardian, that their title to their land was only that of occupancy, the United States succeeding to it whenever their own possession lapsed; that their appeal lay to the President; that the supreme court could not call out force to resist the extension of Georgia laws over territory claimed as its own; that it could pass on the title to land, upon suit properly brought, but this question was a political one.

A second case, though not cited under this head, properly belongs with this. Under the law restricting white men's entry into the Cherokee country, 10 missionaries and others were arrested and sentenced to four years' imprisonment, in September 1831. Eight were released on making submission; two refused; and one, Rev. Dr. Worcester, brought suit for a habeas corpus in the supreme court, which gave decision in March 1832, and to the lay mind appears to have reversed its former one. It held that all the acts of the Georgia legislature with respect to the Cherokees were unconstitutional and in violation of the treaties and laws of the United States; and ordered the prisoner released as condemned on a void statute. The State refused to comply; but in place of waiting till the next term of the supreme court, to see if it would call on the United States authorities to enforce the decree, the prisoners made submission and were released. It is probable that Jackson's famous «John Marshall has made his decision — now let him enforce it,» would have prevented them from regaining freedom till their term was up.

Cherry, the name of various species of trees and shrubs of the genus *Prunus,* natural order *Rosaceæ,* closely related to the almond, peach, apricot, and plum, thus comprising one of the most important groups of fruits — the drupaceous or stone fruits. Cherries are characterized by white flowers usually in umbel-like fascicles, or in racemes, and sub-globular, mostly red, yellow, or black fruits, without bloom, and containing stout, nearly globular smooth stones. Few of the native species have attracted horticultural attention except for ornamental purposes, but some, especially the wild black cherry (*P. serotina*), are highly prized as cabinet woods and for interior house-finishing.

The cultivated cherries have been derived almost wholly from two European species, *P. avium,* and *P. cerasus.* The varieties of *P. avium* belong to four groups: mazzards, inferior seedlings common in the eastern United States; hearts, heart-shaped, soft, light or dark, sweet fruits; bigarreaus, heart-shaped, firm, light or dark, sweet fruits; and dukes, light, somewhat acid fruits. Of these four groups, the bigarreaus are the most important; they are largely grown in California and shipped to the eastern markets. The hearts are somewhat grown for home on both the Atlantic and Pacific coasts, in Europe, and in Australia. The varieties of *P. cerasus* are divided into amarelle (light-colored) and morello (dark-colored) groups. The morellos are the leading acid cherries and are most popular in the eastern United States, especially in western New York, where they are largely canned for market, as well as shipped in the fresh state.

Besides these important species and their varieties, a few others have horticultural value, notably, *P. mahaleb*, a hardy, rather small European species, which is used as a propagating stock; *P. pennsylvanica*, the pin, wild red, or bird cherry, whose hardness seems to promise usefulness in the Western plains region; *P. bessyi* and *P. pumila*, the sand or dwarf cherries, which seem to grade into one another, the former producing sweet fruit, the latter acid, and which, being natives of the plains region, seem worthy of the attention of the hybridizer.

Cherries are propagated by budding upon either mazzard or mahaleb seedlings, the latter being in more general favor, especially in the West, because they are hardier, easier to grow, easier to bud, and are freer from blight in the nursery. Sweet cherries succeed best upon well-drained light loams where the moisture is abundant, but not excessive; sour kinds will stand heavier, but not wet land; neither prove profitable upon very rich soils. The ground should be thoroughly and deeply plowed and harrowed; the sweet kinds, which are large spreading trees, set 25 to 30 feet part, and the sour kinds 15 to 20 feet. The land should be kept clean by frequent cultivation until midsummer, when a clover crop should be sown. This must be turned under the following spring, and the land treated as before. Each year liberal applications of potash and phosphoric acid should be given and the trees protected from the attacks of insects and fungi by systematic spraying.

Two insects are most dreaded. One is the cherry aphis, which attacks the foliage in May. It is particularly troublesome upon the sweet kinds. Kerosene emulsion and fish-oil soap are each useful in controlling the pest. The other is the cherry slug, a shiny, dark-green worm, the larva of a four-winged black fly. The slug eats the soft tissue of the leaves between the veins. It may be controlled with air-slaked lime or arsenites. See FUNGICIDE.

The most important diseases of the cherry are brown rot, leaf-blight, and black knot, which are treated under PLUM. Mildew (*Podosphæra oxycanthæ*) is troublesome upon nursery stock. It is a gray fungus which causes the leaves to fall, but may be controlled by a fungicide. Consult: Bailey, 'Cyclopedia of American Horticulture' (1900–2).

Cherry, Wild, the bark of *Prunus serotina* collected in autumn. This is very extensively used in medicine as a vehicle basis, the syrup of the bark being used very extensively in cough remedies. It contains a small amount of hydrocyanic acid.

Cherry-laurel (*Prunus lauro-cerasus*), a shrub closely allied to the common cherry, but having evergreen leaves. It was introduced into Great Britain in the 16th century, and is well known as an ornamental shrub. It yields the celebrated laurel-water. This is a powerful poison, the strength of which (like that of peach-kernels, bitter almonds, cherry-leaves, etc.) depends upon the presence of prussic acid. Laurel-water is obtained from the leaves and flowers, or the leaves only, by distillation. This shrub is often called the common laurel, another evergreen species being distinguished as the Portugal laurel: both are distinct from the true laurel.

Cherry Valley, Massacre at. The site of this village, in Otsego County, N. Y., was made memorable by the scenes of 11 Nov. 1778. With the exception of the massacre at Wyoming in July previous, that at Cherry Valley was the greatest of those indiscriminate murders of peaceful settlers which inflamed American fury without much diminishing American resources, and loaded England with odium while not advancing her military success. It was led by Lieut. Walter N. Butler, a Mohawk Valley Tory leader, son of the more famous Col. John Butler. He had been captured at German Flats in the summer of 1777, while misusing a flag of truce to incite the inhabitants of the then Tryon County to desert the patriot cause; was sentenced to death as a spy, but unfortunately spared on the intercession of friends, carelessly guarded, and escaped, burning for vengeance on Tryon County. He selected Cherry Valley, a well-known frontier settlement, as the point to strike; because its noted beauty, and the unusual cultivation and morality of its inhabitants, would make the blow resound. Lafayette, seeing its exposed situation, had fortified it with a blockhouse the preceding spring; and Col. Peter Gansevoort, an experienced officer of high reputation, solicited the command. For some reason, however, it was given to Col. Ichabod Alden, a respectable Massachusetts officer, not used to Indian warfare. During the summer the inhabitants lived in the fort and went warily; but by November they had returned to their dwellings. On the 8th Col. Alden received a message through a friendly Indian that at a great meeting of Tories and Indians at Tioga it was resolved to attack the place; and the people begged to take refuge in the fort again. Alden pooh-poohed it as an idle Indian rumor, assured them that he would guard against a surprise, and sent out scouting parties. The party that should have beaten up Butler's went to sleep by a camp-fire on the night of the 9th, and awoke as prisoners of the enemy. Butler had obtained a company of his father's rangers, induced Brant, the great Mohawk chief, to join him, with a few hundred of his Indians, picked up a band of Senecas and other straggling Indians and Tories as he went on, and with about 700 men approached Cherry Valley. Securing from the prisoners, under threat of torture, all information as to the conditions there — as that the officers of the garrison lodged with families near the fort, instead of in it — the expedition camped about a mile southwest of the village on the night of the 10th. It snowed in the night, turning to rain in the morning. As the enemy approached under cover of the thick mist, an Indian fired on a stray settler and wounded him, but he escaped and warned the colonel. That remarkable officer thought the assailant only a straggling Indian, and paid no attention. The rangers stopped near the village to examine their guns, and the Indians sprang forward, the ferocious Senecas in advance, under their chief, Sayenqueraghta, and with them some Tories worse than themselves. In the massacre that ensued, 32 settlers, mostly women and children, besides the colonel and 15 other soldiers, were slain; 30 to 40 prisoners were taken,

also nearly all women and children; and the village was reduced to ashes. Most of the prisoners, however, were released the next day, and sent back; not, probably, from any motives of humanity on Butler's part, his hot temper and hard nature making him as cruel as the Indians, but to effect an exchange for his mother and younger brothers and sisters, in the power of the Americans. The massacre was long charged upon Brant as chief actor, but it is now known that he commanded only his own Mohawks, and kept them in hand, his object being to destroy the fort and garrison, and that the Senecas committed most of the horrors. It fact, it is notable that the only deed of humanity that day was done by a Mohawk sub-chief, and that the worst atrocity was perpetrated in cold blood by a Tory, who was afterward hanged for it.

Cherso, kĕr'sō, a long, narrow island, in the northern Adriatic, belonging to Austria, yielding wine, olives, and other fruits. It is situated on the Gulf of Quarnero, between Veglia and the mainland, and forms part of Istria. It is about 35 miles long, and the area is 105 square miles. The town of the same name stands on the west coast, and has a population (1890) of 4,725. Pop. of island (1890), 10,180.

Chersonesus, kėr-sō-nē'sŭs (Greek, a peninsula). This name has been given to several peninsulas, as (1) the Cimbrian Chersonesus, now Jutland; (2) the Taurian Chersonesus, the peninsula formed by the Black Sea and the Sea of Azoff — the Crimea; (3) the Thracian Chersonesus, the great peninsula in Thrace, now the peninsula of the Dardanelles; (4) the Golden Chersonesus, in India beyond the Ganges, supposed to be the Malay Peninsula.

Chert, a crypto-crystalline (not visibly crystalline) variety of quartz closely related to flint, but less translucent and having a more splintery fracture. In geology the term is applied to a considerable range of siliceous rocks, from the impure flints largely formed from the siliceous remains of organisms, sponges and diatoms, found in limestones and other stratified rocks, to the jasperated quartz formed by the alteration of limestones or limy sandstones. Cherts of this last type grade into jasper. See FLINT; JASPER; QUARTZ.

Chertsey, chĕs'sĭ or chĕrt'sĭ, England, a town in the county of Surrey, 20 miles southwest of London, on the Southwestern Railway, is pleasantly situated on the right bank of the Thames, over which there is a handsome bridge, connecting it with the north or Middlesex side of the river. The houses are mostly of brick, and in general well built. The church of St. Peter has a square embattled tower, and contains a tablet to the memory of Charles James Fox. A school was founded here by Sir William Perkins in 1725 for clothing and educating 25 girls and 25 boys. It is now converted into a public elementary school. There was here formerly a monastery of the Benedictine order, in which Henry VI. was interred, and where his remains lay until removed to Windsor by Henry VII. The chief industries are manufacturing iron, engineering, boat- and steam-launch building, carriage building, and cabinet work. Vegetables are cultivated for the London market. Chertsey gives name to a parliamentary division. Pop. (1901) 12,762.

Cherub (plural, cherubim), a celestial spirit which, in the angelic hierarchy, is placed next in order to the seraphim. All the several descriptions which the Scripture gives us of cherubim differ from one another, as they are described in the shapes of men, eagles, oxen, lions, and in a composition of all these figures put together. The hieroglyphical representations in the embroidery upon the curtains of the tabernacle were called by Moses (Ex. xxvi. 1) cherubim of cunning work.

Cherubini, Maria Luigi Carlo Zenobi Salvatore, mä-rē'ä loo-ē'jē kär-lō zä-nō'bē säl vä tō'rä kä-roo-bē'nē, Italian composer: b. Florence 8 Sept. 1760; d. Paris 15 March 1842. In 1773 he produced a mass, which, with other of his compositions, attracted the attention of the grand duke Leopold, who enabled him to become a pupil of Sarti of Bologna, under whom he studied from 1778 to 1782. As early as 1780 he produced his first opera, 'Quinto Fabio,' at Alessandria, and in 1784 he had already produced eight operas in the theatres of Italy. In 1785 he composed for the London Italian opera 'La finta Principessa and Giulio Sabino'; in 1788 at Turin his 'Ifigenia in Aulida'; and in the winter of the same year he brought out his 'Demophoon,' and in 1791 his 'Lodoïska,' at Paris. The latter opera established his fame, and was followed by 'Élisa'; 'Médée'; 'L'hôtellerie Portugaise'; 'Les deux journées'; 'Anacréon'; and his ballet of 'Achilles at Scyros.' In 1806 he produced 'Faniska' at Vienna; in 1809, 'Pimmalione' at Paris; in 1813, 'Les Abencerrages'; in 1814, 'Bayard à Mézières'; in 1821, 'Blanche de Provence'; and in 1833, 'Ali Baba.' He excelled most in sacred music. His celebrated mass in F for three voices, his grand 'Requiem,' his 'Messi Sacrie,' are the noblest monuments of his genius. Haydn and Beethoven pronounced him the greatest sacred composer of the age. In 1822 he became director of the *conservatoire* of Paris, with which he had been connected from the date of its foundation in 1795, and which is greatly indebted to him for its prosperity. The most important of Cherubini's literary works is 'Méthode de contre-point et de fugue,' published in 1835, containing a summary of the lessons in strict composition which for several years he had given at the conservatory. He was enthusiastically devoted to his profession, and his independence as an artist frequently manifested itself. Napoleon for a long time could not forgive him, because on one occasion, when he rudely contradicted him on some point of music, the artist replied: «Citizen Bonaparte, in the art of war you are pre-eminent, but you should leave music to those who understand it.»

Cherusci, kē-rŭs'sī, the most celebrated of all the German tribes. It is difficult to determine their exact position, owing to the fact that ancient writers sometimes confound the national league formed by the Cherusci with the tribe, properly so called. It seems probable, however, that the tribe was situated in

that part of Germany lying between the Weser and the Elbe, and having the Harz Mountains on the north and the Sudetic range on the south. This tribe was known to the Romans before 50 B.C. and it is mentioned by Cæsar as a people of equal importance with the Suevi. Their territory was first entered by the Romans under Drusus, the stepson of Augustus; and a year or two later they entered into an alliance with the Romans, and served in their armies. But when Varus attempted to make them tributary to Rome, and subject them to the Roman laws, they formed a confederation with many smaller tribes, and having decoyed Varus into the forest of Teutoburg, destroyed his whole army in a battle which lasted three days, and in which he himself was slain (9 A.D.). Upon this the Cherusci became the chief object of the attacks of the Romans. Germanicus, victorious over the Marsi and Chatti, marched against the Cherusci, whose leaders, Segestus and Arminius (the latter of whom had carried off the daughter of the former), were at war with each other. Segestus, pressed by Arminius, called Germanicus to his aid, who delivered him, indeed, from his danger, but was obliged to return after several campaigns without having obtained any permanent advantages. In the end the Cherusci were overcome by the Chatti in the second half of the first century of our era; but this seems to have been owing more to internal dissensions among themselves than to any natural superiority in their opponents. Before the end of the 4th century they appear as members of the great confederation of the Franks, and after that they are lost sight of.

Cher'vil, a popular name for several plants of the natural order *Umbelliferæ*. Leaf chervil or salad chervil (*Anthriscus cerefolium*) is an annual herb native to southern Europe, and has long been cultivated in Europe, but very little in America, for its sweet-scented compound leaves, which are used like parsley for garnishing, flavoring soups, stews, etc., and as a pot-herb. It is of easy cultivation and yields its leaves in about eight weeks from sowing the seed. In some localities it has escaped from gardens and has become a weed. Turnip-rooted or tuberous chervil (*Chærophyllum bulbosum*) is a biennial or plur-annual herb native to southern Europe and has long been cultivated for its small grayish or blackish carrot-like roots, which are eaten either like beets or as a flavoring in soups, stews, etc. Since its seeds lose their vitality very quickly, they should be sown in the autumn, or else stratified until spring. If sown in the fall they need not be expected to appear before spring. Except as just mentioned, the cultivation of tuberous-rooted chervil resembles that of carrots. The name chervil is also sometimes given to sweet cicely (*Myrrhis odorata*), a native of southern Europe, widely cultivated in Europe, where it is also known as Spanish chervil, anise chervil, and myrrh.

Chéry Philippe, fē-lēp shā-rē, French painter: b. Paris 15 Feb. 1759; d. 28 Feb. 1838. Espousing the cause of the Revolution, he took a part in the siege of the Bastile, and was successively a member of the Convention, member of the first committee of public safety, mayor of Charonne and Belleville, and chief of police in the department of the Seine. Banished by Bonaparte after the 18th Brumaire, he did not return to France until 1802. His historical paintings gained for him a high reputation.

Ches'apeake and Delaware Canal. See CANAL.

Chesapeake and Leopard, Affair of the, 22 June 1807. The Chesapeake was a 40-gun frigate destined to relieve the Constitution in the Mediterranean; Capt. James Barron was to go out in her as commander of the Mediterranean squadron. She had been refitted at the Washington navy-yard, and made final preparations at Norfolk, reporting ready for service on 19 June. On the 22d she got under way, but expecting no attack from powers at peace with this country, was in no shape for immediate action, and being four months behind time, could not wait. The gun deck was obstructed with various lumber, sick seamen were lying on the upper deck, the cables were not stowed away, the powder-horns were not filled, and the crew was raw and not exercised at the guns. At this time, in the heart of the Napoleonic wars, the high wages and relatively safe employ of the American merchant and even naval service, with the rights of American citizenship immediately obtained, raised the normal rate of desertion from the British navy so much that its officers were much embarrassed and greatly incensed; and Great Britain claimed, as for many years afterward, the right of searching neutrals for deserters and contraband. At the same time, her press-gangs crimped for service any strays who could be caught, of any nationality, and rarely gave any redress. Early in 1807 a British fleet lay off Norfolk watching to intercept some French frigates in the Chesapeake; and a boat's crew deserted bodily and escaped to Norfolk. The captain was told that they had enlisted on the Chesapeake,— which was true of only one, and he under an assumed name; and meeting the latter and another deserter in the streets of Norfolk, was defied. Another vessel, the Melampus, reported three deserters gone to the Chesapeake, but it was proved that they were native Americans illegally pressed. Admiral Berkeley, at Halifax, on complaint of his officers, ordered any of his vessels to overhaul and search the Chesapeake on meeting her outside the United States jurisdiction. The order was carried by the 52-gun flagship, Leopard, Capt. Humphreys, who, after consulting with the local commandant at Lynnhaven, followed the Chesapeake out beyond Cape Henry, hailed her, and sent a boat with a copy of Berkeley's order. Barron. who believed that he had no deserters aboard except the Melampus', which were not really such, honestly denied having any, but refused the right to search; the messenger lieutenant at once left, and within five minutes the Leopard came closer, and Humphreys announced that he should carry out his orders. Barron at once called his men to quarters, and did everything that skill, coolness, and courage could do to prepare for action, but the Leopard almost at once poured her whole broadside into the Chesapeake, and then two more in rapid succession, without the possibility of her opponent replying. Three of

the latter's men were killed, Barron and 17 others wounded, and it was certain that the vessel would be sunk in a short time if the fire kept up, and Barron, to stop a useless massacre, struck his flag. The one English deserter was hunted out and hanged, the three Americans taken and imprisoned. The mass of the country was on fire with indignation; the extreme Federalists at first justified the English course, but were compelled by public feeling to exhibit some patriotism. Even the timid Jefferson, whose course had brought on the catastrophe, interdicted British cruisers from American ports, and demanded disavowal and reparation from Great Britain, which were not given; but he did nothing to prevent the recurrence of such outrages. The unfortunate Barron, who had behaved like a brave man and good officer, and whose instructions had bound him to do nothing to bring on collisions, was made the scapegoat of the popular fury. His own captain screened himself by accusing him, and a court-martial on board his own vessel from 4–8 Jan. 1808, Capt. John Rodgers president, after acquitting him of all blame in every respect but one, found him guilty in not preparing for action as soon as he read Admiral Berkeley's order, and sentenced him to five years' suspension without pay or emoluments. The gross injustice of this is now admitted. One of the judges was Stephen Decatur (q.v.), who never ceased reflecting on Barron till the latter challenged and killed him.

Chesapeake and Shannon, Battle of, 1 June 1813. In the War of 1812, the former vessel (see above) cruised to no purpose from December 1812, till April 1813, and arrived at Boston 9 April. Her captain, Evans, left her on account of ill health, and about the middle of May was replaced by Capt. James Lawrence, famous for the brilliant victory of the Hornet over the Peacock. He accepted against his will; nearly all the officers and crew were new, and the latter second-rate, totally untrained, and sulky over questions of prize money. On 25 May Capt. Broke of the Shannon, lying outside, sent away his consort, the Tenedos, to have a fair chance to fight the Chesapeake alone, and repeatedly urged Lawrence to arrange a duel between the ships. In theory they were evenly balanced; they were of almost exactly the same length; the Chesapeake now carried 50 guns, the Shannon 52; the Chesapeake had 379 officers and crew against the Shannon's 330, but the latter had been trained for seven years under Broke himself, kept in constant artillery and other practice, and was a thoroughly disciplined fighting machine, men used to each other and the officers. On 1 June, however, Lawrence, whose experience had made him despise British skill and courage alike, sailed out to meet his enemy, and at 5.30 P.M. they engaged. After a couple of broadsides, the Shannon's shot cut the Chesapeake's stays, and the latter drifted helplessly stern foremost toward her adversary. There was no salvation but to make sail forward or to board, and both were impossible. The Shannon's broadsides and the musketry fire from her tops swept the Chesapeake diagonally from stem to stern, without the latter being able to fire a shot in reply, beating in the stern ports and killing or wounding every man on the quarter-deck and the after part, including the men at the wheel. Just before the vessels struck, Lawrence ordered up his boarding party; but almost at the same instant he fell mortally wounded by a musket ball, and was carried below. Not a living person was on the quarter deck, and Broke, with 50 boarders rushed on board unresisted just as the vessels parted. He was in deadly peril from his own guns, which killed his first lieutenant as the latter pulled down the American flag, and so fierce was the resistance from the 30 or so of the American crew who had rallied at the forecastle, that 37 of the boarding party were killed or wounded, including Broke himself. Had the rest of the crew shown even decent pluck, not one of the British would have escaped; but the upper party, heavily overmatched, were killed or driven below, and though the dying Lawrence called out from the cockpit, "Don't give up the ship! Blow her up!" the remainder refused to go above, and surrendered. The Chesapeake lost 61 killed and 85 wounded; the Shannon 33 killed and 50 wounded. The former was towed into Halifax as a prize, turned into a British war vessel, and in 1820 broken up. Lawrence died four days after the battle.

Chesapeake Bay, in Maryland and Virginia, and dividing the former State into two parts, is the largest inlet on the Atlantic coast of the United States, being 200 miles long, and from 4 to 40 broad. Its entrance, 12 miles wide, has on the north Cape Charles, and on the south Cape Henry, both promontories being in Virginia. The bay has numerous arms, which receive many navigable rivers, such as the Susquehanna on the north, the Potomac, Rappahannock, and York on the west, and the James on the southwest. Unlike the shallow sounds toward the south, this network of gulfs and estuaries, with its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenal of Washington.

Chesapeake Bay Dog, the American retriever, so named from the district in which it first became well known. It is a large animal, with a thick coat about an inch and a half long, with an under coat of soft woolly fur to protect the skin. Its legs are rather short, and the feet are well webbed, and it is held to be the finest retriever in the world.

Chesapeake Stage. The rocks of the Chesapeake Stage, a younger Miocene of the Atlantic coast, are clays and marls in the north, and marls and limestones in the south. They differ chiefly from the older Miocene, or Chattahoochee and Chipiola Stages, in the character of the fossils, particularly in the north; these fossils indicating that the climate was much colder in the newer than in the old Miocene. This change of climate is believed to have been due to a change in the direction of the Gulf Stream, which flowed farther from the coast than before. The stage is well developed at Duplin County, N. C., at Yorktown, Va., and along rivers in Maryland. Strata of this age are found at Martha's Vineyard, Mass., and in Texas. See MIOCENE SERIES; TERTIARY SYSTEM.

Chesebro, chĕz'brō, **Caroline,** American novelist: b. Canandaigua, N. Y., 30 March 1825; d. Piermont, N. Y., 16 Feb. 1873. In 1851 a collection of her writings was published entitled 'Dream Land by Daylight: a Panorama of Romance.' This was followed by 'Isa, a Pilgrimage' (1852); 'Victoria, or the World Overcome' (1856); 'Philly and Kit' (1856); 'Peter Carradine' (1863); 'The Beautiful Gate, and Other Tales' (1863); 'The Foe in the Household' (1871); her best work.

Cheselden, chĕs'ĕl dĕn, **William,** English surgeon and anatomist: b. near Melton, Mowbray, Leicestershire, 1688; d. Bath 10 April 1752. At the age of 22 he began to give lectures on anatomy, and in 1711 he was chosen F.R.S. In 1713 he published a treatise on the 'Anatomy of the Human Body,' long a favorite manual of the science. He continued to read his lectures for more than 20 years, during which he gradually rose to the head of his profession. In 1723 he published a 'Treatise on the High Operation for the Stone.' In 1733 was published his 'Osteography, or Anatomy of the Bones.' Cheselden obtained in 1737 the appointment of chief surgeon to Chelsea Hospital, a situation he held till his death.

Cheshire, chĕsh'ĕr, **Joseph Blount,** American Protestant Episcopal bishop: b. Tarboro, N. C., 27 March 1850. He was graduated at Trinity College in 1869, and practised law from 1872 to 1878. He was ordained to the priesthood in 1880, and, after holding various rectorships, became Bishop of North Carolina in 1893.

Cheshire, or **Chester,** a maritime county of western England, bounded by seven other counties in England and Wales, by the estuaries of the Dee and Mersey, and by the Irish Sea. Its area is 1,026 square miles, of which the greater part is under cultivation. The surface is generally level, the soil mostly a rich reddish loam variously clayey or sandy. There is some of the finest pasture land in England; and cheese, the main product of the Cheshire farmer, is made in great quantities. Extensive tracts of land are cultivated as market-gardens, the produce being sent to Liverpool, Manchester, and other towns. Minerals abound, especially rock-salt and coal, which are extensively worked. Cotton manufacture is carried on at Stockport, Stalybridge, and in the northeastern district, ship-building at Birkenhead and other places. There are numerous railroad lines and a splendid system of canals. The principal towns are Chester, the county town, Macclesfield, Stockport, Birkenhead, and Stalybridge. Pop. 815,000.

Cheshire Cheese. See CHEESE.

Chesney, chĕs'nĭ, **Charles Cornwallis,** English soldier and author: b. 6 Sept. 1826; d. 19 March 1876. He was a well known military engineer, but was still better known as a writer on military themes, publishing 'Campaigns in Virginia' (1863); 'Waterloo Lectures' (1868); 'Military Biographies' (1870). The last named volume contained essays on Gens. Grant and Lee. He was a nephew of F. R. Chesney (q.v.).

Chesney, Francis Rawdon, English explorer: b. Annalong, County Down, Ireland, 1789; d. Mourne 30 Jan. 1872. He was gazetted to the Royal Artillery in 1805. In 1829 he inspected the route for a Suez canal which he proved to be practicable. His first exploration of the route to India, by way of Syria and the Euphrates, was made in 1831, and he made three other voyages with the same object. The idea was taken up by government, who made a grant of £20,000 after his first expedition, but owing to the opposition of Russia it was never brought to a practical issue. He commanded the artillery at Hong Kong from 1843 to 1847. In 1850 he published his 'Expedition for the Survey of the Rivers Euphrates and Tigris,' and in 1868 a 'Narrative of the Euphrates Expedition.' See 'Life,' edited by Lane-Poole (1885).

Chesney, SIR **George Tomkyns,** English writer: b. 1830; d. 1895. He was a colonel in the army, and later a general and K.C.B. and sat in the House of Commons for Oxford in 1892. But he will be longest remembered for his remarkable realistic 'Battle of Dorking' (q.v.) (1871); and his brilliant novel, 'The Private Secretary' (1881).

Ches'nut, Victor King, American botanist: b. Nevada City, Cal., 28 June 1867. He graduated at the University of California in 1890 and pursued post-graduate work at the University of Chicago and at Columbia University. In 1894 he became assistant botanist in charge of poisonous plant investigation, carried on by the United States Department of Agriculture. He has written: 'Principal Poisonous Plants in the United States'; 'Thirty Poisonous Plants of the United States'; and 'Preliminary Catalogue of Plants Poisonous to Stock.'

Ches'nutt, Charles Waddell, American author: b. Cleveland, O., 20 June 1858. While still a child he was taken to North Carolina, where he was educated, becoming subsequently principal of the State Normal School at Fayetteville. He removed to New York and entered journalism temporarily, returning later to Cleveland, where he was admitted to the bar in 1887. He has written 'The Conjure Woman'; 'The Wife of His Youth and Other Stories'; 'Life of Frederick Douglass' (in 'Beacon Biographies'); 'The House Behind the Cedars'; and 'The Marrow of Tradition.'

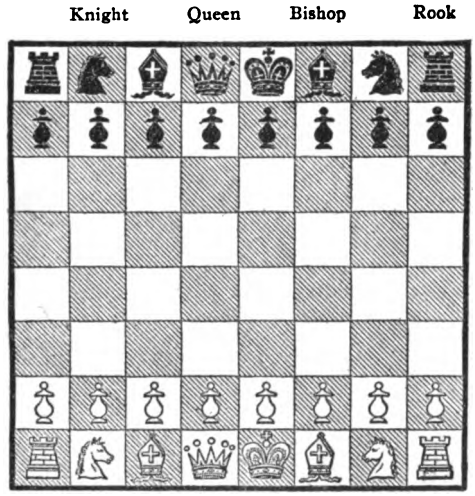
Chess, a well-known game of great antiquity and of Eastern origin, having probably arisen in India, and thence spread through Persia and Arabia to Europe. The name itself, as well as many of the terms used in the game, are clearly Eastern, the word "chess" being formed from the old French *eschecs,* from Persian *shâh,* "a king"; "rook" is from the Sanskrit *roka,* meaning a "ship" or a "chariot"; "checkmate," from Persian *shâh, mât,* "the king is dead." The game is played by two persons on a board, which is divided into 64 squares arranged in eight rows of eight squares each, alternating black and white, or black and red. Each player has 16 men, eight of which, known as "pawns," are of the lowest grade; the other eight, called "pieces," are of various grades. They are, on each side,

«king» and «queen»; two «bishops,» two «knights,» and two «rooks» or «castles.» The board must be placed so that each player shall have the single white square of his rear row to his right hand. The men are then set upon the two rows of squares next the players; the pieces on the first or rear row; the pawns on the second or front row, leaving between each side four unoccupied rows. The king and queen occupy the central squares, facing the corresponding pieces on the opposite side. The queen always occupies the central square of her own color. The two bishops occupy the squares next the king and queen; the two knights the squares next the bishops; the rooks the last or corner squares. The pieces standing on the king's or queen's side of the board are named respectively king's (or queen's) bishop, knight, or rook. The pawns are named from the pieces in front of which they stand; as king's, king's knight's, queen's rook's pawn, etc. For purposes of chess notation the names of the men are contracted as follows:

King	K.	Queen	Q.
King's bishop	K.B.	Queen's bishop	Q.B.
King's knight	K.Kt.	Queen's knight	Q.Kt.
King's rook	K.R.	Queen's rook	Q.R.

The pawns are indicated by adding the initial P. to the abbreviations of the names of the pieces noted above.

CHESS BOARD.



The squares on the board are known as rows and files, the rows running across the board in relation to the players, and the files directly from opponent to opponent. Each file is named from the piece which occupies its first square, and, counting inversely from the position of each player to that of the other, the rows are numbered from 1 to 8. At White's right-hand corner we have thus K.R. square; immediately above this K.R. 2; and so on to K.R. 8, which completes the file; the second file begins with K.Kt. square on the first row, and ends with K.Kt. 8 on the eighth. White's K.R. 8 and K.Kt. 8 are thus Black's K.R. square and K.Kt. square, and the moves of each player are described throughout from his own position, in inverse order to the moves of his opponent.

In chess all the men capture by occupying the position of the captured man, which is removed from the board. The ordinary move of the pawn is straight forward in the same file; a pawn never moves backward. The first time a pawn is moved it may be played forward one square or two; afterward only one square at a time. But in capturing an adverse piece the pawn moves diagonally to occupy the position of the captured man. Thus if White opens a game by playing his pawn to K. 4 and Black answers by advancing his pawn to K. 4, the pawns are immovable; but if White now plays a pawn to K B. 4 or Q. 4, Black may capture the pawn last advanced. Pawns have another mode of capture peculiar to themselves, and only available against pawns. If Black's pawn, instead of occupying K. 4, stood on K. 5, and White played his pawn to Q. 4, Black could not capture it by placing his pawn on the square it occupies, which would be a false move; but he is at liberty to make the capture by placing his own pawn on the square passed over by White's (Q. 6). This is called taking *en passant*. When a pawn, by moving or capturing, reaches the eighth square of any file, it can no longer remain a pawn, but must be exchanged for a piece. The player may choose any piece except the king, but the queen, on account of her power, is generally the one chosen. This is called «queening» a pawn, and a player may thus have several queens on the board. The moves of the pieces are not, like those of the pawns, limited to a single direction. The rook moves in any direction and for any distance that is open along the particular row or file on which it happens to stand. It can capture any obstructing man and occupy its place. The bishop's moves are unlimited in range, and may be either backward or forward; but their direction is diagonal, and they can never change the color of their square. The queen combines the moves of both rook and bishop. She is the most powerful piece on the board, and can move to, or capture at, any distance or direction in a straight line. The king is at once the weakest and the most valuable piece on the board. In point of direction he is as free as the queen, but for distance he is limited to the adjacent squares. Standing on any central square he commands the eight squares around him and no more. Besides his ordinary move the king has another by special privilege, in which the rook participates. Once in the game, if the squares between the king and either his or the queen's rook are clear; if neither the king nor the rook has moved; if the king is not attacked by any hostile man; and if no hostile man commands the square over which the king has to pass, the king may move two squares toward either rook, and the rook, in the same move, must occupy the square over which the king has passed. This is called «castling.» The knight, unlike the other pieces, never moves in a straight line. His move is limited to two squares at a time, one forward or backward and one diagonally, and he can leap over any man occupying a square intermediate to that

to which he intends to go. The knight, like the king, when on a central square, commands eight squares, but they are at two squares' distance, and all in an oblique direction. All captures in chess are optional.

The definite aim in chess is the reduction to surrender of the opposing king. The king is supposed to be inviolable; that is, he cannot be taken: he can only be placed in such a position that if he were any other piece he would be taken. Notice of every direct attack upon him must be given by the adversary saying "Check," and when the king is attacked all other plans must be abandoned, and all other men sacrificed, if necessary, to remove him from danger, cover the attack, or capture the assailant. It is also a fundamental rule of the game that the king cannot be moved into check. When the king can no longer be defended on being checked by the adversary, by moving him out of danger, by interposing, or by capture, the game is lost, and the adversary announces this by saying "Checkmate!" When, by inadvertence or want of skill, the player having the superior force blocks up his opponent's king so that he cannot move without going into check, and no other man can be moved without exposing him, the player, reduced to this extremity, cannot, without violating the fundamental rule referred to, play at all. In such a case, the one player being unable to play and the other out of turn, the game is considered "drawn," that is, concluded without advantage to either player. The position is known as a stalemate. The laws of the game must be sought in some special manual. Perhaps the best code is that given in Staunton's 'Chess Praxis.'

Chest, in man and the higher vertebrates, the cavity formed by the breastbone in front and the ribs and backbone at the sides and behind, shut off from the abdomen below by the diaphragm or midriff. It contains the heart, lungs, etc., and the gullet passes through it. See THORAX.

Chest-foundering, a disease in horses, a rheumatic affection of the muscles of the chest and fore-legs, impeding both respiration and the motion of the limbs. It in some degree corresponds with what is called pleurisy in man.

Ches'ter, Albert Huntington, American chemist and mineralogist: b. Saratoga Springs 22 Nov. 1843. He graduated from the Columbia School of Mines in 1868 and became a mining engineer. From 1870–92 he was professor of chemistry in Hamilton College. He has written a 'Dictionary of the names of Minerals'; and 'Catalogue of Minerals With Their Chemical Compositions and Synonyms.'

Chester, Colby Mitchell, American naval officer: b. New London, Conn., 29 Feb. 1844. He graduated at the United States Naval Academy in 1863; fought under Farragut in the famous battle of Mobile Bay; became captain 12 June 1896; was commandant of cadets at Annapolis 1890–4; commanded the Galena, Richmond, Newark, Minneapolis 1895–7; the Cincinnati during the war with Spain, and in 1899 was placed in command of the new and powerful battleship Kentucky.

Chester, Joseph Lemuel, American genealogist; b. Norwich, Conn., 30 April 1821; d. London, England, 26 May 1882. His earlier life was taken up chiefly with mercantile pursuits, but his strong literary tastes found expression in contributions to the 'Knickerbocker.' From 1845 to 1850 he was musical editor of Godey's 'Lady's Book,' and in 1852 became one of the editors of the Philadelphia *Inquirer*, and of the *Daily Sun*. In 1858 he went to England to sell some patent rights, but not succeeding in the undertaking, settled in London, and devoted himself to genealogical investigation. For more than 20 years he collected materials illustrating the ancestry of American families, made special researches for clients, and investigated the English descent of noted Americans, especially that of George Washington. His greatest work was the editing and annotating of 'The Marriage, Baptismal and Burial Registers of the Collegiate Church or Abbey of St. Peter, Westminster,' dedicated to the queen (1876), a work that cost him 10 years' labor, and which he generously allowed the Harleian Society to issue as one of its publications. He was a founder of this society in 1869, and edited five of its volumes. He was also a member of the Royal Historical Society, and of many other learned societies in England and America. His non-genealogical writings were: 'Greenwood Cemetery, and Other Poems' (1843); 'Treatise on the Law of Repulsion' (1853); 'Educational Laws of Virginia: the Personal Narratives of Mrs. Margaret Douglas' (1854); 'John Rogers, the Compiler of the First Authorized English Bible, the Pioneer of the English Reformation, and its First Martyr' (1861), a work of great industry and research.

Chester, England, an ancient and episcopal city, the capital of the county of Cheshire, 16 miles southeast of Liverpool. The two main streets cross each other at right angles, and were cut out of the rock by the Romans four to ten feet below the level of the houses. The houses in these streets were curiously arranged; the front parts of their second stories, as far back as 16 feet, form a continuous paved promenade or covered gallery, open in front, where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. St. John's Church, now partially in ruins, is supposed to have been founded by Ethelred in 698. Chester still preserves its old walls, two miles in extent, and the gateways have been rebuilt during the last century. Pop. (1901) 36,281.

Chester, Pa., a city and port of entry of Delaware County, on the Delaware River, and the Philadelphia, Wilmington & Baltimore, the Baltimore & Ohio, and the Philadelphia & Reading R.R.'s, 15 miles south of Philadelphia. The favorable location and excellent shipping facilities of the city have given it a diversity of industries.

Business Interests.— Chester is the local trade centre of a very prosperous agricultural and manufacturing district. It is the site of the Roach ship yards, where several vessels of the United States navy have been built. According to the Federal census of 1900 Chester

had 315 manufactories, employing $18,977,710 capital and 7,682 hands, and having annual products to the value of $16,421,725. The principal industries were ship-building, foundry and machine-shop work, and the manufacture of cotton, woolen, and worsted goods. In 1900 there were three national banks with $700,000 capital and a surplus of $575,000, several private banking houses, daily and weekly newspapers, and an assessed property valuation of $42,000,000.

Public Interests.— Chester is connected with Media, Darby, and other surrounding towns by electric railways. It is the seat of the Pennsylvania Military College and Crozier Theological Seminary, and Swarthmore College is near-by. The notable buildings are the United States Government Building, including the post-office; the city hall, erected in 1724, of great historic interest; Chester and Homœpathic hospitals, and the public library. Besides the educational institutions mentioned, there were at the close of the school year 1897–8, 23 public schools, with 125 teachers and 5,446 pupils, and public school property valued at $500,000; a public high school, and Chester Academy.

History.— Chester was settled by the Swedes in 1643, under the name of Upland, and is the oldest town in the State. It was incorporated in 1866. Pop. (1900) 33,988.

Chester, S. C., capital of Chester County, on the Cheraw & Chester, the Chester & Lenoir, and the Seaboard Air Line R.R.'s, 65 miles north-northwest of Columbia. It is a trade centre, cotton is the chief shipping product. Pop. (1900) 4,080.

Chester Stage, the youngest of the limestones laid down in the interior sea that covered, in Lower Carboniferous or Mississippian time, much of what is now the Mississippi valley. Limestones of this stage are found in Texas, Arkansas, Kentucky, Tennessee, and Alabama, and in places reach a thickness of 600 feet. Some of the Lower Carboniferous limestones of West Virginia correspond in age to the Chester. The characteristic fossils include several genera of lamellibranchs and brachiopods. See CARBONIFEROUS; (*Mississippian.*)

Ches'terfield, Philip Dormer Stanhope, 4th EARL OF, English statesman and orator: b. London 22 Sept. 1694; d. 24 March 1773. On the accession of George I. Gen. Stanhope, his great-uncle, procured him the place of gentleman of the bed-chamber to the Prince of Wales; and the borough of St. German, in Cornwall, elected him to Parliament, though he had not yet attained the legal age. He soon acquired distinction as a speaker, which he maintained also in the Upper House after his father's death in 1726. In 1728 he was appointed ambassador to Holland, and succeeded in delivering Hanover from the calamities of the war by which it was threatened. He was afterward, in 1744, appointed lord-lieutenant of Ireland, and on his return in 1746 received the place of secretary of state; but in 1748 retired from public affairs, and devoted the remainder of his life almost entirely to study and the society of his friends. His talents as an author were displayed in several moral, critical, and humorous essays, in his parliamentary speeches, which were printed at a later period, and particularly in a collection of 'Letters to his Son' (1774), which have become famous. To the charms of wit and grace he united good sense, a thorough knowledge of the manners, customs, and the political condition of Europe, and a polished style. The moral tone of his letters, however, is low. One is shocked to hear a father recommending to his son grace of manners as the most essential quality for a man of the world, and even instigating him to licentious irregularities. Another series of letters addressed to his godson, and published in 1889, show Chesterfield in a more favorable light.

Chesterfield's Letters to His Son. (1774.) These were not written for publication, but were intended by Chesterfield to aid in training his son and forming his character; and were first given to the public after the Earl's death. Begun when the boy was but seven years old, the earlier ones are filled with rudimentary instruction regarding history, mythology, and the use of good language; later follows what has been called «a charming course of worldly education,» in which mingle philosophical truths, political sophistries, petty details regarding wearing apparel, and so on. Almost every page contains some happy observation or clever precept worthy to be remembered. The letters show evidences of the lax morality of the times; but are remarkable for choice of imagery, taste, urbanity, and graceful irony.

Chesterfield, England, a town in Derbyshire, on the Midland Railway, 24 miles north of Derby. It has a large market-place and five principal streets, and is irregularly but substantially built. Among its public buildings are a large parish church, noteworthy for its crooked wooden spire 250 feet high, a commodious townhouse, guild-hall, grammar-school, the Stephenson Memorial Hall, and the Chesterfield Institute. The principal manufactures are ginghams, lace, earthenware, leather, etc., but a majority of the working people are employed in connection with the collieries, iron-mines, quarries, and blast-furnaces of the vicinity. There are also iron-foundries, corn-mills, and engine-works. Mrs. Radcliffe, the celebrated romance-writer, was born at Chesterfield, and a branch of the Stanhope family takes the title of earl from it. Pop. (1891) 22,009; (1901) 27,185.

Chesterfield Inlet, Dominion of Canada, an inlet of Hudson Bay, 250 miles long, and 25 miles across at its widest part. It receives the waters of several rivers, and contains numerous small islands.

Ches'terton, Gilbert K., English author: b. London. He has published 'Wild Knight and Other Poems'; 'The Defendant'; 'Carlyle' (1903); 'Browning' (1903).

Chesterton, George Laval, English sporting journalist: b. London 20 July 1856. He entered a newspaper office in Exeter at 14, was bandsman in the Third Dragoon Guards, 1875–8, special correspondent to the London *Morning Advertiser* from Bechuanaland, 1884–5, and since 1892 has been sporting correspondent to the *Morning Advertiser* over the signature «Arion.» He has published: 'Racecourse Reminiscences'; 'Racing Reflections'; 'Won by a Head.'

Chestnut, chĕs'nŭt, a genus of trees, and shrubs (*Castanea*) of the natural order *Cupu-*

liferæ. The species are characterized by long male catkins and bristly ovaries (burs) which contain rounded nuts. Three species are of wide economic use, their wood being used for many purposes, their bark for tanning, and their nuts for food. In America the most important species is the common chestnut (*C. americana*, by some writers considered a variety of *C. sativa*), which is a tall spreading tree often attaining a height of 100 feet and a girth of 10 or more feet in the forests, which are usually upon high gravelly or sandy land or mountain sides where clay and limestone are absent or in but slight evidence. Its range is from New England to the high lands of Alabama and westward to southern Michigan. During the closing half of the 19th century this species attracted the attention of horticulturists, who have produced about a score of improved varieties worthy of being cultivated for their nuts. The Japanese chestnut (*C. crenata*, by some botanists considered a variety of *C. sativa*), has long been cultivated for its large nuts, which are produced by very young trees and are highly prized for food. The trees are rather dwarf, compact and symmetrical, and free from the attacks of blights, qualities which, together with their ease of propagation, have commended them to orchardists throughout the world. During the closing years of the 19th century it came into prominence in America. The European chestnut (*C. sativa*) a native of southern Europe, northern Africa, and western Asia, is a large tree which forms great forests throughout its range. Its nuts are probably more widely used as food than those of either of the other species, being a principal article of diet in the western countries bordering the Mediterranean Sea. In America it has become popular with orchardists on account of its large nuts. Of the three species the American produces the finest-flavored nuts, but they are generally much smaller than those of the other two species.

Two other American species are valued for their nuts. The tree or common chinquapin (*C. pumila*), which is usually less than 10 feet tall, but occasionally attains a height of 30 feet or even more, is found from Pennsylvania to Florida and westward to Indiana and Texas. The bush chinquapin (*C. alnifolia*, considered by some botanists a variety of *C. pumila*) rarely attains a height of five feet. It is found in the South Atlantic States and westward to Arkansas. Both these species bear small ovoid pointed nuts about half the size of ordinary American chestnuts. They are as yet little cultivated and have produced few varieties.

The various species and their varieties are readily propagated from seed. The seedlings are, however, generally grafted to choice varieties, and when the grafted plants are one or two years old they are set in orchards and cultivated like other fruits or are allowed to care for themselves. In places where chestnuts grow naturally, the sprouts which arise from the stumps of felled trees are often grafted with European or Japanese varieties, and the land pastured with sheep. The principal enemy of the chestnut is the weevil, a beetle which lays its eggs in the young nuts and destroys them or injures them so much as to prohibit their sale when mature. No satisfactory remedy or preventive has yet been discovered.

Chestnuts are eaten raw, boiled, or baked, or are used in many culinary preparations such as dressings. They are often dried and ground into flour, which is used like wheat flour in bread- and cake-making. Sometimes they are used for making confectionery. Fresh chestnuts have the following average percentage composition: Water, 45.0; carbohydrates (principally starch), 42.1; protein, 6.2; fat, 5.4; ash, 1.3.

Chesuncook (chē-sŭn'kŭk) **Lake** is in Piscataquis County, Maine. It is really an expansion of the Penobscot River, is 20 miles long, and 2,500 feet above sea level.

Chettik, chĕt'ĭk, a tree of Java, the Strychnos Tieute, yielding a very virulent poison called by the same name, more powerful than that obtained from the upas-tree, and owing its virulence to the strychnine it contains.

Chet'tle, Henry, English dramatist and pamphleteer; d. about 1607. He was editor of Greene's 'Groat'sworth of Wit' (1592), wrote 13 plays of considerable merit, and was part author of 35 others; including 'Robin Hood' in two parts; 'Patient Grisel'; 'The Blind Beggar of Bethnal Green'; and 'Jane Shore.' In Mere's 'Palladis Tamia' (1598) he is mentioned as one of the "best for comedy amongst us." Of his other works, his 'Kind-Hart's Dreame' (1593?), and 'Englande's Mourning Garment' (1603), are of interest, the former as containing an apology undoubtedly intended for Shakespeare as one of those whom Greene had attacked; the latter, a stanza supposed to be addressed to Shakespeare as "silver-tongued Melicert."

Cheval, shĕ-văl, **A** (French, from the word meaning horse), on horseback, astride any object. In a military sense, a body of troops is said to be *à cheval* of a river, if one wing is stationed on the right and the other on the left bank.

Chevalier, shĕ-vä-lē-ā, **Albert,** English comedian: b. 21 March 1861. He is of Italian, French and Welsh blood. His first appearance was at the age of eight. For many years he was associated on the stage with the Kendals, John Hare, etc. For four years he appeared in music halls, then he came into vogue as a drawing-room entertainer with his coster ballads. He has made tours in England and America and has given 1,000 recitals at Queen's Hall, London. Besides 100 sketches, monologues and plays, he has written, 'Before I Forget.'

Chevalier, Michel, mē-shĕl, French economist: b. Limoges 13 Jan. 1806; d. Montpellier 28 Nov. 1879. He was educated as an engineer in the School of Mines, joined the Saint Simonians, and suffered six months' imprisonment for promulgating the free doctrines of Père Enfantin's party. On his liberation he renounced his extreme doctrines, and was sent to the United States and to England on special missions. He became a councilor of state (1838), professor of political economy in the Collège de France (1840), member of the chamber of deputies (1846), and member of the Institute (1851). He published 'Letters on North America' (1836); 'On the Materials of Interest in France'; 'Essays on Industrial Politics'; 'Course in Political Economy'; 'His-

tory and Description of the Ways of Communication in the United States' (1840–2); 'Mexico: Ancient and Modern' (1863). He was known as a strong advocate of free-trade, and as a specialist on questions of currency. With Cobden and Bright he had a great part in the commercial treaty of 1860 between France and Great Britain.

Chevalier, shĕ-vä-lē-ā or shĕv-ạ-lēr', an honorary title given, especially in the 18th century, to younger sons of French noble families. Brought up in comparative luxury, and left at the death of their fathers almost entirely unprovided for, these men generally lived at the expense of others, as a sort of aristocratic parasites, even when they did not prefer recourse to such less honorable means of livelihood as gave occasion to the synonym for swindler, *chevalier d'industrie.* In the plays of the 18th century the chevalier is a constant figure. Both the Old and Young Pretender were each called the Chevalier by their partisans. The word is at present often used with its old meaning, and a chevalier may mean a man of honor.

Chevaux de Frise, shė-vō-dė-frēz (Friesland horses, so called because first used at the siege of Groningen, in that province, in 1658), armed beams of square timber or iron used to defend the fronts of camps, breaches, etc. They are usually from 15 to 18 feet long, and connected by chains, each being perforated with small holes to receive rods of wood or iron, pointed at their extremities, and when moved in any direction making a sort of hedge of spears.

Cheverus, shĕ-vrūs, **Jean Louis Anne Madleine Lefebvre de,** lė-fāvr dė, French bishop and cardinal of the Roman Catholic Church: b. Mayenne, France, 28 Jan. 1768; d. Bordeaux 19 July 1836. He was destined for the Church and at the early age of 12 years received the clerical tonsure: he was ordained priest in 1790. Refusing to take the constitutional oath regarding the clergy he was imprisoned at Paris as contumacious in 1792, but escaped to England. There he soon acquired the English language and engaged in missionary work, but in 1796 came to Boston, Mass., where he was soon in high repute for his kindly Christian demeanor and his graceful and winning pulpit eloquence. In an epidemic of yellow fever in the city he won the hearts of all men by his heroic self devotion in ministering bodily and spiritually to the stricken. Learning of the spiritual destitution of the Catholic Abenaki Indians on the Penobscot and the Passamaquoddy in Maine, he began the study of their language, and having attained some proficiency in it he visited their settlements and remained among them at his first visit three months; and every year thereafter he repeated his visit to them, built them a church, and procured for them a missionary priest, who thereafter till his death, 20 years later, devoted himself to their spiritual care. On the occasion of a visit of President John Adams to Boston, the two seats of honor at a public banquet were reserved for the chief magistrate and the priest. Mr. Adams' name headed the list of names of subscribers to a fund to erect a church for Cheverus' congregation. In 1810 he was consecrated bishop of Boston and entered on the duties of the episcopate with a zeal and industry that taxed his strength to the utmost, and his physicians in 1823 counseled his return to his native land. There the French king, Charles X., named him to be bishop of Montauban, and in this new field his religious and charitable zeal was not relaxed: on the occasion of a disastrous flood he harbored in his episcopal residence 300 destitute people. In 1826 he was made bishop of Bordeaux and a peer of France by King Charles X. Here in a visitation of cholera he placarded his episcopal palace as a *maison de sécours* or dispensary. At the instance of King Louis Philippe the Pope, Pius VII., in 1836 created him a cardinal. See Life, by Huen-Dubourg (1837).

Cheves, chēvz, **Langdon,** American statesman: b. Rocky River, S. C., 17 Sept. 1776; d. Columbia, S. C., 25 June 1857. He began to study law at the age of 18, entered upon his profession with superior natural qualifications and after severe discipline, he rapidly attained eminence and wealth in its practice. He was a representative in the national congress before and during the War of 1812, and was a zealous supporter of the party which carried the declaration of war. He was chairman of the Naval Committee in 1812, and of the Committee on Ways and Means in 1813, and constantly opposed the restrictive system. When Henry Clay was sent as commissioner to Ghent, Cheves succeeded him as speaker of the House. He retained this office till 1815, and not one of his decisions was reversed by the House. The bill for the recharter of the United States bank in 1815 was lost by his vote. The national bank having been rechartered in 1816, that institution under injudicious management had become hard pressed and was on the verge of stoppage in 1819, when Cheves was elected president of its board of directors. By a rigorous system of retrenchment, and by making credits only upon sufficient securities, the bank was saved, and specie payments maintained at the principal centres of commerce; but the public clamor increased against the power of an institution charged with subjecting to itself all the monetary concerns of the country, and even the national treasury. Resigning this arduous office after three years, he became chief commissioner under the treaty of Ghent for settling some of its provisions. He returned to South Carolina, concentrated his labors upon his plantation, and though retaining his interest in public affairs, declined to accept any further public office.

Chevet, shĕ-vā, a variety of the apse, almost exclusively confined to French Gothic churches. The extreme end of the chancel or choir is called the chevet.

Cheviot (chĕv'ĭ-ŭt) **Hills,** a range on the borders of England and Scotland, stretching southwest to northeast for above 35 miles. Their culminating point, known specially as the Cheviot, has a height of 2,676 feet; Carter Fell, the next in height, is a little more than 2,000 feet high. They are clothed for the most part with a close green sward, and are pastured

by a celebrated breed of sheep admirably adapted for hilly districts, and known in many of the more elevated districts of Great Britain.

Cheviot Sheep, a breed of sheep of large carcass and valuable fleece, which has been pastured from time immemorial on the Cheviot Hills, on the borders of England and Scotland, and from its powers of endurance is justly regarded as the most valuable mountain sheep of Great Britain. The peculiar features of the Cheviots are the absence of horns in both sexes; white or mottled-gray face and legs, an erect, long, and clean head, destitute of wool, while both the throat and neck are well covered, long open ears well covered with hair, and altogether a fine open sprightly countenance, with every indication of hardiness. The fleece weighs from three to four pounds, and the weight of the carcass varies in ewes from 12 to 16, and in wethers from 16 to 20 pounds per quarter. The Cheviots, though originally confined to a small area, are now spread over all parts of the kingdom, and except on the most barren and stony grazings, are far more profitable than the heath breed.

Chevreul, Michel-Eugène, mē-shĕl ė-zhān shė-vrėl, French chemist: b. Angers 31 Aug. 1786; d. Paris 9 April 1889. He was educated in his native town, and when a youth went to Paris, and was employed in the chemical factory of Vauquelin. In 1813 he became professor of physical science in the Charlemagne Lyceum; in 1824 he was made director of dyeing in the carpet manufactory of the Gobelins; and in 1830 succeeded Vauquelin in the chair of chemistry at the Museum of Natural History. He was the author of 'Lectures on Chemistry Applied to the Art of Dyeing' (1831) and other treatises on chemistry and dyeing, and an important work on the 'Principles of Harmony and Contrast of Colors,' 1839, which has been translated into English. He was a commander of the Legion of Honor, and the centenary of his birth was celebrated in Paris with much enthusiasm.

Chevreuse, chėv-rėz, **Marie de Rohan Montbazon,** môń-bä-zôń, DUCHESS DE, French political adventuress: b. December 1600; d. Gagny, near Paris, 12 Aug. 1679. When scarcely 17 years old, she married Charles d'Albert, grand constable of France, then a favorite of Louis XIII., who died four years afterward. She next became the wife of Claude de Lorraine, Duke of Chevreuse. A great friend of Anne of Austria, she incurred the hatred of Richelieu, and succeeded so well in making herself obnoxious to him, that he determined to have her arrested; but, made aware of his project, she assumed man's attire, crossed the Somme by swimming, and fled to England. For years she was an exile from France, and King Louis XIII. had been inspired by his minister with such fear of her uncontrollable spirit and cunning, that in his will he forbade her return to France. In spite of this, Anne allowed her to return, without, however, showing her the same degree of confidence as before, and the queen's coldness induced the duchess again to leave the court. Afterward she engaged in new plots against Mazarin, mostly acting in concert with Cardinal de Retz, and was once more compelled to leave France. Her intriguing spirit outlived her beauty, which had so much contributed to her former successes. She wandered through the Netherlands, Germany, and England, still persisting in plotting against her enemies.

Chevron, shĕv'rŭn, a bent bar, rafter-shaped, in heraldry. A chevron is, according to some, a third, and, according to others, a fifth of the field. A chevronel is half a chevron, and the couple close the fourth of the shield. A chevron couped is that which does not reach the sides of the escutcheon. A chevron in chief is one which rises to the top of the shield. In architecture a chevron is a zigzag molding, characteristic of Norman work.

Chevrotains, shĕv'rō tānz, a family (*Tragulidæ*) of ungulates, which though ruminant, in the general sense, differ in many respects from true deer; they resemble the true *Cervidæ* in certain minor peculiarities, and the musk-deer in others; but anatomically they are, in the main, distinct, especially in such of the more important characteristics as make naturalists class them by themselves. The chevrotains are divided into two genera, one African, and the other Asiatic, the latter genus (*Tragulus*) being that of the true chevrotains. These form a group of diminutive, hornless, deerlike animals, standing only about 12 inches high, found in southern India, Ceylon, and the Malayan peninsula. They are usually reddish, tawny, or mouse-grey in color, except the Indian mouse-deer (*Tragulus memminna*), which is flecked with white. The "water-deer" of western Africa is a kindred species, as is also the species found in the Philippines. Wherever found, these animals are sly little creatures, with a peculiarly stiff manner of walking, and given to hiding in thickets and inaccessible crags. They may, however, be readily tamed. They are considered as a survival of the Miocene form to which is also attributed the ancestry of the deer.

Chevy Chase, chĕv'ĭ chās, the name of a celebrated border ballad probably founded on some actual encounter occurring between Percy and Douglas, although the incidents mentioned in it are not historical. It is this ballad that Sir Philip Sydney speaks of when he says, in his 'Defense of Poetry,' "I never heard the old song of Percie and Douglas that I found not my heart moved more than with a trumpet"; and which is made the subject of a critique by Addison in Nos. 70 and 74 of the 'Spectator.' On account of the similarity of the incidents in this ballad to those of 'The Battle of Otterbourne,' the two ballads have often been confounded; but the probability is that if any historical event is celebrated at all in the ballad of Chevy Chase, it is different from that celebrated in 'The Battle of Otterbourne,' and that the similarity is to be explained by supposing that the incidents were borrowed.

There are two versions of the ballad bearing the name of Chevy Chase, an older one and a more modern one. The older version is sometimes called the 'Hunting of the Cheviot,' which is its original title. It begins thus:

"The Persè owt of Northombarlande,
And a vowe to God mayd he,
That he wolde hunte in the mountayns
Off Chyviat within dayes thre,
In the mauger of doughtè Dogles,
And all that ever with him be."

Neither the exact age nor the name of the author of this version is known. From the fact that it is mentioned in the 'Complaynt of Scotland,' written in 1548, where it is called the 'Huntis of the Chevot,' it is clear that it was known in Scotland before that time, and since James of Scotland is mentioned in the ballad, it may be inferred that it was not written before the reign of Henry VI., for James I. did not ascend the throne of Scotland till two years after Henry VI. had become king of England. As for the author, it is true that a manuscript of the ballad contained in the Ashmolean collection at Oxford is subscribed by one Rychard Sheale, but it is likely that this Rychard Sheale was merely one who had frequently recited the ballad, and perhaps the person who committed this old version to paper. This is probably the version with which Sir Philip Sydney was acquainted, since he speaks of it as "evil apparelled in the dust and cobweb of an uncivil age."

The age of the more modern version is no better known than that of the older one, but it is said by Dr. Rimbault to be no later than the reign of Charles II. This is the version which forms the subject of the critique by Addison in the above-mentioned numbers of the 'Spectator.' The following is the opening stanza as given in Percy's 'Reliques':

> "God prosper long our noble king,
> Our lives and safetyes all;
> A woefull hunting once there did
> In Chevy-Chace befall."

Chew, Benjamin, American jurist: b. 29 Nov. 1722; d. 20 Jan. 1810. He studied law in Philadelphia under Andrew Hamilton, and in London. He began the practice of his profession in Philadelphia in 1745; and held a number of public offices, becoming chief justice of the State in 1774. In 1776 after the adoption of the Declaration of Independence, he took a decided stand against the patriot cause, and was imprisoned at Fredericksburg, Va., because he refused to sign parole. In 1790 he became president of the high court of errors and appeals, a position which he held until the court was abolished in 1806. He lived in Germantown in a large stone house which is still standing and shows the marks of the cannonading it received during the battle of Germantown, when a party of British took refuge there and were fired upon by the American artillery. See GERMANTOWN, BATTLE OF.

Chewing-gum, a resinous gum used as a masticatory. The habit of chewing gum is perhaps peculiar to the United States. At first the resinous exudations of the spruce, cherry, etc., were employed in their native state; but with the increase of the habit the spruce supply nearly failed, and recourse was had to other ingredients. Of late years a gum known as chicle (q.v.) has come to the front as the foundation of most of the chewing-gum. The chicle gum is chopped into fine particles, dried, and then cooked in steam-jacketed kettles. At this stage sweetening and flavoring ingredients are added to the mass, which is mixed mechanically. The resulting "dough" is then kneaded on a table and rolled between rollers having knives set into their faces. These knives cut the sheets into suitable sizes for the market, and, after drying, the sticks are wrapped, packed, and shipped.

Chewink'. See TOWHEE BUNTING.

Cheyenne, shī-ĕn (Sioux, "red," i. e. foreigners = enemies: their own name = "ours"), an important Indian tribe of the great Algonquin stock, and its westernmost member except the Blackfeet. In the 18th century they lived on the Sheyenne River in eastern North Dakota, but were gradually driven southwest by the Sioux to the forks of the Big Cheyenne near the Black Hills, where Lewis and Clark found them in 1803. Originally settled agriculturists, their acquisition of horses turned them, like the other plains Indians, into nomad raiders and led to their foraying even to Mexico, and claiming lands as far apart as the upper Missouri in northern Montana, and the forks of the Platte, though they numbered but little over 3,000. The first United States treaty with them was made in 1825 in the former locality. They had already fraternized with the Sioux; and when their location at the Black Hills grew unsatisfactory, one section (the "Northern Cheyenne") joined the Ogallalla Sioux in driving the Crows from the Powder and Tongue river valleys in southeast Montana, while the remainder (the "Southern Cheyenne") moved south and formed a confederacy with their Algonquin kinsmen, the Arapaho, on the Arkansas. In 1851 a treaty was made with the Northern band at Fort Laramie, on the North Platte, to cut roads through their lands. A number of treaties were made with the Southern, but it is alleged that the commissioners neither made them intelligible nor executed them fairly; the Cheyenne, with their Indian allies, committed the usual atrocities which were their one method of retaliation; the settlers clamored for their extermination; the military desired to cow them by heavy punishments; the Indian department blamed both and wished peace. The Indian commissioner in 1864 sent some 400 Cheyenne and Arapaho to a camp at Sand Creek, Col.; Col. Chivington fell upon them 29 November (see SAND CREEK MASSACRE), and butchered 131 men, women, and children. A bloody and costly war followed; the next year the tribe consented to go upon a reservation, except a band called the "Dog Soldiers," who held out. In 1867 Hancock burned their village at Pawnee Fork, and another war with them began. On 27 Nov. 1871, Custer inflicted a crushing defeat upon them at the Washita in Indian Territory, killing Black Kettle, their chief, and compelling them to return to their reservation. The Northern band all this time remained peaceful, despite urgent solicitations from their brethren and the Sioux. Fresh treaties were made in 1866 and 1868. In 1900 the Northern Cheyenne numbered 1,357, on a reservation in the Tongue River valley, Custer County, Mont., and were increasing. The Southern Cheyenne are united with the Arapaho, in Oklahoma; their reservation was on the Canadian River, near Elreno, but was opened up in 1892. They number about 2,100, and are governed by a council of five chiefs. The Cheyenne are a tall, finely built race, the best physically of all the plains Indians except the Osages; but rather dull intellectually. Their language is one of the most difficult even of Indian tongues.

Cheyenne, Wyo., city and capital of the State, and county-seat of Laramie County; on the Union Pacific, Denver & Gulf, and Burling-

ton Route R.R.'s, 150 miles north of Denver. Cheyenne is situated on a plateau 6,075 feet above the sea and contains Fort Russell, a United States military post, and the main repair shops of the Union P. R.R. It has a fine State House, waterworks, electric lights, a public library, high school, and two national banks, and is the great beef growing centre, the shipping point for beef-cattle to eastern markets, and the supply depot for a large amount of the trade of the Rocky Mountain region. Pop. (1900) 14,087.

Cheyne, chān, **George,** Scotch physician: b. Methlick, Aberdeenshire, 1671; d. Bath, England, 13 April 1743. He started a London practice in 1702, in which year he was elected a Fellow of the Royal Society. Full living made him enormously fat, as well as asthmatic, but from a strict adherence to a milk and vegetable diet he derived so much benefit that he recommended it in all the later of his dozen medical treatises, which included 'A New Theory of Fevers' (1701); 'Philosophical Principles of Natural Religion' (1705); 'Essay of Health and Long Life' (1725); and the 'English Malady, a Treatise on Nervous Disorders' (1733).

Cheyne, Thomas Kelly, English biblical scholar: b. London 18 Sept. 1841. He was educated at Merchant Taylors' School, Worcester College, Oxford, and Göttingen. In 1868 he was elected Fellow of Balliol College, from 1880 till 1885 he was rector of Tendring in Essex. In the latter year he was appointed to the Oriel professorship of the interpretation of Scripture at Oxford, also becoming canon of Rochester. He edited the Old Testament portion of the Variorum Bible for Messrs. Eyre and Spottiswoode, and in 1884 became a member of the Old Testament Revision Company. His numerous works deal exclusively with the exposition and criticism of the Old Testament books. They include: 'Notes and Criticisms on the Hebrew Text of Isaiah' (1868); 'The Book of Isaiah Chronologically Arranged' (1870); 'The Prophecies of Isaiah' (1880–1, new ed. 1884); 'The Book of Psalms Translated' (1884); 'Job and Solomon' (1887); 'The Book of Psalms or Praises of Israel' (1888); 'Jeremiah: his Life and Times' (1888); 'The Hallowing of Criticism' (1888); 'The Origin and Religious Contents of the Psalter' (1891); 'Founders of Old Testament Criticism' (1893); 'Introduction to the Book of Isaiah' (1895); 'Religious Thought and Life Among the Hebrews' (1898); 'Isaiah, Critically Revised' (1897–9); 'The Christian Use of the Psalms' (1899). He has also written many articles on similar subjects in various periodicals, and is joint editor of the 'Encyclopædia Biblica.' Canon Cheyne's works reveal a scholarly and able attempt to reconcile the views of the advanced critics of the Bible with those belonging to the evangelical school.

Cheyne, William Watson, English surgeon. He was educated at Edinburgh University and was Hunterian professor of the Royal College of Surgeons of England, 1888–90. He has published: 'Antiseptic Surgery: its Principles, Practice, History, and Results' (1882); 'Manual of the Antiseptic Treatment of Wounds' (1885); and other important professional works.

Chézy, Antoine Léonard de, äṅ twäṅ lā-ō-när dė shā-zē, French Orientalist: b. Neuilly, France, 15 Jan. 1773; d. there 31 Aug. 1832. He began his studies in the École Polytechnique, and afterward attended the lectures of Andran, Caussin, and Silvestre de Sacy, on Oriental literature. Unassisted, he taught himself Sanskrit, and became such a proficient in it that, in 1814, a chair of Sanskrit was formed expressly for him in the College of France. Among his productions is a free French translation of the Persian poem, Medjnun and Leila. He also published Kalidasa's drama of Sakuntala, in the original, with a translation accompanied with notes (Paris 1830).

Chézy, Wilhelm von, German novelist and historical essayist: b. Paris 21 March 1800; d. Vienna 13 March 1865. He was the son of A. L. Chézy (q.v.). He acquitted himself creditably as a journalist, and wrote many popular tales: 'The Wandering Pupil' (1835); 'The Six Noble Passions' (1842); and 'The Last Janissary' (1853), among them; as well as 'Chivalry in Picture and Word' (1848), a study of much value.

Chézy, Wilhelmine Christiane von Klenck, German poet and novelist: b. Berlin 26 Jan. 1783; d. Geneva, Switzerland, 28 Feb. 1856. She received an excellent education, and was married in her 16th year to a gentleman of the name of Hastfer, from whom she separated about a year after. Madame de Genlis, who had been acquainted with her at Berlin, invited her to Paris, where she shortly afterward became the wife of Antoine Léonard de Chèzy (q.v.), but separating from him as from her former husband, she returned to Germany and engaged in various literary pursuits. She has acquired considerable celebrity by her 'Poems' (1812); 'Heart Notes During a Pilgrimage' (1833); and 'Emma's Ordeal' and other novels, but is perhaps best known as the writer of the libretto of Weber's opera of 'Euryanthe.'

Chhatisgarh, chŭt-tēs-gär', India, the southeast division of the Central Provinces, with an area, including feudatory states, of 25,013 square miles. It is mainly a vast fertile plateau, and has of late become a great centre of the Indian grain trade. Dongargáon is the capital. Pop. 3,545,000.

Chi-Li, chē-'lē', or **Pe-Chi-Li,** one of the provinces of China proper. It has an area of 57,800 square miles and is bounded north by Mongolia, east by the gulf called Pe-Chi-Li, and the province of Shan-Tung, and west by the province of Shan-Hsi. In the north there are extensive unworked seams of anthracite, and the southern portions of the province are very fertile, the chief productions being cotton, tobacco, and various cereals. Chi-Li is in many respects the most important of the Chinese provinces, containing as it does the imperial capital, Peking, the treaty port of Tien-Tsin, and the only completed line of railway in the empire. The provincial capital is Pao-Ting-Fu, 80 miles from Peking. The Great Wall runs across the whole of the north part of Chi-Li, while on the coast are the forts of Taku, and the nearest approach to a naval station belonging to the Chinese government. The province is mountainous and traversed by important rivers;

notably the Pei-Ho, the Lan, the Ho-Kien, and the Hu-to. The Yu-Ho is especially important because of its canal system. The climate is at times severe, the Pei-Ho being generally frozen over from December to March. There are Christian missionaries of many denominations throughout the province. The Belgians, the Italians, the English, and the American China Development Company hold important concessions in the province. There is a good system of telegraph lines. The exports are principally bristles, feathers, wool, skins, etc. The railway system open for traffic in 1900 was 290 miles in length, 79 miles from Peking to Tien-Tsin, 27 miles from Tien-Tsin to Tang-Kou (near Taku), 144 miles from Tang-Kou to Shan-hai-Kwan, a point where the Great Wall touches the sea, and an extension of 40 miles beyond toward Manchuria. No census has been taken since 1879 when the population was returned as 17,937,000. In 1900 the population was estimated at 25,000,000, including a large Manchu element. See CHINA.

Chiabrera, Gabriello, gä-brē-ĕl'lō kē-ä-brā'rä, Italian lyric poet: b. Savona 8 June 1552; d. Savona 14 Oct. 1637. Impatient of dependence on the great, he again and again abandoned the courts of noble patrons. He visited Rome, and resided a considerable time at Florence and Genoa, settling finally in his native place. Wherever he went he was loaded with presents and honors. Pindar and Anacreon were his models among the poets, and his countrymen named him "the Italian Pindar," but his Pindaric odes have little grace and force, being labored rather than spontaneous. Some of his little songs after Anacreon are models of elegance and grace. He wrote epic and dramatic poems also. He left a charming autobiographical sketch. His collected poems were published under the title of 'Rime.'

Chian (kī'ăn) **Turpentine,** a greenish-yellow, non-acrid turpentine or resin obtained mainly from the island of Chios (Scio), yielded by *Pistachia terebinthus,* of the order *Anacardiaceæ,* a large tree, native to the Mediterranean islands and shores. The turpentine, now used only in medicine, exudes from the tree in small quantities during the warmer months, but it is obtained at other seasons by making incisions in the bark. It is called also Cyprus turpentine.

Chiana, kē-ä'nä (the ancient *Clanis*), a river of central Italy, originally a tributary of the Tiber, watering a perfectly level valley, which its overflow rendered once the most pestilential district of Italy. The bed was deepened in 1789–1816, and in 1823 extensive hydraulic works were undertaken for further improving the river course, and for leading a north branch, through canals, to the river Arno, a few miles below Arezzo, the south stream reaching the Tiber through the Paglia at Orvieto. The double stream is 60 miles long, and one half to one mile broad; and the district has since become one of the most fruitful in all Italy.

Chianti, kē-ăn'tĭ, a district in Italy, near Siena, where what is now the best-known red wine of Italy is produced. Chianti wine is full flavored and astringent, with an alcoholic strength of about 20 per cent.

Chiapas, chē-ä'pas, a state of the republic of Mexico, on the Pacific slope, having an area of 27,111 square miles. The capital is Tuxtla-Gutiérrez. The state is in many parts mountainous, and is also in many parts traversed by fine streams, including the Rio Chiapas. At Palenque are the ruins of an ancient Aztec city of great beauty and magnitude. The valleys have a rich soil and produce maize, sugar, cotton, etc. There is a considerable export of logwood. Trade is, however, in a backward state for lack of roads. Education is free and compulsory, but the law is not strictly enforced. The state forms part of the Central American tableland, and has a fine climate, although the whole region is largely clothed in primeval forests. Pop. 364,000.

Chiari, Pietro, pē-ä'trō kē-ä'rē, Italian novelist and comedian: b. Brescia 1700; d. Brescia 1788. After completing his studies he entered the order of Jesuits, but soon changed the monastic for the secular life, and devoted himself solely to letters. He resided at Venice, with the title of poet to the Duke of Modena, and in the space of 10 or 12 years brought more than 60 comedies on the stage. Chiari and Goldoni were rivals, but the public adjudged the palm to the latter. Chiari's dramas in verse fill 10 volumes; those in prose, four.

Chiari (known to the Romans as CLARIUM), Italy, a town in Lombardy, 14 miles west of Brescia. It is well built, has several churches, two convents, an elementary school, a hospital, and a public library. It was formerly fortified, and some of its ancient defenses still exist. It has manufactures of silk, linen, and cotton, and some tanneries. Prince Eugene here defeated the French and Spanish troops, 1 Sept. 1701. Pop. 11,000.

Chiarini, Giuseppe, joo-sĕp'pĕ kē-ä-rē'nē, Italian poet and critic: b. Arezzo 17 Aug. 1833. He is a student of foreign literatures, especially English and German, and has been editor of literary journals. His verse is mostly lyrical, and has been collected under the titles: 'Poems' (1874); 'In Memoriam' (1875); 'Lacrymæ' (1879); etc. It gives proof of deep poetic sensibility. He has translated some of Heine's poems, and has published critical essays on English and German poets.

Chiaroscuro, kē-ăr-ŏs-kū'rō, or **Chiaro-oscuro,** kē-ä-rō- (It. *chiaro,* "clear"; *oscuro,* "obscure"), in painting the art of judiciously distributing the lights and shadows in a picture. A composition, however, perfect in other respects, becomes a picture only by means of the chiaroscuro, which gives faithfulness to the representation, and therefore is of the highest importance for the painter; at the same time it is one of the most difficult branches of an artist's study, because of the want of precise rules for its execution. Every art has a point where rules fail, and genius only can direct. This point in the art of painting is the chiaroscuro. The drawing of a piece may be perfectly correct, the coloring may be brilliant and true, and yet the whole picture remain cold and hard. This we find often the case with the ancient painters before Raphael; and it is one of the great merits of this sublime artist that he left his masters far behind him in chiaroscuro, though he is considered not so perfect in this branch as Correggio and Titian, who were inferior to him in many other respects. The

mode in which the light and shade are distributed on any single object is easily shown by lines supposed to be drawn from the source of the light which is shed over the figure; but chiaroscuro comprehends, besides this, aerial perspective, and the proportional force of colors, by which objects are made to advance or recede from the eye, produce a mutual effect, and form a united and beautiful whole. Chiaroscuro requires great delicacy of conception and skill in execution; and excellence in this branch of art is to be attained only by the study of nature and of the best masters. Chiaroscuro is also understood in another sense, paintings in chiaroscuro being such as are painted in light and shade and reflexes only, without any other color than the local one of the object, as representations of sculpture in stone or marble. There are some fine pieces of this sort in the Vatican, at Rome, by Polidoro da Caravaggio, and on the ceiling of the Paris Bourse by Meynier and Abel de Pujol.

Chiastolite, ki-as'to-līt, a variety of the mineral andalusite, occurring in stout crystals of prismatic aspect, and distinguished by containing carbonaceous impurities that are distributed through the interior according to a geometric scheme, so that a section of the crystal presents a tesselated appearance or shows a distinct cross. Also called "macle." The name "chiastolite" is derived from a Greek word signifying "arranged diagonally."

Chiavari, kē-ä-vä'rē, Italy, a seaport in the compartimento of Liguria, province of Genoa, on the Gulf of Rapallo, 23 miles southeast of Genoa. It has all the appearance of an old Italian town, consisting of narrow streets lined with substantial houses and open arcades. Silks, lace, etc., are manufactured, and fishing and trading are carried on. Pop. 13,000.

Chiavenna, kē-ä-vĕn'nä, Italy, a town on the Mera 38 miles north-northwest of Bergamo, in the province of Sondrio, Lombardy. It stands in a valley in the midst of magnificent scenery on the road to the Splügen, and at the junction of two passes through the Alps, and has an important transit trade. Pop. (1901) 4,788.

Chibchas, chēb'chäs, or **Muyscas,** a tribe of South American Indians who formerly lived east of the Magdalena River, occupying the region from its head waters to the Sierra Nevada de Merida. They were partially civilized and excelled in weaving and pottery making, were skilful goldsmiths and also followed agriculture to a considerable extent. They were ruled by women as well as men in the line of succession, and believed in a Supreme Being, although they worshipped the sun and stars. The Chibchas were conquered in a war with the Spaniards in 1537 and their descendants, who have intermarried with Europeans constitute a large part of the present population of Colombia.

Chibouque, chĭ-book', a long Turkish pipe having generally a wooden stem, an amber mouth-piece, and a clay bowl.

Chica, or **Chicha,** chē'chä, a South American word having several meanings.

1. A species of *Sterculia,* the seeds of which are eaten in Brazil. They are about the size of a pigeon's egg, and have an agreeable taste.

2. A red coloring matter prepared by the Indians on the upper parts of the Orinoco and the Rio Negro from the leaves of a plant native to that region called *Bignonia chica,* and with which they paint their skin, in order to be better able to resist the rays of the sun. It is of a beautiful vermilion color, and, although of a resinous nature, is not liable to become liquid under the influence of heat. It is soluble in alcohol, and stains cotton orange-yellow. It is extracted by boiling the leaves in water, decanting the docoction, and allowing it to settle and cool when a red matter falls down, which is formed into cakes and dried. It is also called *carajuru.*

3. A dance popular among Spanish South Americans. It is said to have been introduced into Spain by the Moors, and to have been the origin of the fandango, which some writers declare to be the chica under a more decent form. It is similar in character to the dance of the Angrismene performed at the festivals of Venus, and still popular among the modern Greeks.

Chica, chē'kä, **Pito,** pē'tō, or **Po'so,** a kind of beer made from maize, in general use in Chile, Peru, and other mountainous regions of South America. It was the national drink of the natives long before the appearance of the Spaniards. The most ordinary method of preparing it is to steep the grains of maize until they begin to sprout, when they are exposed to the sun. The malt thus prepared is then ground, mixed with warm water, and left to ferment. The beer, when ready, has a dark-yellow color and a pleasant and somewhat bitter and sour taste. It is consumed by the Indians in great quantities. In the valleys of the north the Indians chew the malt instead of grinding it. It is then mixed with warm water and other ingredients and allowed to ferment as before. In a short time the beer is ready. When it has been buried for some time in the earth in pitchers it has a violently intoxicating effect. This kind of chica is called *chica mascada,* and is said to be much preferred by good judges to the ordinary sort.

Chicacole, chĭk-a kōl', or **Cicacole,** India, a town in the Ganjam district, Madras Presidency, near the coast, about 567 miles northeast of Madras, notable for its fine muslin manufactures. On two occasions, namely in 1791 and 1866, it suffered much from famine, and in 1876 a flood did considerable damage to the town. Pop. 18,241.

Chicago, Ill., the second city in the Union, is in Cook County, and lies on the southwestern shore of Lake Michigan. The dome of the court-house is in north latitude 41° 53′ 6.2″, and longitude 87° 36′ 1.2″ west. The city has a shore line on the lake of 26 miles, and extends 10 miles inland. The city area, 190.638 square miles, covers a great part of the alluvial plain formed by the Chicago and Calumet rivers. The Chicago River is formed by the junction of two small rivers, the north and south branches, thus dividing the city into three portions commonly known as the North, South, and West sides, respectively. Calumet River is the outlet by which the shallow sheet of water known as Calumet Lake empties into Lake Michigan. The land on which the

city is built is level and lies quite low, the elevation above Lake Michigan being only 25 feet. The two rivers form natural harbors, which have been improved by dredging. The shore of Lake Michigan is broken by few bays or inlets, and harbors are infrequent, and, as a rule, not commodious. Wherever, therefore, a river is found, navigators eagerly use it, so far as its depth permits, as a refuge from the storms of the great lake.

Early History.— In the early days of French exploration it was found that the Indians used the Chicago River as one line of travel by which the Mississippi could be reached. Passing up the river and its south branch, a portage of only four or five miles brought the traveler to the Desplaines River, down which his canoe passed to the Illinois River, and so to the Mississippi. This route seems to have been used by white men for the first time in 1673, when Joliet and Marquette, returning from the Illinois River, were shown by the Indians the Chicago portage. It may be that they descended to Lake Michigan by the Calumet. Père Marquette spent the winter of 1674–5 in a cabin on the south branch of the Chicago River, being unable on account of physical weakness to prosecute his journey to the Illinois villages. It was in the following springtime that the devoted missionary died, while endeavoring to make his way to Mackinac by the east shore of Lake Michigan.

The French seem later to have had a fort at the Chicago portage, although it was probably a mere stockade, and no regular garrison was kept in it. This fort is mentioned by James Logan in his report to the governor of Pennsylvania in 1718, and also in the treaty of Greenville, 1795. However, the Chicago portage was not much used by the French, as they found other routes of travel safer and more convenient.

About the time of the Revolutionary War a colored man from San Domingo, Jean Baptiste Point de Saible (or au Sable), made his way to the Chicago River and established himself there as an Indian trader. Here, about 1777, he built a house of squared logs which may be regarded as the beginning of continuous settlement at Chicago. This house he sold in 1796 to a French trader, who in turn sold it in 1803 to John Kinzie, the first American settler. The house, known as the old Kinzie mansion, stood on the north bank of the river opposite the site on which Fort Dearborn was later built, and was in existence until 1837.

Kinzie was an Indian trader, and no doubt thought the Chicago a convenient centre for his business. He brought his family to his new home in 1804, the same year in which the fort was built, and thereafter continued his residence there until his death (1828).

Fort Dearborn was a mere stockade, with two blockhouses. The quarters for the garrison were enclosed in the stockade. It was situated on the south bank of the river, not far from the lake. At that time the river took a sharp turn to the south just east of the fort, and made its way into the lake over a heavy sandbar not far from what is now the eastern end of Madison Street. The bar was not capable of being crossed by anything larger than a small boat, and the schooner which, in 1804, brought the stores for the garrison had to anchor and land passengers and cargo in boats. The first garrison consisted of one company of infantry (of the First regiment). The site of the fort was on a reservation of six square miles, set aside from the United States in Wayne's treaty with the Indians made at Greenville in 1795.

The settlement at Fort Dearborn made little growth until after the War of 1812. It was far in the wilderness, being reached from Detroit by a trail through the woods, and from Mackinac by lake schooners of which usually two came each year, in spring and fall.

The Massacre of 1812.— In 1812 the second war with Great Britain broke out, and at the outset in the northwest all the advantage lay with the British and their Indian allies. Mackinac was captured, thus securing to the British the control of the upper lakes, and Gen. Hull, in command at Detroit, sent orders that Fort Dearborn should be evacuated, and that the surplus stores should be divided among the Indians. These orders were executed, and on 15 August the garrison, escorting a number of women and children, set out for Detroit by the road which wound along the lake shore. At a point among the sand hills near the eastern end of the present Eighteenth Street the savages attacked in force, and the whole body of whites were captured or destroyed. Two of the women and twelve children were butchered during the fight, and a number of the wounded men were killed afterward. The Indians then burned the fort and divided the plunder.

In 1816, after peace was fully restored, Fort Dearborn was reconstructed on a somewhat larger scale than before, and under protection of its garrison a small village slowly grew up.

Political Jurisdictions.— In the old days of French and British occupation the territory, including the valleys of the Wabash and Illinois rivers, west to the Mississippi and north to Lake Michigan, was commonly known as the "Illinois Country." The main French settlements were at Vincennes, on the Wabash, at Kaskaskia on the river of that name, and at Cahokia and Fort Chartres, on the Mississippi. In 1763, by the Treaty of Paris, the French government yielded to Great Britain all claim to land east of the Mississippi, and thus the Illinois Country became British. By the "Quebec Act" of 1774 — one of the legislative acts of the British government which led to the Revolutionary War — all of the newly acquired land between the Ohio and the Great Lakes was included in the province of Quebec, thus placing it under the arbitrary military government at that time prevailing over Canada.

In 1778 a small army of Virginia troops sent out by Gov. Patrick Henry, under command of Col. George Rogers Clark, seized Kaskaskia and Vincennes, and thus replaced British authority by American throughout the Illinois Country. The treaty of peace of 1783 drew the northern line of the new republic through the Great Lakes, instead of through the Ohio River, as doubtless would have been done had it not been for Clark's victorious expedition, and thus the site of Chicago became finally American and not British. Virginia organized the Illinois Country as a county — the County of Illinois — and under that government it continued from 1778 until the cession of all the northwest by Virginia to the United States, in 1783.

While Clark's expedition determined the exclusion of British authority from the Illinois Country, there remained a dispute as to jurisdiction over it among several of the States. Virginia claimed all the territory between the Ohio, the Mississippi and the lakes, on the ground mainly of conquest. New York claimed the same territory, on the ground of a treaty with the Iroquois, who were asserted to have extended their conquests as far as the Mississippi. Massachusetts and Connecticut claimed, under their original charters, to own all the land between their northern and southern boundary lines of latitude west of New York as far as the Mississippi. Under these various claims Chicago is in territory claimed respectively by Virginia, New York, and Connecticut. The conflicts were settled by acts of cession on the part of the various States to the United States.

After the Virginia act of cession of 1783, the authority of that State was withdrawn from the Illinois Country, and for several years the French villagers were a law unto themselves. In 1787, however, the ordinance for the government of the Northwest Territory was enacted by Congress, and thus the Chicago area came legally into that territory. In 1790 Gov. St. Clair visited Kaskaskia and formed St. Clair County from the southwestern portion of the Illinois Country. The wilderness north of that had practically no white population, and hence no local government was needed. In 1796, however, the County of Wayne was organized, which included Detroit and the Chicago area. It was in this year that the British finally withdrew their garrisons from Detroit, and the new county was named from the victor over the Indians in the campaign of 1794, who also made the Treaty of Greenville in 1795. In 1800 the Indian Territory was organized, in which all the Illinois Country was included, and in 1809 the Illinois Territory was created, including all west of the Wabash River and north to British America. When the boundaries of Wayne County were changed, in 1803, the Chicago area was left out, and it was not included within any county until 1812, when the county of Madison was formed. Under the law of the Territory of Illinois, Chicago was included in Edwards County in 1814, and in Crawford County in 1816. In 1818 Illinois was admitted to the Union as a State. Under the laws of the State Chicago was successively included in Clark County, organized in 1819; in Pike County, 1821; in Fulton County, 1823; in Peoria County, 1825; and finally in Cook County, organized 15 Jan. 1831.

The ordinance of 1787 seemed to indicate that a State in the northern part of the Northwest Territory west of Lake Michigan should have as its southern boundary a line drawn east and west through the southern extremity of that lake, and the bill for the admission of Illinois was originally drawn accordingly. Mr. Nathaniel Pope, delegate in Congress from the territory, however, succeeded in having the bill amended so as to secure the present northern boundary for Illinois. Had this not been done, Chicago would be in the State of Wisconsin.

Origin of the City.— In 1830 Chicago was a hamlet of log houses inhabited by something less than a hundred people. These log houses were nearly all on the North and West sides. The beginning of the city as a prosperous town was due to the Illinois and Michigan canal, authorized by act of Congress in 1827. By this act the State was granted alternate sections of land on both sides of the canal route, and the canal commissioners proceeded to lay out towns and sell lots in order to secure funds. One of these towns was Chicago, at the eastern terminus of the canal, and the lands platted therein were sold in 1830. The town was bounded on the east by State Street, on the north by Kinzie Street, on the west by Desplaines Street, and on the south by Madison Street. Buildings began to be erected and slowly immigration began to come. The early settlement of Illinois had been in its southern counties and was derived mostly from southern States. The new migration, beginning with 1830, came in the main by way of the lakes and was largely from the East, New York and New England being especially represented. In 1833 Congress made an appropriation for a harbor at Chicago. Piers were built out into the lake, a channel was cut through the old sandbar, and the spring freshets sufficed to scour it out. It was in 1834 that, for the first time, a schooner sailed up the river. By 1837 the town had grown to have a population of 4,170, and in that year it was incorporated as a city.

Railroads.— The canal, from which so much was expected, did not prove the wonderful success that was hoped. It was not finished till 1848. Meanwhile, however, railroad construction began and effectively opened up the prairie interior of the State, while the application of steam to navigation made it comparatively easy to transport passengers and freight between Chicago and Buffalo. In 1852 the Michigan Southern and the Michigan Central railways reached Chicago, and others speedily followed in all directions.

Population and Area.—The growth of the new city in population, slow at first, finally became very great. The area was extended also by successive annexations of contiguous territory. The 4,170 people of 1837 became 4,479 in 1840, 28,269 in 1850, 109,206 in 1860, 306,605 in 1870, 503,298 in 1880, 1,105,540 in 1890, and 1,698,575 in 1900. The city area in 1837 was 2.55 square miles. In 1900 the area was 190.638 square miles.

The Great Fire of 1871.—The year 1871 was memorable for the great fire which swept a large part of Chicago from the earth. Beginning at a little before nine o'clock on Sunday evening, 8 October, in a small barn on the West Side, the flames spread through all the three sections of the city, and were not finally extinguished until Monday night, 9 October, at ten o'clock, when a welcome rain fell. The main business and residence portion of the city was devastated. The total area of the burnt district was 2,024 acres, nearly three and a third square miles, and the value of the property destroyed was estimated at $187,000,000. The loss of life can only be conjectured — perhaps it amounted to 300 persons. The destitution which for a time fell upon the city was relieved with lavish generosity from all parts of this country and of Europe.

This appalling disaster did not daunt the people of Chicago. They began at once to rebuild the city and to reconstruct business. While many insurance companies were obliged to suspend, still some $46,000,000 were realized from this source, and fortunately the bank vaults in every instance but one were found to have preserved their contents intact. years the burnt area was again covered with buildings, and of a more solid type than before the fire.

The Columbian Exposition.— In 1892–3 a World's Fair was held in Chicago, to commemorate the discovery of America four centuries before. An act of Congress, passed in the spring of 1890, authorized an international exposition in Chicago as an illustration of the development of the new world which Columbus found, made appropriations for the share of the United States government, and provided for a national commission to supervise the work. In Chicago a corporation was formed under the laws of Illinois, to undertake the practical details. Funds were provided from private subscriptions to the stock of the exposition company, from a loan of $5,000,000 made by the city, the proceeds of which were devoted to the exposition, from a special appropriation by Congress, from gate receipts, and from various concessions. The site was Jackson Park and the Midway Plaisance, an area of 666 acres being included, with a frontage of two miles on Lake Michigan. Buildings were erected on an elaborate scale, and with taste which met wide approval. The great building devoted to manufactures had a ground area of nearly 31 acres, and a floor and gallery space of 44 acres. In the central hall 75,000 people could be seated, while the entire building would seat 300,000. The standing army of Russia might have been drawn up under its roof. The entire cost of the fair was estimated at upward of $43,000,000. The number of paid admissions throughout the six months from May to November was 21,500,000, the whole number of admissions being 27,529,401.

Chicago and the Federal Government.— In Chicago are held United States courts as follows: The Circuit Court of Appeals, and the Circuit Court of the seventh judicial circuit, and the District Court of the northern district of Illinois. Pending the erection of the new United States federal building, now nearing completion, the courts are held in leased rooms.

The Chicago post-office includes the central office, 47 carrier stations, 4 stations without carriers, and 200 sub-stations. There are 1,633 clerks in the main office and stations, and 1,400 carriers and collectors. The receipts for the year 1902 were $9,175,895.88. During the same period the pieces of mail handled numbered 457,382,116 first-class, and 216,901,206 second-class, of 49,090 tons weight.

By the apportionment under the census of 1900 Illinois has 25 representatives in Congress. Six of the Illinois congressional districts lie wholly in Chicago, and four more are partly in Chicago.

The port of Chicago showed vessels entered for the year 1902, to be 8,083, with a tonnage of 7,179,053, while the number cleared for the same period was 8,164, with a tonnage of 7,229,342. The receipts of the Chicago custom-house for 1902 were $6,339,889.45. The internal revenue collections for the same period were $8,876,909.33.

Chicago and the Government of Illinois.— The General Assembly of the State of Illinois numbers 51 senators and 153 representatives, one senator and three representatives being elected from each district. Of these districts 14 are wholly and 4 are partly in the city of Chicago.

The Supreme Court of Illinois consists of seven judges elected one in each of seven districts for a term of nine years. Chicago is in the seventh judicial district. The five counties composing that district had in 1900 a total population of 2,013,353, of which Chicago had 1,698,575.

Cook County forms a judicial circuit of the State, and has (in 1903) a Superior Court of 12 members and a Circuit Court of 14 members. These courts have concurrent jurisdiction in law and equity. The members are elected for a term of six years by the voters of the county. The population of Cook County in 1900 was 1,838,735, of whom 1,698,575 were in Chicago.

Three judges of the above courts are designated by the Supreme Court of the State to sit as an appellate court, with appellate jurisdiction over the circuit, superior, and county courts. In like manner three other judges are designated by the same authority to form a branch appellate court.

The Criminal Court of Cook County is formed by judges of the Circuit and Superior courts, who alternate in the duty of holding such court. Cook County also has a County Court and a Probate Court, each consisting of one judge, elected by the people of the county, for a term of four years. All these courts sit in the city of Chicago.

As has been noted, Chicago contains 1,698,575 of the 1,838,735 people of Cook County, or 92.4 per cent. The taxable value of property in Cook County, which, by State law, is one fifth of the assessed full real value, is $433,487,627. The taxable value of property in Chicago is $402,482,319, or 92.8 per cent of that of the county. Moreover, many of the people residing in Cook County outside the limits of Chicago, have their business in the city. From these facts it is plain that Cook County is largely identical with Chicago.

The affairs of the county are administered by a county board of 15 members, elected for a term of three years. Ten are elected in the city and five from that part of the county outside the city. The president of the board is designated by the people at the election for commissioners.

The administrative officers of the county are a treasurer, clerk, sheriff, coroner, recorder, superintendent of schools, State's attorney, county attorney, a civil service commission, a jury commission, a board of assessors, a board of review, and some other officials of minor functions. The county maintains an insane asylum and poor-house, and a county hospital (the last-named being in the city). As the city has no hospital, except one for contagious diseases, the county hospital practically takes the place. Chicago is the county-seat, and hence all the county officials above named have their offices in the city. The administrative officers are in the main elective.

The City Government.— The city is incorporated under the general laws of the State for municipal corporations. The constitution of Illinois forbids special charters for corporations, and the statutes provide in detail a scheme of government for cities.

Local legislation and general administrative oversight are vested in the common council. Each of the 35 wards elects two members, for a

term of two years. One half of the council are chosen each spring. The mayor presides over the council.

The mayor is the administrative head of the city. He is chosen by popular election, also for a term of two years. He has the veto power over all acts of the council, and exerts directive control over the administrative departments. The mayor appoints the heads of departments, subject to the approval of the council. Heads of departments appoint their subordinates, subject to the approval of the mayor. The city treasurer, city clerk, and city attorney are elected by the people. The main administrative departments are those of finance, law, public works, police, fire, health, and education. The departments of health and education are under boards. The others have a single head.

The city budget is made annually by the common council, and the same body levies a tax to meet a great part of the expenses. Water rates provide the cost of water supply, and there is a considerable income from licenses. The sanitary board and the three park boards are permitted by law to levy taxes for their own purposes.

The board of education forms, strictly speaking, a department of the city government. The 21 members are appointed by the mayor, subject to the approval of the common council. Seven are appointed each year for a term of three years. The board, with the common council, levies an annual tax on city property. Such tax may not exceed two per cent on the assessed value of property. The city school tax for the year 1902 yielded $7,397,860.60. Besides this the city school fund received during the same year $331,833.86 from the State, $512,596.41 from interest on investments, and $82,455.94 from miscellaneous sources. The total income of the school board for 1892 amounted to $8,395,791.06.

The public schools offer free education through all grades up to and through the high schools, and the law makes elementary education compulsory. There are 15 high schools, with 356 teachers and an enrollment of 10,920 pupils. There are 235 elementary schools, with 5,021 teachers and 257,472 pupils. Students finishing the high school course are prepared to enter college. There is also a city normal school, with 74 teachers and 521 students, and there are 327 special teachers. The grounds, buildings, and equipments of the schools represent an investment of $34,474,311.33.

The Park System.— The parks of Chicago are under control of three boards, one for each of the three sections of the city. These boards are created under State law, and they are independent of the city government. The members of the Lincoln Park Board, on the North Side, and those of the West Park Board, are appointed by the governor of the State. The members of the South Park Board are appointed by the judges within Cook County. Each park board levies taxes on the property within its park district. The park system forms a girdle around the city, from Lincoln Park, on the lake shore at the north, to Jackson Park, on the lake shore at the south. The various parks are connected by a series of boulevards. The total area of parks and boulevards is 2,111.494 acres (1902). On the lake front between Randolph and Twelfth streets a park is being formed by filling in the submerged land to a distance of 1,200 feet from the existing shore line. This will result in a lakeside park of 203 acres, which is to contain the Field Columbian Museum, as well as the Art Gallery of the Chicago Art Institute. The shore line of this park will be a mile and a quarter. Funds for the parks are obtained by taxes levied by the boards on their respective districts, and by the sale of a limited amount of bonds. By a statute of 1903 park loans to the amount of $5,000,000 were authorized, and in consequence the total park area will presently be doubled.

The Chicago Sanitary District.— The Chicago Sanitary District was authorized by act of the State legislature in 1889, ratified by vote of the people in the same year, and organized in 1890. The water supply of the city is taken from the lake, being pumped into the mains from a series of stations at varying distances from the shore. The city drainage also was of necessity carried into the lake, either directly or by way of the river. Contamination of the water supply it was hoped to avoid by carrying the pumping stations farther into the lake than it was supposed the sewage outflow would go without purification by air and sun. As the city grew, however, it became manifest that the lake water was dangerous to health, and in the end the plan was devised of cutting a canal between the south branch of the Chicago River and the Desplaines River, with a pumping plant capable of turning the water of the south branch into the canal. Then, by connecting all the sewers with the river, it was intended to convert the city drainage into the Desplaines. As all parts of the city could not be included in the new drainage area, and also as a great part of that area must be outside the city limits, a drainage district was created, known as the Chicago Sanitary District. The construction and management of the canal within that district was entrusted to a board of nine commissioners, elected by the people. Funds were provided by bonds of the district and by taxation. The bonds amount to $14,005,000. The total cost of the work has been nearly $40,000,000. Earth was broken 3 Sept. 1892, and the water of the lake was turned into the canal 2 Jan. 1900. Since that date it may be noted that the Chicago River no longer flows into Lake Michigan. Its waters now reach the Mississippi. The Sanitary District as originally created comprised all of Chicago north of Eighty-seventh Street, and some 43 square miles of Cook County outside of Chicago. The assessed value of taxable property in the district is $393,080,042, of which $387,204,282 belong to that portion within the city — a percentage of 98.5. By law the board was authorized to effect loans to the amount of five per cent of the value of the taxable property in the district, provided that the total should not exceed $15,000,000. The tax levy of the district must not exceed one half of one per cent of the assessed value of taxable property in the district.

By a statute of 1903 large additions of territory will be made to the Sanitary District, so as to protect the lake water both north and south of the original area.

The main channel of the canal, from river to river, is 28.5 miles long. The width on the bottom varies from 110 feet to 202 feet, and on the top from 198 feet to 290 feet. The mini-

mum depth of water is 22 feet. It is evident that in the drainage canal is the beginning of a navigable waterway from Lake Michigan to the Mississippi River — including, indeed perhaps two thirds of the work and cost of such waterway.

Public Works.— The city department of public works has charge of the paving, repair, and cleaning of streets and alleys, of the construction and maintenance of sewers, and of the city waterworks. There were in the city 31 Dec. 1902, 2,798.34 miles of streets and 1,375 miles of alleys — a total of 4,173.34 miles. Of these 1,373.01 miles were paved. This is exclusive of the parkways and boulevards under the care of the various park boards, in which there are 101.250 miles of improved driveways. The total mileage of sewers, 1 Jan. 1903, was 1,527.05. Intercepting sewers are now under process of construction for the purpose of diverting the flow of sewage from the lake into the drainage canal.

The pumping stations provided the city during the year 1902 with 130,892,288,020 gallons of water. The mileage of water pipe in use was 1,918.74. Water rates were collected to the amount of $3,225,317.43 — an amount sufficient to cover the cost of the supply.

The City Library.— The Chicago Public Library contains 282,925 volumes. The main library building, on Michigan Avenue between Randolph and Washington streets, is valued at $2,055,550. The income of the Library Board (the members of which are appointed by the mayor), was for 1902, $284,098.08. Of this sum $273,696.69 were derived from taxation, and the remainder from miscellaneous sources. The library maintains branch reading rooms and delivery stations in different parts of the city. The T. B. Blackstone Memorial Branch Library, an Ionic building of granite and marble, with shelving capacity for 25,000 books, is nearing completion, the gift to the city of Mrs. T. B. Blackstone.

The City Corporate.— The city corporate, that is, the city exclusive of the Sanitary and Park corporations and the school board, had a total public revenue for 1902 of $11,055,391.78. Of this sum $5,770,876.97 were derived from taxation, $3,770,735.37 from licenses. The public debt of the city corporate was 31 Dec. 1902, $15,123,000. There were also at that time outstanding water certificates to the amount of $1,000,000.

Institutions of Private Endowment.— The public spirit of Chicago citizens is manifest in many institutions endowed by private munificence for the public good.

The Chicago Art Institute is devoted to maintaining an art gallery and to conducting education in art and architecture. The enrollment of students for 1902–3 was 2,580. The Ryerson Library of Art, a beautiful wing of the main building, contains about 3,000 volumes.

The Newberry Library, on the North Side, has an endowment of $2,500,000, and occupies a building valued at $500,000. The library, used wholly for consultation, has 260,773 books and pamphlets.

The John Crerar Library, on the South Side, has an endowment of $3,400,000. The books, which are confined to branches of science, number 89,210.

The library of the Chicago Law Institute, which has quarters in the County Court-house, numbers 39,830 volumes.

The library of the University of Chicago contains 365,000 volumes.

Higher education is represented by the University of Chicago, by the professional schools of Northwestern University, by the medical schools of the University of Illinois, by the Armour Institute and the Lewis Institute, and by various independent schools of law and medicine.

The University of Chicago (q.v.) opened its doors for instruction in 1892. The buildings are situated on the South Side, fronting on the Midway Plaisance, one of the south parkways. Its assets amount to $17,348,000. The enrollment of students in 1902–3 numbered 4,463. The university consists of colleges of arts, literature, and science, a divinity school, a law school, a medical school, a professional school for teachers, and of various other activities, including a press department, which publishes both books and periodicals.

Northwestern University maintains in the city its schools of law, medicine, pharmacy, and dentistry. The college of liberal arts and the school of music are at Evanston. The entire endowment of the university, including grounds and buildings, amounts to $6,000,000. The total number of students in all departments (1902–3) was 2,731.

The University of Illinois (located at Urbana, Champaign County) has its schools of medicine, dentistry, and pharmacy in Chicago. There were in 1902–3 in these schools 1,039 students.

The Lewis Institute is a polytechnic school, on the West Side. It was opened for instruction in 1895, the endowment at that time amounting to $1,600,000. The enrollment of students for 1902–3 included 1,143 in the day classes and 1,362 in the night classes.

The Armour Institute, on the South Side, is also a polytechnic school. The endowment amounts to $4,500,000, and the enrollment of students, 1902–3, was 1,300.

The Field Columbian Museum (q.v.) is an outcome of the Exposition of 1893. The museum was incorporated in that year, and was at the outset enriched by many of the most valuable exhibits which had been made at the Exposition. The original endowment of $1,250,000 was the gift in large part of one citizen. Large acquisitions have been made, especially in the fields of American ethnology. The collections are at present housed in one of the remaining Exposition buildings, in Jackson Park. Plans are on foot for more adequate provision in the near future. In 1900–1 there were 4,196 students enrolled in the schools of law, medicine, and theology situated in Chicago.

There are 52 hospitals in the city, including the Cook County hospital. Many of these are liberally endowed. There are also 33 free medical dispensaries, 59 asylums, including the Cook County Insane Asylum and the county poor-house, both of which are situated at Dunning, outside the city limits.

Churches.— Religious organizations number some 919 churches and missions. Of these the most numerous are the 70 churches and 14 missions of the Baptists, the 79 churches and 20 missions of the Congregationalists, the 47 churches and 6 missions of the Episcopalians,

the 34 Jewish congregations, the 93 Methodist Episcopal, 69 Lutheran, 56 German Protestant, and 135 Roman Catholic.

Business.— Manufactures and commerce form the basis of Chicago's prosperity. With the development of the West and the extension of railroads the industries of the city have grown to enormous magnitude. The manufactures of iron and steel in South Chicago, the agricultural implement works, and the beef and pork packing, are among the largest. The receipts of live cattle at the Union Stock Yards in 1902 were 2,941,559, of sheep 4,515,716, and of hogs 7,895,238. By far the greater part of these were either consumed in the city or packed and sold abroad. The Chicago elevator warehouses have a capacity of 30,470,000 bushels of grain. The total clearings of the associated banks of Chicago for 1902 were $8,394,872,351.59, and the total balances were $653,199,396.54. The national banks in the city had (25 Nov. 1902) a total capital stock of $24,900,000, and total deposits of $265,136,636. State banks showed (22 Dec. 1902) total deposits of $215,413,008.

The census of 1900 records 19,203 manufacturing establishments. Chicago, with a capital of $534,000,689, an average number of 262,621 wage earners, total wages amounting to $131,065,337, and a product valued at $888,945,311. New York by the same census shows 39,776 establishments, with a capital of $921,876,081, and a product of $1,371,358,468. The third manufacturing city in the Union is Philadelphia, with 15,887 establishments, a capital of $476,529,407, and a product valued at $603,466,526.

HARRY PRATT JUDSON.

Chicago, The, a ship of the U. S. navy, launched 5 Dec. 1885; put out of commission 1 May 1895; remodeled and made into a protected cruiser in 1898. The Chicago was used as a flagship by Admiral John G. Walker until 1895, and visited many foreign countries, among them the shores of the Mediterranean, Brazil, the Argentine Republic, Venezuela, and the principal European ports. The ship originally could make but 14 knots an hour; but with her new engines has increased her speed 5 knots an hour. Her new battery consists of four 8-inch rifles, and 14 rapid-fire 5-inch rifles, with a secondary force of seven 6-pounders, two 1-pounders, two Colts, and one 3-inch field-piece. In time of war the Chicago is intended to serve as a scout, a commerce-destroyer, and a blockader. In 1900–1 she was the flagship of Rear-Admiral Schley's South Atlantic squadron.

Chicago Drainage Canal, a canal intended chiefly for carrying off the sewage of Chicago, but which may be used for commercial purposes. It was begun in September 1892, and was completed in January 1900. The main channel is 29 miles long, extending from Chicago to Lockport on the Illinois River, into which stream it discharges. The cost of the canal was about $45,000,000. See CANALS.

Chichen, chĭ-chān', or **Chichen-Itza,** ē-tzā', Mexico, an ancient ruined city of Yucatan, 18 miles southwest of Valladolid. Its magnificent ruins have a greater appearance of antiquity and are in better preservation than most of the other ruined cities of the same province, which has received much attention from archæologists on account of its remains of a little known people in a state of considerable civilization. Here have been studied the most interesting and important remains of the Mayan tribe of Itza. Among the ruins of the ancient city is a pyramid 550 feet square at the base; a vast building, supposed to be a temple, with bas-reliefs; houses containing sculptured chambers; and many other structures of archæological interest.

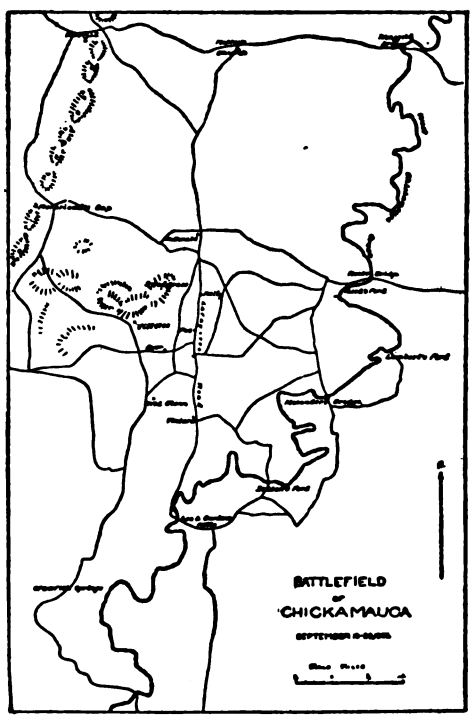
Chichester, chich'ĕs-tẽr, England, a municipal borough and episcopal city, near the southwest corner of the county of Sussex. It is well built and has wide streets. Its old wall, still in good preservation and lined with lofty elms, gives it a very picturesque appearance. Its principal edifice is the cathedral, an ancient Gothic structure, with one of the most graceful spires in England, and containing among many monuments one of the poet Collins, who was born and died here. The fine old octagonal market-cross should also be mentioned. Pop. (1901) 12,241.

Chick-pea, the popular name of *Cicer arietinum* and other plants of the same genus, growing wild along the shores of the Mediterranean and in many parts of the East, and producing a short puffy pod with one or generally two small wrinkled seeds. It is an important article of French and Spanish cookery, and the plant is cultivated in Europe, Egypt, Syria, India, Mexico, etc. When roasted it is the common parched pulse of the East. It is sometimes used as a substitute for, or as an adulterant of coffee. The herbage serves as fodder for cattle. The chick-peas are leguminous plants of the vetch tribe, differing from the vetches mainly in the fruit. Seven species are known, having the flowers solitary or in small axillary groups.

Chick'-a-dee (an onomatopoeic word, imitating the note of the bird), a local name for the black-cap titmouse. See TITMOUSE.

Chickahom'iny, a river in Virginia, about 75 miles in length. It is an affluent of the James and runs parallel to it for many miles from its source northwest of Richmond. As its course was between the Union armies and Richmond, on and near it occurred many of the most important events of McClellan's Peninsula campaign in 1862, including the battles of Williamsburg, Hanover Court-House, Fair Oaks, Mechanicsville, Cold Harbor, Savage's Station, Frazier's Farm, and Malvern Hill (qq.v.). The second battle of Cold Harbor under Grant occurred 3 June 1864.

Chickamauga, chīk-a-mâ'ga, Battle of, fought near Chickamauga Creek, and on Georgia soil, 19–20 Sept. 1863. Gen. Rosecrans (q.v.) having forced Bragg (q.v.) out of his fortified position in Middle Tennessee by a campaign of strategy, prepared to gain possession of Chattanooga, the gateway through the mountains to the Gulf States, and a most important railroad centre for the Confederacy. Bragg held the city, which was beyond the Cumberland Mountains and the Tennessee River. Rosecrans' army lay along the western base of the Cumberlands. His headquarters were at Winchester, Tenn. His army was composed of three corps of infantry, the Fourteenth, Gen. George H. Thomas; the Twentieth, Gen. Alex. McD. McCook; and the Twenty-first, Gen. Thomas L. Crittenden. Gen. D. S. Stanley commanded the one corps of cavalry. McCook's corps was the right wing, Thomas'



the centre, and Crittenden's the left. Stanley's cavalry guarded the right flank, and Minty's brigade of cavalry the left.

The plan of campaign involved the repair of the railroad to the Tennessee River, the collection of supplies for a month's absence from any base, and ammunition for two battles. It also included throwing Rosecrans' army to the rear of Chattanooga and advancing to it from the south. His centre and right were ascending Lookout before Bragg became aware of the character of the movement. He then evacuated Chattanooga and moved to La Fayette, 26 miles south and behind Pigeon Mountain, the next range east of Lookout, leaving his rear-guard just below Lee and Gordon's Mill at the crossing of the Chickamauga. Crittenden having accomplished his purpose north of the Tennessee, withdrew through Sequatchee Valley to the river, crossed both that and the Sand Mountains, and entered Lookout Valley near the north point of Lookout Mountain. A reconnoitering party, 9 September, discovered the evacuation of the city. Passing around the point of the mountain, Crittenden, leaving one brigade in the city, proceeded at once by way of Rossville Gap to operate to the left of Thomas, who had descended Lookout at Stevens' Gap. McCook was further to the right, having crossed Lookout at Winston's. The grand strategy of the campaign had been entirely successful. The army had been thrown over three formidable mountain ranges and a wide river, all within the immediate territory of Gen. Bragg, without opposition, almost without discovery, and entirely without loss. To possess Chattanooga it remained necessary to concentrate the widely separated corps in it, or between it and Bragg.

Erroneous dispatches led Rosecrans to believe that Bragg was retreating on Rome. He ordered pursuit, and found Bragg occupying the gaps in Pigeon Mountain in force and preparing movements against each separate corps. These failed, and Bragg, having notice of the arrival of Longstreet, with two divisions from the Army of Northern Virginia, issued, 18 September, orders of battle designed for interposing between the Union army and the city. At this time the main bodies of the two armies confronted each other across the upper Chickamauga, and Longstreet was arriving at Ringgold. Crittenden's corps was concentrated at Lee and Gordon's mill.

During the afternoon of the 18th Gen. Bushrod Johnson from Ringgold, in command of five brigades, including Hood's division of Longstreet's corps, forced a crossing at Reed's Bridge, after a sharp defense by Minty's cavalry. Walker's corps, after failing at Alexander's Bridge, which was defended by Wilder's brigade of mounted infantry, crossed at a ford below. During the night about two thirds of Bragg's army crossed the Chickamauga, and early in the morning of the 19th he formed line of battle directly on Crittenden's left flank and in near contact with it. Bragg's plan was to drive Crittenden's corps back on Thomas in the centre, and both on McCook at the right, and force the whole into the mountains. His plan of battle was interfered with and finally destroyed by an undiscovered night advance of Rosecrans' centre and right, by which he passed several miles beyond Bragg's position and thrust his lines across the La Fayette road and eastward to the Chickamauga, and so gained position between Bragg and Chattanooga. The head of Thomas' corps, which struck Forrest's cavalry at Jay's Mill, was Brannan's division. The fighting became desperate ,and at close quarters, and so continued until 1 o'clock, when Forrest and his supports were repulsed. Soon both armies were rapidly advancing toward this vortex of fierce fighting. It was of desperate character on both sides, continuing from noon until sunset, with alternate success and repulse for each side, the field finally remaining in possession of the Union forces. The deadly fighting throughout the day had been largely in forests thick with underbrush, and so all within the limits of point-blank range. At nightfall Cleburne's division burst with great force upon the lines of

Johnson's and Baird's divisions, which were well in advance at the centre. They gradually withdrew from under the fire which continued for an hour after dark. At the close of the fighting for the day Rosecrans' army held the La Fayette road between Bragg and Chattanooga, and Bragg's plan of battle for the day had been effectually defeated.

On the Union side the entire force except five brigades had been engaged. Of Bragg's army three divisions and one brigade present had not been engaged, and two brigades did not arrive until the second day. At the close of the first day's battle the Confederate line extended from Hall's Ford to Jay's Mill. The Union line was brought back nearer to the La Fayette road, which was the axis and the objective of the battle. The Confederate line extended far beyond the Union left. Counting by brigades, the Union line was overlapped on its left by four brigades of cavalry, two fighting dismounted, and two brigades of infantry, and on its right by two brigades of infantry. The Confederates had 15 brigades in their reserves, counting Longstreet's second and third lines, Law's and Kershaw's divisions, at the centre. The Union army had five, an overlapping force for the Confederates of four brigades, and an excess of 10 in the reserves. The Union line had strengthened its front by logs, stumps, stones, and fence rails. Counting by divisions from left to right, it was formed as follows: Baird, Johnson, Palmer, and Reynolds east of the La Fayette road; Brannan, Negley, Davis, Sheridan, and Wilder's Mounted Brigade west of it, with Wood and Van Cleve in reserve. The Confederate line, from right to left, was thus composed: Pegram and Armstrong of Forrest's cavalry, Breckenridge, Cleburne, Stewart, Bushrod Johnson, Hindman, Preston, with Walker, Liddell, Cheatham, Law, and Kershaw in reserve.

The Confederates attacked about 9 o'clock, Breckinridge moving against Baird, the left brigade, striking Baird's rude works, being broken on them and its commander being mortally wounded. The other two brigades swung around full in the Union rear, but were driven back after sharp fighting. Cleburne and Stewart assaulted in succession and were both repulsed. At 11 o'clock Negley, in rear of the Brotherton house, had been replaced by Wood from the reserve, and sent to the left. Brannan, on the left of Wood, had also been ordered to the left, but the Confederate attack developing on his front, he did not move. Upon the supposition that he had gone, Wood was ordered to close on Reynolds, the next division to the left of Brannan. Wood moved promptly to find Reynolds. This left a gap, just as Longstreet, with a column of three divisions, Bushrod Johnson in the front line, Law in the second, and Kershaw in the third, was moving to attack Wood's position. This broke the Union centre. Davis' and Sheridan's divisions to the right of the break were rushed toward the gap, but failed to restore the line, and being attacked in front and on both flanks by Johnson's and Hindman's troops were forced off the field in confusion. Rosecrans, Crittenden, and McCook, being with the right wing, were driven off the field with that portion of the army which left it. Brannan's division, the first on the left of the break, swung back nearly at right angles, and took position on Snodgrass Hill, a quarter of a mile in the rear, on which also rallied other portions of the Union army that had been scattered or broken. At noon Forrest's cavalry, opposite Cloud's, had crossed the La Fayette road and captured the field hospitals of the Union left wing.

The four divisions of Baird, Johnson, Palmer, and Reynolds maintained their lines around the Kelly field. At 1 o'clock Gen. Thomas had formed parts of Brannan's, Wood's, and Negley's divisions, with various fragments, on Snodgrass Hill. Negley had left at noon with two regiments of infantry and 40 guns. Gen. Thomas then found himself with only one battery. About 1:30 the hill was assaulted by five brigades, that of Fulton overlapping Brannan's right and gaining the valley in his rear. At this juncture Gordon Granger arrived from McAfee's Church with Whitaker and Mitchell's brigades of Steedman's division, and promptly attacking, drove the Confederate force which had crossed the ridge over it again, and extended Gen. Thomas' line for a half mile along the crest. About the same time Van Derveer's strong brigade arrived from its successful charge on Breckenridge in the Kelly field and strengthened Brannan's line. Longstreet's assault continued with little intermission until sundown, all being of the most courageous character. Finally 11 Confederate brigades were participating in the attack on Snodgrass. For its defense Thomas at the last had five brigades and about one half of two others. There was little fighting on the Kelly field line after 1 o'clock, though Bragg ordered a general attack for 3. It was not delivered until about sundown. At 3 Longstreet, from Snodgrass Hill, asked Bragg for re-enforcements, but was informed that the right wing had been so beaten back that it could be of no service to him. Longstreet's last assault was with troops that had not been engaged. Their attack began at 4:30 and lasted until 6. They gained a salient of the Union line and held it for an hour, with a loss of 36 per cent, but were finally dislodged by Gen. Charles H. Grosvenor's regiment.

At 5.30 Gen. Thomas began withdrawing his army. The four divisions on the Kelly field retired in succession from right to left. Reynolds and Palmer were not attacked. The Confederate attack ordered for 3 o'clock was delivered just as Johnson and Baird were leaving their lines, and some captures were made, though both reached the forest west of the La Fayette road without disorganization, and followed the rest of the left wing through McFarland's Gap to Rossville. At 7 o'clock the Snodgrass Hill line began to retire from left to right. Steedman's withdrew at 6, sundown. Fighting in his front had ceased. An hour later Trigg and Kelly, passing over the ground which Steedman had occupied, captured the greater part of three Union regiments which were temporarily attached to the left of his line, and by mistake had not received notice of the withdrawal. The last volley of the battle was fired by troops of Van Derveer's brigade at Kelly's and Trigg's lines, which, after capturing the isolated troops, attempted to move on Van Derveer's position. Davis' division, which had been cut off at noon, reached a point on its return near Gen. Thomas' right at sundown.

Gen. Sheridan, who had continued to Rossville, marched toward the field from that point, reaching Cloud's an hour after sundown. Both of these divisions acted as supports for the flanks, while the troops were being withdrawn. Gen. Thomas withdrew the army without molestation through McFarland's Gap to Rossville, and during the night placed it in strong position in the gap at Rossville, along the adjacent crests of Missionary Ridge, and across the valley to Lookout Mountain. It was thus firmly established between Bragg and Chattanooga. Holding his lines through the next day, at night he withdrew toward Chattanooga.

Gen. Rosecrans crossed the Tennessee with an effective force of a little above 55,000. Two brigades and an additional regiment were detached. A maximum figure for his force at the opening of the battle would be 50,000. It is difficult to approximate Bragg's force. A week after the battle he reported 38,846 effectives, and his losses to have been 18,000, which would make his force in action 56,846. Gen. R. E. Lee, writing to President Davis of Bragg's strength, five days before the battle, said: «His total effective force will therefore be 76,219, as large a number as I suppose he can operate with.» This was counting Longstreet's re-enforcement, according to Gen. Lee's figures, but a large part of Longstreet's forces never reached Bragg. In view of Gen. Lee's statements, and the known overlapping of the Union lines, and the preponderance of his reserves, it would seem that Bragg's force can be fairly fixed at 55,000.

Few, if any, of the great battles of the war show an equal percentage of casualties, considering the numbers engaged and the time of fighting. The losses for killed and wounded and missing for Rosecrans were 16,179, and for Bragg 18,000. For the troops actually engaged these figures give a percentage of 33 per cent for each side. On the Confederate side, Longstreet's wing lost 44 per cent, nearly all on the second day. Bushrod Johnson's division lost 44 per cent, and Preston's 33 per cent in the attack of an hour and a half on Snodgrass Hill; and Gracie's brigade of the latter division lost 36 per cent during the same time. The brigade losses in Cheatham's division ranged from 35 to 50 per cent. The loss in Breckinridge's division was 33 per cent, and in Cleburne's 43 per cent. Bates' brigade of Stewart's division lost 52 per cent. The Confederates assaulted throughout the second day.

On the Union side Steedman's division lost 49 per cent in four hours, and all of these were killed or wounded but one. Brannan's division lost slightly over 36 per cent; Van Derveer's brigade of that division only two less than 50 per cent; Davis' division a little over 50 per cent; Van Cleve's division 23.5 per cent. Among the Union brigades Buell's loss was 45 per cent, Carlin's 53 per cent, Hazen's 34 per cent, Dick's 25 per cent, Connell's 37 per cent, and Croxton's 39 per cent.

On 22 September Bragg began to establish his lines before Chattanooga and prepare for either driving or starving the Union army out of it. Consult 'War of the Rebellion Records,' Vol. 23, parts 1 and 2; Vol. 30, parts 1, 2, 3, and 4.

H. V. BOYNTON.

Chickamauga National Military Park. Congress, in 1890, passed an act authorizing the establishment of a park on the site of the battle of Chickamauga. In carrying out the project the States of Georgia and Tennessee co-operated with the commission appointed by Congress. To the United States Federal government the citizens of each State sold and the States ceded jurisdiction over lands and roads included in or leading to the battle-field of Chickamauga, as well as the sites of those actions which took place about Chattanooga, and which the park also commemorates. The actual area of the park is 11 square miles, but to all intents and purposes it embraces a much larger tract. It was dedicated with elaborate ceremonies 19–21 Sept. 1895, and already it has been greatly beautified, and markers, monuments, etc., furnishing explanations of the field, have been erected. See BOYNTON, HENRY V.

Chick'aree, the American red squirrel; a popular name, imitative of its cry. See SQUIRREL.

Chickasaw Bayou, or Bluffs, Battle of. On 8 Dec. 1862 Gen. Grant ordered Gen. W. T. Sherman to organize at Memphis, Tenn., an expedition which, in co-operation with Admiral D. D. Porter's gunboat fleet, should reduce Vicksburg. On the 22d the expedition rendezvoused at Friar's Point on the Mississippi, ready to move up the Yazoo River in rear of Vicksburg. Sherman had the four divisions of Gens. F. Steele, Geo. W. Morgan, M. L. Smith, and A. J. Smith, aggregating about 30,000 men. The transports, preceded by the gunboats, entered Yazoo River on the 25th, and on the 26th and 27th the troops were landed on its south bank, confronting the bluffs overlooking the swamps through which ran Chickasaw Bayou. Gen. J. C. Pemberton, commanding the Confederate forces in Mississippi, was at Grenada opposing Grant, who was moving south from Grand Junction and Corinth on the line of the railroads. On the 21st Pemberton heard that the fleet and transports were moving down the Mississippi for the supposed purpose of attacking Vicksburg, which at the time was held by Gen. Martin L. Smith with the brigade of Gen. S. D. Lee. Vaughn's brigade was immediately ordered to Vicksburg, and was soon followed by the brigades of Gregg and Barton. Pemberton arrived at Vicksburg on the 26th and the last of the three brigades during the night of the 27th. Pemberton disposed his forces, Vaughn, Gregg, Barton, and Lee, on a line from Vicksburg on the left to Haynes' Bluff on the right, a distance of 13 miles, on high ground overlooking Chickasaw Bayou and the Yazoo River, S. D. Lee holding Walnut Hills from Vicksburg to Snyder's Mill on the right, a distance of 10 miles. Lee was a good engineer and a fine officer; he strengthened his position by works for his batteries and rifle-pits on the slope of the bluff, which rose to an elevation of about 200 feet above the bayou. Between this position and where Sherman had landed was bottom land, almost wholly densely wooded, intersected with bayous and low, swampy ground. There were but three roads through this area, and these were obstructed by earthworks and felled timber. By these roads Sherman advanced on the morning of the 27th, Steele on the left, Morgan on the right of Steele, and

M. L. Smith and A. J. Smith on the right of Morgan. There was heavy skirmishing on the 27th and 28th, the Confederate outposts were driven in, and at night of the 28th the Union troops lay parallel to Chickasaw or Walnut Hills bluff and about 600 yards from its foot. The main assault on the bluff was to be made by Morgan, supported by Steele; while, to make a diversion in favor of Morgan, A. J. Smith, with M. L. Smith's division and one brigade of his own, was to cross a lake, a mile below Morgan, by a narrow sand-bar, and attack. On the extreme right the rest of A. J. Smith's division was to demonstrate on the road to Vicksburg. On the morning of the 29th Morgan represented to Sherman that an attack from his position was impracticable; but Sherman, after an examination, made no change in his disposition, and rode off to his headquarters, whence he sent his adjutant-general to Morgan with this message: "Tell Morgan to give the signal for assault; that we will lose 5,000 men before we take Vicksburg, and may as well lose them here as anywhere else." Morgan replied that Sherman's entire army could not carry the position in his front, but that he would order the assault. De Courcy's brigade of Morgan's division, and the two brigades of Blair and Thayer of Steele's, were formed for the assault. The signal was given by a heavy artillery fire upon the Confederate lines, and at 12 o'clock the three brigades went forward. By some misunderstanding Thayer's brigade, with the exception of the 4th Iowa, diverged too far to the right, but De Courcy, Blair, and Thayer (with the 4th Iowa), about 6,000 men, after clearing the obstruction in front and floundering through deep mire and tangled marsh, under a terrific fire of artillery, finally made a lodgment on the hard table-land at the foot of the bluff, where an abandoned line of works gave shelter, and where some of the men stopped. All formation was broken up, brigades and regiments mixed, but on went the main body, pushed up the bluff, and reached different points of Lee's works, but were met on both flanks by such a withering fire from the rifle-pits that ran diagonally up the slope of the hill, and so severe a cross-fire of shell and canister from the batteries, that the men faltered and, no support being in sight, fell back to the point of starting, leaving about 1,500 killed, wounded, and captured. Lee lost 115. More to the right, where A. J. Smith was to demonstrate, the 6th Missouri gained the levee at the foot of the bluff, but not able to go farther under the hot fire poured upon them from above, the men sought shelter by digging with hands and bayonets into the bank of the levee, where they remained until night covered their withdrawal, after a loss of 57 killed and wounded. Sherman thought of renewing the assault in the morning, but after a personal examination he came to the conclusion that the enemy's centre could not be broken without crippling his army beyond the power to act with any vigor afterward, and proposed to attack Haynes' Bluff, higher up the Yazoo. Preparations were made to assault at 4 o'clock on the morning of 1 Jan. 1863. Admiral Porter, who was to co-operate in this attack, found the fog so dense on the river that he could not move his boats. The attack was deferred and then abandoned, and by sunrise, 2 January, the troops were all re-embarked on transports and sailed for Milliken's Bend. The Union loss in the assault on Chickasaw Bluffs and in the skirmishing preceding it was 1,213 killed and wounded, and 563 missing. The Confederate loss was 177 killed and wounded, and 10 missing. Consult: 'Official Records,' Vol. XVII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.; F. V. Greene, 'The Mississippi.'

E. A. CARMAN.

Chickasaw, chĭk'ạ-sâ, the most active and warlike tribe of the great Muskhogean (q.v.) Indian stock; a branch of the Choctaw (q.v.), and according to their own tradition, not separated till after the united tribe crossed the Mississippi eastward. They occupied northeastern Mississippi, and the adjacent part of western Tennessee to the Ohio. Their chief settlements were on the head-waters of the Tombigbee and Yazoo, about the present Pontotoc and Chickasaw counties, and a trail led to them from the site of Memphis, 160 miles off, their principal Mississippi landing. They were first found by De Soto, who reached the village of "Chicaça." with 200 houses, on the west bank of the Yazoo, 17 Dec. 1540, and remained there till March; but when he undertook to impress some of the Indians as porters, he was repeatedly assailed, the village fired, his path barred by a stockade, and he lost many men before he beat them off. English traders penetrated thither in the 17th century. After the French settlement at Mobile, the rivalry of the two nations first set them against the French, and for a time cut off the Mississippi trade from both; but with the French, as the only real colonists in that region, they were in constant and envenomed hostility for many years, and Bienville and D'Artaguette led expeditions against them again and again, not even a nominal peace in 1740 putting an end to their warfare. With Oglethorpe of Georgia they had friendly relations. At this time they had four large contiguous settlements, with the houses in each scattered over a space 1 to 2 miles wide and 4 to 10 long; the chief was called Chookka Pharaah, or Long House. Their sachem was called the *mico*. In 1765 Gov. Johnstone of west Florida induced them and the Choctaws to hold a council with him at Mobile, where a trade tariff was framed; but the white traders among them soon precipitated fresh troubles. After the Revolution, at the great general treaty of Hopewell, 28 Nov. 1785, their *mico* Pio and others made a treaty delimiting their lands from the Ohio River to the Mississippi State line. Their number was then estimated at 800 to 1,200. The reliability of these estimates may be judged from the fact that they are said to have had 10,000 warriors when they crossed the Mississippi, 450 in 1755, 750 in 1764, and 500 in 1768. In 1793 they joined the whites against the Creeks, and continued friendly to the settlers. In 1805, 1816, and 1818, they gradually ceded all lands north of the Mississippi line. About 1800, as the hunting grounds narrowed, the tribe began to migrate west of the Mississippi, as did the Cherokees and others. In 1822 there were in Mississippi 3,625 on a reliable count, with eight towns, and a progressive civilization: they were industrious farmers and cattle-men, marketing live stock among the whites. By the treaty of Pontotoc Creek, 20 Oct. 1822, they made another large cession of

lands; and by that of Washington, 24 May 1834, they gave up all the remainder, the two cessions comprising 6,442,400 acres, or over 10,000 square miles, for which they received $3,646,000. On 17 Jan. 1837 they bought of the Choctaws for $530,000 a district on the Red River west and south of the Washita (the extreme western part of the present Indian Territory), to be inalienable except with the consent of the Choctaws; relinquished their governmental organization, and became a part of that nation, with proportionate representation in its government. A considerable number, instead of remaining with the tribe, scattered through the Choctaws, buying and taking up lands at pleasure. They lagged behind the Choctaws in progress, however; a smallpox epidemic carried off several hundred; the government annuity made them lazy; and they opened no schools till 1851. Aggrieved at being represented in the Choctaw government only according to numbers, instead of equally as a tribe, they appealed to the President, and on 27 June 1855 were given separate title to their district as the Chickasaw Nation. They organized a government with a council and two-chambered legislature, and advanced rapidly. In the Civil War, as slaveholders, and having southern agents, they joined the Confederate side; lost about one fourth of their people, and were liable to the penalties of treason. By the treaty of Fort Smith, September 1865 they were conditionally restored to their rights. On 28 April 1866 all the old treaties were renewed; but they were forced to sell to the government 7,000,000 acres of land, nearly 11,000 square miles, for $315,000, the money to go to their former slaves unless they admitted them to full tribal citizenship. They held off for some years, but finally acceded on 10 Jan. 1873. The "nation" in 1900 numbered 5,872, of whom probably two thirds were Chickasaws proper, and they are increasing.

Chicken. See FOWL.

Chicken-flea, the common name of *Sarcopsylla gallinacea,* a pest of young chickens in tropical and subtropical regions, and destructive from Florida to Texas. It is smaller and shorter than the cat flea, with the eyes and antennæ in the hinder part of the head, and it does not hop. It abounds mostly in shady places, under old houses, and in earthen floors. It is first observed to infest young chickens and turkeys, and by its number and pertinacity kills young chickens, while being more or less permanently parasites on hens. Consult: Packard, 'Insect Life,' Vol. VII.

Chicken-lice, several species of bird-lice (*Mallophaga*), or louse-like wingless insects, afflicting chickens and hens. Unlike the louse (*Pediculus*), which obtains its nourishment by suction, the bird-lice have free jaws adapted for cutting feathers, though they also draw blood from the skin of their host. The large chicken louse (*Goniocotes abdominalis*) is less common than the lesser chicken-louse (*G. hologaster*); it is only one millimetre long, while the first-named kind is three millimetres long. Quite a different kind is the common hen-louse (*Menopon pallidum*), which is the most abundant and annoying of all. It differs from the others in its light color and greater activity, running among the feathers and from them upon the hands of persons handling fowls. It is from one to one and a half millimetres long, rather slender, and of a pale straw-yellow color. Fowls should be allowed plenty of ashes and road dust in which to roll. An infested hennery should be well fumigated and whitewashed, and insect-powder should be dusted upon the birds themselves.

Chicken-mite, or **Poultry-tick,** a small mite (*Dermanyssus gallinæ*) which gathers on fowls at night and sucks their blood. It is about one millimeter high, light gray, with dark patches, but red when gorged with blood. It swarms in cracks and corners of the henhouse, and should not be confounded with the bird-tick (*D. avium*).

Chicken-pox, an acute, specific, infectious disease, characterized by a definite incubation period, an eruption of successive crops of vesicles which persist for a certain length of time, and a well-marked clinical course of short duration. It is one of the mildest of the eruptive fevers. The disease is usually epidemic, but sporadic cases do occur. It very frequently accompanies small-pox, and great care must be exercised not to confound mild cases of small-pox with severe cases of chicken-pox. The stage of incubation is usually about eight days, although it may vary from 8 to 18 days. The child may be feverish in some cases, have a slight chill, pain in the back and legs, nausea and vomiting. The eruption usually develops within 24 hours after the first onset. There are first raised red papules which in a few hours are transferred into raised hemispherical vesels filled with clear serum. At the end of 36 to 48 hours, this clear serum may become purulent, and the vesicles then begin to shrivel, and in from three to four days are changed to dark-brown crusts which fall off and rarely leave a scar. Fresh groups occur during the first two or three days of the illness; as a rule they are not very many in number. In delicate children the number may be large, and gangrene may set in unless great care is taken in the treatment of the vesicles. Chicken-pox is very contagious, but is not dangerous, and the first treatment should be the complete isolation of the patient.

Chicken-snake, a name given in the northern United States to the *Coluber eximius, C. quadrivittatus,* or *Ophibolus eximius.* The head is short and the snout rounded; the nostrils are lateral, the eyes large, with a dusky pupil and gray iris; the neck is contracted, the body long but robust, covered with smooth, small, hexagonal scales above, and broad plates below; the tail is short, thick, soon becoming cylindrical, and ending in a horny tip. The color is milky white above, sometimes tinged with red; along the vertebral line is a series of dusky oval spots bordered with black, sometimes giving the appearance of transverse white and black bands. Alternating with these bands on the sides is another series of smaller rounded and blacker spots, and sometimes a third smaller series lower down. The upper lip is milky white; the abdomen is silver white, sometimes yellowish, each plate marked with one or two black, quadrilateral spots, near the centre if single, and near the margins if double, giving a tessellated appearance. It grows to the length of five feet. It is perfectly harmless; from its frequenting houses and dairies it has been called "house

snake» and «milk snake.» It feeds on frogs, toads, mice, insects, and small birds. It does not appear to be found below lat. 37° N.; westward it extends to the Mississippi. It prefers shady and rocky places. The chicken snake of the south is *Scotophis quadrivittatus;* the body is very long; above, a greenish clay color, with four longitudinal brown bands; yellowish beneath; scales on the back ridged; and on the sides smooth; the head is quite distinct; the tail is one fifth the whole length; body three and a half feet, and tail 10 inches. It is said to attain a length of seven feet. It is found from North Carolina southward, and to the Mississippi; it destroys rats, young chickens, and small animals, but its bite is harmless to man. It is sometimes found on trees.

Chicken-tick, an arachnid of the family *Argasidæ,* and related to the mites, but very much larger. Originally an inhabitant of tropical America, this tick (*Argas miniatus*) has been found to annoy poultry in Texas and Florida. It is about a quarter of an inch long, usually very flat, unless gorged with blood. The surface of the body differs from that of other ticks in having scattered pits with a raised edge; it also differs from ordinary ticks in the head being covered by the body, in the spiracles being placed between the third and fourth pairs of legs, and in having no pulvillum between the claws. It was originally found in Texas among ordinary ticks taken from cattle. The young is six-footed. Of 10 other species of *Argas, A. reflexus* of the Old World lives on pigeons and occasionally attacks man; the Persian *Argas* (*A. persicus*) in Persia attacks man and poultry.

Chick'ering, Jonas, American piano maker: b. New Ipswich, N. H., 5 April 1797; d. Boston, Mass., 8 Dec. 1853. The son of a blacksmith, he received only a common school education, and in 1819 entered a piano manufactory in Boston, Mass., conducted by John Osborn, later going into business for himself. At that time the making of a piano was an event of sufficient importance to receive extended public mention, and the first instruments made by Chickering and his contemporaries were works of art. Before his death his Boston factory was turning out 2,000 pianos a year. The firm has been carried on continuously by his sons, and their pianos have a high reputation among musicians everywhere. Some of the most important developments in pianoforte construction have first been introduced in the Chickering piano.

Chick'weed (*Alsino media*), an annual plant abounding throughout the world in ill cultivated or neglected places. It is botanically related to the corn-cockle or Agrostemma, belonging, like it, to the natural order of the *Caryophyllaceæ.* It grows in waste places throughout North America, and may be used when young as a substitute for spinach and other greens.

Chiclana, chē-klä'nä, Spain, a town in Andalusia, 12 miles southeast of Cadiz. It stands in a plain on both sides of the Lirio, and about a mile northeast of Barrosa, famous for the defeat of the French, under Marshal Victor, by the British under Gen. Graham, in 1811. It consists of well built houses of hewn stone, white as snow, and generally enclosed by gardens. The principal buildings are a magnificent hospital, two parish churches, and a large and well-decorated theatre. The manufactures consist of linen, starch, earthenware, and other articles, and there is a considerable trade in corn, wine, and fruit. The baths of Chiclana, which have a temperature of 60°, and are said to be very efficacious in cutaneous affections, are much frequented. Pop. 12,348.

Chiclayo, chē-klä'yō, Peru, a city in the northwest on the coast, is near a valuable sugar district, and the shipping of the sugar is its chief occupation. Pop. 14,000.

Chicle-gum, chēkl- or chē'klą-, an elastic gum produced by the bully-tree, naseberry, or sapodilla (*Achras sapota*), a native of South America. It is largely imported into the United States for the purpose of being manufactured into chewing-gum.

Chico (chē'kō) **Series,** the Upper Cretaceous rocks that originally extended in a broad belt from Lower California northward beyond the Queen Charlotte Islands, and covered the region of the Coast and Cascade ranges. The lower portion of the Chico beds comprises sandstones and conglomerates chiefly, and is from 900 to 1,400 feet thick. The upper portion is mostly shale with some sandstone. The greatest thickness of the whole series in Tehama county, Cal., is nearly 4,000 feet. On Vancouver Island the Nanaimo beds of Chico age contain valuable seams of coal. The fossils show a fauna related to that of southern Asia rather than to the interior American continent. See CRETACEOUS SYSTEM.

Chic'opee, Mass., city in Hampden County, on the Connecticut River, at the mouth of the Chicopee, four miles north of Springfield, and on the Boston & Albany, and Boston & Maine R.R.'s. It is connected with Holyoke and Springfield by electric street railway lines. The former villages of Chicopee Falls, Willamamsett, and Fairview are now included in Chicopee city, which has manufactures of cotton, artillery, bronze, bicycles, rifles, swords, paper, etc. Manufacturing power is furnished by the Chicopee River. It contains numerous churches, public and parish schools, national and savings banks. Pop. (1900) 19,167.

Chicopee River, rises in Worcester County, Mass., flows south southwest into Connecticut River. It has an abundance of water power which is utilized for manufacturing by the numerous towns on its banks.

Chic'ory, or **Succory,** a perennial herb (*Cichorium intybus*) of the natural order *Compositæ.* It is a native of Europe which has become naturalized in many parts of the world, having escaped from gardens in which it is often grown as a pot-herb and salad, or for its roots, which, while young, are used like carrots. In many places it has become troublesome as a weed. The plant may be cultivated like other root crops upon rich, deep, well-drained soil. It resembles dandelion in its leaves, but the perennial roots send up a branched flower-stem which bears leaves of various shapes and flowers of various colors, blue predominating, but pink and white not being uncommon. Besides the use of the root leaves in a green state for salads and as a boiled vegetable, the roots are made to produce two important salads,

witloof and *barbe de capucin.* For these they are dug late in autumn and trimmed of their leaves and superfluous branching roots, and buried in sand or soil in a dark cellar. For witloof, or white leaf, they are stood in a vertical position and covered with several inches of fresh manure or tanbark packed hard; for *barbe de capucin,* they are laid horizontally in pyramidal heaps, a layer of soil and one of roots alternating. In both cases the soil is moistened and the temperature kept uniform. In two or three weeks small heads form in the first case, and long white leaves in the second. Chicory is much more widely grown for its roots, which are used as a substitute for and an adulterant of coffee. The roots are dug, washed, sliced, dried in kilns, roasted in coffee-roasters, ground, and marketed in bulk, in packages, and in sticks. Among the foreign-born population chicory is largely used as a beverage, and since American fields do not supply the demand it is imported from Europe, where the use originated during Napoleon's time. As an adulterant chicory is far less used than is popularly supposed. Its presence may be easily detected by placing a little of the suspected article in a glass of water. Chicory will soon sink and stain the water brown; coffee will float for a long time and then scarcely discolor the water.

Chicoutime, shē-koo-te-mē, Dominion of Canada, county of the Quebec province, formed from Saguenay in 1853. Several smaller sheets of water are scattered over its surface, and the Saguenay intersects it, receiving in its course several small tributaries. The surface is rocky, rough, and broken, but near the streams are fertile and cultivated strips. A great deal of lumber is cut and sawed on the small streams emptying into the Saguenay. The Hudson Bay company have several stations in the county. Capital, Chicoutimi. Pop. 23,760.

Chief Justice, the title of the presiding justice of the supreme court of the United States, and of the presiding justice of the several State supreme courts. Various other courts in the United States are also presided over by a chief justice. The following is a list of the persons appointed as chief justice of the supreme court of the United States from its establishment, some of whom, however, being rejected by the Senate, or, declining the position, never served:

John Jay, of New York, appointed by Washington 26 Sept. 1789; resigned 1791.

John Rutledge, of South Carolina, appointed by Washington 1 July 1795; rejected by the Senate 15 Dec. 1795.

William Cushing, of Massachusetts, appointed by Washington 26 Jan. 1796; declined promotion from his associate justiceship.

Oliver Ellsworth, of Connecticut, appointed by Washington 4 March 1796; resigned 1800.

John Jay, of New York, appointed by John Adams 19 Dec. 1800; declined.

John Marshall, of Virginia, appointed by John Adams 31 Jan. 1801; died 6 July 1835.

Roger Brooke Taney, of Maryland, appointed by Jackson 15 March 1836; died 12 Oct. 1864.

Salmon Portland Chase, of Ohio, appointed by Lincoln 6 Dec. 1864; died 7 May 1873.

George H. Williams, of Oregon, appointed by Grant 1873; rejected.

Caleb Cushing, of Massachusetts, appointed by Grant 1873; rejected.

Morrison R. Waite, of Ohio, appointed by Grant 21 Jan. 1874; died 23 March 1888.

Melville W. Fuller, of Illinois, appointed by Cleveland 20 July 1888.

Chief Justice, or **Lord Chief Justice,** in England; the presiding judge in the king's or queen's bench division of the high court of justice, and, in the absence of the lord-chancellor, president of the high court, and also, *ex officio,* one of the judges of the court of appeal. The chief justice of the court of common pleas, previous to 1881, was the presiding judge in the common pleas division of the high court of justice, but the office is now merged in that of the chief justice of England. The title chief justice is also generally given in the various British colonies to the heads of the different judicial establishments, as in Canada, Australia, etc. In Canada there is not only a chief justice at the head of the supreme court of the Dominion, but also chief justices in the separate provinces.

Chief of Staff. See GENERAL STAFF OF THE UNITED STATES ARMY.

Chiemsee, hēm'zā, the largest lake in Bavaria, circle Isar, district Trostberg, 48 miles southeast of Munich; greatest length, 10 miles; greatest breadth, 9 miles; area, 74 square miles; depth, about 480 feet. It is of an irregular shape, very much indented, and contains three pretty islands — Krautinsel, Herrenwörth, and Frauenwörth.

Chieri, kē-ā'rē, Italy, in the province of Turin, eight miles east-southeast of the town of Turin. It is walled and well built, contains the largest Gothic church in Piedmont, with a very ancient baptistery, and at a very early period became celebrated for its manufactures of fustian, which are still flourishing. Pop. 10,000.

Chieti, kē-ā'tē, Italy, capital of province of same name, on a hill near the right bank of the Pescara. It was anciently one of the largest and most important towns in this part of Italy, and was for some centuries in possession of the Greeks, from whom it passed successively to the Romans, Lombards, Franks, and Normans. In 1802 it was taken by the French troops. The modern town, which is well built and adorned with several handsome edifices, is the see of an archbishop and the seat of a superior civil and criminal court, and has manufactures of woolens, and a trade in silk, wine, wheat, and oil. Pop. 12,273.

Chiff-chaff, a small European bird (*Sylvia hippolais* or *Phylloscopus collybita*), of the warbler family (*Sylviidæ*), so named from its cry. Its head, back, and upper wings are ashy brown, and its under parts are brownish green dashed with yellow. In length it is between four and five inches, and it frequents woods, hedges, and thickets. Its food consists of the larvæ of various insects and some of the smaller moths.

Chigi, kē'jē, a noble Italian family, founded by AGOSTINO CHIGI (d. 1512) of Siena. He became a patron of the fine arts and banker for the Pope. (See Cugnino's 'Agostino Chigi il Magnifico.') FLAVIO CHIGI (b. 1810) was one

of the papal guard until 1848, when he was made Bishop of Mira *in partibus*, nuncio at Munich, but was sent to Paris (1873) and later made cardinal, d. 15 Feb. 1885. The head of the family is Prince of Campagnano and Duke of Ariccia. He is also hereditary marshal of the conclave.

Chignecto (shĭg-nĕk'tō) **Bay**, an inlet at the head of the Bay of Fundy, in the Dominion of Canada. It separates Nova Scotia from New Brunswick, is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of St. Lawrence.

In October 1888 work was begun on the construction of a ship railway across the neck of land connecting Nova Scotia with the main land of Canada, under the encouragement of an annual subsidy from the Canadian government. The promoters had spent nearly $4,000,000 on the work, when in 1890 a financial depression in London prevented them from obtaining further capital. As the subsidy from the Canadian government was to be payable on the completion of the work in a given time, the contractors were unable to secure any aid from that source. In March 1901 the undertaking was revived. The railway was projected to be 18 miles long, and by uniting the Gulf of St. Lawrence with the Bay of Fundy and the waters of the Atlantic Ocean, a run of several hundred miles around the province would be saved.

Chignon, shēn-yôṅ, a peculiar arrangement of the hair, worn by women, a knot or mass, natural or artificial, arranged low on the back of the head, at the nape of the neck. It comes from a French word meaning link or chain. This style of hair-dressing was common in the 18th century, but fell into disuse, was revived in the last half of the 19th century, not now in vogue.

Chigoe, chē'gō. See JIGGER; SARCOPSYLLA.

Chihuahua, chē-wä'wä, Mexico, a state bounded on the north by the United States, on the east by Coahuila, on the south by Durango, and on the west by Sinaloa and Sonora. It is the largest of the Mexican states, having an area of 227,468 square kilometres, or about three times that of the State of New York. The Sierra Madre range traverses the state, and the Sierra de Tarahumares lifts its peaks (Bufa de Cerro Prieto, Jésus y Maria, Mesa de Tabascotes, etc.) to a considerable height; otherwise the surface is an undulating table-land, the elevation of which varies from 3,500 to 7,000 feet above sea-level. The largest of the elevated plains lying between the mountain ranges are the Chilicote, Gigantes, Bolsón de Mapimi, etc. The Rio Grande forms the northern boundary, separating the state from the United States; but this river, which rises in Colorado and flows through New Mexico, is almost dry by the time it reaches Mexican territory, the greater portion of its waters having been utilized for the irrigation of lands in the country of its origin. The mineral resources of Chihuahua are probably not surpassed by those of any other region in the republic. Gold, silver, copper, and lead are being mined with profit, and it is thought that the deposits of coal will prove to be valuable when transportation facilities are provided. The climate is healthful, though the summers are long. Even during the hottest months the nights are cool, and in winter frost and snow are not unknown. The summer is the rainy season. Cattle, sheep, horses, and mules are bred in great numbers. Haciendas, several hundred square miles in extent, are common, and 30,000 or 40,000 calves are branded yearly on some of the large ranches. The cultivation of cotton is restricted to the lower lands near the rivers; corn, wheat, oats, rye, potatoes, beans, and many fruits and vegetables of the temperate zone, grow readily in the uplands. Forests of oak and pine cover the mountain slopes in some parts of the state. Cedar is found in the Sierra Madre. There are nine colonies of Mormons, all successful in agriculture. Cattle, sheep, and hogs are exported to the United States. (For manufactures, see CHIHUAHUA [City].) The main line of the Mexican Central Railway runs through the state for a distance of 850 kilometres; a branch of that road crosses the mining district of Parral; the Mexican Northern Railway runs from Escalon to Sierra Mojada, state of Coahuila, connecting a region of low-grade lead ores with the Mexican Central system; and, finally, the capital of the state is to be united with mining and agricultural sections by the Rio Grande, Sierra Madre and Pacific Railway, and the Chihuahua and Pacific Railway, neither of which is yet completed. Wagon-roads are numerous and good. The state is divided into 10 districts, the names, population, and principal towns of which are as follows: Andres del Rio, population 14,450, principal town Batopilas; Arteaga, 8,075, principal town Chinipas; Bravos, 25,122, principal town Juarez (4,500); Camargo, 27,126, principal town Santa Rosalia; Guerrero 22,252, principal town Ciudad Guerrero (4,250); Hidalgo, 36,997, principal town Hidalgo del Parral (7,000); Iturbide, 72,869, principal town Chihuahua, capital of the state; Jimenez, 23,377, principal town Jimenez de los Santos; Mina, 16,978, principal town Guadalupe y Calvo; and Rayon 15,521, principal town Ocampo. Statistics of 1897 show 127 public and 45 private schools; total attendance 4,775 boys and 2,164 girls. The state has (statistics of 1902) a population of 262,271 persons, of whom 8,000 are Indians belonging principally to the Tarahumara race. Number of inhabitants to the square kilometre, 1.15.

Chihuahua, Mexico, the capital city of the state of the same name (q.v.). It is the metropolis of the entire northwestern section of the republic; supplies outfits for a majority of the mining camps and prospecting expeditions of the state; and has manufacturing establishments, banks, and commercial houses engaged in various branches of business. One of the largest iron foundries and machine factories in Mexico has its works here. Cassimeres, blankets, carpets, cotton goods, beer, etc., are other products of the place, which is conspicuous among towns of its size and country for activity and enterprise.

In the Mexican war, Chihuahua was to have been occupied by Gen. John E. Wool; but the latter marched to Taylor's assistance, and enabled him to win the battle of Buena Vista. Col. Alexander W. Doniphan, however, sent by Gen. S. W. Kearney to reinforce Wool at Chihuahua, occupied the city

without opposition, and finding that he was not needed and Wool was not coming, soon abandoned it. Pop (1902) 25,000.

Chilán Balám, chē-län' bä-läm', **Books of,** a series of Maya writings which have been preserved, supposed to have been written by a Maya priest by the name of Chilán Balám. They concern the life of the people before the arrival of the Spaniards; and it is said that the author prophesied the coming of a strange people.

Chi'law, Ceylon, a town on the west coast, near the mouth of the Dederoo-oya, 45 miles north by west from Colombo. Its proximity to the pearl-fisheries gave it an interest which it did not otherwise possess, and made it repeatedly the object of a keen contest. The Tamils wrested it from the Singhalese in the 14th century, and it afterward passed successively to the Moors, the Portuguese, and the Dutch. From the last it was taken by the British in 1796. In the forest to the east of Chilaw, within a radius of 20 or 30 miles, are contained the ruins of a number of ancient cities. The road leading from Chilaw southward to Negombo passes through almost continuous cocoanut plantations. Pop. 5,000.

Chilblain, or **Frostbite,** a mild or severe inflammatory reaction from the effects of severe cold on the toes, fingers, nose, chin, ears, etc. In mild cases there is swelling only, with an inflammation of the skin. This disappears and the part is apt to be tender. In severe frostbite there is ulceration and sloughing of the part. The treatment of mild chilblain is by slow raising of the temperature of the chilled part to that of the body. Too rapid heating results disastrously. Special clothing may be necessary for the tenderness, particularly of the feet.

Child, Francis James, American scholar and educator: b. Boston, Mass., 1 Feb. 1825; d. Cambridge 11 Sept. 1896. He was professor of rhetoric and oratory at Harvard from 1851 till 1876, when he exchanged for the chair of English literature. His principal work, 'English and Scottish Ballads,' a subject on which he was the highest authority in this country, he improved and enlarged for publication in 1886. Among his other works are 'Four Old Plays' (1848); a collection of 'Poems of Sorrow, Comfort, Counsel, and Aspiration' (edited 1865); and 'War Songs for Freemen' (edited 1862).

Child, Frank Samuel, American Congregational clergyman: b. 20 March 1854. He was educated at Hamilton College, N. Y., and after graduating from Union Theological Seminary in 1878 was ordained to the ministry. Since 1888 he has been pastor of the First Church of Fairfield, Conn. He has published 'An Old New England Town' (1895); 'The Colonial Parson of New England' (1896); 'A Colonial Witch' (1897); 'A Puritan Wooing' (1897); 'The House with 60 Closets' (1899); 'An Unknown Patriot' (1899); 'The Little Dreamer's Adventure' (1900); 'Friend or Foe' (1900).

Child, Sir **Josiah,** English merchant: b. London 1630; d. there 1699. The work by which he is known is entitled 'Brief Observations Concerning Trade and the Interest of Money, by J. C.' (London 1668). An enlarged edition was published in 1690, under the name of 'A New Discourse on Trade.' The work has been several times reprinted. It was written in defense of the reduction, by legal enactment, of the rate of interest on money from 8 to 6 per cent, and recommends a further diminution to 4 per cent. He was for some time chairman of the East India Company, and wrote several papers, without signature, in defense of the traffic with the East, arguing, in opposition to those who complained of the drain of coin, that the India trade percolated through other countries with which Britain traded, and thus returned indirectly a surplus in cash. In his essay on trade he advocated the compulsory emigration of paupers to the colonies, and suggested the appointment of corporate officers called «fathers of the poor» to superintend those who were left. He became very wealthy, and his children, by three marriages, allied themselves with the highest nobility. Charles II. made him a baronet. His son became Earl Tylney, but the title is now extinct.

Child, Lydia Maria Francis, American prose writer: b. Medford, Mass., 11 Feb. 1802; d. Wayland, Mass., 20 Oct. 1880. She was married to David Child, a Boston lawyer, in 1828. Her first novel, 'Hobomok,' was written and published in 1821. She was an ardent abolitionist, and published one of the first anti-slavery books, entitled 'Appeal for that Class of Americans Called African,' one immediate result of which was the loss of her former literary popularity in the southern States. From 1841 to 1844 she and her husband edited the 'National Anti-Slavery Standard.' Among her numerous works are 'The First Settlers of New England' (1829); 'Philothea, a romance of Greece in the days of Pericles' (1835); 'Fact and Fiction' (1846); 'Isaac T. Hopper: A True Life' (1853); 'Progress of Religious Ideas' (1855); 'Looking Toward Sunset' (1864); 'Miria: A Romance of the Republic' (1867); and 'Aspirations of the World' (1878). A collection of her letters, with an introduction by John G. Whittier, and an appendix by Wendell Phillips, was published in 1882.

Child-labor. The growth of child-labor is coincident with the introduction of machinery and the development of the factory system. Arkwright obtained his first patent for a machine for spinning cotton yarn in 1769, which immediately resulted in taking the manufactures out of the English cottages and farmhouses. Compton's spinning mule followed in 1775, Cartwright's power loom in 1787, and Eli Whitney's famous cotton-gin in 1793. The sudden displacement of home labor, the rapid development of manufacturing, and the substitution of mere mechanism for the skill of the individual operative, resulted in a demand for cheap child-workers. The employment of children soon became general, and large numbers were crowded together in factories, before the change had attracted much attention. It began with the apprentice system, the children being procured from the poorhouses of London, Birmingham, and southern England.

«Agreements of the most revolting character were often made between the manufacturers and the different parish workhouses for bands of children for a number of years, in which the condition of the children was totally disre-

garded. Such, for example, were those provisions whereby it was agreed that with every 20 sound children one idiot should be taken." (William F. Willoughby, American Economic Association, March 1890.) In 1784 the magistrates of Lancashire passed a resolution that apprentices should no longer "work in the night or more than 10 hours in the day." No protection was provided for children who were not parish apprentices, and no inspection was established, so that the resolution had no force, and remained a dead letter. In 1802 Sir Robert Peel, Sr., secured the passage of a bill abolishing the apprentice system, so far as the cotton factories were concerned. This mild measure met with bitter opposition from the manufacturers, and was of very little immediate benefit, but it was valuable as the first definite step to awaken public sentiment to the evil. According to Walker (Political Economy): "The beginning of the present (the 19th) century, found children of five and even three years of age in England working in factories and brick-yards; women working underground in mines, harnessed with mules to carts, drawing heavy loads; found the hours of labor whatever the avarice of individual mill-owners might exact."

In 1815 a parliamentary committee was appointed to "inquire into the expediency of extending the Apprenticeship Act to children of every description." During the next three years reports were presented which showed that the children employed were worked to the point of exhaustion, and that their condition was worse than slavery. In 1819 an act was passed forbidding the employment of children under 9, and the hours of labor for those between 9 and 16 were limited to 12 hours a day. In 1833 Lord Ashley, afterward Earl of Shaftsbury, introduced a bill which extended the provisions of former acts, and stipulated that inspectors should be appointed to enforce the law. During the following years until 1878 various progressive steps were taken, under the able championship of such men as Lord Shaftsbury and Robert Owen. The act of 1878 was the culmination, and is still regarded as an admirable code for factory legislation. It prohibits the employment of children under 10, and those under 14 may only be employed half time. Night work is forbidden, and children under 16 must furnish medical certificates of fitness for employment. Weekly certificates must be obtained, showing the required amount of school attendance.

During the first half of the 19th century, every political economist opposed factory legislation, and the employers were practically unanimous in their opposition to any abridgement of their right to employ children. The motives of the early reformers were exclusively humanitarian, and they advocated the necessity of protecting women and children because they are not "free agents." It is, however, generally conceded now that the real grounds of state interference with, and regulation of industry are considerations of the safety and well-being of the community. In accordance with this principle, acts were passed in 1891, 1895, 1898 to regulate home work, to prohibit the employment of women for one month after the birth of a child, to prevent and define overcrowding in future, and to minimize the evils of dangerous trades and occupations. A whole code of special rules for each dangerous trade has been formed by the home secretary, to enforce precautions for the protection of the workers, and an arbitration court is provided for the adjustment of protests. According to Thomas Oliver, "Experience shows that there is scarcely a dangerous trade from which, with extreme care and attention to regulations, the dangerous influences cannot be largely removed."

Perhaps the most marked difference between the development of child-labor legislation in Great Britain and in the United States, is this — that in Great Britain, a knowledge of the conditions has always preceded legislation, whereas in many of the American States legislation has been hasty and ill considered, and frequently in advance of public information and public sentiment.

Social legislation which affects industrial interests must be supported by an intelligent public opinion, which has been educated to believe that a state of evil exists, and that the remedies proposed are really necessary. The mere passage of a law may have a certain educational value, but it cannot be enforced without a public conviction of its value. In 1889 Mrs. John Armstrong Chanler offered a prize, through the American Economic Association, for the best essay on child-labor. The prize was divided equally between William F. Willoughby and Miss Clare De Graffenried, both of whom were connected with the Federal Department of Labor, and their essays are still the best general source of information as to the conditions in the United States. Mr. Willoughby says that in England "the regulation of factories and labor is the single duty of the central government, while here it falls to the different State legislatures. As a consequence, while throughout England the laws are uniform, and but one set of statutes and reports, those of Parliament, which are easily accessible, have to be studied; here no two States have the same laws; only a comparatively few have any at all; and information must be obtained through the various bureaus of labor or the reports of the inspectors of factories and workshops. . . . These reports are often unsatisfactory, and are confessedly unreliable. Each department is conducted in its own way. Some, with adequate means, are well organized, and their reports are of the greatest possible value, while others, with very limited resources, can do but feeble work. The law creating them has, in most cases, been inadequate and too timid." He adds that in no case can the statistics of one State be compared with those of another, and that the reports of the State bureaus are in most cases incomplete, "owing to the refusal of the factory owners to make returns or the gross falseness of many of those which were made." At the time Mr. Willoughby wrote (1889), the following States had organized labor bureaus: Massachusetts, 1869; Pennsylvania, 1872; Ohio, 1877; New Jersey, 1878; Illinois and Indiana, 1879; New York, Michigan, Wisconsin, Missouri, and California, 1883; Iowa and Maryland, 1884; Connecticut and Kansas, 1885; Rhode Island, Maine, Colorado, Minnesota, North Carolina, and Nebraska, 1887. In the 14 years which have intervened since Mr. Willoughby wrote, the following States have established bureaus of labor statis-

tics, or have provided for factory inspection, or have legislated in some way for the regulation of child-labor, namely, Alabama, Arkansas, Kentucky, Louisiana, Montana, North Dakota, Oregon, South Carolina, South Dakota, Tennessee, Texas, Virginia, Washington, and West Virginia; and legislation is now pending in the State of Georgia. There has been a great awakening of public sentiment on the subject of child-labor during the last few years and at the present time the general interest is intense. The governors of seven different States have referred to it during the past year in their annual messages, and in one form or another bills to regulate child-labor or amend former laws have been introduced recently in most of the manufacturing States. Much of this legislation is for the purpose of improving the administration of the departments of inspection, which is almost as lax as it was 14 years ago. Very little progress has been made in the compilation of data on child-labor. The writer has recently examined the reports for 1901 and 1902 of the various State bureaus of labor statistics and factory inspection, and can confirm literally to-day Mr. Willoughby's findings of 14 years ago!

In a number of the manufacturing States child-labor laws were first passed at the instance of the labor organizations, and for the purpose of placating the "labor vote." Many of the States have failed to make adequate provision for the cost of inspection, and only a few of the inspectors have been men of trained observation, or men whose previous experience has been such as to fit them in any way for the exacting duties of their office. In some States the department of factory inspection has simply been the football of politics, and the inspectors have been changed with each administration; while in others, the "spoils" have fallen to local labor leaders, who have been placed in positions of great responsibility, overloaded with diverse duties, and allowed a free hand without any supervision. For some reason or other, the laws for the regulation of child-labor have been fully enforced in a few of the States only, and much of the available data as to the number and ages of the children employed, is still very unreliable. The figures of the 12th census (1900) quoted below, may be taken as a minimum estimate only, since they are based on schedules filled out by the manufacturers themselves, at their own discretion, without any verification of the census taken. In fact, the director of the census says himself:

"The limitations connected with the taking of a great national census preclude proper care upon the question of child employment. There is a great uncertainty as to the accuracy of a mass of information of this character taken by enumerators and special agents, who either do not appreciate the importance of the investigation, or find it impracticable to devote the time to the inquiry necessary to secure good results. Again, the answer to the question, 'average number of children under 16 years of age,' may have been inconsiderately given, or, if considered, answered more as the word 'children' was construed by the individual than according to the interpretation intended by the schedule to be placed upon it. The word 'children' to manufacturers has many meanings, in accordance with the geographical location of their plants, or the character of the work performed."

According to the census, the average number of children under 16 years of age (evidently including only those in factories) earning wages in 1900 was as follows:

States	No. children	States	No. children
Alabama	3,474	Missouri	4,510
Arizona	38	Montana	112
Arkansas	643	Nebraska	776
California	2,114	Nevada	20
Colorado	243	New Hampshire	1,651
Connecticut	3,479	New Jersey	8,042
Dakota	6	New Mexico	29
Delaware	859	New York	13,189
District of Columbia	116	North Carolina	10,377
Florida	374	Ohio	4,369
Georgia	6,373	North Dakota	37
Hawaii	40	Oregon	38
Idaho	23	Pennsylvania	33,135
Illinois	10,419	Rhode Island	5,036
Indiana	3,618	South Carolina	8,560
Indian Territory	16	South Dakota	114
Iowa	1,888	Tennessee	2,171
Kansas	860	Texas	1,041
Kentucky	2,687	Utah	218
Louisiana	1,321	Vermont	263
Maine	2,202	Virginia	4,164
Maryland	5,884	Washington	265
Massachusetts	12,556	West Virginia	840
Michigan	2,636	Wisconsin	5,679
Minnesota	792	Wyoming	15
Mississippi	1,049	United States	168,623

According to the United States agent of the Department of Labor, Mr. Wm. Waudby, there were approximately 860,700 children between the ages of 10 and 15 years employed in various "gainful occupations" in 1880 in the United States; in 1890 that number had grown to 1,750,000!

Miss De Graffenried's essay, referred to above, is still the best available statement of conditions of child-labor in many manufacturing industries, notably corset factories, box factories, packing houses, and tobacco and woolen manufacture. In 1891 she wrote an article (based on personal investigation) dealing with the deplorable conditions of child-labor in the southern cotton mills, which excited violent controversy in the South (Century Magazine, February 1891), but her assertions have been fully confirmed during the past two years by the child-labor committees of Alabama and Georgia. In the same way the statements made by Miss De Graffenried in her prize essay as to the evils of child-labor in the sweat-shops, and in the large department stores and mercantile establishments, have been completely verified by the subsequent investigations of the New York Tenement House Commission and the National Consumers' League. The determined and successful fight waged by the Alabama Child-Labor Committee, under the direction of Mr. Edgar Gardner Murphy of Montgomery, Alabama, for the passage of a law to forbid the employment of very young children, deserves special mention. His printed arguments are a part of the permanent literature of child-labor, and created such a wave of public sentiment, that the organized and powerful opposition of the cotton mill owners was finally overcome and the legislature forced to yield to the popular pressure. The owners of the cotton mills in Georgia put forward the plausible plea that compulsory education laws should precede legislation to prevent employment of children under 12. The effect of this would simply be to postpone action for another generation, since the State cannot afford to provide sufficient schooling

facilities until its resources increase in value, or its pensioners die off. At present Georgia is burdened with an annual pension tax of nearly $1,000,000, and the misfortunes of the parents are reflected in the ignorance of their children. In this connection the following deductions from the census of 1900 are interesting:

	White Children of School Age 5 to 20.	White Illiterates of 10 years and over.
Alabama	394,152	104,883
Georgia	457,958	101,264
North Carolina	490,782	175,917
South Carolina	218,323	54,719
Virginia	435,612	98,160

One main cause of the extent of child-labor abuses in the southern cotton mill States is the general lack of vagrancy laws. The "poor white" is shiftless and lazy, and will not work indoors, and in the general exodus of his family to the factory towns, he has been left out of the calculation. His wife and children find their way into the factories, while he exists on the proceeds of their labor. An action for non-support is almost unknown, and not only is there no apparent remedy for the evil, but the State by its failure to prevent the slavery of his children, puts a premium upon the idleness of the parent! Of course the enforcement of compulsory education laws, in conjunction with a simple educational test for children of school age who seek employment, is a powerful aid to the factory inspector. Indeed the State of New Hampshire controls the whole matter by giving its truant officers the right to enter all mechanical, mercantile, and manufacturing establishments, and make a rigid examination; and so far has not found it necessary to employ a factory inspector. But it is reasoned that if, in a community where free schooling is lacking, the factory owners were forbidden to employ children who cannot read and write, the practical result would be to induce the parent to provide for his children's education, in order that they might the sooner qualify as wage-earners.

The child-labor committee of New York has just won a similar victory in securing the passage of laws to license newsboys, and to protect telegraph, messenger, and delivery boys. This movement originated with the social settlement workers, whose daily life brought them into contact with the actual conditions of the "street boy." The report of this committee also is very valuable.

During the past winter the Anthracite Coal Strike Commission developed the fact that large numbers of children under the statutory age were employed in the coal mines and silk and knitting mills of Pennsylvania, under most distressing conditions. As the result of the commission's investigation, bills were introduced to raise the age limit of breaker-boys to 14, and of mine employees to 16, and to abolish the night work of little girls in mills and factories. The first two measures were supported jointly by the coal operators and their employees, and were passed. The other measure failed, but the various women's organizations of Pennsylvania have taken the matter up, and have organized a committee of citizens to fight for legislation and to see that existing laws are rigidly enforced.

The problems of child-labor are now engrossing the attention, not only of the economists, but of those who are engaged in studying the causes of social disorder, and seeking to prevent pauperism and disease. Charity workers have found that child-labor is wrapped up and interwoven with many of the problems of disease, of crime, and of dependence, and the Thirtieth National Conference of Charities and Correction, which met in Atlanta, Ga., May 1903, devoted two notable sessions to the discussion of 'Child-Labor as a National Problem.' The addresses and discussions will be published in the proceedings of the conference. The sixth annual meeting of the American Academy of Political and Social Science was also largely devoted to the subject, and the annals of the academy for July 1902 contain the papers which were read. The women's clubs are also agitating the subject continually, and the labor men no longer have to fight alone for the passage and enforcement of child-labor laws. In almost every State a strong body of public sentiment is being brought to bear upon the subject, and there is general demand for a thoroughly scientific investigation of existing conditions, and better facilities for regulating the employment of children.

The State of Massachusetts has hitherto supplied the standard of statutory law and administration in this department, but Mrs. Florence Kelley is now heading the forward movement for better methods, and her article in the Annals of May 1903 on 'An Effective Child-Labor Law' may be taken literally, as she suggests, as 'A Problem for the Current Decade.'

A careful study of the status of child-labor in Europe, as made by Miss Edith J. Rich, reveals the fact that "no state is without some protection against this evil, and no state affords a protection even approximately adequate. For a century and a half the separate countries slowly developed a public sentiment against child-labor and formulated laws upon the subject, but harmony of action was not attempted until 1890, when an International Labor Conference was held in Berlin. At this conference it was decided to recommend to every state in Europe the passage of the following law, as a safeguard against industrial decay: That children of either sex not having reached a certain age must be excluded from factories, the age limit to be fixed at 12 years, except for southern countries, where it be fixed at 10. Bald statistics show the following as the present conditions: In Switzerland the age limit is 14; France and Germany, 13; Hungary, Portugal, Holland, Sweden, Russia, Austria, and Belgium, 12; England, 11; Denmark and Spain, 10; Italy, 9.

But these statistics, unqualified, give no conception of the true state of affairs. England is, in reality, far from the bottom of the list in matter of protection, and Switzerland's position at the head would not pass unchallenged. And this for many reasons. In the first place, the age limit itself is invariable in few cases. In Hungary and Portugal, for example, the limit is fixed at 12, but may be reduced to 10 if the applicant has a medical and educational certificate of fitness, which is not at all hard to obtain. In England, on the other hand, the exception has the contrary effect. The limit is fixed at 11, but this is raised to 13 unless a child can show a proper certificate of education. In Ger-

many, Denmark, Austria, Norway, Sweden, and Russia, the tendency is also upward rather than downward from a given standard.

The next difficulty in the way of estimating European conditions from statistics, lies in the lack of harmony between child-labor laws and those cognate laws without which the former are ineffective. In Germany, for instance, child-labor is prohibited under the age of 13, and even then, unless the primary education is complete; the system of compulsory education is good; the employer is made liable for all risks, and there are special regulations for the dangerous trades; but the definition of a factory is so indefinite that many important industries escape factory jurisdiction entirely; the system of inspection is so incomplete and the penalties for violation so slight and so seldom enforced that a large and growing number of children are employed. It is said that the Saxon mines are full of children, and that in this same province children five and six years old are employed in the "flat-stitch" trade, earning two and one fourth cents an hour, and working from 10 to 12 hours a day.

Belgium shows much the same result from another cause. The laws are good and the system of inspection is almost unequaled, but compulsory education is unpopular there, and, as is always the case when educational laws do not supplement those prohibiting child labor by offering a substitute employment for the child, the effect of legislation is negatived. There both the parent and employer are made liable for a violation of the law, and 45 trades are absolutely forbidden; but it is the custom to grant exemptions, and the census of 1896 showed that out of 671,596 laborers 76,147 were under 16 years of age. And even these startling figures do not include the workers in the domestic workshops, which are the *bête noire* of child-labor reformers.

These domestic workshops are a relic of a dead system in vogue before the rise of factories where labor is concentrated. They remain to-day in almost every country of Europe practically excluded from factory legislation. The line that divides factories from domestic workshops differs in all cases and is usually so drawn as to exclude from factory jurisdiction large and important industries, whose representatives have power enough to influence legislation. This is especially true in Russia, and is also notable in Belgium, where the entire clothing industry is beyond reach of the child-labor laws. In Austria it takes 20 persons to make a factory; in Italy 10 persons or the use of mechanical motors; in Germany the inspector is free to define an industry as it suits his purpose; in Switzerland the definition is as follows:

1. All industrial establishments where more than five persons are employed and use is made of mechanical motors or where persons under 18 are employed or which present unusual danger to the health or lives of employees.

2. All industrial establishments employing more than 10 persons, whether they present foregoing conditions or not.

3. All industrial establishments employing less than six persons and presenting unusual danger to health or lives of employees or those employing less than 11, but presenting plainly the type of factories.

And yet in spite of this inclusive definition the domestic workshops of Switzerland, which form a large part of Swiss industrial establishments, continue to employ children unmolested. The reason is not far to seek.

Among the leading Swiss industries are watch- and clock-making, the making of paper boxes, embroidery, wood-carving, silk- and cotton-weaving. For centuries these industries have been carried on in the provinces in small establishments, seldom employing more than 10 or 12 persons. In many cases the parent is the employer, and the children the only employees; in others apprenticeship is still in vogue, although that system practically died with the death of the trade guilds. The Swiss federal laws are limited to factories and dangerous trades, the cantons reserving to themselves the right of apprenticeship legislation. In the special Swiss industries, a certain deftness, flexibility and agility are required which can, with difficulty, be acquired by a person who has not begun the work in the early years before the joints and the fingers are stiff and the power to learn mechanically is lost. The conditions necessary to progress in these industries have therefore been an effective barrier to the enforcement of the laws militating against child-labor.

These laws, nevertheless, have by no means been void of good. Their presence on the Federal statute books has caused deep study of the methods by which they might be obeyed without injuring the industries of the country. The result has been the establishment of great trade training schools, still in their incipiency, but offering to the student the largest hope for the future. In Berne, schools are already in active and highly successful operation, where a child may learn a given trade while he is receiving his general education. The system employed in these manual training schools must never be confused with the fundamentally opposite system of half-time employment which has proven distinctly unsuccessful in several countries, notably in England. Until such schools are established, however, or until some substitute for them is found, which shall at the same time displace the domestic workshops, there should be, in every country attempting to protect its children, inhibitory laws which shall make the employer responsible, according to the laws provided for factories, for all work from which he receives the profit, whether such work be done with or without pay (to include apprentices) and whether it be done on factory premises or at home; and, further, making the word "factory," as far as child-labor is concerned, cover every possible industry in which a child may engage.

In this connection it is interesting to note a French law, also recently adopted in Belgium, which forbids the employment of children under the age of 13 as actors or at public exhibitions of any kind, and further prohibits those under 16 from becoming acrobats or professional beggars. The Belgian law differs from the French in age restriction. In the former country the prohibition extends to all under 18, unless a parent is the employer, when the age limit is 14.

In the matter of night work and in special regulations against the employment of children in dangerous trades, the outlook is more generally hopeful, both in the matter of statutes

and of their enforcement. Even in Italy 21 trades are absolutely forbidden to children, in Russia 26, and in Belgium 45. Dangerous trades are of two general kinds — those in which the employment of children implies danger to the community, to risk of fire or accident, and those which are dangerous to the worker himself. The latter class is again sub-divided into those in which the danger is inherent or direct, as in the white lead industry, glass-blowing, phosphorus, etc., and those in which the danger is indirect through length of day, employment under ground, and like causes. A notable example of the last class is the mine, child-labor in which is prohibited in almost every country of Europe.

It is almost impossible to make a comparison of the European and American status of child-labor, because neither stands as a unit, being a composite of conditions in various States. The most suitable basis for future reform is harmonious action founded on a study of the universal principles that underlie this great question. What is needed is the universal minimum age limit of 14, which shall remain invariable and impossible of exemption except for unusual cases; a universally accepted definition of factories which shall include every industry in which it is possible for a child to be at work; a universal system of compulsory education to supplement child-labor laws; better factory inspection; stricter enforcement of penalties, and finally, the establishment of great trade schools the world over.»

BIBLIOGRAPHY.— *American.*— Among the various reports and bulletins may be named the following: 'Bulletins of the Department of Labor,' and 'Eighteenth Annual Report of the Department of Labor,' Carroll D. Wright, Commissioner; 'Report of Commissioner of Education,' W. K. Harris (1901); 'Report of Anthracite Coal Strike Commission' (1903); 'Reports of Child-Labor Committee,' New York (1903); 'Report of Child-Labor Committee,' Alabama (1901); 'Reports of Industrial Commission'; 'Reports of the National Consumers' League'; 'Reports of the Industrial Association of Factory Inspectors.' See also 'Reports of Factory Inspectors and Labor Bureaus of the Various States and of the Province of Quebec'; and 'Special Report on the Factory System (Wright) in Tenth Census'; and 'Twelfth Census of the United States' (1902). Authors: Addams, 'Democracy and Social Ethics'; Campbell, 'Prisoners of Poverty'; Ely, 'Social Aspects of Christianity'; Gunton, 'Wealth and Progress'; Riis, 'The Children of the Poor'; Warner, 'American Charities'; Willoughby and De Graffenried, 'Child Labor.'

British.— Booth, 'Life and Labor of the People'; Brooke, 'Tabulation of Factory Laws of European Countries'; Brentano, 'Hours and Wages in Relation to Production'; Cobden, 'The White Slaves'; Eden, 'State of the Poor'; Gibbins, 'English Social Reformers'; B. L. and H. A. Hutchins, 'A History of Factory Legislation'; W. S. Jevons, 'The State in Relation to Labor'; Morant, 'Theory and Practice of Labor Protection'; Oliver, 'Dangerous Trades'; 'Parliamentary Reports'; Pike, 'Life of Lord Shaftsbury'; 'Report of House of Lords' Committee on Sweating System'; Walker, 'Political Economy'; S. and B. Webb, 'Industrial Democracy'; and 'Problems of Modern Industry.'

Childe Harold's Pilgrimage, a narrative poem in Spencerian stanza, written by Lord Byron (q.v.). It describes the impressions of a young man traveling in southern Europe, and is marked by a tone of melancholy and dissatisfaction. Many have supposed that Childe Harold represented the poet himself. The poem was published in four cantos, the first two appearing in 1812 and the others in 1816 and 1818.

Childebert, shĕl-dĕ-bār or chĭl'dĕ-bĕrt, three kings of the Merovingian dynasty, France.

1. CHILDEBERT I.: b. about 495 A.D.; d. 558. On his father's death in 511 he succeeded to the kingdom of Paris; his brother, Clodomir, king of Orleans, having been killed in battle, Childebert and his brother, Clotaire, king of Soissons, determined to seize and divide his dominions, and murdered his two eldest sons and their followers. Childebert afterward quarreled with Clotaire and laid waste his territory.

2. CHILDEBERT II.: b. about 570; d. 596. On the death of his father in 575, he was proclaimed king of Austrasia, and subsequently, by the death of his uncle, Gontran, succeeded to the kingdoms of Burgundy, Orleans, and part of that of Paris.

3. CHILDEBERT III., surnamed the Just: b. about 683; d. 711. He was proclaimed king in 695, on the death of his brother, Clovis III. His kingship, however, was merely nominal, the true sovereign being Pepin le Gros or d'Héristal, who, under the title of mayor of the palace, exercised the real authority.

Childermas (chĭl'dĕr-mas) **Day** (Feast of the «Holy Innocents»), a festival celebrated by the Roman Catholic Church, 28 December, in commemoration of the massacre of the male children by Herod.

Children, Societies for the Prevention of Cruelty to, organizations that had their origin in New York, and have since been adopted in most American and many European cities. Experience has proved that defenseless children, even within the range of our boasted civilization, are not infrequently grossly maltreated by parents or other legal protectors, and that therefore special legislation is necessary to secure their proper treatment. To ameliorate the condition of children has, therefore, entered largely into the scope of modern legislation. The operations of the societies show in the strongest light the necessity for their action, though it is but a few years since this special agency was introduced. Under seven a child is supposed to be incapable of committing felony. Between 7 and 14 it is held to be *doli incapax,* that is, incapable of crime, while above 14 it is *doli capax,* that is, capable of crime. If, however, anything atrocious be done with obvious malice by a child, it may be held that *malitia supplet ætatem,* malice supplies (the want of) age. The age at which a child can be sworn as a witness depends on the education it has received and its apparent comprehension of the nature and obligation of an oath.

Children in the Wood, The, or **The Babes in the Wood,** an old English ballad, telling the story of two children whom their uncle wished to murder and who were left to die in the woods, by the man who was ordered to kill them. The authorship is unknown, and the date uncertain; it appears in the 'Stationers' Register' of 1595, and was probably written about that time. An old play, published in 1601, has a similar plot, and the source of the two is supposed by some critics to be the same.

Children of the Abbey, The, a once famous romance, by Regina Maria Roche, published in 1798. The Earl of Dunreath, marrying a second time, is induced by the machinations of his wife to cast aside her stepdaughter, for a luckless marriage. It is with the children of this marriage that the story deals. The motherless Amanda is the heroine; and she encounters all the vicissitudes befitting the heroine of the three-volume novel. These include the necessity of living under an assumed name, of becoming the innocent victim of slander, of losing a will, refusing the hands of dukes and earls, and finally, with her brother, overcoming her enemies, and living happy in the highest society forever after.

Children of the Ghetto, a noted book by I. Zangwill, published in 1892. It is, as the author says, "intended as a study, through typical figures, of a race whose persistence is the most remarkable fact in the history of the world." The book raises problems that it does not solve; but the masterly and sympathetic exposition of the Jewish temperament invites a better comprehension of that wonderful race.

Children of Gibeon, a popular novel by Walter Besant, published in 1886. Like his 'All Sorts and Conditions of Men,' it deals with society in both the West and East Ends of London, and their relations to each other. The plot is so ingeniously managed that it seems entirely plausible; the studies of London wage-earners and London slums are faithful, without being too repulsive; and the tone of the book is cheerful, while many social problems are touched in the course of an entertaining story.

Children of the Soil, a novel of modern Polish life, by Henryk Sienkiewicz, published in 1894. There are interesting side issues to the story, involving questions of property, of the social order, of marriage. The work as a whole, although realistic, is sane in spirit, genial and broad in its conception of life and character.

Children of the World, a romance by Paul Heyse, published in 1873. It obtained immediate popularity, and caused great controversy over the fearless treatment of the theme. The children of the world are represented by a young doctor of philosophy, a strong, well-balanced character; his younger brother, an almost Christlike idealist; and their circle of friends and fellow-students, who, in spite of mistakes and eccentricities, bear the stamp of true nobility of soul.

Children's Crusade, The, a singular movement in 1212, preached in France by Stephen, a peasant boy, and in Germany the same year by Nicholas, also a peasant boy. Some 90,000 children left their mothers and schoolmasters in the spring "to rescue the Holy Land from the infidels," and ships were placed at their disposal. The French contingent embarked at Marseilles in August; part perished the same month by shipwreck on the island of San Pietro, and the rest were sold into slavery to Mohammedans. The German contingent reached Genoa in August, and was utterly dispersed by various disasters before the next spring. See CRUSADES.

Childs, George William, American philanthropist and publisher: b. Baltimore, Md., 22 May 1829; d. Philadelphia 3 Feb. 1894. He published the Philadelphia 'Public Ledger,' 1864–94. He gave a Shakespeare memorial fountain to Stratford-on-Avon, a memorial window in Westminster Abbey to Cowper and Herbert, and assisted in establishing a home for printers at Colorado Springs. He published 'Recollections of Gen. Grant' (1885); and 'Personal Recollections' (1889).

Chile, chĭl'ē, or **Chili,** chĭl'ĭ (the Republic of), situated on the western coast of South America, between the Andes Mountains and the Pacific Ocean, is bounded on the east by Argentina and Bolivia, and on the north by Peru. In length it surpasses even the Argentine Republic, for it extends from lat. 55° 59′ S. to 17° 57′ S., a distance of 2,629 miles, but its average width is only 101 miles. The total area is, therefore, about 265,529 square miles. Besides the Andean range on the east, there is a parallel western coast range, and in the valley between the two ranges, from Santiago, the capital, to the south, are found the best agricultural districts and many of the important towns.

Population.— Compared with the other South American countries, Chile ranks as the seventh in size, the fifth in density of population, and the fourth in the number of its inhabitants. The population of the republic in 1895 was 2,712,145, of which number 1,240,353 resided in cities and towns, and 1,471,792 in the rural districts. There has been a considerable increase during the last few years, and on 1 Jan. 1900, the total population was estimated at 3,110,088. The number of the inhabitants of the principal cities on the date last mentioned was, according to an official publication, as follows: Santiago, 291,725; Valparaiso, 135,674; Concepción, 49,766; Iquique, 42,440; Talca, 40,987; Chillan, 34,994; Antofagasta, 19,482; La Serena, 17,137; Talcahuano, 15,643; Curicó, 14,577; San Felipe, 12,359; Valdivia, 9,819; Copiapó, 9,586.

Climate and Productions.— The northern part of Chile is a hot desert; the southern part, a cold region of almost incessant rains; but between these extremes lies a great extent of territory blest with a temperate and healthful climate. Dividing the republic, for convenience of characterization, into five zones, we may say that in the northernmost zone there is a nearly absolute lack of vegetation, but yet we find here some of the chief sources of the national wealth — the deposits of nitrate of soda, mines, etc. The second zone, continuing toward the south, is less torrid. Rain falls several times in the year; and though mining is the chief industry, small areas are also devoted to agriculture. The third zone, in the centre of the country, has a temperate climate and fairly abundant rains. Cattle-raising, mining, and the cultivation of cereals, vines, and fruits are the leading industries. In the fourth zone, where

rains are more abundant and the climate cooler, the chief products are wheat, cattle, lumber, etc. The fifth and most southerly zone, extending to Cape Horn, is a land of bold and rugged features with a cold and rainy climate — a land of shepherds, lumbermen, and fishermen.

National Finances.— The national debt of Chile on 31 Dec. 1901, as shown in the report of the auditor-general of the republic, amounted to 302,672,280.91 pesos (Chilean peso = $0.365). Of this amount, 227,234,400 pesos were for foreign loans dating from the years between, and including, 1885 and 1894. A reduction of 2,896,607.26 pesos in the national debt was effected in 1901. The message of President Riesco (1 June 1902), shows that the revenue, ordinary and extraordinary, in 1901 amounted to 110,059,496.97 pesos. On 31 Dec. 1900 there remained a surplus of 18,576,829.43 pesos. These two sums make a total of 128,913,989.40 pesos. The total of expenditures in 1901 was 130,913,989.94 pesos. There was consequently a deficit of 2,277,663.54 pesos, which sum was increased by certain payments to 2,809,337.66 pesos. In 1902 the president anticipated a deficit of 29,719,339.31, "which may be reduced by 3,000,000 by certain economies, and almost totally met by the 20,000,000 in gold taken from the conversion fund and the premium paid upon this sum. The conversion fund will be made up again out of the sales of land in Magellan territory and of nitrate grounds." The estimated revenue for 1903 amounts to 107,000,000 pesos, and the estimated expenditure to 105,665,545.79 pesos. This somewhat unsatisfactory condition of the national finances may be traced to political events which will be mentioned under *History*. The foreign trade in 1901 amounted to 300,383,118 gold pesos, which which was the largest sum on record. Imports were 139,300,766 gold pesos; exports, 171,844,976 gold pesos, an increase of 10,223,079 gold pesos over 1900. Receipts of the custom-house amounted to 71,998,955 gold pesos, of which sum 27,872,696 gold pesos corresponded to imports and 44,126,259 gold pesos to exports.

Countries Leading in Trade with Chile.— The year 1901 cannot be regarded as normal in the matter of imports, the failure of the Chilean wheat harvest having occasioned an unusually large importation of wheat and flour in that year. Analyzing the figures for a normal year, 1899, we find that the five principal nations having commerce with Chile are:

Countries	Exports to in pesos	Imports from in pesos
Great Britain	110,528,378	44,338,050
Germany	20,921,999	29,748,898
France	9,334,281	5,525,162
United States	7,349,858	8,197,569
Peru	4,248,312	5,185,194

Of the Chilean products, which constituted the commerce of exportation, 84⅓ per cent belonged to mining; 10½ per cent to agriculture; 2½ per cent to manufactures; and the rest to various products and to coin. The imports of that year were classified as follows: Woolen goods, 29,058,119; raw material, 21,731,717; food-products, 17,696,659; manufactures, 14,032,630; machinery, 12,695,066; beverages and cigars, 1,268,099; sundry articles, 9,778,068.

Exports.—One of the principal exports is nitrate, the quantity and value of which has steadily increased during recent years. Chile, in fact, leads the world in the production of nitrate of soda, no other country being able to supply this mineral in commercial quantities. The value of the exported nitrate in 1899 was 96,650,282 pesos; in 1900, 109,945,156 pesos; in 1901, 118,860,131 pesos; and in 1902 there was a still more noticeable increase in the amount produced. Copper bullion is also exported in considerable quantities, the amount in 1901 being 24,479,922 kilos, valued at 19,627,114 pesos. A decrease is noted during recent years in the exportation of wheat, flour, and barley. In 1898 wheat to the value of 7,696,460 pesos was exported; in 1899, flour to the value of 996,979 pesos, and barley to the value of 2,246,866 pesos. Chile exported in 1901, honey valued at 1,034,088 pesos, and beeswax valued at 582,045 pesos; hay to the value of 260,815 pesos; wine, 68,344 pesos; and gold and silver coin, 13,150 pesos.

Mining.—Chile is the second largest silver mining country in South America, and the third largest copper producer in the world. In the northern zone, notably in the province of Antofagasta, extensive deposits of calcium borate are being worked. The annual exports from the manganese mines in Coquimbo and Atacama are between 20,000 and 25,000 tons. Other minerals, with amounts produced in the year 1900, are: Coal, 896,000 tons; iodine, 318 tons; and gold, 4,576 pounds. The nitrate of soda produced in that year weighed 1,465,935 tons.

History.— The dominion of the Incas of Peru included the northern and central portions of Chile — at least to lat. 37° S. In 1535 the Spanish conquerors of the Inca empire sent their first expedition southward along the Pacific coast; but the task of adding this territory to the Spanish possessions in Peru and Upper Peru (Bolivia) was not undertaken in earnest until 1541, nor was it brought to a successful conclusion before 1550. The courageous Araucanians offered a stubborn resistance to Valdivia's forces, and even as late as the 18th century they made good their prior claim to a large part of the country below lat. 37° S.

Independence and Adoption of Constitution.— In September 1810 was formed the first national government, to rule the country during the captivity of the king of Spain, whom the French held as a prisoner. From that time forward the design to achieve independence was never relinquished, though the events of the years immediately following were of a character to discourage patriotic aspirations. The Chileans were defeated and compelled to return to a nominal subjection; the final success was won with the help of Argentine troops under Gen. San Martin (see Argentina), and the independence of the country was proclaimed in 1818. A constitution, adopted in 1824, and remodeled in 1828, was given its final shaping — substantially the form which it still retains, though modifications demanded by the progress of the country have been made — in 1833. (See under *Government*.) Independence was recognized by a formal arrangement with Spain, and embodied in the treaty of 1844. In 1865, however, a war broke out between the mother country and Chile and Peru, hostilities continuing until 1869. After an interval of peace, the important "war on the Pacific" began.

The War on the Pacific.— For many years the rights of Bolivia and Chile, respectively, in certain mining lands bordering on the Pacific Ocean remained without definition, but in 1874

an agreement was entered into between the two countries which apparently disposed of the questions at issue. The exploitation of these lands by Chileans increasing, Bolivia saw fit to reopen the dispute by imposing an export tax on the nitrate, or "saltpetre," obtained in Bolivian territory. A Chilean company refused to pay the tax, alleging that it contravened the treaty of 1874. The Bolivian government's reply was an order for the sale by auction of the property of the offending company, on 13 Feb. 1879. Thereupon the Chilean government sent a man-of-war to seize the port of Antofagasta. It soon became apparent that Chile would be obliged to deal with Peru also in this matter; and in fact a secret offensive and defensive alliance against Chile had been formed by Bolivia and Peru in 1873. On 5 April 1879 Chile declared war against the latter republic. Tacna and the neighboring port of Arica were occupied by the presidents of Peru and Bolivia with their troops; the defense of Iquique was entrusted to a sufficient force, and at Lima a reserve of about 10,000 men was held in readiness to meet the Chileans at any point that might be attacked. The plans of the allies seemed to be well laid, and some initial successes fell to their share.

Capture of the Huáscar.— Two Chilean warships, the Esmeralda and the Covodonga, blockading Iquique, were attacked by the Peruvian frigate Independencia and the monitor Huáscar. The Esmeralda was sunk by the Huáscar, but the latter vessel on 18 October fell in with the Cochrane and Blanco of the Chilean navy north of Point Mejillones. A fight of great severity ensued. Only 86 men were left alive on board the Huáscar, out of her complement of 216, when she was obliged to surrender. This vessel was repaired and added to the Chilean navy.

Triumph of Chile.— Pisagua was captured from the Bolivians by Chilean warships. On 18 Nov. 1879, the allies were defeated in the battle of San Francisco, but before the close of the same month they scored a dearly bought success against the Chilean forces in the battle of Tarapacá. Chilean divisions commanded by Gen. Baquedano invested the town of Moquegua, and on 23 March 1880 entered Torata. Two months later a decisive contest occurred, the city of Tacna (now the capital of the Chilean province of that name) being taken on 26 May. The troops of the allies, including 5,120 Peruvians and 3,200 Bolivians, commanded by Admiral Montero, and the Bolivian president, Gen. Campero, sustained a crushing defeat. Arica, the port of this district, was attacked by the land and sea forces of Chile in June, and fell after making a desperate resistance. In order to emphasize the defeat and to cripple the more important members of the alliance, the Peruvian coast was laid waste, Mollendo was destroyed, Callao and other ports blockaded, and an expedition under Baguedano's command made ready to proceed to Lima. See PERU.

Acquisition of Territory.— As the fruits of her victory, Chile took from Bolivia the districts of Cobija and Atacamá; from Peru the coast line north of the Bolivian possessions to, and including, conditionally, the province of Tacna. Thus Chile's territory on the Pacific was extended northward from the old boundary, at lat. 24° S. One of the allies was cut off from communication with the outside world by way of the Pacific Ocean; and a strategic frontier was established against the other ally. A truce, instead of a treaty, was concluded between Bolivia and Chile after the war, the sentiment of the Bolivians being utterly averse to any permanent arrangement which did not give them access to the sea. Renewal of negotiations for a definitive treaty, which should include the concession of a seaport, has been repeatedly urged by Bolivia, but hitherto without effect.

Treaty of Ancon.— Peru, by the terms of the treaty of Ancon (1883), surrendered to Chile absolutely the valuable nitrate district of Tarapacá, but with respect to the Tacna-Arica region a peculiar convention was made. It was agreed that Tacna-Arica should be governed by Chile for a period of 10 years, and that at the end of the decade the vote of the inhabitants should decide whether it would be better for the province to revert to Peru or to be administered by Chile in the future — the country thus rejected by popular vote receiving from the other country $10,000,000 silver by way of compensation. Nearly 20 years have passed, and the Peruvian government has repeatedly urged fulfilment of the treaty, but the plebiscite has not yet been held.

Balmaceda.— Some of the amendments to the constitution which we have referred to above were adopted before the outbreak of the war with Peru and Bolivia; they embodied the liberal ideas which, in 1874, triumphed over the conservation of the proprietors of large estates — a class practically dominating the government's policy up to that time. The most forceful of the liberal leaders who effected this important political change was Balmaceda, a member of Congress in 1868, minister to the Argentine Republic at the time of the war with Bolivia and Peru, and, in 1885, elected to the presidency of the republic. The conspicuous success of President Balmaceda in his advocacy of measures relating to internal improvements, a system of popular education, the separation of Church and state, etc., created bitter antagonisms. United in opposition to him were all those who disapproved of his vigorous liberalism on principle, and all who were jealous of his power as an individual. In 1888 his cabinet was overthrown; his unyielding attitude in this crisis provoked an armed revolt; and the country was plunged into civil war, the operations of the forces of the revolutionists being directed by a junta representing Congress, and the president somewhat too readily assuming the powers of a dictator for the defense of his position. Balmaceda was defeated, and died by his own hand on 19 Dec. 1891.

The effect of this civil war upon Chile's foreign credit was deplorable. With characteristic enterprise her people have developed the resources of the country in many new directions, yet the utmost wisdom and firmness in the administration of her government have been required to bring about even such conditions of the national finances as we have stated. On the other hand, the country was fortunate in escaping a serious foreign war.

The Baltimore Incident.— The opinion prevailed in Chile when this conflict was at its height that the United States government, through Minister Patrick Egan, was showing favor to the cause of Balmaceda, and discriminating against the congressional party.

The fierce resentment felt by the latter expressed itself in an attack upon sailors of the United States cruiser Baltimore, who became involved, while on shore, in a brawl with Chilean sailors. There was a riot of the populace in the streets, and several of the Baltimore's men were seriously or mortally wounded. When a report of this indignity reached Washington, suitable representations were made by the authorities there, but unfortunately it was necessary to address such representations to a merely provisional government at Santiago. The latter not only refused the just demand for satisfaction, but also insisted in offensive terms that the men who had been assaulted should be handed over to Chile for trial as criminals. An improvement in this threatening situation occurred when the management of Chilean affairs was entrusted to President Montt, and when the demand of the United States was emphasized by the sending of two additional warships to Chile. The new president tendered apologies for the discourtesy of the provisional government, as well as for the attack upon men wearing the uniform of the United States; and compensation was made to the wounded sailors, or to the families of those who had died.

Arbitration and Limitation of Naval Armaments.— On 28 May 1902, the plenipotentiaries of Chile and the Argentine Republic concluded two important agreements, the first of which provides for the arbitration of all questions not affecting constitutional precepts, or that cannot be settled by direct negotiations. It is entitled a "General Treaty of Arbitration," and the desire is expressed in its introductory clause "to settle by friendly methods whatever questions may arise between the two countries." The second agreement is entitled a "Convention on Naval Armaments," which has "the object of removing all causes of anxiety and suspicion." The two governments "renounce the acquisition of the war vessels they have in construction and the making for the present of any new acquisitions"; agreeing, moreover, to reduce their respective fleets until they arrive at "a prudent equilibrium." In this connection we note that the launching of the first iron steamer built in Chile took place on 24 Nov. 1901 at Valparaiso. The entire ship, from keel to truck, was of domestic construction.

Government.— The national Congress is composed of two chambers: (1) The chamber of senators, with 32 members, elected for a term of six years by direct vote and by provinces, in the proportion of one senator to each three deputies; (2) the chamber of deputies, with 94 members, elected for a term of three years. Congress exerts a certain amount of control over the president of the republic by giving or refusing its confidence to the cabinet ministers appointed by him — as illustrated in the contest with Balmaceda. To represent Congress in the period of its recess, there is a Permanent Committee of 14 members, one-half chosen by each chamber.

The president of the republic holds office for five years, and he cannot be re-elected for the next consecutive period. A council of state, composed of 11 members, some of whom are appointed by the president, and others by the chambers, has the power to intervene in certain appointments, and its consent is necessary for the promulgation of the laws, the granting of pardons, and some other matters. This council is not to be confused with the cabinet, in which are but six ministers or secretaries, to wit: The minister of the interior; of foreign affairs; Church, and colonization; of justice and public instruction; of war and the navy; of the treasury; of industries and public works.

The judicial branch of the government comprises: The supreme court of justice, located at Santiago, and composed of seven members, with authority over all other tribunals of the republic; the court of appeals, for the great districts of Tacna, Serena, Valparaiso, Santiago, Talca, and Concepción; one or more justices of the peace in each department of the republic; and sub-delegation or minor district judges. Juries exist only for suits involving the question of abuse of the freedom of the press.

For the purposes of political government, Chile is divided into 23 provinces and one territory. The provinces are divided into departments, the departments into sub-delegations, and the latter into districts. For the purposes of local administration, the republic is divided into municipal circumscriptions, or communes, one for each 20,000 inhabitants. A list of the provinces follows, beginning at the north: Tacna, Tarapacá, Antofagasta, Atacama, Coquimbo, Aconcagua, Valparaiso, Santiago, O'Higgins, Colchagua, Curicó, Talca, Linares, Maule, Ñuble, Concepción, Bio-bio, Arauco, Malleco, Cautin, Valdivia, Llanquihue, and Chiloé. The territory referred to above is Magallanes, at the southern end of the continent.

Education.— In 1901 there were 1,700 public schools, with 124,265 names of scholars on the books, and an average attendance of 79,666. During the first six months of 1902, there were opened 88 new schools and three new lyceums. The University of Chile in its various departments (including law, engineering, medicine, theology, and the fine arts) has an attendance of 1,300. Other public educational institutions are: The National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lyceums of secondary instruction for men; and 15 lyceums for girls; 6 normal schools; a Conservatory of Music; a Commercial Institute; also schools of fine arts, agriculture, arts and trades, mining, for the blind and for deaf-mutes, professional schools for girls, and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic University has courses of engineering and law. There are several museums of natural history and fine arts; an Astronomical Observatory, and meteorological observatories; botanical gardens, and, in various parts of the country, 41 public libraries, with 240,000 volumes.

Army and Navy.— By the law of 31 Dec. 1896 the maximum strength of the active army was placed at 9,000 men, and in 1899 the effective strength of the active army was stated to be 6,987 men; nevertheless a system of military instruction and drill is enforced which practically renders a much larger number available for military service in an emergency — possibly 10 regiments of infantry, 6 of artillery, 8 of cavalry, and one of military engineers. Establishments for military instruction are the Academy of War, the Military School, and the School for Sergeants and Corporals. The Chilean navy includes nearly 40 vessels of various classes:

the armor-clad Capitan Prat, O'Higgins, and Almirante Cochrane; the monitor Huáscar; five protected or armored cruisers; five gunboats and torpedo-cruisers; four destroyers; 13 torpedo-boats; a training ship, etc. Naval instruction is given on board the vessel last mentioned, as well as in the academy at Valparaiso.

Railways, Postal Service, etc.— The state railways in operation in 1901 had an extent of 1,420 miles, and private railways 1,430 miles. Including several hundred miles which have been constructed since that time, we may say that there are somewhat more than 3,000 miles of railway in the republic; and the interesting statement is made that, although the government lines transported nearly 6,500,000 passengers and 2,500,000 tons of freight in 1899, "the net product was small, because rates are kept very low, for the purpose of promoting the public wealth by facilitating intercourse and the interchange of products." All the more important cities have street railways.

There are about 740 post-offices, and the total delivery in 1899 was 40,000,000 pieces. Newspapers, reviews, and other periodical publications are circulated free of postal charges, in the interest of the public education. The telegraph service is chiefly performed by the state, the private lines being only about 2,800 miles in extent, out of a total of 14,000 miles. Two lines of underground cables cross the Andes, and there are two submarine cables. Telephone companies have about 15,000 miles of wires in operation in the larger towns.

Agriculture, and Various Industries.— There are approximately 6,200,000 acres under cultivation, while the total area of arable land is probably not less than 25,000,000 acres. The production of wheat in good seasons is about 22,700,000 bushels, and of barley about 4,250,000 bushels. Other grains, fruits, and vegetables are raised in large quantities in the central provinces. The cultivation of the vine has received much attention during a score of years; in fact, this industry ranks next to cattle-raising in certain districts. Even the island of Juan Fernandez (made famous by Defoe's story of 'Robinson Crusoe') is included in the plans for industrial development. This island, lying 600 miles west of Valparaiso, belongs to Chile, and arrangements are being made quite seriously for turning to some good account the interesting little possession.

Milling holds the first postion among Chile's manufacturing industries. More than 500 flour mills, supplied with the most modern machinery, are in operation in different parts of the country, especially the provinces lying south of the capital. Wood-working and tanning, and the manufacture of woolen cloth, building materials, and coarse paper are also worthy of mention.

MARRION WILCOX,
Authority on Latin-America.

Chile Saltpetre. See NITRATE OF SODA.

Chi-Li, or Chih-Li, China, one of the 18 provinces into which the country proper is divided. It has an area of 58,949 square miles and is bounded north by Mongolia, east by the gulf called Pe-Chi-Li, and by the province of Shang-Tung, and west by the province of Shan-Hsi. Chi-Li is in many respects the most important of the Chinese provinces, containing as it does the imperial capital, Peking, the treaty port of Tien-Tsin, and the only completed line of railway in the empire. The Great Wall runs across the whole of the northern part of Chi-Li, while on the coast are the forts of Taku, and the nearest approach to a naval station belonging to the Chinese government. The province is mountainous and traversed by important rivers, notably the Pei-Ho, the Lan, the Ho-Kien, and the Hu-to. The Yu-Ho is especially important because of the canal system developed throughout its course in Chi-Li. The provincial administration is in charge of a viceroy (Tsoung-tou) and a Fou-youen or subgovernor. There are numerous towns of the first, or Fu, class, second, or Chou, class, and third, or Hien, class. These towns are surrounded by walls. There are Christian missionaries of many denominations throughout the province. In 1900 the population was estimated at 25,000,000, including a large Manchu element. They are generally engaged in commerce, Chi-Li having much communication with Russia by way of Siberia. The climate is at times severe, the Pei-Ho being generally frozen over from December to March.

Chiliasm, kĭl'ĭ-ăzm, the belief that Christ will come to earth and rule the world from Jerusalem for 1,000 years. The Latin word millennium means the same thing. The Revelation of John is the chief authority of the Chiliasts. Papias, Justin Martyr, Irenæus, Tertullian, and Lactantius were Chiliasts, but Origen was opposed to the notion. Papias, bishop of Hierapolis, says, in the millennium every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, and every berry 36 times 25 gallons of wine; and if a saint comes to pluck a berry it will cry out, "Pluck me, O saint; I am better for being plucked, praise the Lord." The Fifth Monarchy Men were, of course, Chiliasts, only they maintained that the golden age had begun, and that they were of it.

Chilkat (chĭl'kăt) **Inlet,** the western arm of Lynn Canal, an inlet in Alaska, in about lat. 50° 7′ N.

Chilkat, or **Dalton, Pass,** a route in Alaska traversed by miners in reaching the gold fields of the Klondike. It is an overland trail, which was used for many years by J. Dalton, a trader, as a pack train route and for driving in cattle. It follows a direct course, more or less independent of waterways, from Chilkat Inlet to Fort Selkirk, and is said to be less difficult than the road over Chilkoot Pass.

Chilkoot (chĭl'koot) **Inlet,** the eastern arm of Lynn Canal, an inlet in Alaska. It is again subdivided, its principal arm being called Taig, an inlet which stretches for 15 miles north and south in about long. 135° 20′ W.

Chilkoot Pass, a pass over the mountains in the northern part of Alaska, traversed by thousands of gold-seekers in the Klondike gold fields' excitement in 1897–8. By way of the Chilkoot Pass is the most direct route to Dawson City, the principal starting point to the Klondike region. The trail starts from Dyea, along the river of that name, and crosses the Pass at an elevation of 3,500 feet, to the head of Lake Lindeman, a total distance of 28½ miles. From the latter place to Dawson City is 548 miles. The Chilkoot Pass route is the old trail used for generations by the Indians, and for many years was the only one taken by miners and prospectors to reach the interior. It is by far the shortest route to the Yukon. The difficulties and dangers attending this route are many, and the steepness and roughness of the ascent have proved fatal in numerous instances, to those unaccustomed to endure hardships. The summit of the Pass is 13 miles from Dyea, the first six miles being traversed by a good wagon road. Owing to the winding of the Dyea River that stream must be crossed several times by ford or ferry. The trail then enters a narrow cañon with steep, rocky sides, which it follows to Sheep Camp, four and a half miles farther on, which point is the timber line. From Sheep Camp to the summit the rise is from 1,800 feet in three and a half miles, to 1,000 feet in half a mile, and here masses of broken rock make the ascent, which is in some places almost perpendicular, difficult and hazardous. It is at this point that the aërial tramway is built.

Chillan, chēl-yän′, Chile, capital of the province Ñuble, about 75 miles northeast of Concepcion. It consists of an ancient and a modern portion, the former built by the Spanish conquerors, who made it a place of some strength, in which the early settlers often found an asylum when hard pressed by the Araucanians. The old town was founded in 1579, and destroyed by an earthquake in 1835. The new town was built shortly after the latter date. Pop. 29,000.

Chilled Iron, iron cast in metal molds called chills, where, on account of the rapid conducting of the heat, the iron cools more quickly on the surface than it would do if cast in sand. Chilled iron is whiter and has a harder surface than iron cast in any other way. It is used in making axle-boxes, hubs, plowshares, and some hammers and anvils.

Chillianwalla, chĭ-lĭ-an-wäl'a, a village of the Punjab, about five miles from the left bank of the Jhelum, 85 miles northwest of Lahore, famous for a well-contested battle fought in its vicinity, in 1849, between the British under Lord Gough and the Sikhs, in which the former, though they remained masters of the field, lost 2,269 men. A second battle fought about six weeks after, at Gujerat, nearly annihilated the Sikh force.

Chillianwalla, Battle of, an engagement in India between the Sikh forces in considerable strength, and the British commanded by Lord (afterward Viscount) Gough, fought 13 Jan. 1849. The Sikhs were completely routed, but the loss of the British was very severe: 26 officers were killed and 66 wounded, and 731 rank and file killed, and 1,446 wounded. The Sikh loss was 3,000 killed and 4,000 wounded. On 21 February, Lord Gough attacked the Sikh army, under Shere Singh, in its position at Goojerat, with complete success; and the whole of the enemy's camp fell into the hands of the British.

Chillicothe, chĭl-lĭ-kŏth'ē, Mo., a city and county-seat of Livingston County; on the Wabash, the Chicago, Milwaukee & St. P., and the Hannibal and St. J. R.R.'s, 70 miles east of St. Joseph. It is a farming trade centre and has several manufacturing industries. It is the seat of the Chillicothe Normal School, State Hospital, State Industrial School for Girls, and St. Mary's Hospital, and is near the noted health resort, Laurel Mineral Springs. It has several daily and weekly newspapers, electric lights and street railroads, and two national banks. Pop. (1900) 6,905.

Chillicothe, Ohio, city and county-seat of Ross County, on the Scioto River, Point Creek, the Norfolk & W., the Cincinnati, H. & D., and the Baltimore & O. R.R.'s, and the Ohio & Erie Canal, 50 miles south of Columbus. It is an agricultural and coal-mining region, and has flour mills, foundries and machine shops, daily and weekly newspapers, three national banks, and an assessed property valuation of $6,000,000. Chillicothe was the first capital of the State. Ohio celebrated in May 1903, her 100th birthday as a State, and it was peculiarly fitting that Chillicothe should have been chosen as the place for the celebration, for all the historic memories of the early years of the State's existence cluster about this city. It was here that Gen. Arthur St. Clair set up his Territorial government, as governor of the Northwest Territory; it was here that the agitation for Statehood gathered momentum, led by a quartet of Chillicothe men — Thomas Worthington, Nathaniel Massie, Edward Tiffin, and Duncan McArthur. It was here, on 29 Nov. 1802, that a constitution for the State was adopted, in compliance with the requirements of the Federal Constitution; and, finally, it was here, in the spring of the succeeding year, that the young State was ushered into being and Edward Tiffin elected her first governor. Pop. (1900) 12,970.

Chil'lies, the fruits of the Capsicum, used to make cayenne pepper, pickles, and chilli vinegar. See CAYENNE PEPPER.

Chil'lingham White Cattle. See WHITE CATTLE.

Chil'lingworth, William, English Anglican divine and controversialist: b. Oxford October 1602; d. Chichester, Sussex, 30 Jan. 1644. He was matriculated in Trinity College, Oxford, in 1618, and in 1628 was made a Fellow of the same college. Having been won to the Roman Catholic Church through the arguments of the Jesuit Father Fisher, Chillingworth entered the English College at Douai, where Laud, then bishop of London, by correspondence implanted in his mind doubts regarding the foundation of the Roman Catholic system; and, resolved to make a thorough investigation, Chillingworth returned to England after a few months abroad. The result was that he declared for Protestantism and in 1634 set forth, in a treatise that was not published and is now lost, the grounds of his conclusion. Laud procured his nomination to a church benefice in 1635, but Chillingworth's scruples about subscription to the 39 articles and acceptance of the Athanasian creed was an obstacle that could not then be overcome. In 1637 was published his great work, 'The Religion of Protestants: a Safe Way to Salvation.' In the preface he explained away his former scruple about the 39 articles, and the next year was named chancellor of Sarum with a prebendaryship annexed. When Gibbon in his autobiography explains his own religious experiences, which closely resemble those of Chillingworth, he insinuates that the reconverted convert afterward repudiated privately the cardinal doctrines of the Church of England.

Chillon, shē-yôn or shĭl'ŏn, a castle, Switzerland, on the Lake of Geneva, 6½ miles southeast of Vevay, once an important stronghold of the counts and dukes of Savoy, and the prison-house of Francis Bonivard, prior of St. Victor, Geneva, from 1530 to 1536. It stands on a rock rising 22 yards from the shore of the lake, and is reached by a bridge. It probably dates from the 9th century. Bonivard was confined in it by the Duke of Savoy because he had assisted the republic of Geneva, with which the Duke was at enmity. Byron's poem, 'The Prisoner of Chillon,' founded on this incident, has made it well known.

Chilo, kī'lō, one of the seven wise men of Greece. See CHILON.

Chiloe, chē-lō-ā', Chile, province of, consists of the island of that name on the west coast, which is separated from the mainland by a narrow strait on the north and by a gulf 30 miles wide on the east, and has a length of 115 miles, and an extreme breadth of 43 miles, and of a number of neighboring islets, mostly uninhabited; total area, 3,995 square miles; almost all Indians living on the principal island. Chiloe proper is hilly in the interior, and everywhere covered, except immediately along the shores, with nearly impassable forest. The climate is mild and not unhealthy, although inordinately wet. The Indians belong to a subdivision of the Araucanian family; they are a gentle and honest race, mostly engaged in fishing and in lumbering, timber being at present the chief export from the island, though immense deposits of coal have been reported. Oysters, which are very scarce elsewhere in South America, are found in large quantities in the Chiloe Archipelago. The potato here, as in other parts of South America, grows wild. The capital, Ancud, on the north coast, has a good harbor, is the seat of a bishop, and has a population of (1895) 3,182. Pop. of province, 82,362.

Chilognatha, kī-lŏg'na-thạ. See DIPLOPODA; THOUSAND-LEGS.

Chilon, kī'lŏn, one of the so-called seven wise men of Greece. He flourished about the beginning of the sixth century B.C., and was a native of Sparta, and one of the Ephori, a body of magistrates which he is even said to have originally introduced. A collection of his sayings may be seen in Orelli's 'Opuscula Græcorum sententiosa' (1819).

Chilopoda, kī-lŏp'ō-dạ, a group of myriapods represented by the centipede (q.v.). In these animals the body is composed of from a few to between 100 and 200 segments; the body is flattened, and there is but a single pair of legs to each segment. There are three pairs of mouth-appendages,— that is, a pair of jaws succeeded by two pairs of accessory jaws; while the first pair of legs are modified to form the poison fangs, which contain at their base a poison sac, the ducts from which open by a minute pore, out of which the blood oozes when the creature bites. The *Chilopoda* are divided into four families,— *Lithobiidæ, Scolopendridæ, Geophilidæ,* and *Scutigeridæ.*

Chilperic, chĭl'pĕ-rĭc, two Merovingian kings: 1. CHILPERIC I., king of Soissons: d. 584. He never was acknowledged king of all the Frankish land, but divided the kingdom with his three half-brothers; he had, however, great power throughout their dominions by reason of his influence with the nobles. The murder of his wife, Galswintha, involved him in a war with her brother-in-law, Siegbert of Austrasia. 2. CHILPERIC II., king of Neustria: d. 720. He was several times at war with Charles Martel (q.v.), but was forced to submit to him, and was in 719 made king of the Franks.

Chil'tern Hills, a range of flint and chalk hills in England, extending through Oxford, Hertford, and Buckingham shires; loftiest summit, 905 feet. These hills were anciently covered with forests, and were infested by numerous bands of robbers. The steward of the Chiltern Hundreds is an officer of the Crown, appointed to protect the people of Bucks from the robbers of the Chiltern Hills. This office is now a sinecure, but as a member of Parliament can only resign his seat by accepting office, he accepts this sinecure, which he immediately vacates for the benefit of others. The stewardship of the manors of East Hundred, Northshead, and Hempholme, are other sinecure offices made use of for the same purpose.

Chiltern Hundreds. See CHILTERN HILLS.

Chil'ton, Robert Hall, American soldier: b. London County, Va., 1817; d. Columbus, Ga., 18 Feb. 1879. He graduated at West Point 1837; became captain of the First Dragoons 6 Oct. 1846, and was brevetted major for gallant and meritorious conduct at Buena Vista, Mexico, 23 Feb. 1847. In this battle Jefferson Davis, afterward president of the Southern Confederacy, but then colonel of the First Mississippi

Rifles, was severely wounded, and Chilton bore him from the field, a life-long friendship resulting from the event. He became a brigadier-general in the Confederate service 20 Oct. 1862, was chief of staff to Gen. Lee, and inspector-general of the Army of Northern Virginia. After the war he was engaged in business in Columbus, Ga.

Chimæra, kī-mē'ra, in classic mythology, a monster, breathing flames, with the head of a lion, the body of a goat, and the tail of a dragon, which laid waste the fields of Lycia, and was at last destroyed by Bellerophon, with the help of Pegasus. Her form is described by the poets as an unnatural mixture of the most incongruous parts. Therefore the name of chimæra is used for a nondescript, an unnatural production of fancy. According to some Chimæra was a volcano in Lycia, around the top of which dwelt lions, around the middle goats, and at the foot poisonous serpents. Bellerophon is said to have been the first who rendered this mountain habitable.

Chimæroidea, one of the primary divisions of fishes, the equivalent of *Holocephali* (q.v.).

Chimango, shē-măn'gō, a carrion hawk of South America (*Ibycter chimango*), closely related to the Caracara (q.v.) The plumage is black, with whitish streaks on neck and breast in the adult, which are lacking in the young. These birds are particularly numerous in the Falkland Islands. Darwin describes them as without fear of man, frequenting inhabited regions and feeding on all kinds of refuse.

Chimborazo, chēm-bō-rä'sō or chĭm-bō-rä'zō, Ecuador, a peak of the Andes, in the province of Quito. Though not the loftiest summit of the Andes, it rises 20,700 feet above the sea-level, and its top is covered with perpetual snow. Through the transparent air it presents a magnificent spectacle from the shores of the Pacific. This mountain was ascended in 1802 by Humboldt and Bonpland, who, though they failed to reach the summit, yet mounted to the great height of 19,390 feet, a greater elevation than ever was before attained by man. Their further ascent was prevented by a chasm 500 feet wide. The air was intensely cold and piercing, and owing to its extreme rarity blood oozed from their lips, eyes, and gums, and respiration was difficult. In 1880 the summit was reached for the first time by Mr. E. Whymper.

Chimere, shĭ-mēr', the upper robe to which the lawn sleeves of a bishop are attached. In the Roman Catholic Church it is of purple silk, and of black satin in the Church of England.

Chimes, music mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given musical scale. The hammers are lifted by levers acted upon by metallic pins, or wooden pegs, stuck into a large barrel, which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism that it is set in motion by it at certain intervals of time, usually every hour, or every quarter of an hour. The music thus produced may consist of a direct succession of the notes constituting an octave, frequently repeated, or it may be a psalm tune or short popular air in the key to which the bells are tuned. This species of mechanical music most probably had its origin, like clock-work itself, in some of the monastic institutions of Germany, in the Middle Ages. The first apparatus for producing it is said to have been made at Alost, in the Netherlands, in 1487. The chime mechanism may be adapted to act with the large bells of a church steeple, by means of wheel-work strong enough to raise heavy hammers; or a set of bells, of different diameters, may be arranged concentrically, within one another on one common axis, sufficiently small to be introduced into the frame of a clock, or even of a watch. The chime mechanism is sometimes so constructed that it may be played like a piano, but with the fist instead of the fingers. This is covered with leather, that the blow on the key may be applied more forcibly. Difficult as the performance is, some players can execute compositions consisting of three parts, and even produce trills and arpeggios. Burney relates that the chime-player Scheppen, at Louvain, laid a wager with an able performer on the violin that he would execute a difficult solo for the violin with the bells, and won his wager. Potthoff, organist and chime-player at Amsterdam, played his bells with the facility of a performer on the pianoforte, although every key in his apparatus required a force equal to a two-pound weight. Burney heard him perform some fugues in 1772. The finest carillons or sets of musical bells are to be found in Belgium, at Bruges, Ghent, Antwerp, Namur, and Mechlin. These consist of from 40 to 50 bells, the largest weighing several tons, the smallest only a few pounds. Instead of bells, sometimes bars, wires, or tubes are used.

Chim'ney, an upright structure of stone, brick, etc., enclosing one or more flues or passages through which smoke and gas from the fire in a stove, furnace, or fireplace may escape into the open air. How far the Greek and Roman architects were acquainted with the construction of chimneys such as we have is a matter of dispute. That kitchens and baths were provided with chimneys appears certain, but how far other apartments were so provided is doubtful. An ancient mosaic found in Algeria, and representing a Roman country mansion, shows chimney stacks projecting above the roof. Of course in southern Europe fires are less necessary than in northern Europe. Chimneys require much attention to make them secure and prevent their smoking, so great an annoyance to domestic comfort. It seems at present to be acknowledged that it is much better to exclude the cold, damp air from the flues, by narrowing the aperture at the top, than to give larger vent to the smoke at the risk of admitting a quantity of air to rush down the flue. For this reason chimney pots are of great use. In Prussia, where the architectural police is strict, great attention is paid to the erection of chimneys, and to the regular sweeping of them, the chimney-sweepers being bound to sweep the chimneys of a certain number of streets within a regular time. The longer a chimney the more perfect is its draft, because the tendency of the smoke to draw upwards is in proportion to the difference of weight between the column of air included in a chimney, and an equal column of external air; and the heated air in the chimney being lighter

than the external air, the longer the chimney is the greater is this difference. Short chimneys are liable to smoke, and fireplaces in upper stories are therefore more apt to smoke than those in the lower ones. Two flues in the same chimney should not communicate with each other short of the top. In manufactories tall chimneys are built for the purpose of carrying away the great quantities of smoke, which would otherwise be highly deleterious to the health of those living in the neighborhood. In chemical works, especially, these chimneys are sometimes built to an immense height. Such chimneys are now built from the inside, by which the expense of the scaffolding is saved.

Chimney-swallow, a species of swallow (*Hirundo rustica*) so-called because of its habit of selecting chimneys and similar sites for its nests. The bird covers the whole of Europe and extends into China, and is one of the most common of the bird kingdom throughout the world, for it has relatives in Africa and America, where the chimney-swift is recognized as belonging to the same group. See SWIFTS.

Chimoio, Africa, a town in the Portuguese possessions, near the border of Mashonaland, 118 miles from Beira on the coast. A railway connects it with Fontesvilla, 28 miles northwest of Beira, and is being continued inland to Salisbury.

Chimpanzee, chĭm-păn'zē or chim-păn-zē', an anthropoid ape (*Anthropopithecus niger*), native in the equatorial region of Africa. In size it is between the orang and the gorilla, although when seen it exhibits little of its stature, for it rarely stands upright, its habitual attitude being that of a bent creature, supporting itself on its long forearms. As the chimpanzee is arboreal in its habits, its hands and feet are larger, in proportion, than those of other apes, and this enables it to climb to the topmost branches of the great trees for soft fruits and insects, birds' eggs, and similar fare. The appetite for fruits makes the chimpanzee a menace to the plantations, especially when bananas are in edible condition. The natives guard the plantations, and as the animal is timid toward man this usually saves the crop; but when he cannot run away, the chimpanzee at bay is a formidable foe, using his long, sinewy arms and sharp teeth with deadly effect. He is even said to be a match for the leopard.

The habits of chimpanzees are largely nocturnal, and their long-drawn, loud, and terrifying cries may be heard at great distances. In the black recesses of the jungles, these cries would serve as calls to stragglers of the troop, and might also, by their suggestion of large numbers, scare away enemies. The nests whereon the females rest when bringing forth and rearing their young, are platform-like structures, built high in the tree-tops; these are deserted as soon as the young one is able to travel.

Chimpanzees are more nearly human in their action and intelligence than any of the other large apes, and many experiments have been tried in training and teaching them. Indeed, they have been made the subject of careful psychological investigation in various ways. They are playful and amusing, and exhibit none of the facial sombreness and ferocity of the gorilla, which they so closely resemble in structure.

The skin on the face of the chimpanzee is naked, yellowish in color, and surrounded by the long black hair which hangs about the head and shoulders. The body is covered with shorter, but equally shining black hair.

Various records are extant as to the training and habits of famous specimens of this species, kept under observation in various zoological gardens. Consult: Hartmann, 'Anthropoid Apes' and general works on natural history. See APE; GIBBON; GORILLA; ORANG-UTAN.

Chin-fly, a horse bot-fly (*Gastrophilus nasalis*) which has been confused with the horse-bot (*G. equi*). This species is smaller than the bot, densely hairy, with the thorax rust-colored. The abdomen is whitish at base and the wings are not spotted. It deposits its white eggs on the hairs about the lips or in the nostrils of equine animals, within easy reach of the tongue, and it is probable that the maggots hatch out more promptly than in the other species. It has been found common and troublesome in Kentucky. Also, in Europe it is a parasite of the ass, mule, and goat. See BOT-FLY; HORSE BOT-FLY.

Chin-Kiang, chĭn-kē-ăng', or **Chin-Kiang-Foo,** a city of China, in the province of Kiang-Su, on the right bank of the Yang-tse-Kiang, near the junction of the Imperial Canal, 150 miles from Shanghai. In 1861 it was made a treaty port. It is advantageously situated for trade, as the river is navigable for large vessels. Extensive suburbs stretch along the river and the canal. Chin-Kiang forms the key of the empire, as the blockade of the river and canal at this spot would in a great measure prevent all communication between the north and south. The city was formerly fortified, but has been dismantled. In 1842 it was taken by the British after a determined resistance on the part of the Manchu garrison. It was also taken by the Tai-ping in 1853. They defeated the Imperialists here on 1 Jan. 1856, and finally abandoned the city in 1858. Cotton goods form the chief import, and the exports are numerous and valuable. Pop. 200,000.

Chin-Wang, chĭn'wăng', a city of China, in the province of Chi-Li. It was declared a treaty port and opened to foreign commerce in 1898. Pop. (1900) estimated 39,000.

China, or **Chinese Empire,** an immense territory, stretching from the centre to the eastern extremities of Asia, and occupying nearly a third of the surface of that continent; between lat. 18° 20′ and 56° N., and lon. 73° and 135° E.; bounded north by Siberia; west by Russian Turkestan, the Russian Pamir, Cashmere, etc.; south by India, Burma, Anam, and the China Sea; east by Siberia, Korea, and portions of the North Pacific Ocean (Eastern Sea, and Yellow Sea); greatest length, west to east, about 3,000 miles; greatest breadth, 2,400 miles; area, about 4,300,000 square miles. This vast empire is usually divided into China Proper, which forms its nucleus, and the following Dependencies:

Manchuria (Chinese, *Tung-san-Sheng*) comprises the extreme northeast portion of the Chinese empire. It is bounded on the north by the river Amur and Russian territory, east by the Russian maritime province, west by Mongolia, and south by the Gulf of Liao-Tung and Korea. It is divided into the three provinces

Mukden, Hei-lung-Kiang, and Kirin, the respective capitals of which are Mukden, Tsitsihar, and Kirin. The total area is 280,000 square miles. *Mongolia* is the name given to the vast stretch of desert land which, interspersed with infrequent oases, stretches across the greater part of the north of China along the Siberian frontier. A large part of its area of 1,288,000 square miles is taken up by the Gobi desert. The population is almost entirely nomadic. The chief town is Urga. *Eastern* or *Chinese Turkestan* is a mountainous region lying between the western tract of the Gobi desert and the Pamirs, and enclosed north and south by the ranges of the Tian-Shan and the highlands of Cashmere and Tibet. It possesses an area of 431,000 square miles. The principal towns are Kashgar and Yarkland. *Sungaria* or *Dzungaria*, the smallest of the tributary states of China, lies to the northwest of Turkestan, on the banks of the Ili River, at the junction of Mongolia, Turkestan, and the Russian province of Semipalatinsk. Its area covers 147,900 square miles, and its population is said to amount to half a million. *Tibet* comprises the mountainous region lying between Turkestan and Nepal and Assam. On the east it adjoins China Proper, and on the west Cashmere. It covers an area of 651,500 square miles. Its capital is Lassa.

The authority exercised by the Chinese over their dependencies is by no means uniform. Some of the dependencies are closely connected with the empire, while others are merely tributary; and Tibet is so independent as to do little more than profess a nominal allegiance to the emperor of China, as the suzerain of the country.

CHINA PROPER (anciently *Cathay;* Chinese, *Chung Kwoh,* "Middle Kingdom") forms the southeastern portion of the empire, and occupies less than a third of its whole extent. Not including the island of Hainan, it lies between lat. 20° 20′ and 41° N., and lon. 98° and 123° E. China is bounded, north by one of the most remarkable of human structures, the Great Wall, which proceeds directly over mountain and valley, and for a length of 1,250 miles forms the barrier between China and Mongolia; on the west it is bounded by Tibet; on the south by Burma, Tonkin, and the China Sea; and on the east by the North Pacific Ocean. There are 18 provinces with area and population as follows:

Provinces	Area; English square miles	Population	Population per square mile
Chi-Li (Pe-chi-Li)	115,800	20,937,000	172
Shan-Tung	55,970	38,247,900	683
Shan-Si	81,830	12,200,456	149
Honan	67,940	35,316,800	520
Kiang-Su	38,600	13,980,235	362
Ngan-Hui	54,810	23,670,314	432
Kiang-Si	69,480	26,532,125	382
Che-Kiang	36,670	11,580,692	316
Fu-Kien (Fokien)	46,320	22,876,540	494
Hupeh	71,410	35,280,685	492
Hunan	83,380	22,169,673	266
Shen-Si	75,270	8,450,182	111
Kan-Su	125,450	10,385,376	82
Sze-Chuen	218,480	68,724,890	314
Kwang-Tung with Hainan	99,970	31,865,251	319
Kwang-Si	77,200	5,142,330	67
Kwei-Chau	67,160	7,650,282	114
Yünnan	146,680	12,324,574	84
Total	1,532,420	407,253,029	av. 266

Physical Features.— The coast-line, forming an irregular curve of about 2,500 miles, gives about one mile of coast for every 500 miles of area. It is not deeply penetrated by gulfs. the only one of great extent being that of Pe-chi-Li in the northeast, but numerous indentations form safe and capacious roadsteads. With exception of a bold and rocky peninsula in the province of Shan-Tung, the shore from the Gulf of Pe-chi-Li south to the island of Chusan is flat, and in many places so little raised above the sea-level as to be extensively inundated during a continuance of strong winds. From Chusan to the mouth of Canton River it is usually rocky; from this point southwest, flats chiefly prevail. A peninsula of some size juts out in the extreme south from Kwang-Tung province, separated from which by a narrow strait is the large island of Hainan. Chusan Island and archipelago are also of importance, but most of the innumerable islands dotted round the Chinese coast are very small. The large island of Formosa, off the east coast, now belongs to Japan. Many lighthouses have been planted along the coast. Owing to the exclusive policy of the Chinese and their dislike of foreigners, a great part of the interior of the country must be regarded as still almost a *terra incognita.* The surface is mostly mountainous. The general slope is from west to east, and the mountains are a continuation of those of Tibet and Central Asia. Branches of the Kuenlun traverse almost the whole breadth of China. In Western Sze-Chuen, there are peaks reaching the height of 25,000 feet. In the north the Nan-shan branch of the Kuenlun range runs under various names along the northeast of China till it reaches the frontier of Manchuria, north of Peking. A third great mountainous region of China is in the southeast, where extensive chains stretch on the south of the Yang-tse-Kiang all the way from the highlands of Yunnan to the eastern seaboard. Between the main mountain systems, and following courses which may be roughly described as parallel, run the two great rivers of China, the Hoang-Ho, and the Yang-tse-Kiang. Here lie the central and richest Chinese provinces. On both sides of the lower Hoang-Ho is an immense delta plain, consisting generally of a deep alluvial soil of unparalleled fertility. This great plain has a length of not less than 700 miles, and a width varying from 150 to 500 miles, and probably maintains a denser population than any other portion of the earth's surface of similar extent.

Rivers and Lakes.— No country of the world is better watered than China. The Yang-tse-Kiang, which traverses the country centrally from west to east, has a course of some 3,000 miles, and forms a splendid inland waterway up which ocean steamers can sail for 1,100 miles to Ichang, a port opened to foreign trade. The Hoang-Ho, farther north, and next in size, has a course of over 2,600 miles, but is of much less value for commerce, being comparatively shallow, subject to tremendous and disastrous floods, and apt to shift its course. The Grand Canal connects the lower course of the Yang-tse with that of the Hoang-Ho, starting from Hang-Chau Bay in the south, and being continued to Tien-Tsin in the north, thus completing what is said to be the most magnificent system of water communication in existence. This great waterway has, however, been greatly

CHINESE EMPIRE.

neglected, and threatens to become unnavigable, unless the necessary repairs are taken in hand. Besides these rivers and their numerous tributaries, the most deserving of notice are the Si-Kiang in the south, of considerable size but still more commercial importance, having at or near its mouth Canton, Hong Kong, and Macao; and the Pei-Ho, which, though much smaller, forms a waterway between Peking and the Gulf of Pe-chi-Li. The lakes of China, though rather numerous, are not individually of great extent. Perhaps the largest is Tung-Ting, in the province of Hunan, which furnishes an affluent to the Yang-tse-Kiang, and has a circuit of 270 miles. Po-yang, in the province of Kiang-Si, is 90 miles long by 20 broad, abounds in fish, and is remarkable both for the picturesque scenery around it and the numerous beautiful and populous islands which it encloses.

Climate.— The greater part of China belongs to the temperate zone, only a small portion of the south lying within the tropics. It has what is called an excessive climate, and has a far greater range of temperature than is usual within the same parallels of latitude. Peking, the capital, is nearly a degree south of Naples, and yet while the mean temperature of the latter is 63°, that of the former is only 54°. In summer, however, the heat reaches from 90° to 100° in the shade, while the winter is so cold that the rivers usually continue frozen from December to March. At Hong Kong, notwithstanding the influence of the sea in checking extremes, the thermometer in June and July, the hottest months, frequently stands at 90°, and in winter, from December to March, sinks nearly to the freezing-point. At Canton, snow, though rarely, has sometimes fallen. At Shanghai, lat. 31° 20′, the range of temperature is still greater, the maximum reaching 100°, and the minimum falling at least 20° below freezing, or 12° F. In the south the climate is of tropical character, the summer heat rising to 120°. Here the southwest and northeast monsoons blow with great regularity, and nearly divide the year. In the north they are more variable. The violent hurricanes known as «typhoons» are not uncommon in the Chinese seas.

Geology.— The geology of China is very imperfectly known, but there is no doubt that all the leading geological formations are found in it. Primary formations are most largely developed in the mountainous regions of the west, where granite, gneiss, and primitive schists prevail. The same formations exist to a more limited extent in the southeast, where bleak mountains of granite give that district a distinguishing feature. The secondary formation, including the carboniferous and cretaceous system, occupies a considerable area, and the coal fields of China are perhaps the most extensive in the world. The Tertiary formation has its largest development in the northeast, and probably underlies the greater part of the alluvium which covers the surface of the Great Plain. A surface feature of a great part of northern China is the earthy deposit known as «loess,» which covers an immense area both of mountain and valley, forming a yellowish-brown soil of the utmost fertility.

Mineralogy.— China is well supplied with useful minerals. Gold, though not thought to be very abundant, is obtained by washing the sand of several of the rivers, particularly those of the upper branch of the Yang-tse, and in the mountainous and almost inaccessible regions of Yunnan. Silver is also found in the same regions. The quantity suffices for a large annual export, chiefly in payment of opium and other goods. Copper, besides forming the ordinary currency in limited mercantile transactions, is worked to a great extent for economical purposes. Mercury or quicksilver, in the form of cinnabar, is of frequent occurrence, and is much used both for coloring and medicine. Its poisonous fumes are even said to be inhaled like opium or tobacco. There is no want of iron either in the form of rich hematite, or in that of the carbonate of the coal-measures, but smelting is not carried on to any considerable extent. Lead, tin, and zinc exist, but owing either to a deficiency in quantity, or ignorance of the method of extracting them economically from the ores, the native product falls short of the consumption. Some authorities reckon the coal-fields of China as equal in value to all the other coal-fields of the world together, and some time they must certainly become of immense economic importance to the country. The area of the coal deposits in the southeastern part of the province of Hunan is about 21,700 square miles. The coal occurs both bituminous and as anthracite, but as most of it is raised without machinery, by the rudest forms of manual labor, the price is necessarily high, and the quantity mined is trifling. Defective means of communication partly account for backward state of coal-mining. Coarse mixtures of culm and earth are used as fuel to some extent, while other still more inefficient and less attractive compounds are employed. Among other mineral substances may be mentioned nitre, alum, gypsum, and more important than all, inexhaustible beds of kaolin or porcelain earth, the early possession of which by the Chinese, and their great skill in working it, has given the name of China to the beautiful ware which so long monopolized the market of Europe. Jade appears to be found in China in its most perfect form, and is there held in the highest estimation, being wrought into trinkets and into ornamental articles of various kinds. Various precious stones also are found, and agates especially are admirably wrought.

Zoology.— China is said to possess about 200 indigenous mammals and over 760 birds, most of which are found in adjacent parts of Asia, and some are also European. Among the *mammalia* are several species of the monkey tribe, one of them being the so-called Cochin-China monkey, marked by a striking variety of stripes and colors. Another is the proboscis monkey. Tigers and leopards were at one time so numerous as to have been regularly hunted in state by the emperors, but these animals have been extirpated except in certain localities, especially in Yunnan and Manchuria. A small species of wild cat is sought for as game, and served at table as a delicacy. Bears are frequently mentioned, and their paws are said to be in high request among Chinese gourmands. Other *carnivora* include the lynx, badger, civet, marten, and weasel. The elephant, rhinoceros, and tapir occur in some localities of the southwest. Both camels and elephants are employed as domestic animals, the former only in the north. Bats are numerous, and one large species is extensively used as food. To the indige-

nous animals already mentioned may be added the wild hog, porcupine, raccoon-faced dog or Chinese fox, and several species of rats, more especially one of a yellow color, larger than those of Europe, and much prized for its skin. Several species of deer are met with, one being the musk deer. In birds, as above indicated, China is extremely rich. Pheasants in particular are famous, both for variety and for beauty. Among others are the well-known gold and silver pheasants, the former one of the most gorgeous of the feathered tribe. The peacock is also indigenous, and fowls akin to our common domestic variety. Birds of prey include eagles, falcons, owls, etc. Song birds, such as the nightingale and thrush, are well known and much appreciated. Water-birds of almost every kind abound, such as ducks, geese, swans, pelicans, etc. The mandarin-duck is a Chinese species famed for beauty of plumage. But perhaps the most remarkable water-bird is the fishing cormorant, the training of which forms an important employment, and is so complete, that when a bird has secured a fish which from its size he cannot manage singly, his neighbor darts down and assists him to complete the capture. The reptiles of China include several large serpents not regarded as dangerous, and one species at least which is very venomous. Tortoises are common, and are often kept in gardens and pleasure-grounds. No country is said to possess a greater number and variety of indigenous fishes than China. All its waters — its rivers, lakes, pools, canals, and even ditches — are full of fish. This is partly owing to the artificial means by which the natural supply is vastly increased. Boat-loads of water containing spawn are carried to distant parts and deposited in ponds, where the fry are fed with various species of lentils, or with yolks of eggs.

Botany.— The flora is naturally extensive and varied. In the south it is tropical in character, farther north, sub-tropical, and still farther there are many plants and trees identical or nearly so with those of middle Europe. Among trees commonly found in China the bamboo (if this gigantic grass should be called a tree), as in India, is perhaps the most valuable of all on account of the almost endless uses to which it is applied. Oaks of different species are common, and the economical uses of the various parts — the wood, bark, and galls — are perfectly understood. Even the acorns of some kinds are ground into flour, and converted into a farinaceous paste. Coniferous trees are represented by numerous forms of pine, yew, and cypress, some of them of great economic importance. The tallow and camphor trees abound, as also the mulberry and paper-mulberry. Palms are not abundant, but the cocoanut flourishes in Hainan and on the adjacent coast. The Pandanus or screw-pine is abundant in the south, but the date-palm is not known. The chestnut, walnut, willow, and hazel are all indigenous. The fruit-trees include the fig, mango, guava, lichi, loquat, orange, peach, pomegranate, quince, nectarine, plum, apricot, etc. Plants producing lacquer or varnish, and medicinal herbs of various kinds (including ginseng), are also well known. Among shrubby plants, the first place is unquestionably due to the tea-plant, of which further mention is made below. The next in importance is the mulberry, on the leaves of which the silkworm is nourished. Among flowering shrubs or trees are the rose, with its numerous varieties, the hydrangea, the passion-flower, the lagerstrœmia, Indian pride, the Chinese tamarisk, various species of cactus, and the camellia. The Chinese flora is particularly rich in varieties of the azalea. Altogether the abundance of flowering-plants, shrubs, and trees is a feature of the Chinese flora. Dwarfing is a favorite occupation, and the Chinese horticulturists force plants to assume the most fantastic forms.

Agriculture.— This first of arts has always been held in the highest veneration in China. The emperor himself, to do it honor, repairs annually to an appointed spot with a large retinue, and, taking the plow in his hand, draws a furrow and sows some seed. A similar festival is held in the capital of each province. The agriculture of the Chinese has been lauded in high terms by almost all who have had opportunities of witnessing it. In the important processes of stirring the soil, eradicating weeds, economizing manures, and applying them in the form best fitted to nourish the crop and bring it to maturity, they display unwearied industry and no small degree of skill. On account of the dense population, every square foot of land that can be made to raise food is kept in constant service and at the highest point of fertility. Even mountain slopes are terraced and tilled, sometimes to the height of 8,000 feet, wheat or other grains being the usual crop in these places. The farmers slavishly follow a routine which has been handed down without change from untold generations, and not only display no inventive powers themselves, but obstinately refuse to profit by the inventions of other countries. Their implements generally are of the rudest description, and though improved European and American plows have been sent out and urged on their acceptance, they reject them with disdain, preferring a rude shapeless thing drawn by oxen or buffaloes. They appear to have no idea of raising improved breeds of horses and cattle by the arts so well known and practised in other countries. The only animal of which the Chinese can be said to have furnished us with an improved breed is the pig. Their asses and mules are also of good quality. Rice, as the principal food of the people, is the staple crop. The rich alluvial plains which cover a great part of the surface are admirably adapted for its culture, and, by careful management, yield amazing crops — not one merely, but in the south latitudes two crops of rice in the hot season, besides a winter green crop usually plowed in for manure. In the neighborhood of Ningpo, lat. 30°, where the summer is too short to mature two crops in succession, they are still obtained by an ingenious device. The rice is sown in seed-beds, and afterward planted out in drills. A first planting is made about the middle of May, and in two or three weeks after, a second planting is made in the intervals between the previous drills. When the first crop is reaped in August the other is still green, but being stirred and manured, and having plenty of light and air, comes rapidly forward, and is reaped in November. The whole steps of the process are conducted with the greatest care; and the water-wheel, worked by the hand, or by an ox or

buffalo, is kept in daily operation from the first planting of the crop till it is nearly ripe. The reaping instrument is not unlike our sickle; and the crop, when not thrashed on the field, as is generally the case, is carried home and built up into stacks, resembling those of Europe. The rice is not always grown on alluvial flats, and there is a variety, known as dry-soil rice, that is cultivated like any ordinary cereal. The sides of the hills are often laid out in a succession of gently sloping terraces, and planted with rice in drills running across the declivity, thus admitting of being irrigated by streams which, retarded at every step, move slowly forward without acquiring any impetus. The same mode of culture is also practised with other crops. In the north the crops principally consist of our ordinary cereals and legumes — wheat, barley, pease, and beans. Vegetables of various kinds are generally grown for household use. Varieties of the cabbage tribe are extensively cultivated for the sake of the oil extracted from the seeds. The raising of green crops to be plowed in as manure is generally common where rice is cultivated. Two kinds of plants are chiefly employed; one of them, a trefoil, grown on ridges similar to those which form the intervals in our celery beds. Among other crops regularly and extensively grown may be mentioned sugarcane, used chiefly in a green state; indigo; the castor-oil plant; and numerous plants grown for their roots. The opium poppy is now so extensively cultivated that there is a much smaller demand for the imported article than formerly. Maize, buckwheat, and tobacco may also be mentioned as cultivated crops. Three other plants of the greatest economical importance, and so extensively grown as to form important branches of Chinese agriculture, deserve a separate notice. The first is the mulberry. Judging from the quantity of raw silk annually exported, and the general use of silk for dress, especially by the wealthier classes of the country, it is evident that a large area must be appropriated to the cultivation of this tree, and millions of persons employed in the different processes connected with it. The plants are not allowed to exceed from four to six feet high, and are planted in rows, often along the banks of canals. The mulberry farms are small, and are generally worked by the farmer and his family. The Chinese silk is much heavier than the Italian, and preferred in fabrics requiring lustre and firmness. Whether it owes its quality to a particular variety of mulberry, or to the climate or soil, has not yet been definitely ascertained. The second plant more particularly deserving of notice is the cotton-plant. That cultivated in China is of the same species as the ordinary American, namely, *Gossypium herbaceum*. The plant producing the yellow cotton used in the manufacture of nankeen appears to be of a more stunted habit than the ordinary cotton. It is chiefly cultivated in a level tract around Shanghai, forming part of the Great Plain, and is the staple summer crop. The culture differs little from that of other cotton countries, more especially the cotton districts of India. The third plant, the tea-plant, is cultivated in two varieties — *Thea bohea* and *Thea viridis;* and though it was long supposed that the former only yielded black and the latter green tea, it is now known that both kinds of tea are obtained from each. The great tea provinces are Kwang-Tung, Fu-Kien and Che-Kiang. In the first the *Thea bohea* is grown, and the tea is of inferior quality; in the other two the *Thea viridis*, which yields all the finer qualities, and furnishes the greater part of all that is exported to Europe. In these two provinces, where the culture is most extensive and carried to its highest perfection, the tea plantations are usually formed in a deep rich loam, never on the low lands, but on the low hilly slopes. The tea farms, as common throughout China in all kinds of culture, are small, and their management, including not merely all the steps of the culture of the plant, but the preparation of the leaves for market, is almost invariably confined to the farmer and his family. The leaves are gathered thrice — about the middle of April, when the leaf-buds are beginning to unfold; about a fortnight after, in the beginning of May, when the leaves are fully grown; and when the leaves again are newly formed. The first gathering yields the finest and most delicate tea, but with considerable injury to the plants.

Manufactures.— In all the arts necessary to the comfort of life, and in not a few of those conducive to luxury, the Chinese have made considerable progress. One peculiar feature in their processes is the general absence of machinery. Except in a few industries the great moving power is manual labor. The silk stuffs of China have long borne a high name, and in several qualities are still unsurpassed. The loom in common use is worked by two persons, one of whom sits on the top of the frame, where he pulls the treadles and assists in making the various changes which must be made on the machine while in operation. By means of it the workman can imitate almost any pattern. The crapes and flowered satins, and damasks for official dresses, manufactured by the Chinese are particularly excellent. Everybody wears silks. It is the prescribed attire of high officers; soldiers are not considered in full uniform without it. The finer kinds of it form the ordinary dresses of the opulent, while the poorest manage to deck themselves in a coarser quality, at least on gala days. The embroidery of silk is carried on to an amazing extent, the perfection to which it has been brought creating an almost unlimited demand, both domestic and foreign, and employing myriads of the inhabitants. Steam-power has latterly been utilized in the reeling and spinning of silk. In cotton goods the Chinese make good and substantial fabrics, but the cheapness and good appearance of the foreign goods have given rise to a large importation. Nankeen, once so common in Europe, is still produced as before, and continues to form an important branch of domestic manufacture. Cotton mills and factories of the European type have recently been established. Linen seems not to be made in China. Flax is not grown, but a good substitute for it is found in the fibres of two or three plants, especially ramee, from which the beautiful grass-cloth, similar in appearance to linen, is extensively woven. Woolen fabrics are made only to a very limited extent. The consumption of leather in China is not great, and the manufacture of it is very imperfect. The porcelain of China has been famous from the earliest periods. The manufacture of the finest forms of it being long known to the

Chinese alone, gave them the monopoly of the world, and though in elegance of shape and design they must now yield the palm to Europe, for quality of material and rich gorgeous coloring they still hold perhaps the foremost place. Paper is an article that has been made in China from an early period and with great success. The manufacture of glass is not carried on to a great extent, and this is one of the few arts which, at least in regard to its finer processes, the Chinese have condescended to learn from Europeans. In beautiful lacquered ware the Chinese continue unsurpassed. Much of its excellence appears to be owing to the fine varnishes which they have learned to extract from native plants. Except in some few articles the Chinese are backward in the manufacture of metal goods; but recently, and under European leading, machinery, small arms and ordnance, warships, etc., are being produced in the country; as well as soap, matches, and other articles. Many small articles made by hand display much finish and delicacy of workmanship. See CHINESE ART.

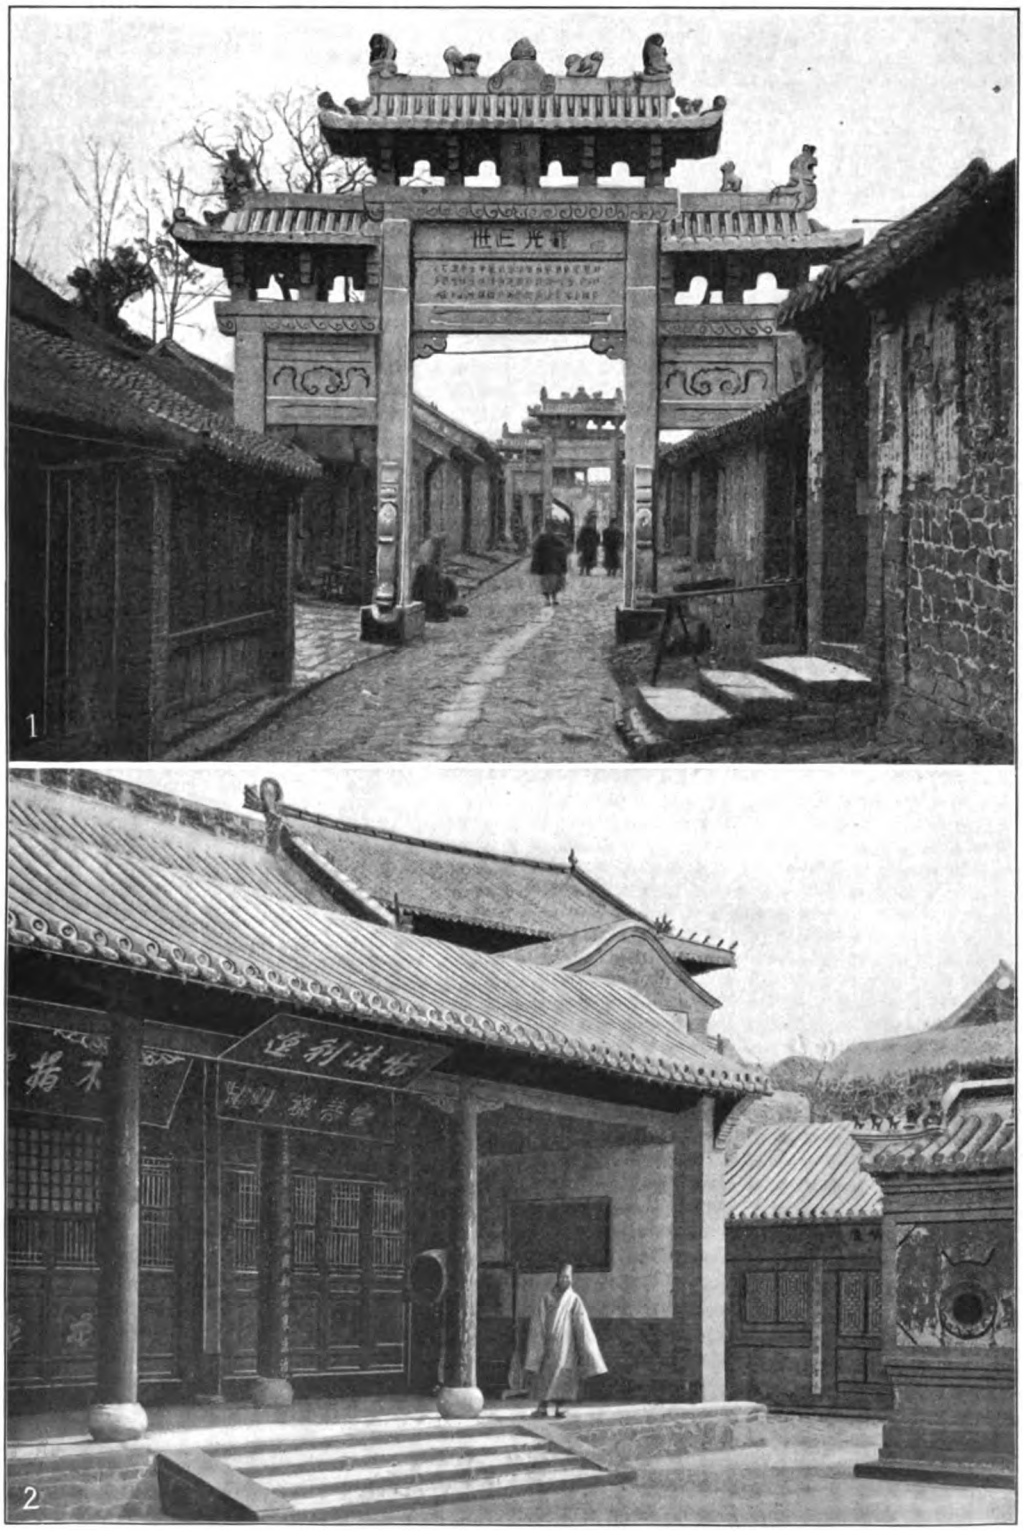
Trade and Commerce.— The inland trade of China, aided by the unusual facilities which it derives from a system of water communication, ramifying like net-work over all its provinces, is of incalculable magnitude. Its rivers and canals are so covered with junks and barges and swarms of smaller boats, that there does not seem much exaggeration in the estimate which makes the tonnage belonging to the Chinese little short of the combined tonnage of all other nations. The inland commerce, however, is much hampered by the rarity of good roads.

By the opening of the principal ports the foreign commerce has been immensely increased. Till 1842 the trade with foreigners, exclusive of that carried on by the mainland through the town of Kiachta, with the Russians, was jealously restricted to the mouth of Canton River. By the Treaty of Nankin, in the above year, Hong Kong was ceded to Great Britain, and Canton and four other ports were thrown open, namely Amoy, Fu-Chau, Ningpo, and Shanghai. At subsequent dates other ports have been added to the list of treaty-ports for foreign commerce, and about 30 ports are now open, the most northern being Niu-Chwang, in Manchuria, and the farthest inland being Chung-King, on the upper Yang-tse, some 1,500 miles from the river's mouth. Steamers do not go higher at present than Ichang (1,100 miles), the trade above this being carried on by junks or other craft. Several other of the ports are on the Yang-tse. Of all the Chinese ports, Shanghai, at the mouth of the estuary of the Yang-tse, carries on much the largest trade. In 1902 China agreed to open five new treaty ports, Chang-Sha, Ngan-King, Wan-Hsien, Wai-Chau, and Kong-Mun. In 1900 the number of foreigners in all treaty ports was 16,811.

Among the countries which maintain commercial relations with the Chinese the principal are: Great Britain and her dependencies, Hong Kong and India; Japan, the United States, and Russia. The latest trustworthy statistics relating to the foreign commerce of China are set forth in a report for the year 1901 by Mr. J. W. Jamieson, British commercial attaché at Peking. He shows that from 1896, when it amounted to little more than $270,000,000, it had increased by the close of 1901 to about $315,000,000, a gain of nearly $45,000,000. To this total the imports contributed a little less than $200,000,000. During that period, however, the imports from the United Kingdom fell off more than $6,390,000, and the exports thither by nearly $1,800,000. The trade with Hong Kong and India, on the other hand, increased, but the returns in relation to Hong Kong are deceptive, because large quantities of Chinese produce are sent thither from Canton and other ports in southern China for transshipment to other localities in the Middle Kingdom. Imports from the United States during the period named have increased by $7,380,000, and the exports from China to the United States by upward of $3,000,000. The imports from Japan have increased more than $10,000,000 in five years. Imports from the United States in 1903 were valued at $18,303,369; exports to the United States from China, $20,583,068. The Japanese merchants are especially welcome in China. Those Japanese who have most to do with China, study not only the language, but also the ideas derived from Chinese literature. That knowledge of the Chinese educational system and of the ideas inherited through it has a value even in the sphere of commerce, the Russians have already recognized; the same insight and sagacity mark the course of Germany.

The Chinese, in carrying on their extensive dealings, domestic and foreign, have in all 24 weights and measures, but of these only 6 are in common use, namely, the liang or tael = 1⅓ ounces avoirdupois; kin or catty = 1⅓ pounds avoirdupois; and picul = 133⅓ pounds, used in weighing bulky articles; and decimals of a tael, called mace or tsien, candareen or fan, and cash or le, used in reckoning bullion, gems, drugs, etc., 19 cash making 1 candareen, 10 candareens 1 mace. The only native coin now current is the cash, a small piece of thin circular copper about three quarters of an inch diameter, with a square hole in the middle for convenience of stringing. Native silver bullion, called *sycee*, and gold bullion of similar shape, and usually stamped with the names of the banker and workmen, and the year and district in which it is cast, are used in larger transactions. All taxes are paid in *sycee* of 98 per cent fineness. Private bankers are found in all large towns, and some of them pay interest on deposits. They issue paper money, which passes current in the particular districts where they are known. The Mexican dollar has been made a current coin all over the empire. In Shanghai, Tien-Tsin, Han-Kow, and the northern ports, the tael is commonly used.

Railroads.— Railway communication is as yet very limited in extent. The lines actually in working order in 1903 were as follows: Shanghai to Wu-Sung (built in 1898); Kai-Ping to Pe-Tang; from Tien-Tsin to within a short distance of the Great Wall, by way of Chan-Hai-Ouan, and with connection to Peking (built by Li Hung-Chang's advice; length 298 miles). Of lines conceded and projected since 1897, the list is as follows: (*a*) The Russian line through Manchuria, with branch to Port Arthur and Niu-Chwang (begun in 1897, to be completed in 1904: length of main line 1,200 miles, branch line 600 miles). (*b*) The German Kiao-Chau line (total length, 621 miles). (*c*) The Franco-Belgian line from Peking to Han-Kow



1. A Street in Tungchow.

2. Reception Hall of Temple.

Mau

(the first line to be constructed by imperial decree). In the north, this line has been completed, and is in working order, as far as Pao-Ting-Fu, about 50 miles from Peking; in the direction of the Yang-tse the work has been completed as far as Sin-Yang, 120 miles from Han-Kow. The line will connect with Tai-Yuan-Fu and Singan-Fu. (*d*) The Anglo-German line from Tien-Tsin to Chin-Kiang with connections to Tsi-Nan; total is about 620 miles. (*e*) The English line from Tai-Yuan to Fu-Chau (298 miles); and two lines from Shanghai, one in the direction of Su-Chau, Chin-Kiang, and Nankin, the other to Hang-Chau and Ningpo. (*f*) The Belgium line from Canton to Han-Kow, with a junction at Hong Kong. (*g*) The French lines from Lavi-Kai to Yunnan-Fu from Lang-Son to Long-Chau and from Nan-ning-Fu to Peking.

People.— The Chinese belong to that variety of the human race which has been called Mongolian, but in them its harsher features, as represented in the genuine Tartars, are considerably softened. They are generally of low stature, have small hands and feet (the last often artificially made so small in the females as to become a deformity), an olive or yellowish complexion, much modified by the degree of its exposure to the open air, prominent cheek-bones, depressed nose, eyes obliquely turned upward at the outer extremities, black hair, scanty beard. In bodily strength they are far inferior to Europeans, but superior to most Asiatics, their great assiduity and patient endurance of fatigue making them highly prized as laborers throughout the Indian Archipelago. Perhaps the finest physical specimens of the race are to be seen among the coolies or porters of Canton. The Chinese are deficient in courage, yet often display great contempt for death. In their moral qualities there is much that is amiable. They are strongly attached to their homes, hold age in respect, toil hard for the support of their families, and in the interior, where the worst kind of foreign intercourse has not debased them, exhibit an unsophisticated and pleasing simplicity of manners. In the great mass these qualities are counterbalanced, or rather supplanted, by numerous vices — treachery, lying, gambling, opium-smoking, etc.

Population.— The Imperial treasury department of China has recently published an official census of China in connection with a readjustment of the imposts that are destined to pay its war indemnities. It appears from this census, that the empire contains 426,000,000 inhabitants, and that China Proper — with its 18 provinces — contains 407,000,000. In the provinces, the number of inhabitants per square mile is greatest in Ho-Nan and least in Kan-Su. In the dependencies the density of population is far less than in China Proper, especially in Mongolia and Turkestan, which are very sparsely populated. The density is 22 times greater in Ho-Nan than in Manchuria. The population of the United States as a whole is about 20 persons per square mile. The population of China Proper is about 300 per square mile. If the whole population of the United States and 40,000,000 more were crowded into the State of Texas the density of population would be about equal to that of the Yangtse Valley and of the plain extending north and south between the lower courses of the Yangtse and the Hoang rivers. Ngan-Hui but a little larger than New York State has more than three times the population. Che-Kiang province, slightly less in area than Kentucky, has more than 10 times the number of inhabitants, and between Kwan-Tung and Kansas the ratio is 21 to one.

No census figures based upon official returns are obtainable for the dependencies, and the nature of the population in these regions makes even a close estimate difficult. The data for 1903 may be given approximately as follows:

China	407,330,000
Manchuria	8,500,000
Mongolia	2,580,000
Tibet	6,430,000
Sungaria	600,000
East Turkestan	600,000
	426,040,000

Language and Literature.— The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words in the Peking tongue end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1,200. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is solely syntax. Since many words similar in sound are different in signification, while in writing each idea has its peculiar symbol, the number of words represented by writing, without reckoning those peculiar to certain dialects, is perhaps 10 times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000. In writing and printing the characters are arranged in perpendicular columns, which follow one another from right to left. In its origin Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; and anyone well acquainted with these symbols has obtained a good introduction to the reading or writing of Chinese. The larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for the purpose; so that the great mass of Chinese written words consists of an ideographic and a phonetic element. Native grammarians divide their characters into six classes.

The confusing variations in the forms used to represent Chinese proper names in English is an almost inevitable result of the characteristics of the former language. Uniformity seems at present almost impossible of attainment, but the practice of compounding geographical names in such a way as to bring into prominence the significance of certain often-used monosyllables has considerable to recommend it. For instance, "Fu" (or "Foo") added to the name of a place, as Ningpo-Fu, indicates a city ruled by an official directly responsible to the head of a pro-

vincial government; that is, a city of the first class. In the form Ningpofu, the force of the compound is weakened. "Chau" (or "Chow") indicates a city of the second class; that is, a city subject to the ruler of a greater city; and "Hien" is used for a city of the third class; that is, a city of a dependent province. "Shan," meaning "mountain," is found in the name of the province Shan-Si ("Mountainous West"), Shan-Tung ("Mountain Province"), etc. "Kiang," meaning "stream," is found in the names of rivers, as Yang-tse-Kiang, Min-Kiang, Si-Kiang, etc. (the form Yang-tse-Kiang River being patently incorrect), and in the names of the provinces Kiang-Su, Kiang-Si, etc. In the case of names that have been longest known to the English-speaking world, or most frequently in use, such as Peking, Nankin, Shanghai, Ningpo, etc., although uniformity demands the compound form, the present form has been fixed by constant usage. Among other Chinese terms in general use in referring to places and institutions are the following:

Fu-tai, or Foo-tai, the governor of a province.

Godown, the place for storing goods.

Haikwan, the customs duties.

Hwang, emperor, yellow.

Li, a Chinese mile (equal to one quarter English mile).

Likin, an inland tax on foreign goods in transit.

Nui-Ko, privy council.

Shih, imperial.

Tael, a coin equal to one and a third ounces silver in weight.

Tao-tai, governor of a city.

Ting, a city of a small province.

Tsin, a prince.

Tsin-wang, a prince of the blood.

Tsung, clan, family (sometimes board).

Tsung-li-Yamen, a cabinet council of advisory powers having charge of official relations with foreigners.

Tsung-tuh, viceroy or ruler of more than one province.

Yamen, office (for official business).

The Chinese literature, from a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the Emperor Kien-Lung's library is composed of 122 volumes. In the five canonical or classical books, called 'King' are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius, in the 6th century B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down. In lyrical poetry the most distinguished names are Li-tai-pe and Tu-Fu, both of whom flourished at the beginning of the 8th century A.D. The romantic poetry of the Chinese, though void of poetic beauty, is valuable for the insight it gives into their domestic life.

The art of making paper is said to have been known in the 1st century, and printing from wooden blocks, in the 7th or 8th century, hundreds of years before these valuable arts were invented in Europe. In China literary eminence is the sure avenue to the highest honors and offices of the state, appointments being obtained by competitive examination; hence "the *literati* are the gentry, the magistrates, the governors, the negotiators, the ministers of China." Naturally among the more comfortable classes, education of the kind which promises to be best rewarded is almost universal. For the lower classes also every village throughout the empire has its school, but the subjects taught are of the most elementary description; attendance is far from general, and is limited to the male sex. In 1898 an "Imperial University of China" was established at Pekin. The first allowance for the building was $112,000, and an allowance of $150,000 is annually made for its support. The sciences, arts, and philosophy are included in the curriculum. Dr. William A. P. Martin, an American missionary and educator, was appointed first president of this institution, and three of its professors were from the United States. Students occasionally go abroad for study at foreign universities or technical schools. A few newspapers and periodicals are published in Chinese, especially at Hong Kong.

Religion.— Judging by the multitude of temples and joss-houses seen in every quarter, and the endless number of ritual acts performed on high festivals and in the ordinary intercourse of life, the Chinese are a most religious people. The religion of the state is Confucianism, an ethical system founded by Kong-Fu-Tse or Confucius, about 550 B.C. Another religion is Taoism, introduced about the same time by Lao-tsze, and numbering a good many adherents. (See CONFUCIUS, LAO-TSZE.) Among the great mass of the people a form of Buddhism prevails, or a curious mixture of religious ideas and forms. In the conduct of daily life they are under the dominion of innumerable superstitions, living in dread of demons whom they constantly endeavor to ward off or appease. Their belief in feng-shui, or the influence of "aspects," works against the introduction of railroads and other modern improvements. Attempts to introduce Christianity were made by the Nestorians as early as the 6th century, but the celebrity of the Jesuit missions has thrown all others into shade. The Roman Catholics now claim to have about 1,000,000 adherents among the Chinese. Various Protestant bodies carry on missionary operations in China. There are now probably over 50,000 native Protestants. During the Boxer massacres many native Christians were martyred.

Customs, Manners, Dress, etc.— Among the Chinese, politeness is carried to an extreme. They scrupulously avoid all contradiction in conversation, and are careful not to use any offensive or irritating expressions. From the same source arises the tedious, frivolous, and often absurd etiquette and extravagant compliment for which they are remarkable. But even here a wish to please and gratify is sufficiently evident. An invitation to dinner is written on a slip of red paper, and is sent some days before; it is usually in this style: "On the ——— day a trifling entertainment will await the light of your countenance; Tsau Sanwei's compliments." This is followed by another card naming the hour. The dinner itself is sumptuous, wine and spirits are drunk freely, and the whole affair goes off with a great deal of boisterous merriment. Fresh pork, fish, and fowls form the staple articles of food, with vegetables of various kinds. Beef and mutton are rare.

Opium and tobacco are in common use. The usual beverage among all classes is tea, of which the Chinese consume enormous quantities.

In ordinary cases, strict separation prevails between the male and female branches of a household. Betrothment is entirely in the hands of the parents, and is conducted through the medium of a class of persons called *mei-jin*, or go-betweens, whose office of matchmaking is considered honorable. The marriage itself is conducted with much ceremony, gay processions, and other convivialities. Besides one wife, strictly so called, a man who can afford it may have several subordinate wives. A wife may be divorced on several grounds that we should deem frivolous. Infanticide is common among the very poor, the female children being almost the only victims.

The return of the new year is an occasion of unbounded festivity and hilarity in China, and New Year's Day is a universal holiday for rich and poor. At this season all accounts are expected to be adjusted, and if this is delayed or neglected the creditor has sometimes recourse to the expedient of carrying off his debtor's door. On New Year's morning all shops are shut, and this usually continues for several days. There are also various festivals throughout the year, but no weekly day of rest. Gambling is universal in China. Porters play by the wayside while waiting for employment; and hardly has the retinue of a great official seen the latter enter the house when they pull out their cards or dice and squat down to a game. Dress, like other things, undergoes its changes in China, and fashions alter there as well as elsewhere; but they are not as rapid or as striking as among European nations. Regarding dress, there are certain restrictive laws in operation. The mandarins or officials have some special peculiarities of dress, and their respective ranks are indicated by the nature of the knob or button they have on the top of their hats. The wearing of the queue or pig-tail is perhaps the most noticeable external peculiarity of the Chinese as regards costume. The headdress of married females is becoming, and even elegant. The copious black hair is bound upon the head in an oval-formed knot. No caps, bonnets, hoods, or veils are worn abroad; a light bamboo hat, or an umbrella, protects from the sun. The extraordinary practice, peculiar to China, of compressing the feet of females (especially those of the better class) into unnatural form and dimensions has been already alluded to.

Dwelling-houses are generally of one story. The common building materials are bricks, sifted earth, matting, or thatch for the walls, stone for the foundation, brick tiling for the roof, and wood for the inner work. The fronts present no opening but the door. The walls are often stuccoed, but not painted, and the bricks are occasionally rubbed smooth with stones, and the interstices pointed with fine cement. The general internal arrangement of a Chinese dwelling of the better sort is that of a series of rooms of different dimensions, separated and lighted by intervening courts, and accessible along a covered corridor, communicating with each, or by side passages leading through the courts. Streets are generally so narrow as to be mere lanes. The most characteristic Chinese structures are the pagodas, built generally with a number of stories, each marked off from the rest by a peculiar projecting portion.

Government, Laws, Army, and Navy, etc.— The government is an absolute despotism. The emperor unites in his person the attributes of supreme magistrate and sovereign pontiff, and theoretically as "Heaven's Son" is to heaven alone accountable. In practice, however, the rigor of this despotism is considerably softened, and the greatest blot upon the Chinese administration is the corruption which in every form that ingenuity can devise is rampant throughout the empire. The emperor's principal ministers, four in number, two of whom are Manchus and two Chinese, form an interior council chamber, and beneath them are a number of assessors who form the principal council of state. The government business is distributed among seven boards, having cognizance respectively of the conduct of civil officers, of revenue, of rites and ceremonies, of military affairs, of naval affairs, of crime, and of public works. Another board, the Tsung-li-Yamen, has the charge of foreign affairs. There is, besides, an office of censors, 40 or 50 in number, who go out into the empire as imperial inspectors, and are privileged to make any remonstrance to the emperor without endangering their lives. The provinces, either singly or by twos, are under a governor and sub-governor, and each province has also a chief criminal judge and a treasurer. Particular magistrates preside over particular districts and cities, and instead of being permanent are changed about once in three years. The great object aimed at is to maintain a strict surveillance and mutual responsibility among all classes; in other words, to imbue them with fear of the government, and infuse a universal distrust. The chief protection of the people is in a body of laws, called Ta-Tsing-Liuh-Li, that is, "statutes and rescripts of the great pure dynasty" which are held in high regard, and agreeably to which, with occasional violations, all public functions are discharged. The new code of laws that is being drawn up for the Chinese empire is to be the work of a Japanese professor of law. The Chinese army has been subjected to a certain amount of reorganization in recent years, and an attempt has been made to introduce improvements from the European countries. In each important town there is a Manchu force, and the total Manchu army is estimated at 270,000 men, with an organization of its own. There is a Chinese army separately organized from this, forming a kind of militia, supposed to include some 800,000 men. A considerable number of the men are now armed with rifles of European pattern, and the European drill has been partially introduced. Li-Hung-Chang, when governor of Pe-chi-Li, organized a corps of instruction drilled and trained on the European model, and this comprises 10,000 men. Numbers of Krupp guns are mounted on the fortifications; and there are arsenals superintended by Europeans. The navy contains several cruisers and other war vessels of the modern type, but the Chinese lost their most powerful ships in the war with the Japanese, and their navy is now of comparatively little strength. Three protected cruisers were built in 1897 in Germany for the Chinese fleet, and several sea-going torpedo boats, ordered before the war, have been also added. The reve-

nue of the empire is derived from customs, excise, and the land and salt taxes. Calculating on the basis of statistics for 1901, if the customs duties, including the sum payable in lieu of the *likin* or in land-transit dues, be computed at about 10 per cent, the revenue, if payable in gold, would be about $20,000,000.

China had a national debt before the war of 1894-5, and at the close of that contest she assumed a new indebtedness of $187,500,000. The aggregate indemnity which the foreign powers were to receive by way of indemnity for the Boxer outrages in 1900 was $337,500,000, payable in 39 annual installments. The whole of the Chinese customs revenue, if payable in gold, would be equivalent to about 6 per cent of the indemnity.

History.— The early history of the Chinese is shrouded in fable, but it is certain that civilization had advanced much among them when it was only beginning to dawn on the nations of Europe. The names of numerous dynasties belonging to a period two or three thousand years before Christ are still preserved, but how much, if any, of this early history is authentic, cannot be determined. The Chow dynasty, which was founded by Wu Wang, and lasted from about 1100 B.C. to 255 B.C., is perhaps the earliest that can be regarded as historic, and even of it not much more is historic than the name. Wu Wang is said to have divided the kingdom into 22 feudal states, and the continual internal rivalries which resulted from this policy encouraged Tartar raids and invasions. Under Ling-Wang, one of the sovereigns of this dynasty, Confucius is said to have been born in 551 B.C. During the latter half of the period in which this line of sovereigns held control, there appear to have been a number of rival kings in China, who lived in strife with one another. Chow-siang Wang, who was the founder of the Tsin dynasty, attempted to bring all China under his rule, but he was unsuccessful. His great-grandson, however, a national hero of the Chinese, who was the first to assume the title of "Hoang" (emperor), and henceforth called himself Tsin-She-Hoang-Ti, succeeded in accomplishing this. He ascended the throne at the age of 13 and fixed his capital at what is now Segan-Fu. Besides building a great palace there, he constructed numerous roads, canals, and buildings, throughout the country. He completely defeated several Tartar and other neighboring tribes, and suppressed a revolt in his own country. The Great Wall of China was begun by his command, and it was he who ordered all books treating of the past history of China to be destroyed. The present name of China is derived from the name of this dynasty. The Tsin dynasty ended with Hoang-Ti's grandson, who gave way in 206 B.C. to Lew Pang or Kaou-Te, the founder of the Han dynasty. Toward the end of the 2d century, or soon after the beginning of the 3d century, of the Christian era, the empire was divided into three states, which were again united under one ruler before the end of the 3d century. During the 10th century the right to the throne was disputed, and civil war raged till an adjustment took place by the establishment of the Tsung dynasty under Tae-Tsu 960 A.D. Under this dynasty great progress was made in literature and art. Inroads of Tartar hordes now pressed the Chinese so hard that they called in the aid of the Mongols or western Tartars, who freed them from their oppressors, but gave them a new master in the celebrated Kublai Khan who founded the Mongol dynasty, and removed the capital from Nankin to Peking. His ninth descendant was driven from the throne and a native dynasty called Ming again succeeded in 1368 in the person of Hungwu. A long period of peace ensued, but was broken about 1618, when the Manchus gained the ascendency, and after a war of 27 years established the existing Tartar dynasty in the person of Tung-Tchi. According to the Chinese, their dynasties, 26 in number, embrace a period of about 5,000 years, during which between 200 and 300 sovereigns have held the throne. The earliest authentic accounts of China, published in Europe, are those of Marco Polo, who visited the country in the 13th century. The first British intercourse was attempted under Queen Elizabeth in 1596, but the vessel sent did not reach its destination. A trade was subsequently established at Canton by the East India Company, but no direct intercourse between the governments took place till the embassy of Lord Macartney in 1793, which was well received by the Emperor Keen Lung. A second embassy in 1816 by Lord Amherst, was treated with insolence, and returned with a letter from the emperor to the prince regent, bearing among other things, "I have sent thine ambassadors back to their own country without punishing them for the high crime they have committed." The arrogance thus manifested could not fail, sooner or later, to bring on a collision; and accordingly, in 1841, the British, on being refused redress for injuries, partly real and partly alleged, proceeded to hostilities, and after scattering almost without a struggle every force which was opposed to them, were preparing to lay siege to Nankin, when the Chinese found it necessary to sue for peace. A treaty was then concluded, by which the five ports of Canton, Amoy, Fu-Chau, Ningpo, and Shanghai were opened to British merchants, the island of Hong Kong ceded to the British in perpetuity, and the payment of $21,000,000 agreed to be made by the Chinese. In 1850 an insurrection headed by Hung-seu-Tseuan or Tien-Te, who gave himself out as a descendant of the Ming dynasty, broke out in the provinces adjoining Canton, with the object of expelling the Chinese Tartar dynasty from the throne, as well as of restoring the ancient national religion of Shan-Ti, and of making Tien-Te the founder of a new dynasty, which he called that of Tae-Ping, or Universal Peace. After the capture and execution of Tien-Te his place was taken by Hong-Sin, who identified Shan-Ti with the God of Christianity, and regarded himself as called of God to make the old true religion of China again predominant. For a long period the insurgents succeeded in maintaining their ground against the imperial forces, and it was not till after the lapse of several years that the latter were enabled in some degree to quell the rebellion. Notwithstanding the cruel retaliation by the victorious party, and the wholesale massacres perpetrated on the insurgents, they were unable to stifle the spirit of revolt. In October 1856, the crew of a vessel belonging to Hong Kong were seized by the Chinese on the allegation that they had been concerned in a piratical attack on a Chinese vessel. The men, on the

remonstrance of the British authorities, were afterward brought back, but all reparation or apology was refused. The attitude taken up by the Chinese in this matter led to a declaration of war, and in 1857 the Chinese fleet was almost totally destroyed, and Canton was taken by the French and English troops. A treaty was at length concluded with Lord Elgin on behalf of the British, by which important privileges were secured; but an attack on the French and English ambassadors who were on their way to Peking to have the treaty ratified by the emperor led to the renewal of the war. The allied forces marched toward Peking, and after twice defeating the Chinese troops entered the city. This brought the Chinese to their senses, and the treaty was ratified. Meantime the Tai-Ping rebellion had been gaining strength, and the trade of Shanghai and Canton was materially interfered with. The British thereupon decided to assist the Chinese in quelling the insurrection, and the services of a young engineer officer, Capt. Charles Gordon ("Chinese Gordon," afterward so well known in connection with the Sudan), were lent to the government for that purpose. The rebels were gradually driven from their posts, and in July 1864, Nankin, their last stronghold, was taken. But the empire was still disturbed by rebellion in other parts. The Mohammedans in Chinese Turkestan, wishing to take advantage of the weakness to which the Chinese government had been reduced by the Tai-Ping rebellion, revolted almost simultaneously, but apparently independently, with those in the province of Yunnan in the southwest. In both cases the rebellion resulted in the temporary separation of the provinces from the empire. In 1883 hostilities broke out between China and France in consequence of the warlike operations of the latter in Tonkin and her claim to the protectorate of the country; but the matter was arranged early in 1885. In 1894 war broke out with Japan in connection with Chinese misgovernment in Korea, and in this struggle Japan had almost an uninterrupted success both by land and sea, driving the Chinese out of Korea, and invading China at several points. Peace was concluded in 1895, China agreeing to give up Formosa and pay a large indemnity to Japan, to open additional ports to foreign commerce, and to recognize the independence of Korea. In the autumn of 1897 two German missionaries were murdered in the province of Shan-Tung, and the admiral commanding the German squadron on the China station immediately effected a landing in the bay of Kiao-Chau, which, after much discussion, was finally leased to Germany early in January 1898. This acquisition of Chinese territory bv Germany attracted much attention among other powers whose interests were likely to be affected, and was followed at brief intervals by the leasing of the town and harbor of Port Arthur in the Liao-Tung Peninsula to Russia, and the leasing of the bay of Wei-hai-Wei to Great Britain. On 22 September, a *coup d'état* was effected by the dowager-empress of China, who had acted as guardian to the Emperor Kwang-Su during his minority, by which the emperor was again placed under her dominion. The prompt remonstrances of the representatives of the powers at Pekin served to prevent any extreme procedure on the part of the empress and her advisers, and the emperor afterward nominally regained power, but early in 1900 was reported to have abdicated.

In September 1899, Secretary Hay instructed the United States representatives in England, France, Germany, Russia, Italy, and Japan to invite from those governments a presentment of their intentions in regard to the treatment of the commerce of foreign powers in the newly acquired spheres of influence, with special reference to the treaties existing between China and the United States, advising that China be regarded as heretofore as an open market for the world's commerce, and that all possible steps be taken to establish much-needed administrative reforms and to preserve and strengthen the imperial government in its integrity. On 20 March 1900, Secretary Hay announced that all the powers concerned had accepted the proposals of the United States, and that he would consider their consent final and irrevocable. In May 1900, a secret society, colloquially known as the "Boxers," rose in the provinces of Shan-Tung and Pe-chi-Li and massacred native Christians and European missionaries. The Boxers were encouraged by the empress-dowager and the palace-party at Pekin, who placed themselves at the head of a movement directed against foreigners. The ministers at the European legations in Peking — Sir Claude Macdonald being at the head of the British legation — determined to requisition guards for their protection, and these arrived on 31 May. On 4 June the Boxers destroyed the Peking-Tien-Tsin Railway, and by cutting communications isolated the Europeans in Peking. Soon after the chancellor of the Japanese legation and Baron von Ketteler, the German minister, were murdered in the streets. In hope of relieving the legations, Admiral Seymour put himself at the head of 2,000 European troops and blue-jackets, and set out from Tien-Tsin for Peking, but had to retire. Meanwhile the Chinese had been manning the Taku forts at the mouth of the Pei-Ho, and making preparations for closing the entrance to the river. The commanders of the allied fleets — British, French, Russian, and German — in the Gulf of Pe-chi-Li gave notice to the Chinese to desist. The Celestials in reply opened fire on the European vessels, 17 June, whereupon the allies bombarded and destroyed the forts. The allied forces entered the foreign city of Tien-Tsin on 23 June, and the native portion of the city was taken on 14 July. All this time the legations at Peking were closely besieged and constantly bombarded. The smaller legations having been destroyed or rendered untenable, their occupants, together with a number of native Christians, took refuge in the British legation, which, from its extent and strength, offered a better prospect of protection. The legation was ill supplied with provisions, and the defenders were reduced to extremities, when the relief force of 12,000 men comprising British, French, German, Russian, and Japanese troops, forced its way from Tien-Tsin, 15 August. Before the arrival of this force the empress-dowager and her court, with the Emperor Kwang-Su, had fled from the capital, and it was impossible, with the troops and transport available, to overtake them.

Troops of various nationalities had been despatched from Europe to North China with all possible haste, and Count von Waldersee, the

German commander, had been accepted by all the allies as commander-in-chief, but international jealousies soon made themselves apparent, and complications seemed likely to ensue. In October 1900 it was announced that Lord Salisbury had concluded an agreement with Germany by which the two powers bound themselves to the principle of the "open door" in China, to abstain from seeking to obtain for themselves any territorial advantage, and to take such steps as might be agreed on for the protection of their interests, as against any other power seeking territorial aggrandizement. Subsequent military operations consisted chiefly of punitive expeditions to the south and west. Negotiations for peace were at once entered upon. On 4 December the powers sent a joint note to the Chinese peace commissioners, demanding among other acts, the execution of the leaders in the massacre of foreigners and the payment of an indemnity, which in October 1901, was fixed at $735,000,000. On the ratification of the indemnity agreement, the foreign troops were withdrawn from Peking. Later, through the good offices of the United States, the indemnity was reduced, being fixed at $337,500,000.

Events of 1902–3.— On 7 Jan. 1902, the imperial court returned to Pekin, making a brilliant entry. The Europeans witnessed the pageant from the Chien-Men gate, the privilege being in contrast to the old rule under which no foreigner could see the passage of royalty through the streets. The empress after her return showed marked courtesies to the ladies of the foreign legations, introducing the innovation of receiving them in person. Four important edicts were issued on 10 January, placing political science and western arts among the subjects of study at the Hanlin Academy; creating Chang Po-Hsi minister of education, with instructions to draw up a new scheme of education; appointing Wang-Wen-Shao director of the board of railways and mines, and nominating Yuan-Shih-Kai director-general of the Pekin-Shan-hai-Kwan Railway. Among other edicts was one urging the abandonment of foot-binding. On 12 February there was made public an Anglo-Japanese agreement. Its aim was the maintenance of the independence of China and Korea, and the prevention of territorial dismemberment. In a note sent to the other powers, by France and Russia, the two allied governments reserved "the right to consider, eventually, means of ensuring the defense of their own interests." The Manchurian convention between China and Russia was signed 8 April. Manchuria was therein acknowledged as an integral part of China, the right of sovereignty and of administration was restored (as before Russian occupation), and the period of the evacuation was reduced to 18 months, the withdrawal to be in six months after signature of the convention, and to be completed in successive removals from three specified portions of Manchuria. Russia also consented to restore conditionally the Shan-hai-Kwan, Niu-Chwang & Sin-min-Ting Railway. A rebellion in the south of China caused much disturbance, in the aim of founding a Chinese dynasty, in lieu of the present Manchu rule. The conflict between political and railway interests among the various powers concerned with concessions continued during the summer. On 15 August, Tien-Tsin was formally restored to China. The protocol tariff agreed to by the powers was signed 29 August. and a scheme for abolishing "likin" (q.v.) throughout the empire was embodied in a commercial treaty with Great Britain, signed 5 September. On 8 October the Russians restored, but in form rather than in reality, the first portion of Manchuria named in the Manchurian Convention. In December it transpired that the German government had imposed upon China, as a condition of the former's consent to evacuate Shanghai, the promise not to grant any preferential rights opposed to the principle of the "open door," and also a stipulation that the forces of all the powers should evacuate the port simultaneously. The government of the United States had in November invited the powers to submit to The Hague tribunal the settlement of the question whether the war indemnity should be paid on a gold or on a silver basis, our State department alone, of all China's foreign creditors, showing disposition to relieve China from the additional burden imposed by any fall in the market value of silver, and the arrival of the period for the payment of the first installment of the indemnity, 1 Jan. 1903, made the question a serious one for the Chinese government. The final payments will be made in 1941. The delay of Russia in carrying out the convention provision regarding the evacuation of Manchuria became in the spring of 1903 a cause of international uneasiness, and the policy outlined by the czar's government regarding relations with China gave rise to so much inquiry and protest that an attempt was made by Russia to explain away her demands. The still occupied portions of Mukden and Kirin were, by the convention, to be evacuated in April, and the final and complete withdrawal from the province was to occur in July; but in spite of Admiral Alexieff's proclamation announcing that there had been a removal of troops on 23 April, an incessant activity after that date in railway development and transportation of supplies and ammunition, the building of barracks, and other signs of permanent occupation, tended to keep up the general distrust of Russia's intentions. The rebellious state of certain portions of the Chinese provinces during 1903, gave cause of serious anxiety to the viceroys, and their fear of anti-dynastic movements even led to the discountenancing of public meetings in Shanghai, called to urge government resistance to Russia's demands. The increased intercourse which has been manifested during the past few years between China and the western powers has tended to bring the vast population into closer touch with western ideas, and the question of to-day is no longer whether the Chinese will tolerate the presence of the foreigner, but which particular nation shall obtain the greatest privileges within the Celestial empire. The rivalry of the different powers concerned in the opening up of China is very keen, and the issue is yet undetermined. Great Britain desires to see the empire freely opened to all traders irrespective of nationality, while Russia and France aim at the acquisition of portions of Chinese territory for their own exclusive advantage. It is this conflict between a partition of China into spheres of influence and the maintenance of the empire in its full integrity,

while opening it up to foreign trade that occupies the attention of diplomats.

Chinese in America.— It is estimated that there are about 100,000 Chinese in the United States, and that 30,000 of them are in San Francisco. There is a considerable Chinese colony in New York, and there are small colonies in Philadelphia, Boston, and Chicago. Though they do not belong to the educated classes, 95 per cent. of them can read and write. A daily paper in the Chinese language is published in San Francisco and another in New York.

Nearly all the Chinese in the United States come from the single province of Kwang Tung, the most populous of the eighteen provinces of the Chinese Empire. Its capital is Canton. Six counties of this province send out most of the emigrants to the United States. In 1900 an educated Chinese from the province of Shan Tung said that beside himself there were only two Chinese in the United States that came from any province in China other than Kwang Tung. The inhabitants of this province have for centuries been more adventurous and fonder of traveling than the rest of their fellow-countrymen, and they are always ready to face danger if there is a good chance of profit.

China and Japan. When in 1823 in response to the Russian ukase claiming exclusive possession of the Pacific coast of North America to the 51st parallel, John Adams told the Czar's minister, Baron de Tuyl, that "we should contest the right of Russia to any territorial establishment on this continent, and that we should assume distinctly the principle that the American continents are no longer subjects for any new European colonial establishments," he not only gave the first clear expression in action to the Monroe Doctrine (q.v.), but he unconsciously perhaps dictated the future history of the Pacific Ocean and in large measure the peaceful progress of China and Japan through American influences. Thus ushered into the world's politics, the United States, after resisting the Czar's demand and by diplomacy alone forcing it back to parallel No. 55, prevented the Russian advance southward in America, and later gained California, Alaska and the Aleutians with a vast front on the Pacific, then whitened by our whaling and trading ships. Once California and Oregon ours, the incentive was quickly given to tap the markets of Asia and awaken the hermit nations to commerce. After Monroe, Fillmore. The latter, on the day that Mutsuhito, the present emperor of Japan, was born, 3 Nov. 1852, ordered Commodore M. C. Perry (q.v.) to proceed, by the shortest route — around the Cape of Good Hope — to Yedo Bay to negotiate a treaty. Perry's triumph was a "brain victory," won by tact, patience, and consummate knowledge of human nature and especially the Japanese variety of it. He opened a new era in the treatment of Oriental nations, showing how, apart from force, the door of international brotherhood might be opened. On the spot at Kurihama, where, in 1853, stood the pavilion for the reception of the President's letter, rises to-day in Perry Park the memorial monolith inscribed in gold by Marquis Ito (q.v.), to the erection of which the Mikado, leading his people, subscribed. At Yokohama, where the conferences of Commodore Perry and Professor Hayashi were held to discuss ethics, humanity, and treaty business, and the first industrial exhibition in Japan of American tools, inventions, and products was held, the United States consulate and the Union Church have been upreared. Thus led forward, the hermit Japan entered the school of experience whence she was to emerge as the pupil of the Anglo-Saxon nations and the champion of their principles in Asia, and the teacher of China and the middle term between the civilizations of the Orient and the Occident. After her own political commotions, consequent upon the clash of old and new ideas, Japan from 1870 engaged the service of hundreds, yes even thousands, of Yatoi (hired specialists) from America and Europe, to rebuild the foundations of the empire, and for 30 years besides sending thousands of her sons abroad, put herself under the tuition of an army of teachers from western countries who were active in every department. Yet what has been in phenomena true of Japan has been in the working of leaven true of China also, only her larger mass hindering the visibility of real progress. Perry's succes with Japan really opened a new era in the whole Chinese world of eastern Asia. The spirit of America's commerce, education, diplomacy, missions, and the political policy of the United States have been the greatest factors not only in the awakening of China, but in influencing and regulating the policies of the aggressive European nations in their dealings with China and the neighbor nations of the Far East. Japan, contrary to popular notions, is a very young nation, being, according to the unanimous verdict of critical scholarship and all the evidence in hand, no older than the Germanic nations, coming to national self-consciousness in the 5th century of the Christian era. Naturally then she has taken quickly to western culture in the 19th, as in the 5th and 15th century. The Chinese, being an old race, with all the limitations of senility are more slow in their mental movements than the Japanese, who show all the peculiarities of a young race. Yet in both empires progress, through the combination of old and new forces, has been real.

Surveying the past fifty years and especially

what has been done within the 20th century, it is well to show still further wherein the Chinese and Japanese are alike or different from each other, and also wherever they have human traits in common and systems in harmony with or in contrast to the nations of the West. We may appraise changes actually wrought and see how far these movements or evolutions are to be attributed to agencies within or without these countries. There are those who consider Japan almost wholly a self-reformed nation, while others think that all transforming agencies have come from without. The truth lies in the golden mean between these extremes of opinion. China's vastness of area and density of population prevent even keen western observers and students and certainly the average Occidental, from any clear perception of leavening principles and transmuting elements within so large and venerable body politic. They may note what is phenomenal, while they are usually blind to the psychic changes in the Far East. Hence, for example, the real energies of the native secret societies and sects within the Chinese empire cannot be definitely gauged, yet that they have been for centuries a real force, frequently showing themselves in both bloodless and bloody manifestations, the last being the so-called Boxer insurrection of 1900, can be demonstrated. That these sects yet exist in great potency is certain. Until Western diplomatists discern that China, equally with Turkey or Russia, and what survives of old Japan, is a church nation, with a fixed creed upheld by the government and maintained by force, and that China always has been, and is still, a persecuting nation, there can be no sound diplomacy. Failure to see this adds mystery to the Chinese problem and accounts largely for the discreditable surprise at the Boxer outbreak in 1900, foreseen by the missionaries, but to the approach of which so many diplomatists in Peking were blind. This politico-ecclesiasticism based on the Confucian writings and philosophy, is the foundation of a social system that has survived the fall of over 30 imperial dynasties, and is still at once the most potent check upon and the choicest weapon of government, whether by pure Chinese or alien rulers like the present Manchus. Hence to attack that dogmatic system is treason in a native, a horrible offense in a foreign missionary, and only tolerable in the Mahometans because they are so numerous and powerful. The maintenance of this dogma by the sword of the normal magistrate, himself *ex officio* an orthodox Confucian, has been the cause of persecutions during the ages with bloodshed abundant. This is the real reason of so many reactions, and of repeated disappointments. China has again and again raised hopes among Occidental people that she was about to modernize her laws and people, only to dash the expectation of optimists to the ground. Even in this 20th century she has, after founding schools and universities, apparently on modern ideas, even appointing American and European officers and teachers, cast these persons aside, and neutralized their methods, ostensibly because natives or Japanese were preferred, but in reality to maintain her dogma of Confucian orthodoxy, because the decrees from Peking demand adherence to Confucianism. Whatever modifications China has made in her system are as yet simply external, nor will there be any real progress in the western sense of the word until Chinese bigotry and persecution are abandoned and the union of church and state given up. The plea of China is that innovators under the pretext of progress are seditious and that reforms by natives mean republicanism and thus destruction of the dynasty. But this is only another phase of that Chinese indirection of mind, which Dr. Arthur Smith in his book on 'Chinese Characteristics' has so exposed with such masterly skill. The certainty of the Chinese union of church and state, the instances of bigotry and bloody persecution, and the great slaughter of Chinese in the name of orthodoxy during past ages, making the Chinese government a shedder of blood for opinion's sake, quite equal to Russia or the mediæval states of Christendom, are shown by that life-long scholar of Chinese, J. J. M. DeGroot of Leyden, in his monograph, 'Sectarianism and Religious Persecution in China.' In weight of scholarship based on original research this work outweighs all that has thus far been written on the subject of China's politico-religious status. In the future these sects will doubtless play a very important part, and probably with more effect on China's internal structure, than either the Tai Ping rebels or the «Boxers» (q.v.). Such possibilities must exist as long as China represses thought and opinion for conscience' sake by her absolutism in religious matters. Nor is it likely that she will find any better solvent for her problems than the complete separation of church and state and the granting, not only of academic freedom, but of perfect liberty of conscience to her people. So long as she refuses to grant such liberty, both in the school and to the masses, there will be no end to internal disorders and to foreign complications. In this matter of self-reformation, as the past has already proved, the elements tending to reconstruction and the evolution of the Chinese into the modern man are most likely to arise from among the natives who have been educated or helped by the teachers from foreign countries. The overwhelming majority of such men of modern mind are Christian, though others are far from lacking. Almost all the knowledge of China by the Western world comes from aliens, who have studied, surveyed, and described the country, and who in addition to propagating their dogmas have given the Chinese pretty nearly all the exact science they possess. One cannot ignore the services of those physicians, engineers, advisers, financiers, customs officers, who, with or without Chinese pay, have for a century or more served China's people. It was an American, Ward, who showed the possibilities of the Chinaman as a soldier. What other Americans have done in China is set forth in the book 'America in the East.' It was an American, S. R. Brown, «A Maker of the New Orient,» for example, who established the first (Protestant) Christian school in China, brought the first Chinese students to America, and demonstrated the ability of the Chinese youth to absorb Western learning and methods. Among his pupils was Yung Wing, who, after graduating with honors from Yale College, brought to the United States under government patronage, six score Chinese lads as students, one of whom was Sir Liang Chang, the present Chinese envoy at Washing-

ton. In a word the efforts of the lay and clerical teachers, helpers, and healers of the Chinese, especially since the opening of the ports, and within the last 60 years, reveal a force that has, in the peaceful American, rather than the conquering Russian way, helped to give credibility to the prophecy of one of the greatest of China's foreign teachers, S. Wells Williams: "The regeneration of China will be accomplished like the operation of leaven in meal, without shivering the vessel."

The Japanese are not compacted wholly of Oriental stuff. They differ from the Chinese physically and psychically. Though they form a race having in it many elements, Tartar, Korean, Malay, Nigrito, etc., their basic aboriginal stock, the Aino, is very probably a branch of the Aryan family of humanity, and the Japanese are thus allied in some measure with the "white" races. In mind and temperament they differ from the Chinese, not only as insular people dwelling on volcanic soil constantly shaken by earthquakes, may be supposed to differ from continentals inhabiting stable lands in river valleys, but also in culture and aims. The Chinese are ethical, the Japanese esthetical. In China filial piety is the cornerstone of civilization, in Japan it is loyalty. The archipelago produced the samurai — soldier and scholar in one. The mainland generated the literati who despise the soldier. In Japan the centre and abiding element of all is the dynasty, one and unbroken during written history, for fifteen hundred years. In China the binding force is the social system, independent of figureheads in the capital, abiding through many changes of rulers but ever crowned by a religious system that tolerates no other and looking on all other cults as alien and dangerous. Even in old Japan we discern a church nation. Religion and politics though not nominally united were practically one, and bloody persecutions were far from unknown. Even yet the germs of fanaticism and persecution are not wholly eradicated though perhaps nearly so, nor can they be so long as academic freedom is curtailed or religion is in any way made an official engine of government. In the early ages of unwritten history the conquest of the primeval tribes of similar ethnic stock and of the Ainos in Japan was by the force of the dogmas of Shintoism (the primitive religion or Divine Way) as well as by superior arms and valor. The Mikado was the regent and deputy of the gods of heaven and earth, and church and state were one. When Buddhism with its superior refining and elevating forces came to civilize the Japanese barbarians, this Aryan cult overshadowed Shinto, but was none the less the great breeder of action and reaction in the life of the nation. When its missionary activities ceased and the nation was Buddhaized, Buddhism became itself the superior influence in politics, reducing the Mikado to a shadow, thus paralyzing the central authority, making the throne a mystery instead of a power. Buddhist monks organized as armies and not only overawed the emperor, but among warring feudal lords decided questions at issue even on the battlefield. Smitten down by Nobunaga (1533–82) and its power for a time curtailed, Buddhism was again patronized by Iyeyasu (1542–1616) in 1600 and made the popular religion, and its priests sent as sleuth hounds to hunt down Christian believers. Roman Christianity was thus suppressed by the sword and ever vigilant inquisition. While the people were ruled by the bell of the bonze, the gentry and scholars who studied Confucianism and made it into a code of ethics, a philosophy and a creed, were given to understand that no departure from the official orthodoxy approved in Yedo would be tolerated. As matter of fact scores of executions of good men under the Yedo bureaucracy were brought about because of philosophical heterodoxy whenever and wherever associated with alleged sedition. It was in the name of the government, also, that imprisonment and death were denounced upon all who should believe in the "evil sect," or Christianity. When in 1868 the Mikado's government assumed supreme control of the empire (one of the powerful elements of the revolution being the revival of the ancient Shinto dogmas and ritual), the old death-dealing anti-Christian edicts were once more republished and enforced. Thousands of suspected Christians near Nagasaki were imprisoned and distributed all over the country. Under strong diplomatic pressure these prisoners were released. When the Japanese embassy in America and Europe saw themselves abhorred as uncivilized because of their persecuting tendencies, the edict boards were taken down. The natives were left free to organize churches and publicly propagate their Christian tenets and steady progress was made until in the constitution of 1889, full freedom of conscience was granted in the famous Article No. XXVIII.: "Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief." In his commentary on this article, the Marquis Ito, called the "Father of the Constitution," writes, "Freedom of conscience concerns the inner part of man and lies beyond the sphere of interference by the laws of the state."

Nevertheless, since there is no real liberty when conscience is bound or scholarship fettered, it is not yet true in Japan that perfect freedom of belief, writing and publication is openly allowed to any one in government pay. When in recent years a learned professor, examining the ancient literature showed that the use of Shinto (which was never formulated into a system or given its name until after the introduction of Buddhism) as an engine of government was not justified, and that the claims of the Mikado to a divine origin rested on very slender foundation, because lacking documentary proof, and that the whole system of ancestor worship was not a part of original Shinto, but was borrowed from China, he was punished by being put out of his position and retired on half pay. Yet, though academic and religious freedom is not absolute in Japan, it is relatively so full and generous, that it must serve as an increasingly powerful example to China, nor will China be rid of her manifold complicated difficulties with both natives and foreigners until such religious freedom, as is guaranteed to the Japanese in the fundamental law of the empire, be made the privilege of the Chinese also.

In so far as freedom in the deepest things affecting man is won and guaranteed, does other freedom follow. China's conceit of her theo-

retical perfection of government and of her own long supremacy among pupil nations prevented her from that recognition of the rights and privileges not only of other nations but of her own people. When a Chinese subject left the frontiers of his own country, he was ignored by his government and what happened to him abroad bred no concern at Peking. The Chinese rulers, to whom China's golden age was in the past, had no suspicion of any civilization superior to their own or knowledge of progress in other lands. To her court for ages had come only vassals or pupils, but in our day economic pressure from the outside, the Western men's desire for trade, the wars and aggressions of foreign countries compelled her to recognize merit and even superiority elsewhere, and gradually China began sending commissioners and embassies to other countries, the first modern instance being the appointment as Chinese envoy to the United States and European powers of the American, Anson Burlingame, who had won the confidence of the government at Peking. Much that was expected of this embassy failed to come to pass because the Western nations were probably as sturdy in their conceit as the Orientals and expected all changes in Asia to come by imitation of Western ideas and methods, whereas genuine international progress comes only by mutual influence. In 1868 the first real treaty made by China, in which the principles of the world's international law received recognition by the Chinese government was negotiated, when reciprocal privileges were granted to the two contracting powers, China and the United States. Mr. Burlingame negotiated other important treaties with Denmark, Sweden, Holland, and Prussia, but died in 1870, while arranging the terms of a treaty with Russia. We say "the world's" international law, for, so far from the name or the thing having originated in Europe, there was for centuries an international law in the Chinese world or orbit of influence in eastern Asia, governing the relations between the great central empire which occupied a position among subject and neighbor lands which the old Roman empire did in the western part of the Eurasian continent. The experience of this Far Eastern international law included such situations and episodes as the frequent despatch and reception of envoys of various grades and for many purposes, concerning which there was a fixed etiquette and a code of rules, the growth of centuries. Among the questions treated in these international communications are those of a "protected state," intervention, defensive and offensive alliances, treaties of peace, naturalization, the treatment of prisoners of war, rules in regard to pillage, even of places taken by assault, the protection or destruction of private or public property, the protection of exempted persons, especially women and priests, the guarding of the edifices of religion, art, and science, the respect due to messengers and bearers of flags of truce and concerning the instruments of war and means of destruction. One may thus easily see that Japan's hearty adoption of the modern laws of nations is no mere borrowing or imitation of things unknown, but that the diplomatic discipline of centuries enables her easily to keep equal step with the most highly civilized nations in those courtesies and proprieties of which Christianity is the informing spirit. To these humane customs and usages Chinese, Japanese, and Korean history bears witness in hundreds of instances, but modern international law as formulated in the West received its initial recognition in China in 1868 under Burlingame. The epochal year of 1868 was the same in which Japan signed the treaties made with the Yedo shogun in the Mikado's name. Perry and Harris had treated with one who was only the Mikado's lieutenant at Yedo, but taught in the new school of international law by the American envoys the men who made the new government at Kioto formally adopted the principles of the laws of nations, and in frank acceptance of these principles began to relay the foundations of the empire, besides adopting representative government and civilized customs generally. When therefore the first great occasion arose between the two Asiatic states and always jealous nations, Japan and China, a still further development took place. Especially in the classic instances of the Peruvian ship Maria Luz in 1872, and the invasion of Formosa by the Japanese in 1873, was this seen. The Japanese government, having made inquiry into a cargo consigned to Callao, which was a human freight of Chinese laborers from Macao and held against their will, released the coolies and shipped them to China, a favor which was gratefully acknowledged by the Peking government. The so-called pagan nation of Japan achieved a great moral victory in breaking up a certain kind of slave trade which by euphemism was called the coolie traffic, while the very act shamed China into taking better care of her people. The results were soon manifest. For the first time China sent out commissioners to look after her own subjects in foreign lands, and her envoy going to Cuba and Peru refused to enter into treaty obligations with any South American state as long as a single Chinaman remained in the country against his will. Despite all protests of foreign consuls and ministers the Japanese persevered. Having freed their own *eta* or *pariahs*, they liberated the Chinese slaves in their own waters. This was the beginning of the establishment of Chinese consulates and legations throughout the world. To-day we find the Chinese increasingly social. The once hermit is in the world's market-place. The Middle Kingdom is represented in the Universal Expositions. Whereas it has been the rigid rule that a prince of the imperial blood must never spend a night outside Peking, we find, in 1904, the heir apparent to the throne, Prince Pu Lun, traveling in America. In 1874 after the wreck of a Riu Kiu junk on the coast of Formosa and the killing of the crew by the head-hunters, Soyeshima, the Mikado's minister, went to Peking and received audience with the Chinese emperor, standing upright though dressed in Western costume. He obtained from the Tsung-li Yamen the disavowal of responsibility over Eastern Formosa to which China laid no claim, and from the maps of which country it was omitted. Nevertheless after the interview, and when 1,300 Japanese soldiers had occupied Formosa for six months and chastised the savages, the mandarins of the capital, incited by foreign influence in Peking, awoke in wrath and shame, declared the Japanese intruders and menaced the island empire with

hostilities. Okubo (q.v.), sent by the Mikado to Peking, refused to treat in the matter except on the basis of international law. By this, war was averted and henceforth the world's legal standard was appealed to in all matters relating to Riu Kiu, Korea, and other questions in dispute, but with a tendency on the part of China to relapse into old tradition and custom, not being able to forget that she was no longer the "Middle" Kingdom. For example, the Chinese emperor Shunchi (1644–61) had written, "But now all lands both Middle (that is, China itself) and foreign, have become united into one vast empire, so that the whole earth has become one family and all the people of foreign countries are my children." When, therefore, Japan in 1870 occupied the Riu Kiu Islands and abolished their dual sovereignty, China protested, though not until 1874, and then in language of an exceedingly undiplomatic nature. After a long and somewhat acrid diplomatic correspondence, the controversy reached a dead-lock, when in the summer of 1879 Gen. U. S. Grant visited Peking. Prince Kung placing the matter before the American ex-President, bespoke the latter's assistance. This eminent American refused to pronounce any opinion on the merits of the case, but on his arrival in Japan, proposed unofficially to the Mikado's ministers a solution, and advised the Chinese government to withdraw their offensive despatches and appoint special commissions with full power to settle the matter. This proposal was accepted. An imperial commission was created by the Mikado's proclamation, and Mr. Shishido was appointed plenipotentiary commissioner to treat with Prince Kung and the ministers of the Tsung-li Yamen, the conference beginning its sittings on 15 Aug. 1880. The draft of the treaty was finished on 2 October, but the caprices of Chinese statesmanship were then beyond the range of ordinary prescience, and the action of the Peking government showed that they did not yet understand fully the meaning of the term "plenipotentiary commissioners." After 26 days' delay, 16 of them being after the date fixed for the signatures to the treaty, the matter was taken out of the hands of the high commissioners and transferred to the northern and southern superintendents of trade. This action turned the whole affair into mockery and began in the Japanese that sense of outrage which made them prepare for the possibilities of war, especially as the question of Korea (q.v.) was still unsettled.

In 1876, three years before, Japan had made a treaty with Korea as an independent state, which precedent, curious as it may seem, China assisted the United States, through Admiral Shufelt to follow, looking complacently on also while other nations, England, France, etc., did the same, each treating Korea as a sovereign and independent state. Nevertheless, while the notion of a vassal state's acknowledgment of dual sovereignty was unknown in the West, it still existed in the Chinese mind and the Middle Kingdom gave no sign of yielding her hold upon Korea as a vassal state. There seems little doubt then, that by 1880, the intelligent statesmen of Japan foresaw and the Japanese military men prepared for a war with China. Events and experiences in Korea during the next 14 years served but to change a suspicion into a determination.

When in 1894, this war broke out, it was evident that both nations had made vast progress in both material civilization, and in those gains which are associated with the triumph of mind in law and morals, revealing clearly by startling contrast both the homogeneousness and thoroughness of the progress of the smaller and the looseness of organization in the larger country. Japan, quickly responsive to a central will, seemed like an athlete in possession of all his powers, while on the other hand there was with "the boneless giant" progress only in lines and spots, the work of partially modernizing China having been chiefly that of a few resolute men, while the great body politic seemed to be insensitive, and vigorous for offence and defence only in portions. Strictly speaking, there never was any war between Japan and China, but only a war between all Japan and a few of the maritime provinces of China. The American, Ward, and the Englishman, Gordon, had shown what the average Chinaman could make of himself as a soldier, when properly drilled, commanded and influenced by example. Under these men, Li Hung Chang (q.v.) was converted to the value of the material forces in Western civilization. Adopting these, and being viceroy of provinces nearest to the capital, he organized an army drilled by German officers, and had the promontories of Wei-hai-wei and Port Arthur, guarding the sea gates of the capital, fortified and the Taku forts commanding the Pei-ho River rebuilt according to modern principles of defence and engineering. Gradually an efficient fleet of battleships, cruisers, and gunboats was organized. A beginning had also been made in China of railways and steamship lines. One part of China's vast system of revenue, "the imperial customs" of the empire, elaborated since 1863 under the British Sir Robert Hart, and honestly administered, has given China her surest source of cash income for general purposes and the purchase of foreign equipment of every sort. For an individual or government service to be free from bribery and routine corruption seems to the normal Chinaman something unearthly, and the imperial customs under Sir Robert Hart have won unbounded admiration from the Chinese. In 1894, when the war broke out which did so much to prick the bubble of Chinese prestige of greatness and mass, and which, paradoxical as it may seem, evoked mutual respect and drew the Chinese and Japanese more closely together in reciprocal understanding, China had, in addition to her military mobs in the various provinces, the beginnings of scientific military system. This in time might have become national. Even then as seen to undiscerning foreigners China appeared from a military point of view invincible. On the humane side of provision for sick and wounded soldiers and in the nobler features of civilization, China was wofully deficient. As soon as hostilities broke out the vast difference between the two nations was manifest. China went to war without surgeons, hospitals, nurses, or the manifold apparatus of civilization for protecting non-combatants, saving life and mitigating the horrors of war. China had not yet become a signatory to any of those conventions of nations in the interests of mercy, nor was there a Red Cross organization within her borders. Her recognition of the international code of war was

slow and her acceptance of it slight. On the contrary Japan, having her object lessons given by Christian missionaries had provided hospitals, surgeons, Red Cross Society and equipments for surgery, healing and hygiene, and these were in splendid condition, while 1,400 trained nurses were ready for work. Japan had in 1887 signed the Geneva and other conventions and had diligently educated her army officers in the commentaries and usages of the signatory nations, while her naval commanders were well versed in the laws of search and capture. When in 1894 her fleets and armies went forth into Korea, Manchuria, and China proper, there was with each field-marshal, besides a hospital corps ready to minister to friend or foe, an expert lawyer, versed in international law, who went as adviser to see that nothing was done by the Japanese which should infringe the laws of nations. Two notable books, 'International Law During the Chino-Japanese War,' by S. Takahashi, and 'La Guerre Sino-Japonaise au Point du Vue du Droit Internationale,' by Professor N. Ariga, the one from the military and the other from the naval college in Tokio, are the literary monuments of this habit of the Japanese, which, in 1904, has developed into a college of five international law experts. These, after being consulted at all points during the progress of the negotiations of 1903–4, have gone upon deck and field with the military and naval men into Manchuria to insure, in every detail, harmony with the laws of nations.

The war of 1894–5, which wrought such great results for the world at large, is worth reviewing in its main outlines, since it blew to pieces and forever China's doctrine of Whang-ti, or world-sovereignty, the tenacious adherence to which over Korea had brought on the war. After being again served by China as they had been in the Riu Kiu matter, the Japanese determined to take no further chances with her rulers. In Korea, after the bloody struggle in Seoul between the native Liberals and Reactionaries in 1884, followed by the armed conflict between the Japanese and Chinese troops, a convention was made dated 7 May 1885 between Li Hung Chang and the Marquis Ito, that both governments withdrawing their troops, would not again land soldiers in Korea without mutual agreement. For awhile there was peace in the Land of Morning Calm, but when the Tong Hak uprising took place, the soldiers from Seoul were overcome and the whole kingdom seemed to be in danger of anarchy, the pro-Chinese faction at court asked for aid from Peking to put down the rebels. Then to the amazement of the world the Chinese government violated the treaty of 1885 by first forwarding troops and then notifying the Japanese minister in Peking, using the words «our tributary state» concerning Korea. China thus reasserted her ancient claim of suzerainty over Korea as a vassal state, notwithstanding that Korea had been recognized as sovereign and independent by Japan and other nations. The government in Tokio interpreting this as a direct insult, on 12 June 1894 announced the despatch of a body of troops under strict discipline to Seoul and five days later invited China to undertake with Japan financial and administrative reforms in Korea in order to preserve the peace of the Far East. The Peking government curtly refused and demanded the recall of the Japanese troops. The reply from Tokio was that pending an amicable settlement of questions in dispute, any further despatch of Chinese forces into Korea would mean war. China had already ordered her soldiers in Manchuria to cross the Yalu River, and having chartered the British ship Kow-Shing despatched 1,100 soldiers to reinforce the Chinese camp at Asan in Korea.

What follows the world knows. With astonishing secrecy and celerity, the armies of Japan occupied Korea and after the decisive battle of Ping Yang drove the Chinese out of the peninsula, crossed the Yalu and in Manchuria conquered an area larger than their own empire, while her navies wiped the Chinese fleet off the ocean and captured the great fortresses of Port Arthur and Wei-hai-wei. After annihilating nearly all the drilled troops of China at Ping Yang, the Japanese fought military mobs, making war chiefly with the forces of only a portion of the empire. During the war the majority of the Chinese people scarcely knew that there was any real hostilities adverse to their empire, nor did they learn for years afterward just what had happened, but the military success of Japan opened the eyes of Europe and enlightened some of the Chinese mandarins and scholars. To-day we find China with a new army, formed on modern principles and drilled chiefly by Japanese officers, while in June 1904, having become a signatory to the Geneva and other conventions made to mitigate the horrors of war, she has entered still the pale of civilization, which means the world in brotherhood.

The Japanese stung to the quick, because neither China nor Western nations had recognized them as highly civilized people, were confirmed in their pride and resolve to make the so-called white race understand and appreciate them, when Russia, France, and Germany joining to deprive them of the lawful fruits of conquest, forcibly compelled them to be satisfied with the cession of Formosa and indemnity in money. Had the Japanese been possessed of four battleships, they would in 1895 have declared war against Russia. As it was, they who never forgive an insult, resolved to nurse their wrath, keep it hot by buying battleships, and in cool science and unwearied perseverance began to invent explosive powders, perfect munitions and equipments and enlarge an army and a fleet that should some day wipe out the insult, and show that the Japanese count none on earth as their superiors. Meanwhile China, profiting by her fresh experience in humiliation, began to inquire more earnestly into the secrets of Western power. A tremendous impetus was given to the reading of all kinds of information about Japan and the Western nations, to the building of railroads and to the renovation of educational methods. The ferment of ideas caused something like a great reform movement in 1897, which, led by progressive literati and apparently sanctioned and even controlled by the young emperor, seemed apparently about to sweep over the whole empire. New schools and universities were planned and a newspaper called 'Chinese Progress' was published. The purchase and sale of official rank was to be abolished. The stirring and patriotic brochure «China's Only Hope,» recommended

by the emperor, fed the flaming zeal of the reformers who were led by Kang Yu Wei. Even the abolition of the queue, the changing of the Chinese national dress, the adoption of the Christian religion, the calling of a national parliament and a journey of the emperor and empress dowager to Japan to see for themselves the pitiful condition of China were advocated in memorials. Reform seemed to be ready to spread like a prairie fire, when suddenly in September, Li Hung Chang was dismissed from office and the emperor virtually dethroned by the Empress Dowager. This act "carried within itself the fruitful seeds of the Boxer outbreak." Yet although the missionaries felt what was in the air, the diplomatists looked on the episode as a "Manchu family quarrel," and ignored the warnings of those living close to the masses of the people.

Meanwhile the disturbing influence of American prosperity and expansion were felt in both Europe and Asia. Within a year after Pittsburg achieved the supremacy of the world in the making of cheap steel, Russia, Germany and Great Britain "precipitated themselves upon the shore of the Yellow Sea, grasping at the positions which had been conquered by Japan and for the same reason,"— to obtain possession of the rich coal and iron deposits in Shansi, said to be "worth ten Pennsylvanias." Germany seized Kiao Chau, Russia Port Arthur and Great Britain Wei-hai-wei, in readiness for the supposed impending "Break-up of China" and its expected partition. The torpedo that sunk the Maine in Havana harbor interrupted the European programme, postponed the partition of China, and united the British, Americans and Japanese in the determination to keep China intact and the door of commerce open. In 1900 the United States, now a world power, was in Asia with force and had a policy — the policy of freedom and uplift — which for a century or more, the Americans in Asia, as traders, teachers, healers, and apostles of democracy and fair play had been steadily developing. Meanwhile in China the old territorial integrity could not be so ruthlessly violated nor the ancient social systems invaded without protest. The introduction of railways had thrown thousands of men out of old methods of employment. The tremendous commercial intrusions, which disarranged old customs and made the problem of livelihood to millions so very serious, brought on a fierce reaction both of the scholars and the people and especially of the Buddhist priests, creating an atmosphere and environment most favorable for the outbreak of another of those sectarian revolts against the official orthodoxy of China, to put down which the Chinese have shed more blood perhaps, than all the religious wars and inquisitions of Europe. This time the heresy was joined with and the cry raised in the name of patriotism. The heretics became the people called "Boxers" or the Fists of United Harmony. The triple pressure of hunger, superstition and patriotic revolt at the territorial incursions of the foreigner at last burst out into a storm, which in blind wrath against everything alien, smote first the railways and foreign workmen and then the teachers of the foreign religion and their converts. The mob reached Peking and surrounded the legations, which were hastily isolated, fortified and for months successfully defended. The foreign powers hastily made preparation to defend and then succor their nationals, but the United States seemed to be the only one that beside its prompt despatch of a military force had a definite policy, which was in recognition of the sovereignty of China to relieve its own citizens and then withdraw its military from Chinese soil. It is absurd to suppose any real harmony or co-operation between the orthodox Chinese government and the heretical Boxers. Whatever be one's opinions on the subject or the form of the encouragement alleged to have been given directly by the Empress Dowager, it is a fact that no hostile shot was fired by a Chinese regular soldier or sailor, until the seven allied nations, in which the Americans were not included, had made war on China by firing on the Taku forts, 17 June 1900. Against this unwarranted proceeding and overt act of war the American Admiral Lewis Kempff protested, and in the crime of attacking peaceful Chinese he refused to participate, his conduct becoming the basis of the triumphal diplomatic policy of the United States government. Briefly stated, the situation was this: A riot of fanatical sectarians, moved by economic and patriotic motives, rose in rebellion against the government already impoverished and weakened by foreign aggression. When unable to put down the uprising in Shan-si, the Pei-ho valley and the vice-royalty from which Li Hung Chang had been removed — though the whole Boxer movement was wisely handled and thoroughly suppressed by able viceroys in the central and southern parts of China — the seven allied nations made war on China in the bombardment of the Chinese forts. When also the Chinese, of course, attacked their enemies in Siberia, the Russians perpetrated the massacre at Blagovestchenk and then marched their soldiers to Peking. The combined relieving force fought the opposing Chinese. The Japanese, having the largest and best furnished of the contingents, led the van. The Russians as very slow marchers came next, so that the American and British contingents had to march during the hottest hours of the day. It is certain that the celerity, character and discipline of the Japanese soldiery on this expedition excited the surprise and admiration of military critics of every nation represented, while on the other hand the familiarity of the men of Nippon with those of Muscovy bred contempt of Russian slowness, heaviness and low grade of intelligence in the *mujik* or common soldier of the czar.

After the capture of Tientsin 14 July, the Japanese or Americans alone could then have pressed on and relieved Peking within a fortnight, but jealousies and unnecessary delays kept the relieving column idle until 4 August. The unspeakable robberies, violation of women, brutalities and generally barbarous conduct of the most of the European troops, by the way and in the capital, demonstrated the hypocrisy of the claim to be called Christian and in contrast to the conduct of the Japanese proved that the terms "Oriental" and "Occidental," as applied to morals, are purely traditional and destined soon to pass away. The Imperial city was captured on 15 August, the Chinese court escaping to the westward and remaining away from Peking until January 1902. On 28 August bodies of soldiers, representative of the

eight allied nations, marched through the Forbidden City as a token of China's humiliation. Li Hung Chang was recalled to office and with Prince Chang commissioned to treat with the Powers, only one of whom, the United States, seemed to have a definite policy. During the "peace" negotiations, the Europeans kept up a series of attacks and massacres of Chinese called "punitive expeditions" which in general character were a disgrace to civilization. An indemnity equal to $330,000,000 was imposed on the Chinese government in expiation of the Boxer outrages, and for her self defence in the war following the attack on the Taku forts. Various safeguards for the legations were arranged and agreed to, the importation of arms and ammunition prohibited, and the Tsung-li Yamen was transformed into the Ministry of Foreign Affairs which was to take precedence of the other ministries. Except legation guards, the foreign troops were to be withdrawn in September 1901. The Imperial edict of February 1901 accepted the terms imposed. On 9 April 1902, the Manchurian convention between China and Russia received the imperial seal. The Russians were to evacuate Manchuria within eighteen months, but to retain control over the railroads.

It was after this Boxer uprising that what we have called the Russian and the American foreign policies and systems of diplomacy had by contrast their most signal illustration. As soon as order was restored and the preliminary diplomatic arrangements made, the United States recalled all its military force, except a small legation guard, asked no favors in return for what had been done, and not only emphasized her recognition of China as a sovereign Power, but set a commendable example to the other governments by dealing justly with the Chinese in the matter and method of payment of the indemnity, thus illustrating again the fixed American policy of helping rather than taking advantage of Asiatic nations. Russians, on the contrary, demanding the right to occupy Manchuria with her troops and to make Port Arthur the terminal of her Siberian railway, began thenceforth the military possession of Manchuria, the building of the city of Dalny (q.v.), and the making of Port Arthur (q.v.) both a city and an impregnable fortress, and initiated various other enterprises on a vast scale, costing hundreds of millions of roubles, all of which suggested a prospective ownership in fee simple, rather than temporary occupation, notwithstanding that she solemnly covenanted to evacuate on the 8th of October 1903. The United States believing in the good faith of the Muscovite government and in accordance with her policy of recognizing China's sovereignty, appointed consuls for the three cities in Manchuria which by treaty agreement were to be thrown open to the trade of the United States. When the appointed time drew near, there was no indication of any purpose on the part of Russia to keep her agreement. As early as 28 July 1903, the Japanese government expressed to Russia its alarm at the Manchurian situation. When Russia formulated new demands at Peking and seemed to consolidate rather than relax her hold on Manchuria, showing also increased activity along the Korean frontier, doubts were raised in Tokio as to the limits of Russia's ambition. Through his minister in Tokio, Baron Komura and his envoy, Mr. Kurino in Saint Petersburg, the Mikado notified the Czar through Count Lamsdorff that wishing to remove every cause of future misunderstanding he desired to enter "upon examination of the condition of affairs in the Extreme East, where their interests meet, with a view to a definition of their respective special interests in those regions." Negotiations were opened and after long delay on the part of Russia the Czar announced that while willing to respect the independence and territorial integrity of Korea, Russia declined to extend the same engagement to China and requested Japan to acknowledge Manchuria and its littoral as entirely outside her sphere of interest. The Czar furthermore requested the limitation of Japanese control in Korea, even proposing a mutual zone covering all Korean territory north of the 39th parallel. Other negotiations, followed by exasperating delays in Saint Petersburg, took place, Russia meanwhile heavily reinforcing both her army in Manchuria and her fleet in eastern seas, purchasing and transporting also large stores of ammunition and coal to Port Arthur. On the 5th of February, Japan telegraphed the termination of her negotiations, severing diplomatic relations with Russia and withdrawing her legation. Then followed hostilities, begun simultaneously, both parties claiming that the other had fired the first hostile shot. In the war that followed, the Japanese surprised Europe with the rapidity and brilliancy of their victories on land and sea, China remaining neutral except to take precautions against the violation of her frontiers. At the request of the German Emperor, the American secretary of state urged upon three of the nations most interested, the limitation of the area of hostilities, to which they promptly responded. From the side of the Japanese it must be remembered that they were smarting under the sense of long-continued Russian aggression in Saghalien and the Kuriles, begun very early in the 19th century. In 1861 a Russian man-of-war proceeded to the island of Tsushima, on which the Russian flag was hoisted and a settlement was made (though not until Japanese blood had been shed in resistance), which would have constituted a title of ownership had not Great Britain interfered. The Russians were finally compelled through British intervention to abandon their claim and leave. By the usual plan of "joint occupation," which in the Ussuri province of the Chinese empire had ended in China's loss of a territory as large as France and its incorporation into the Russian empire, the Russians gained complete possession of Saghalien. After the restoration of the Empire in 1868 it was foreseen by the Japanese statesmen that Russia would be their chief danger, for already signs of her movement in Korea were menacing. This fact was the strongest determining element in the creation in 1871, in place of the old clan contingents, of a powerful army and navy for national defence.

It is more than probable, as history has clearly shown in the past and as the racial constitutions intimate, that progress in Japan and China will proceed from varying levels and in different channels. In the island Empire the centre of national life is in the one unchanging dynasty and national amelioration has issued from the government downward. Any sure advance for Japan in the future will be from the

same source and in a similar direction. On the contrary among the Chinese people, to whom the existence of this or that dynasty makes no vital difference, reform will arise in and proceed through their social system and not from throne or court. In China real and permanent progress has been less through anything done in Peking than directly traceable to the work of men who rose from the people and who had been instructed by foreign diplomatists, teachers or missionaries. These men have trained the people through the schools, the press, the churches and the hospitals, reaching all parts of the empire by means of the printed word, book, tract, newspaper, or by personal influence upon China's leading men, whether in or out of office. In Japan before Perry's advent there were hundreds of men already enlightened, keeping eye on European aggression in Asia, and moving for the unification and reform of the nation. The great motive supplying the force of their lives came from no foreigner but from their own inborn patriotism and self sacrifice. Nevertheless, when fullest credit is given to the propulsive power of her Bushido, or the Knightly Code, it must be remembered that Japan, after her first contact with Europe, never was truly a hermit nation. For two hundred years or more the Dutch at Nagasaki fertilized the Japanese mind, keeping open not only the door of outlook on and information from Europe, but nourishing the Japanese intellect with exact science, varied knowledge and the applications of occidental methods especially in medicine and the mechanical arts. In 1853 it was strenuously charged by the Conservatives who wished the country kept shut that only the native "Dutch scholars" wanted the empire opened to commerce and western influences. In 1868 when the men rich in Dutch culture and the "Mikado-reverencers" gained possession of the imperial person in Kioto, they began to relay the foundations of the empire by seeking for knowledge in every part of the world. Teachers, advisers, engineers and experts of all sorts were imported by the hundreds, who during thirty-five years have literally taken off their coats and, by example and teaching, redecraft and handicraft have shown the Japanese how to do those very things which they are now doing so well. The configuration of the Japanese Islands has fitted them to profit to an extraordinary degree by the adoption of the forces of steam and electric communication at a time most needed, that is, immediately after the abolition of feudalism and in the transit to industrialism helping to unify them politically and consolidate them into a marvelously compact nation. In China, railways will re-distribute into wholesome evenness of proportions of tableland and littoral, the population now congested in the river valleys and alluvial plains, will develop and distribute the wealth of the mines, will abolish the almost periodical famines, and by adding healthy movement and contact of the inhabitants of distant provinces develop in the Chinese that patriotism (as distinct from race pride which is already so intense), the lack of which has been the cause of China's many woes, and will give that middle term of a large intelligent and practical body of men of affairs between the throne and the masses, so notable in Japan and which China so sadly needs. The progress in both Japan and China has necessarily been thus far mostly of the material, educational, and economic sort, for neither the Chinese nor the Japanese take kindly to the abstract thought or science of the West. It is an exceptional thing to get a Japanese or Chinese to listen patiently to the presentation of even the outlines of a metaphysical or abstract argument or proposition. Hence, therefore, in its doctrinal form, Christianity has made but slight progress, and the chief experience noted by foreigners in the reception of an Occidental creed of any historic name by Chinese or Japanese has been its simplification. It seems quite certain that Christianity as known and practised by the countries of the Extreme Orient is to a very hopeful degree expressed in practical forms or in reform. Nor is it at all likely that in accepting what Jesus taught these peoples will ever receive or assimilate also that Greek philosophy, Roman tradition and doctrinal achievement, and the ethnic peculiarities which form so large a part of popular Christianity in America and Europe.

The chief role which the Japanese are to play in the future — with probably the development of reserves of power greater than the average Occidental suspects in them — will be as the teachers of the Chinese, who number one fourth of the population of the world, by interpreting to the sons of Han the civilization and systems of the West, themselves acting as the middle term between Occident and Orient.

This article does not pretend to picture or set forth in detail the external progress which Japan and China have made in revenue or development of natural resources, or to tabulate by statistics the possession of the material forces of the West as seen in railways, steamships, lighthouses, telephones, etc., and the manifold application to the comforts and conveniences of life of western inventions. So long as the ideas bred by a rigid Confucianism or the hardening of those ancient Chinese and Japanese traditions and dogmas which once were living forces of progress, but which have long since become obstacles to growth, prevailed in these lands, there could be no real progress. All changes which seemed progressive would be mere surface efflorescence rather than organic and vital growths. With the adoption of universal principles of truth, as formulated in science and illustrated in the lives and work of good men and women, the old mists of superstition pass away, the matted growths of tradition are plowed up, and the mental soil of the Chinese and Japanese lies open to receive the seeds of new and perennial progress. Those who look beneath the surface have every reason to believe that the progress of the past fifty years in China and Japan has been as genuine, and will be as fruitful for the good of the race as that made in the western world.

WM. ELLIOT GRIFFIS,
Author of 'The Mikado's Empire' and 'America in the East.'

China Decoration. The decoration of china, and, indeed, of all kinds of clay wares, falls into two groups: (1) Controlled by method, and (2) controlled by producer. The former group deals with the fact that a decoration can be introduced at any stage of the manufacture; the latter concerns itself with the various handicrafts employed.

Decorations may be used under the glaze, either on the unburned or burned clay; in the glaze, as a natural coloring; on the glaze, after the hard-glaze fire.

Decorations on the clay usually take the form of *sgraffito* (incising); inlaying, or *pâte-sur-pâte;* or painting with diluted clay. In the two latter it is important that the inlaid or overlaid clay should be similar in composition to the main body, or the fire will cause them to separate. The body piece, formed either in a mold or upon the wheel (see POTTERY), is kept quite damp, and the design, lightly sketched in India ink, is carefully followed. In inlaid work a channel is tooled out of the body, and filled in with clay of a different color. In *pâte-sur-pâte* no cutting out is necessary, but usually the background is stained a dark color and the design is laid on in white. The beautiful works of M. Solon are of this class.

On the burned ware under-glaze decoration may be either painted or printed. Most of the modern hotel and restaurant ware is printed under the glaze.

For some classes of work a coloring added to the glaze itself is very effective. By this means are produced the flowing and flashed effects much followed by the Japanese and by many French ceramists. In America the Dedham Pottery has worked in this direction.

For work over the glaze a lower fire is employed, many more colors are available, and the processes of decoration include painting, gilding, printing, and ground-laying.

Ceramic colors are made from certain metallic oxides with which are blended a fusible flux, so that the mixture may melt and attach itself to the glaze. Various fluxes are in use. They are composed of red lead, borax, and quartz sand in varying proportions. These ingredients are melted together, and the resulting glass is finely ground. For blues the oxide of cobalt is used; for greens, those of copper and chromium; for yellows, antimony and lead; for reds and browns, iron; for dark brown, manganese; and for grays, nickel and iridium. Gold produces rose color and purple, and a pink is also made from tin oxide and chromic acid. In some cases the colorant and the flux are melted together; sometimes they are united only in the grinding-mill. For under-glaze work, as well as for the coloring of clays and glazes, the list is not so full. Some of the oxides fail under the higher temperature, and must therefore be confined to over-glaze use.

In the second group, decoration is considered as a handicraft. Division of labor is the rule in a manufactory, and thus a piece of china may pass successively through the hands of the ground-layer, the painter, the printer, and the gilder, together with those of many minor operators. To the ground-layer falls the task of distributing an even tint over the whole piece or upon some part of the design. Using a stiff oil, —linseed boiled with litharge or lead acetate.— he dilutes it with turpentine, and brushes a thin coating over the china. This coating he dabs with a soft linen pad, and then spreads the color, which is a fine dry powder. A certain quantity adheres to the oil, and a smooth tint is the result. If only part of a design is to be covered, the free portions are painted with a water-color mixed with molasses. The work is oiled and dusted as before, and is then immersed in water, when the water-color is washed up, taking with it any of the ground color which may have settled upon it.

The painting of china scarcely needs a description. The colors are as already explained, and the painting depends upon the personal skill put forth. The colors are mixed in turpentine and fat oil just as the painter pleases, for each artist mixes his own palette. The colors change somewhat in the fire, but not as much as is often supposed. The main difference is a great gain of brilliance.

The gilder is mainly employed to embellish the work of others. He uses pure gold, as pure as it can be purchased. This is received in the form known as "coffee gold," a brown granular mass. Mercury is added of about the same weight as the gold and the whole is ground perfectly fine. When mixed with the proper oil this can be used freely as a paint, and the oil and mercury are driven off in the fire. Gold thus prepared needs to be burnished after firing; but there is another form of gold, known as bright or liquid gold, which is much cheaper, and therefore largely used on common wares. In this case the gold is dissolved and the solution is mixed with certain oils. The fire removes everything but the metal, which is left as a brilliant film on the china.

Printing from copper plates has been in use ever since 1756, but for many years has taken an inferior position. At first it was employed for fine engravings and decorative subjects, but lately only for borders and outlines. The pattern is engraved upon a plate of planished copper, and the printer makes this plate quite hot upon his stove. The color, mixed in a very stiff oil, is also kept hot, and with this the engraving is charged. An impression is taken upon thin paper, and this print is handed to a woman who cuts away the superfluous paper and presses the print on to the china. A bath of cold water removes the paper, and the color, rendered hard by the low temperature, remains firmly fixed. The fire completes the process.

Lithographic printing is now very popular in china decoration. The process was introduced from France some 12 years ago, and for a long period the prints were made abroad, but recently the more successful manufacturers have established their own lithographic departments. The prints are made in the usual way from stone, except that no color is applied to the stone itself. The impression is taken in varnish, and the color is dusted on the printed paper. On account of the transfer the order of impression is reversed, the print which is first on the paper becoming uppermost when the impression is transferred to the china. The paper used is double, consisting of a sheet of tissue paper cemented on to a stiff backing. The stiffness is necessary to withstand the pressure of the machine, and when printed the tissue is stripped from the sheet and proves flexible enough to accommodate itself to the surface of the ware. The printing is done in vitrifiable colors, of course, and the finished china is fired in the usual way.

China, Great Wall of, the largest artificial structure on the face of the earth, a barrier extending for about 1,500 miles in the north of China Proper, of which it partly forms the boundary. Its western end is in the deserts of

central Asia, its eastern reaches the sea to the northeast of Peking. It was erected as a barrier against the inroads of the barbarous tribes, and dates from about 214 B.C. It is carried over height and hollow, and avoids no inequality of the ground, reaching in one place the height of over 5,000 feet above the level of the sea. Earth, gravel, brick, and stone were used in its construction, and in some places it is much more substantial than in others. Its greatest height, including the parapet on its top, is about 50 feet, and it is strengthened by towers at regular distances.

China Ink, or **Indian Ink,** a black solid substance, which, when rubbed down with water, forms a very pure black indelible ink. It has been used in China from time immemorial, and both there and in Japan is employed for writing, small brushes being the implements made use of. In Europe it is used by draftsmen, artists, etc. It is manufactured in various ways and from various materials, but consists essentially of fine lampblack incorporated with a gluey substance, the whole being dried and consolidated into cakes and sticks. Some kinds are made with animal or ivory black, others with lampblack got from camphor or oil of sesame. There is generally added some perfume — a little musk or camphor. Many attempts have been made to imitate Chinese ink, some of which have been tolerably successful. Almost all the imitations consist of carbon ground up with gum, gelatine, or fish-glue, but the quality and tint may vary according to the special carbon employed and the process of manufacture. Good Chinese ink should have a velvety black appearance, with a gloss which becomes very conspicuous on rubbing. The color it gives on paper should be pure black and homogeneous, and if water be passed over it it should not run or become streaky. See INK.

China Root, the root or rhizome of *Smilax china,* a climbing shrubby plant closely allied to sarsaparilla, for which it is sometimes used. *Vitis sicyoides,* a species of vine, is known by this name in Jamaica.

China Rose, the name given to a number of varieties of garden rose chiefly derived from *Rosa indica* and *R. semperflorens,* both natives of China. The name is also given to *Hibiscus rosa-sinensis,* one of the mallow tribe, common in China and the East Indies, and an ornament in greenhouses.

China Sea, that part of the North Pacific Ocean bounded on the north by Formosa, on the northwest by China, on the west by Anam and the Malay Peninsula, on the southeast by Borneo, and on the east by the Philippines. It contains numerous islands, receives several considerable rivers, and forms the important gulfs of Siam and Tongking. The currents in this sea are very mutable, depending much upon local circumstances.

China-tree, Wild, a common name for the soapberry-tree (*Sapindus marginatus*). It is a handsome tree, sometimes growing as high as 60 feet. The flowers are white and the oval berries are very saponaceous. It grows from Florida westward to Arizona and northern Mexico, and in southern Kansas. The wood is very hard, and heavy, weighing nearly 60 pounds to the cubic foot.

China-ware, the name given to porcelain made in the Chinese empire and imported as "China ware," now chiefly confined to the soft porcelain made in England, of which bone-ash is the characteristic ingredient. This class of ware is called "bone china" by the potters and dealers of America.

Bone-ash was used at Bow and at Chelsea, near London, as early as 1750 and has been extensively employed ever since. Bone china consists of kaolin, pigmatite, or Cornwall stone, and bone-ash. The clay and rock are found in Cornwall, England; the bone is largely imported from America.

The proportions in a dry mix are about as follows: Kaolin, 40; stone, 20; bone-ash, 40. The heat at which the kilns are burned ranges from 2,300° to 2,400° F. Bone china is not made to any great extent in America, though some few manufacturers have put it forth as a side line. The particular merits of this ware lie in its snowy whiteness, and in the soft glaze which makes it possible to produce very beautiful decorations over the glaze. For rich services this class of china is unrivaled. See PORCELAIN.

China Wax. See WAX.

Chinandega, chē-nän-dā'gä, Nicaragua, a town 26 miles northwest of Leon, and 10 miles from the port of Corinto on the Pacific, with which and with Managua it is connected by rail. It is a place of considerable trade. Pop. about 11,000.

Chinch, the popular name of certain fetid American insects of the family *Lygæidæ,* genus *Rhyparochromus,* resembling the bed-bug, very destructive to wheat, maize, etc., in the southern and western States. The name is also applied to the common bed-bug (*Cimex lectularius*).

Chincha (Chēn'chä) **Islands,** a group of small islands off the coast of Peru; lat. 13° 38′ S.; lon. 76° 28′ W. They are granitic, arid, and destitute of vegetation, and the coasts bold and difficult of access. Immense deposits of guano used to exist here, but after being exported for 34 years the supply became exhausted in 1874.

Chinchaycocha, chēn-chī-kō'chä, a lake of Peru, in the department of Junin, 13,330 feet above the level of the sea; 36 miles long and 7 broad, with an area of about 300 square miles. It is the source of the river Jauga, and abounds in fish and wild fowl.

Chinchilla, chĭn-chĕl'yä, Spain, a city in Murcia, in the province of Albacete, 10 miles southeast of the city of that name; situated on a rocky eminence. It is surrounded by a wall and commanded by a castle. Its handsome parish church has three naves, and a lofty tower containing six bells; the interior is richly decorated and contains pictures and other works of art. Quarries of granite, alabaster, gypsum, and limestone are wrought in the vicinity. Pop. 6,500.

Chinchilla, chĭn-chĭl'la, a genus of South American herbivorous rodents allied to the cavies, which they resemble in the general shape of the body, in the limbs being longer behind than before, in the conformation of the rootless molars, and by the nature of the fur, which is more woolly than silky. *C. lanigĕra,* the only species, is about 15 inches long from the muzzle to the tip of the tail, and is covered with a beautiful pearly-gray fur, which is highly

esteemed as stuff for muffs, pelisses, linings, etc. The chinchilla lives gregariously in the mountains of western South America, and makes numerous and very deep burrows. It is gentle and sportive, loses none of its gaiety in captivity, and is very cleanly. This genus gives its name to the family *Chinchillidæ,* which contains two other genera, one (*Lagidium*), including a large chinchilla-like rodent of the Andes; and the other (*Lagostomus*), containing that large numerous burrower of the pampas called vizcacha (q.v.).

Chincholle, shăn shŏl, **Charles Henri Hippolyte,** ĭp-pō-lēt, French novelist: b. Chauny, France, 16 July 1845; d. Paris 21 Aug. 1902. In the earlier portion of his career he was secretary to the elder Dumas, with whom he occasionally collaborated, and from 1872 was a member of the staff of 'Figaro.' He was an extremely versatile writer, but his style is wanting in finish. Beside his one-act farce, 'Oncle Margotin,' which ran 300 nights in 1870, and 'Le Mari de Jeanne' and other plays, his romances and other works include 'La Plume au Vent' (1865); 'Alexandre Dumas Aujourdhui' (1867); 'Les Pensées de tout le Monde' (1868); 'Dans l'Ombre' (1871); 'Le Lendemain de l' Amour' (1880); 'Le Catalogue de l' Amour' (1881); 'Paula, Histoire d' une Neurosée' (1882); 'La Ceinture de las Survivants de la Commune' (1884); 'Le Vieux Général' (1886); 'Femmes et Pois' (1886); 'La Grande Prêtress' (1887); 'Biographe du Général Boulanger' (1889).

Chinchon, chēn-chōn', Spain, a town 25 miles southeast of Madrid. After a Countess of Chinchon, wife of the governor of Peru in 1638.

Peruvian bark was named "chinchona," now habitually misspelled "cinchona."

Chinde, Africa, a town on the only navigable mouth of the Zambezi. Here the inland steamers meet the ocean steamers of various European companies; and here, too, Great Britain has obtained from Portugal a small piece of land called the "British Concession," for commercial purposes, and a residential district called the "Extra Concession."

Chinese Architecture and Art. The fine arts in China are as varied in character and as rich and tasteful in design as those of the peoples most successful in art; but they are known to Europeans in a very unequal fashion. Thus the architecture of the vast country, contained in the old provinces of China, as large as the United States west of the 100th parallel, and as diversified in soil and climate, is so little known that the essays on the art written even by former residents in China deal obviously with certain very limited places only — the neighborhood of a certain city, the borders of a certain river, and the like — and are, moreover, the studies of men not conversant with the construction or with the decorative buildings of any part of the world. The history of this architecture is yet to be written. The photographs now obtainable, having been made during the years since 1890, open up a new world of architectural art. It is enough to say here that there exist two systems of building: the one being a framed construction, usually of wood and capable of great elaboration, the other a solid masonry construction carried out in brick or stone according to the resources of the neighborhood and the cost of the building. The framed system of building is closely akin to that used in Japan; and it is there that we can best study the wooden temple-tower and the wood-framed hall of reception. As for the masonry buildings, they are often large and massive, as is well known to all who have observed the walls and gateways of the great fortified cities and the famous "Great Wall" which protected Pekin and its neighborhood from northern invasion. In the way of more decorative buildings less is known of the system of design, but several peculiarities may be mentioned. Thus there is a marked preference for the octagonal form in towers, and everywhere throughout the central provinces these buildings, called by the Europeans pagodas, rise above the hills and show over the groups of houses. The often cited use of the polygonal arch, that is, one with the intrados at least many-sided instead of curved, is to be noted as indicating how much that is attractive we have still to discover. The decorative gate-ways (pailoo) corresponding nearly to the *torii* of Japan and to those edifices called *toran* in the peninsula of India, are often admirable designs in the way of purely decorative architecture, monumental architecture, having no direct utility. The dwellings of the Chinese, even the palaces of the princes, do not seem to include many-storied and ponderous structures, but cover immense tracts of ground with gardens, among which stand buildings of no great height, but of a singular beauty of construction, especially in the roofs, and very richly decorated within. The dwelling-houses of the people are generally walled with brick and are not striking in their external appearance. The roof is an especial feature in Chinese art. It is commonly built with a hollow upward curve, the result of a very interesting system of construction, with light wood-work. This slightly concave surface covered with glazed ridge-and-furrow tiles richly colored, is an important feature in Chinese architectural composition. Painting in strong pure colors is a recognized element of external design; and it has been truly said that the special and distinguishing feature of Chinese exteriors is gaiety. Even the slightly-built one-story shops of the great towns are bright with vermillion and green; and the signs, painted with the very ornamental Chinese ideographs, help in this effect.

Chinese painting reached a great development as early as the 8th century A.D.; and there is every probability that it had then been a great school for several centuries. Landscape was one of its especially favored branches. While in Europe no one dreamed of landscape art for its own sake, the Chinese impressionist designers were producing admirable studies, both in color and in monochrome. Some few of these are in European museums, their authors and dates having been fixed by careful comparison, but the much more modern Japanese landscapes, in painting, monochrome, and wood-cut, are the best material from which to gain a general idea of that ancient landscape art. A highly religious art was developed in the 12th century A.D. At that time Buddhist religious feeling was strongly expressed in the art of some painters, while others affected rather a kind of decorative realism, that

Mau

is to say, a close observation of natural objects used to inspire and to influence a highly decorative system of design. These paintings have been little known to Europe, because they are preserved in temples and almost inaccessible palaces; and again it is Japan which has opened to us, through her own art, a knowledge of the older arts of China. A few ancient paintings known to Europeans are of surprising interest; and they open up to us a whole system of design in form and color on the flat surface, which the West is now studying, much to its own advantage. The paintings best known to us are of some purely decorative character, those on porcelain having attracted the attention of Europe ever since the 16th century. These paintings are closely connected with the system of inlay which in the form of cloisonné enamel (see ENAMEL) is another of the great art industries of China. The porcelains affect a more close and careful study of the natural forms in flowers, trees, costume of figures and the like, whereas the enamels are more severe and are confined more closely to the making of admirable patterns; but the two systems differ only as one and the same artist might change his style according to the material and the demands upon him. A similar method of decoration by the free use of natural forms, conventionalized but still retaining much of their character, is seen in the splendid embroideries which have been little known to the West until within a few years. The textile fabrics of China — silks, brocades and velvets — have been known to collectors for many years, but very few national museums have provided themselves with any number of them: they present an inexhaustible treasure of beautiful design in strong and positive colors. It may be stated here that brilliant color is a specialty of the Chinese artist. Where, as in a fine cloisonné enamel, a Japanese artist works in dark and sombre colors, the Chinese will use a sky-blue ground, upon which an elaborate pattern is carried out in deep ultra-marine blue, violet, reddish-gray, dark green, apple green, vermillion, bright yellow, and white, with dividing lines of gilded metal, and many passages of gradation from one color to another. No people have equaled the Chinese in the decorative use of bright, pure colors.

Sculpture in the sense of a grand and permanent art of form is less the business of the Asiatic artist than painting, or than decoration properly so-called. Sculpture in the form of carving in ivory and wood and bronze figures of small size, has always attracted great attention in China and has reached an extraordinary state of excellence in spirit, movement, and skilful composition. Thus, a bronze figure will express perfectly the character and the sentiment of the occasion, while yet losing nothing of its sculpturesque value; and a group of «The Seven Wise Men» seated around the trunk of a bamboo will be rendered in cheap glazed pottery or in minutely carved ivory with equal skill and at a price proportionate to the labor expended and the prime cost of the material.

The ivory group may have cost, when new, a hundred times as much as the piece molded in clay, fired and then glazed and painted, but it is not on that account a finer design, the characters are not more perfectly expressed nor the attitudes of the figures more forcible or more harmonious with each other. This is a great evidence of an old traditional skill of sculpture excelling in the larger as well as in the smaller scale of work. Relief sculptures, especially those in wood, in soft stone and in the surface of lacquer, which has generally a wooden background prepared to receive the impressed and sculptured coat of the viscous material, are as effective for their decorative purpose as are the sculptures in the round. Finally there must be mentioned the lapidary's art, in which the Chinese have always excelled, for the most marvellous carvings in agate, jade and rock crystal, that is to say, in the hardest materials known, are unmatched in the world, and they are as artistically perfect as the carvings in the softer stones; their essential characteristics perfectly understood and always observed. The conventional way of rendering in hard material the most delicate leafage and sprays of twig and blossom is perfectly maintained: and the brilliant polish which is one of the beauties of these carvings is carried through beneath those delicate undercut sprays.

RUSSELL STURGIS,
Author of 'Dictionary of Architecture.'

Chinese Bible, The, a work compiled and partly composed by Confucius, divided into five books:

1. Called the 'Yih-King,' a treatise on cosmogony.

2. Called the 'Shu-King,' the acts and maxims of Yaou, Shun, and other ancient kings held in religious veneration.

3. Called the 'Shi-King,' which contains 311 sacred poems.

4. Called the 'Ee-King,' or book of rites, containing maxims and directions for everyday life and all conditions of men.

5. Called the 'Chun-tsien,' a history of Confucius' own times.

Chinese Cæsar, The, Kao-hoangti, founder of the Han dynasty, one of the most illustrious that ever occupied the Chinese throne. Dynasty lasted 202 B.C.–226 A.D.

Chinese Immigration. Until the California gold discoveries of 1848 there were literally no Chinese laborers in the United States; nor was there then, or for years afterward, the least prejudice against their coming — the one objection to the Chinese being that they kept foreigners out of their own country, not that they infested others. From 1840 to 1850, according

to the records of immigration, only 35 came over, and those all in the year from June 1849 to June 1850. The treaties of 1844 and 1858 with China expressly aimed at securing a freer interchange both of commodities and citizens. The current "buncombe," even in California (the surest indication of public feeling, because its one aim is to please the unreflecting) was to proclaim America the asylum for the poor and oppressed without exception; and San Francisco business men welcomed the early Chinese comers, publicly fraternized with their traders, and made speeches of mutual compliment, with no objection from any source. During the next decade 1850–60, 41,397 Chinese came to the port of San Francisco, of whom about 6,500 returned to China, leaving the net Chinese population in 1860 34,933, nearly all in California. For some years the general feeling continued to be favorable, as labor was dear and domestic service almost impossible to obtain; and the Chinese laborer, and above all, the Chinese house servant, seemed to make industrial progress and lives of refined leisure possible. In the latter half of the decade some uneasiness began to be felt, but mainly from the belief that Chinese criminals were being deported here. The first restrictive legislation, not specifying Chinese, was to prohibit this. In 1855 an act was passed, said to have been aimed against the Chinese, fining any shipmaster $50 who landed passengers incapable of becoming citizens of California under its Constitution and laws, and ordering commissioners of immigration to obtain certificates of identity; but this, too, must have referred to criminals alone, for there was at this time no bar to Chinese citizenship. In 1858 the Reed Treaty was negotiated, after the Chinese war of that year, and no restriction was placed on immigration. In 1862 the California legislature appointed an investigating committee on the subject; but it was still felt to be only a local nuisance, not calling for any hasty or severe measures. Even as late as 1868 the Burlingame Treaty with China, though reprobating enforced immigration (coolies under contract), asserted the right of migration to be inherent in the human race; and on 27 July 1868, a special resolution of Congress, in response to anti-immigration measures in the East, repeated this assertion as to the right of human beings to expatriate themselves, and declared that its restriction was contrary to the fundamental principles of the republic. This meant European immigration, and caused a painful "straddle" in later political campaigns when California votes were needed; but it proves that even then the Chinese question had not become acute enough locally to force California politicians into making it a national touchstone. Within a few years after this, however, it was not only the burning issue of the Pacific Slope, but had emerged into the national arena. Bret Harte's 'Heathen Chinee' shows that "Chinese cheap labor" had become a popular local catchword; and the attempt of Eastern manufacturers about this time to use the Chinese for strike-breakers made the question of national notoriety.

This hostility was partly due to the Chinese as such — as extreme aliens with social and religious customs marking a permanent separation; but mainly to the special character of the immigration. Except a few merchants, it consisted almost wholly of the lowest class of coolies about Canton, and it was firmly believed that it was not voluntary and self-selected immigration, like that from Europe, but a system of exploited serfage — the coolies being collected in gangs by a Chinese corporation called the Six Companies, and shipped under rigid contract to work for a period of years under terms fixed by their masters. Their low standard of comfort was believed to affect the market and wage-rate for white labor unfavorably, and to build up great corporations without building up a corresponding class of civilized citizens; their sections of the cities were plague-spots of overcrowding and filth, besides being Alsatias where law did not run; they brought no wives, intending no permanent residence, and supplied the places of wives with hundreds of imported Chinese prostitutes; and their iron-barred opium joints, tempting not Chinese alone, were a still greater danger. Lastly, those who saw the excessive strain placed on democratic institutions by ignorant European immigrants, ultimately assimilable, were appalled at the prospect of operating them among a huge unassimilable and purchasable brute-vote on the Pacific Slope. If they were made voters, they would force a permanent political division on the lines of race; and if not, would form a dangerous anomaly and nuisance in the republic. Thus, white industry, order, sanitation, public morals, and statesman-like forecast united in the conviction that this class of immigration must be prohibited or severely restrained. These valid objections and fears were reinforced by others, unsound or exaggerated. The numbers arriving were vastly swollen in popular imagination, and the departures suppressed; except that when a point was made of their worthlessness to the country, it was asserted that all returned to China and so "drained the country" of their wages — which, if true, of course nullified the permanent danger from them, and involved an economic fallacy. The actual number of Chinese in the United States in 1870 was 62,376, an increase of some 27,000 in 10 years; 69,298 had come over within 10 years, and 34,850, or over one half, had gone back. But it was generally stated at 150,000 to 175,000; and the rate of increase at fully 25,000 a year. The population of China was estimated at 400,000,000 (pure guesswork), and it was assumed that the immigration represented a tendency diffused through this entire mass, who could and probably would pour 100,000,000 of its people into America in a short time, and swamp the European element utterly. As a matter of fact, the entire immigration came from within 40 miles of Canton, and the mass of Chinese will not emigrate, even to countries where they have full civil rights. It may be mentioned that in such places as Java and Hong Kong, they live and die with the same permanency as others; so that the argument which rests at once on the danger of their remaining and the financial loss of their not remaining must lose the latter clause. It was also asserted that there were more Chinese males in California than voters; but in fact they were under one sixth. But after all deductions, it was certain that the Chinese population in no long time would form a grave and apparently insoluble problem, a social and political menace, on the Pacific coast, and that the State could better afford a slower industrial growth, than a rapid

one based on a proletariat and a body almost equally dangerous as citizen or aliens.

After attempts at restriction by local legislation, which were invalidated by the federal courts as in violation of United States treaties, California appealed to Congress for a national law; but that body evaded the question till 1876. Then the exigencies of the Hayes-Tilden campaign compelled both parties to bid for California's electoral vote by anti-Chinese planks in their platforms; and Congress (the House, 6 July, the Senate 17 July), appointed a joint special committee to investigate the subject. It met at San Francisco 18 October, heard a mass of testimony, and made a very voluminous report, taking the strongest ground in favor of a restrictive law (Senate report 689, 44th Congress, second session, 27 Feb. 1877). At this time the Chinese population was about 100,000. Nevertheless, the party pledges were not redeemed in Congress till 1879, when on 20 March such a bill was passed; but it was vetoed by President Hayes as being in conflict with the Burlingame Treaty. In 1880 a commission was sent to Pekin to negotiate a new treaty permitting the restriction. This treaty, signed 17 Nov. 1880, ratified by the Senate in March 1881, gave the United States the power to "regulate, limit, or suspend" the immigration of new Chinese laborers, but not to prohibit it altogether; permitted laborers already in the country to remain and travel to and from it at will; and allowed Chinese merchants, students, teachers, or travelers, to exercise their functions without molestation, each class to have all the privileges and advantages of the most favored nation. (The Chinese population here in 1880 was 105,465.) Under guise of giving effect to this treaty, Congress, in March 1882, passed an act suspending Chinese immigration altogether for 20 years. This was vetoed by President Arthur on the ground that so long a suspension was virtually absolute prohibition, and not in accord with the spirit of the treaty. On 6 May another bill was passed to meet this objection, suspending fresh immigration for 10 years, both of skilled and unskilled laborers, permitting those already here to remain, but forbidding their naturalization. The provisions of this act were minutely severe. The exempted Chinese must have certificates of identity issued by the Chinese government and vised by the United States consul or diplomatic representative at the port of departure; departing Chinese laborers must take out return certificates, with heavy penalties for forgery or false personation; a master of a vessel who landed any unauthorized Chinese was subject to fine and imprisonment and the confiscation of his vessel; no Chinese passengers could be landed until the collector of the port had received the lists of the passengers and compared them with the persons, etc. The only Chinese laborers who could be permitted to return after once departing were those who had a living wife, parent, or child here, or $1,000 worth of property, which was made answerable for their default.

This was "amended" on 1 Oct. 1888 by the Scott Act, striking out all permission to return for any purpose, forbidding the issue of return certificates, and declaring all that were issued void,— in a word, absolutely barring America to any Chinese workman once outside it. A treaty was at this time pending between the United States and China by which the Chinese government was to prohibit the emigration of laborers, and the United States was to protect those in the country from violence, which it had shamefully failed to, but the Scott Act enraged the former government, and it refused to ratify the treaty. It may be mentioned that the supreme court in 1883, October term, decided that Congress can abrogate a treaty. On the expiration of the 1882 act in 1892, the "Geary law" of 5 May, extended it for another 10 years, with further severities, not called for by any dangers at hand; chief of these, that any Chinaman found in this country unlawfully should be imprisoned for a year at hard labor. On 3 Nov. 1893, on complaint that Chinese are so much alike to Western eyes that certificates of identification are not sufficient, an act was passed that each certificate must include the holder's photograph in duplicate. On 7 Dec. 1894, a convention with China restored the conditions of return to the status of 1882. On 3 March 1901, it was enacted that a Chinaman can only be arrested under these acts on sworn complaint of certain specified United States officers. In 1902 the exclusion was re-enacted for another decade. With the general intent of these acts, there is little difficulty in concurring; but some of the provisions, and the petty acridity of their execution, exhibit a spirit of panic which is neither dignified nor sensible. The volume of the immigration is the very essence of the danger; if it is insignificant it is harmless. Hence, the groundless harrying of innocent travelers or students, as if the mere presence of a single Chinaman constituted a grave national danger, is unmanly and irrational. The Chinese population in 1890 was 107,488; in 1900, 89,863 — a falling off of nearly 20,000 in 10 years. Consult: George F. Seward, 'Chinese Immigration' (1881); Mayo Smith, 'Emigration and Immigration' (1895); and the congressional report above cited.

Chinese Language, Literature and Writing. See CHINA.

Chinese Lantern, a lantern made of thin paper, usually variously colored and much used in illuminations.

Chinese Olive, the fruit of *Canarium commune*, order *Amyridaceæ*, a tree of the Asiatic archipelago yielding an oil which is used as a condiment and for lamps.

Chinese Pavilion, a semi-musical instrument composed of a pole with several transverse brass plates of some crescent or fantastic form, generally terminating at top with a conical pavilion or hat. On all these parts are hung small bells, which the performer causes to jingle by shaking the instrument held vertically up and down. It is employed only in military bands, and is more for show than use.

Chinese Swallows' Nests, curious productions, which sell at a high price in China, though they have no special points of recommendation beyond many other gelatinous ingredients in soups. They were formerly supposed to be made of some species of the rose-spored *Algæ*, as *Sphærococcus lichenoides;* but this is now ascertained to be a mistake, and it is known that they are formed of dried saliva from the mouth of the bird itself. The nests are the production of certain

species of swifts (not swallows) of the genus *Callocalia* which breed in caves on islands of the tropical Pacific and Indian oceans. All species of swifts secrete an abundant mucous saliva which is utilized along with other materials in constructing the nests; but species of *Callocalia* only form their nests of saliva exclusively.

Chinese Tartary, an old name of Eastern or Chinese Turkestan.

Chinese Terms. See CHINA.

Chinese White, a pigment prepared from the white oxide of zinc (ZnO), introduced into the arts in the latter part of the 18th century as a substitute for the preparations of white lead. Its color is not changed by exposure to the air.

Chinese Windlass, a differential windlass, in which the cord winds off one part of the barrel and on to the other, the amount of absolute lift being governed by the difference in the diameters of the respective portions. It is a good contrivance in the respect that great power may be attained without making the axle so small as to be too weak for its work.

Ching, Chinese prince: b. Peking about 1840. He is related to the Chinese imperial family and has held important civil and military posts, although he boasts that he has never been outside of Peking. He was at the head of the Tsung-li-Yamen, but was deposed in 1900 for his efforts to protect the legations in Peking, during which he attacked the Boxers (q.v.).

Ching-Hai, chĭng'-hī', or **Chin-Hai, China,** a seaport in the province of Che-Kiang, about 11 miles from Ningpo. Ching-Hai has no foreign commerce of its own, not being a treaty port; but is a resort for native traders from the Chusan Archipelago, and from here Chinese merchandise is sent to Ningpo. There is a missionary station and a native academy for students who compete in the civil service examinations at Ningpo. Pop. (1900) estimated 150,000, mostly Chinese.

Ching-Tu, chĭng-too', China, city, capital of the province of Sze-Chuen, situated on the Min River, 150 miles from its junction with the Yang-tse-Kiang, and 175 miles from the treaty port Chung-King. Ching-Tu is in one of the largest fertile plains of China, and is surrounded by mountains rich in the minerals of commerce. By way of the Min River and canals nearby, trade is carried on with the places in the valley of the Yang-tse-Kiang. The walls around the city are 12 miles in extent. The houses and streets indicate wealth. Telegraphic communications have been established with Hankow. It has an arsenal with modern equipment, and goods of European manufacture are found in some shops. Pop. about 9,000,000.

Chingleput, chĭng-glĕ-pŭt', or **Chengalpat,** or **The Jaghire,** India, a coast district in the province of Madras, area 2,842 square miles, surface rocky, water scarce, crops scanty. In the fertile localities grain and fruits are raised which are shipped to the Madras markets. Some manufacturing of cloth is carried on. The chief towns are Conjeveram, St. Thomas' Mount, Saidapet, Tiruvotiyur, and Chingleput. This tract of country was obtained in 1760 and 1763, by the East India Company, from the Nabob of Arcot. It was invaded by Hyder Ali in 1768, and again in 1780, when it was nearly depopulated by famine and emigration. Pop. 1,136,928.

Chingleput, or **Chingalpat,** India, town in the district of the same name, 15 miles west from the Bay of Bengal, 35 miles southwest of Madras, situated in a valley surrounded by hills. In 1751 it was taken by the French, retaken the following year by the British under Clive. A railroad enters the town. It has Roman Catholic and Protestant missions, hospital, jail, civil and criminal courts, and a dilapidated fortress which at one time was of considerable extent and well fortified. Pop. 7,000.

Chin'iot, India, town in the Jhang district of the Punjab, near the Chenab. It is famed for wood-carving, and has manufactures of coarse cloth. Its trade is also of considerable importance. Pop. 13,476.

Chiniquy, shē-nē-kē, **Charles Paschal Telesphore,** Canadian clergyman: b. Kamouraska, Que., 30 July 1809; d. Montreal 16 Jan. 1899. He was a Roman Catholic priest from 1833 to 1858, when he abandoned the Roman Catholic and joined the Canadian Presbyterian Church. He lectured in England in 1860, 1874, and 1882, and in Australia 1878–80. He wrote 'The Priest, the Woman, and the Confessional' (1874), a work that has had an enormous circulation in English-speaking countries, and has been translated into French, Italian, Spanish, and Dutch; 'Fifty Years in the Church of Rome' (1886; 5th ed. 1886); Papal Idolatry: Exposure of the Doctrine of Transubstantiation' (1887).

Chinkara, the common gazelle of India, sometimes called the "ravine deer." See GAZELLE.

Chinoline, kĭn'ō lĭn. See QUINOLINE.

Chinon, shē-nôn', France, an antique town in the department of Indre-et-Loire, beautifully situated on the Vienne, 31 miles southwest of Tours. Crowning a lofty rock are the ruins of its vast old castle, the French Windsor of the Plantagenets, the death-place of Henry II., and later the residence of several French sovereigns, where, in 1429, Joan of Arc revealed her mission to the Dauphin, A farmhouse across the Vienne is pointed out as Rabelais' birthplace. Pop. (1901) 4,200.

Chinook (chĭ-nŭk') **Wind,** a warm dry wind that often blows from the Rocky Mountains over the plains that stretch from their eastern base. The moisture-laden winds from the Pacific Ocean striking the lofty barriers of the Cascade and Rocky Mountains are forced to precipitate their moisture as rain and snow. When the ranges are crossed the winds are cold and dry. Descending the eastern slopes of the mountains the winds become warmer, because in descending the air is condensed, the atmospheric pressure at the base of the mountains being much greater than at the summit. The winds are, however, still dry, all their moisture having been precipitated in crossing the mountains. In the de-

Photograph by J. Horace McFarland Co.

scent of 10,000 feet or so to the plains of Montana and the prairie province of Canada, the winds become so warmed by the increased pressure that they give a mild climate to regions far north. It is on account of these winds that cattle on the prairies of Alberta can graze in the fields all winter, a snowfall of a foot or more disappearing in a few hours before the warm, dry breath of the Chinook. Not all the warm winds of Montana and the regions north and south have their origin west of the Rockies. Various causes contribute to the formation of descending air, and when the descent is a number of thousands of feet, the winds resulting are always warm. Such winds blow over prairie regions west of the Missouri, but not always adjacent to the Rockies. Similar warm winds are known in other parts of the world, as in Switzerland, where they are called Föhn winds.

Chinooks, chĭ-nûks', a tribe of Indians, now nearly extinct, on the Columbia River, or in Oregon. Their language is very difficult to learn and to pronounce, and this led to the formation of the Chinook jargon, a trader's *lingua Franca,* consisting of words from French, English, and Hawaiian, as well as from Chinook and other Indian tongues.

Chinquapin, ching'kạ-pĭn, a dwarf chestnut (*Castanea pumila*), a native of South America, but growing wild in the Southern States as far north as Pennsylvania and westward as far as Texas. It is a shrub four or five feet high, but sometimes grows to the height of 30 or 40 feet.

Chins, a savage tribe living in the mountainous region between Lower Bengal and Upper Burma, of very primitive habits.

Chinsura, chĭn-soorā, British India, a town beautifully situated on the Hugli, and now included in the town of Hugli, 20 miles north of Calcutta. It is a military station, was formerly a Dutch settlement, and contains many neat houses in the Dutch style. It is celebrated for the manufacture of cheroots, and has several schools, among them some belonging to the Free Church of Scotland.

Chintreul, Antoine, äṅ twäṅ shäṅ-trėl, French landscape painter: b. Pont-de-Vaux, France, 15 May 1816; d. Septeuil 13 Aug. 1873. He was a pupil of Corot, obtained a medal at the Paris Exhibition, 1867, and that of the Legion of Honor in 1870. His sunlight effects have been greatly admired. The Luxembourg Gallery contains his 'Thicket With Deer' (1873).

Chintz, a cotton cloth gaily printed with designs of flowers, etc., in five or six different colors. It was a favorite in the time of Queen Anne, long before cotton prints became cheap. The name, being highly respectable, has since been applied to goods lacking the graceful and artistic character of the genuine article. The Chintzes of the Coromandel coast were celebrated in the time of Marco Polo, 13th century. They are mentioned also by Odoardo Barbosa, a Portuguese, who visited India soon after the passage of the Cape of Good Hope by Vasco de Gama: "Great quantities of cotton cloths admirably painted, also some white and some striped, are held in the highest estimation."

Chio, kē'ō. See CHIOS.

Chiob'be, a town in China, province Fokien, 15 miles southwest of Amoy. It is situated on a river bearing different names, navigable by junks of 400 tons, and is defended by a citadel and numerous other fortifications. It is the great emporium for common china-ware, and has important fisheries. The rearing of silk-worms forms an important occupation. Pop. estimated, 300,000.

Chiococca, kī-ō-kŏk'ạ, a genus of tropical plants of the natural order *Rubiaceæ,* consisting of small, often climbing, shrubs, with opposite stipulate leaves and bell-shaped or funnel-shaped, yellowish flowers in axillary clusters. The fruit is a white berry with two seeds. The bark of the root of *C. anguifuga* is a violent emetic and purgative. The root of *C. densifolia,* a woody bush, is considered a remedy for snake bites by the people of Brazil.

Chioggia, kē-ōd'-jä, or **Chiozza,** an important seaport town of northern Italy, 15 miles southwest of Venice, on an island at the southern end of the Venetian Lagoon, connected with the mainland by a stone bridge of 43 arches. It is founded on piles, has a beautiful cathedral; its harbor, the deepest in the lagoon, is guarded by forts and batteries. It is one of the strongest places in the Venetian lagoons. Many of the people are engaged in the coasting trade, lace-making, weaving, ship-building, and fishing. Pop. 25,100.

Chione, kī-ō'nē, the daughter of Dædalion, who was killed by Diana for boasting of her beauty.

Chios, kī'ŏs (now called by the natives *Chio,* Italianized into *Scio*), one of the most beautiful and fertile islands in the Ægean Sea, belonging to Turkey, seven miles off the coast of Asia Minor, at the entrance to the Gulf of Smyrna; about 30 miles long from north to south, by 8 to 15 miles broad, with a coastline of about 110 miles, an area of 320 square miles, and a population of about 70,000, almost all Greeks. The northern part is more mountainous than the southern part. The climate is delightful. Earthquakes are common, and one in 1881 caused the death of 3,558 persons, and the destruction of property to the value of over $15,000,000. The wine produced on the northwest coast, the *Vinum Arvisium* of ancient times, is still esteemed. Other products are figs, also noted in classical days; mastic, silk, lemons, oranges, and olives. Goats' skins are also exported. The capital, Chios, about the middle of the east coast, contains about 13,000 inhabitants, and has a harbor touched by various services of steamers, and doing a good trade. On the west coast is a rich monastery, Nea-Moni, founded in the 11th century. In ancient times excellent marble and potter's clay were quarried in the mountains, and recently pits of antimony and ochre have been worked.

Chios is one of the places which contended for the honor of giving birth to Homer. It formed in early times one of the most flourishing of the Ionian states, and contributed 100 ships to the Greek force defeated by the Persians in the sea-fight off Miletus (494 B.C.).

After the Persian victory the town and temples of Chios were burnt and many of the people enslaved. In more recent times the island was taken by the Genoese (1346), and by the Turks (1566), in whose hands it has since remained, except for a short interval. It was conferred as a private property on the sultana. After a long period of prosperity, Chios suffered a terrible blow during the war of Greek independence. A number of the Chiotes having in 1821 joined the revolted Samians, a Turkish fleet and army, in 1822, inflicted dreadful vengeance; 25,000 Chiotes fell by the sword, 47,000 were sold into slavery, and only some 5,000 escaped. A second rising in 1827 was likewise unsuccessful. The island has since been prospering.

Chip'man, Nathaniel, American jurist: b. Salisbury, Conn., 15 Nov. 1752; d. Middlebury, Vt., 15 Feb. 1843. He was an officer in the American army for a part of the Revolutionary War, and was admitted to the bar in 1779. He then removed to Tinmouth, Vt., where he commenced practice, and served as State's attorney for four years. In 1786 he was elected assistant judge of the supreme court, being the first lawyer who had been placed upon the bench in Vermont. In 1789 he was elected chief justice, and held that office until October 1791. In 1789 he was also appointed one of the commissioners to adjust the differences between Vermont and New York. In 1791 he was a member of the convention called to decide the question whether Vermont should accede to the Union. On 18 Jan. 1791 he was appointed a joint commissioner with Lewis R. Morris to attend Congress and negotiate for the admission of Vermont into the Union. In 1793 he published a small work entitled 'Sketches of the Principles of Government,' and a volume of 'Reports and Dissertations.' In 1796 he was again elected chief justice of the supreme court. In 1796 he was appointed one of a committee to revise a code of statute laws for Vermont, and the revised laws of 1797 were written by him. He was a United States senator in 1798–1803. In 1813 he was again elected chief justice of the supreme court, and continued in office two years. From 1816 to 1843 he was professor of law in Middlebury College. In 1833 he published 'Principles of Government: a Treatise on Free Institutions, Including the Constitution of the United States,' containing portions of his former treatise.

Chip'man, Ward, Canadian jurist: b. St. John, New Brunswick, 10 July 1787; d. there 26 Dec. 1851. He was the son of Ward Chipman (1754–1824), a Massachusetts loyalist who went to New Brunswick after the American Revolution. He graduated at Harvard in 1805, and succeeded his father as agent for the crown in determining the northwest angle of Nova Scotia. After holding minor legal offices he became puisne judge of the supreme court 1825, and chief justice of New Brunswick 1834, president of the legislative council, and speaker of the assembly.

Chip'munk, an American ground-squirrel, a small animal of the genus *Tamias,* about six inches long, with a slender furred tail, nearly as long as its body, and a coat of reddish-brown fur, striped with white on the back; from the marking it is called *Tamias striatus.* The eastern species has two white stripes, and the western chipmunk, *Tamias quadrivittatus,* which is exceedingly common all over the Rocky Mountain region, bears four stripes. The ground color also is extremely variable according to habitat. This little creature is often found frisking along stone walls, stopping now and again to sit erect and dart sharp glances at moving objects. It is generally shy in the presence of man, and escapes with great rapidity, when need arises, into some hiding-place. Its home is a burrow in some woodland place, tunnel-like in structure, sometimes fully 20 feet long, and always deep enough to be below the frost-line. It is enlarged into chambers at intervals. One of these, supplied with dried leaves, grass, and like material for bedding, is the sleeping apartment; the others are storehouses. In them the chipmunk stores his winter supplies of small nuts and acorns, especially the sweet beech-nuts. These he carries home, often several at a time, in his distensible cheek pouches. They are his chief food; but he will eat, also, buds, mushrooms, and insects. The breeding season is in May; and the young are usually from four to six in number. The chief enemies of the chipmunk are the fox and the weasel. The former is dangerous only in the open, as he is too large to disturb the chipmunk at home. But the weasel can attack him in his burrow; and, to escape him, the chipmunk makes an opening for possible escape, at the far end of his burrow. For consideration of the various species of *Tamias,* consult J. A. Allen, 'Bulletin of the American Museum of Natural History,' Vol. III.

Chippawa, chĭp'a wā, Canada, a village in the province of Ontario. It is situated at the confluence of the Chippawa and Niagara rivers, two miles above the Falls, and contains an extensive steam-engine manufactory, and one of the largest factories of stoves in the province. On 5 July 1814 the battle of Chippawa (q.v.) was fought here between the Americans and the British.

Chippawa, Battle of, 5 July 1814, an action in the War of 1812, remarkable for the defeat of a force of British regulars by an inferior number of Americans, in pitched battle on an open plain, without advantage of position, and with weaker artillery. Maj.-Gen. Riall, commanding the British forces, had about 1,500 line infantry — the King's regiment, the 100th, and the Royal Scots, with dragoons and artillerymen, and 600 skirmishers — north of the Chippawa River, which enters Niagara on the Canada side just above the rapids; the bridge from Chippawa village crossed it near its mouth. Joseph Brown's American force lay to the south beyond Streeter's Creek, and Brown started on the morning of the 5th to build another bridge across the Chippawa, to outflank Riall, whose skirmishers crossed the river and harassed the work and the camp from the woods on the west, and Peter B. Porter's militia brigade was sent to drive them out. As it approached the river, Riall's army

crossed the bridge on its right flank, and it fled in panic, about 5 P.M. Riall thereupon deployed his force and advanced on the plain toward Brown. Scott's brigade of 1,300 was about crossing the creek bridge for a Fourth of July parade and, the creek being lined with woods, only learned of the danger at the last moment. Each side had three guns; but the British were two 24's and a 5½-inch howitzer, against the American three 12's. Scott's troops crossed the bridge under fire from the 24's, and coolly deployed beyond; while Scott threw his wings forward to avoid being outflanked, the left wing reaching into the woods. Both sides advanced, with pauses to load and fire, till the flanks touched and the centres were 200 feet off; when the British, unable to endure the deadly musket-fire in front and the artillery now sweeping diagonally through the ranks, broke and ran for the Chippawa. The battle lasted less than an hour; and when Ripley's brigade came to Scott's help the plain was deserted by the enemy. Riall lost 137 killed and 305 wounded of the regulars, nearly a third of his entire force, besides 73 skirmishers; Scott, 48 killed and 227 wounded; and Porter, 22 more. The victory was won by superior musketry and artillery fire, as shown by the enormous disparity in killed; and by a leader under whom every private was a hero. Consult Henry Adams, 'History of the United States,' Vol. VIII., ch. 2.

Chip'pendale, Thomas, English cabinet-maker. He is supposed to have gone to London from Worcestershire before 1750. The style of furniture named from him was less heavy and severe than that of his successors, and was elaborate, delicate, and baroque, with classical tendencies. He wrote a 'Cabinet-maker's Director' (1752).

Chip'penham, England, a municipal borough of Wiltshire, 12½ miles northeast of Bath, on the Avon, here crossed by an ancient stone bridge of 22 arches. It consists of one principal street, with others diverging from it. It contains two large parish churches with lofty spires, an old and a new town-hall, etc. The station of the Great Western Railway here is a very large one. The town is an important mart for cheese, and contains a woolen factory, a silk factory, large condensed-milk factory, railway works, boot factories, etc. Pop. (1901) 5,074.

Chippewa, chĭp'pē-wä. 1. Michigan, an eastern county of the upper peninsula, bordering on lakes Superior and Huron, and bounded east by the river St. Mary. The surface is hilly and partly covered with forests of pine. Capital, Sault Ste. Marie. 2. Wisconsin, a county bordering on the Mississippi River, traversed by the Chippewa and several affluents; area, about 4,300 square miles. Sandstone is abundant, and much of the surface is well wooded. Capital, Chippewa Falls.

Chippewa, a river of Wisconsin, which has its rise in the north of the State, and after receiving several tributaries flows southwest into Lake Pepin, an expansion of the Mississippi.

Chippewa Falls, Wis., town and county-seat of Chippewa County. It is on the Chippewa River, and the Chicago, M. & St. P., the Chicago, St. P., Minneapolis & O., and the Wisconsin Cent. R.R.'s; 12 miles northeast of Eau Claire. It contains the County Insane Asylum, the State Home for the Feeble-Minded, and has important manufactures, large water power from the river, electric lights, and street railways, daily and weekly newspapers, two national banks, and an assessed property valuation of $2,000,000. Pop. (1900) 8,094.

Chippeways, chĭp'pē-wāz, or **Ojibways,** a tribe of North American Indians in the United States and Canada. They are distributed in bands round both sides of the basin of Lake Superior, where they once owned vast tracts. They are of the Algonquin stock, tall, active, and well formed, subsist chiefly by hunting and fishing, and number about 18,000.

Chip'ping Spar'row (*Spizella socialis*), a common North American migratory bird allied to the chaffinch, some five or six inches long, whose song consists of about half a dozen notes uttered in quick succession. It is also called chipping bird, and chippy. It is also known as the hair-bird from its habit of lining its nest with horse-hair. In the nest, which is built in low trees or shrubs, are laid four or five blue eggs slightly speckled with brown. Two or three broods are raised during the season. The bird is naturally an eater of seeds, and has sometimes been known to destroy insects, but the evidence in favor of the contention that it is the friend of the farmer and gardener is hardly enough to warrant the encomiums of some writers.

Chips from a German Workshop, by F. Max Müller (5 vols). A collection of special studies incidental to the author's editing of a library of the 'Sacred Books of the East.' The several volumes cover various fields, as follows: (1) 'The Science of Religion'; (2) 'Mythology, Traditions, and Customs'; (3) 'Literature, Biography, and Antiquities'; (4) 'Chiefly the Science of Language'; (5) 'Miscellaneous' and later topics. Although they are the result of «occasional work,» their wealth of material and thoroughness of treatment, and the importance of the views presented, give them not only interest but permanent value. On many of the points treated, discussion is still open, and some of the views advanced by Prof. Müller may come into doubt; but his contributions to a great study will not soon lose their value.

Chiquichiqui (chē'kē-chē'kē) **Palm,** a native of Brazil, where it is called piassaba. It grows in swamps and along low river banks. Its leaves are used for thatching, and it is the source of a fibre which is used for making brushes.

Chiquimula, chē-kē-moo'lä, Guatemala, Central America, a small town in the east of Guatemala, 55 miles northeast of the city of New Guatemala. It is in a mountainous region, valuable mineral deposits near, and a delightful climate. Pop. 6,500.

Chiquinquira, chē-kēn-kē-rä', Colombia, South America, the largest town in the department of Boyacá, near the Suarez, 42 miles west of Tunja; was an Indian place of pilgrimage before the conquest. In one of the churches is a miraculous picture of the Virgin. Where it is preserved is now visited annually by some 60,000 pilgrims. Pop. 12,800.

Chiquitos, chē-kē'tōz, a race or stem of Indians inhabiting western Bolivia. The chief occupation of the people when first discovered by the whites, was agriculture. They rejected Spanish rule and European customs until 1691, when the Jesuits established a mission among them. The soil here is rich, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little cultivation. The policy of the Jesuit missionaries has made the Chiquito language the predominant one among the natives. It is copious, and is said to have a separate vocabulary for female use. The size and decorations of the churches, and the perfection of the church music in which the natives take a part, are a curious monument of the perseverance of the Jesuit missionaries, which has succeeded in implanting in the midst of these solitudes a fragment of European civilization. In the year 1767 the Jesuits were expelled from the place, by Spanish authority. Since then the Chiquitos have not prospered, and their numbers have decreased. They still cultivate the soil, which is fertile, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little ambition to raise large crops. The native population is about 22,000, distributed among 10 missions.

Chiragra, kī'răg-ra, that species of gout which attacks the joints of the hand (the wrist and knuckles) and hinders their motions. It gradually bends, distorts, and finally stiffens the fingers.

Chirata, chĭ-rä'ta, or **Chiretta,** *Ophelia Chirata,* a slender branching annual of the gentian family, two to three feet high, with yellow flowers. It is a native of India, where the dried stems are in repute as a tonic and febrifuge both with native and European practitioners.

Chiretta, chĭ-rĕt'ta. See CHIRATA.

Chiriqui, chē-rē-kē', Panama, formerly one of the administrative divisions of Colombia, adjoining Costa Rica; area, 6,500 square miles. It is well wooded, and has rich pasturage, especially on the Atlantic coast, where the climate is very moist. The Cordilleras that occupy the interior reach their highest point in the volcano of Chiriqui (11,265 feet). Chief town, David. On the north coast is a spacious lagoon with a depth of water for the largest ships. Pop. 45,000.

Chirogale, kī'rō-gāl, or MOUSE-LEMUR, a small lemur of the genus *Chirogale,* native exclusively to Madagascar, especially *C. Coquereli.* It lives in trees and at the approach of the dry season curls up in a hollow place in a tree and sleeps until the rainless time is over. Like hibernating animals of cold regions, it accumulates a large deposit of fat before becoming torpid; and when it wakes it has regained its normal condition. It feeds on fruits and insects, and builds a nest somewhat like a bird's. Four other species are known whose habits are similar, generally, to those of the lemurs (q.v.), especially the galagos, to which they are closely allied.

Chiromancy, kī'rō-măn-sĭ. See PALMISTRY.

Chiron, kī'rŏn, in Greek mythology, the son of Kronos (Saturn) and Philyra. Kronos assumed the shape of a horse, in this amour, to deceive his wife, Rhea. The shape of Chiron, therefore, was half that of a man, half that of a horse. In point of fact, Chiron was one of the people called *Centaurs.* He was celebrated through all Greece for his wisdom and acquirements; and the greatest princes and heroes of the time were represented as his pupils. He was particularly skilled in surgery. When Hercules drove the Centaurs from Mount Pelion, they took refuge with Chiron in Malea; but their enemy pursued them even into this retreat, and unfortunately wounded his old teacher with a misdirected arrow. The speedy operation of the poison in which the arrow had been dipped rendered remedies useless; and Chiron suffered the severest torments. The gods at his prayer put an end to his life, though his nature was immortal by reason of his descent from Kronos. After his death he was placed among the stars, and became the constellation Sagittarius.

Chirop'tera. See CHEIROPTERA.

Chiru, chĭ'roo, a large antelope (*Pantholops hodgsoni*) native to the plateau of Tibet, especially in pine forests. It is about 32 inches tall, and pale in color. The buck has a black face, and long horns like those of the gazelle. It is wary to a degree that makes the autumnal hunts of the natives a matter of patience as well as of skill. This fine antelope is related to the saiga of Eastern Russia.

Chisel, an edged tool for cutting wood, iron, or stone. It is operated by striking its upper end with a hammer or mallet, or by pressure. It is one of the most ancient of tools. Chisels of sharp flint have always been used by savages to cut wood, and in very early times bronze ones were made which would cut the hardest stone. The ancient Egyptians carved most of their granite monuments with copper or bronze chisels, which are said to have cut as well as the best steel chisels of the present day. Chisels are now made in many different forms and for many kinds of work. Those used by sculptors, masons, and other workers in stone are merely short pieces of steel with sharp edges. The tool is held in the left hand and is made to cut by striking it on the end with a broad hammer called a mallet, made usually of wood. Blacksmiths, and other iron-workers use chisels much like those of stone-cutters, for cutting off bars of iron and like work. Carpenters and joiners' chisels are much finer tools, and usually have handles. They are made out of bar iron by forging, or hammering it while hot, and the edge of tool steel, is put in in the same way as the edge of an axe. Such chisels are made of many sizes, from an eighth of an inch up to several inches in width, and are used for different kinds of wood-cutting and -carving. Dovetails, mortises, and other such work are usually cut with chisels. A kind of chisel with a rounded blade, used for cutting grooves and round places in wood, is called a gouge.

Chis'elmouth. See CHUB.

Chisholm, chĭz'ŭm, MRS. **Caroline** (JONES), English philanthropist: b. Wootton, North-

amptonshire, 1808; d. 1877. In her 20th year she married an officer of the Indian army, with whom she proceeded to Madras. Prompted by the destitute condition of the orphans of British soldiers, she established and managed there, with happy results, a school for girls and a school of industry. In 1838 she removed with Capt. Chisholm to Australia, and at Sydney she found a new call upon her exertions in the numerous young women landed there in destitution from emigrant ships. Between 1841 and 1845, she procured employment for 11,000 persons, to whom she had lent in small sums £1,200, the whole of which, excepting £16, was repaid to her. She visited England in 1846; instituted the family colonization society, by which passage money was paid in weekly instalments; and in many ways planned to relieve emigrants of the poorer classes. She returned with her family to Australia in 1854.

Chisholm, William Wallace, American official: b. Morgan County, Ga., 6 Dec. 1830; d. De Kalb, Miss., 13 May 1877. In 1847 his family removed to Kemper County, Miss., and between 1858 and 1867 he was a justice of the peace and probate judge. During the Civil War he was a union man, but was continued in office, although regarded with suspicion by the Confederate authorities. After the war, a fusion of white unionists and negroes elected him sheriff. In 1877 a long standing personal and political feud between Chisholm and an opposing faction, led by John W. Gully, came to a head. On April 26 Gully was waylaid and murdered. His friends accused Chisholm and his party of being instrumental in bringing about the crime. Chisholm and four others were arrested on the morning of April 29; a mob entered the village and insisted that Chisholm, who was in his own house in the custody of the sheriff, should be lodged in the jail. His wife, daughter, and son accompanied him there; the jail was shortly after attacked by the mob; Chisholm and his daughter receiving wounds that later proved fatal, while the son was killed in his father's arms by a shot from one of the leaders of the assailants. One of the other prisoners, Gilmer, had previously been killed by the mob. In December, 1877, Walter Riley, a negro, confessed that he had murdered Gully, and denied any knowledge or complicity on the part of Judge Chisholm or the latter's associates. See Wells' 'Chisholm Massacre' (1878). 'Kemper County Vindicated' gives the Democratic side of the affair.

Chisholm v. Georgia, in the United States supreme court, the case which led the several States to protect themselves from legal responsibility to individuals, while retaining legal powers of aggression. The Constitution provides (Art. iii., sec. 2): "The judicial power shall extend to all cases — between a State and citizens of another State." Under this provision Maryland was sued soon after the adoption of the Constitution, and acknowledged process by her attorney-general; but the case was compromised, and the question of jurisdiction did not come up. On 11 July 1792, Alexander Chisholm of South Carolina, as legatee in an inheritance case, served a process on the governor and attorney-general of Georgia to appear before the August term of the supreme court. Georgia instructed its attorney-general not to appear, and its counsel to enter a denial that States could be sued by individuals, or that the supreme court had jurisdiction in such cases, but not to argue the case. Chief Justice Jay, and all the court except Iredell of North Carolina, found that the court had such jurisdiction; and a writ of inquiry was issued, but not served because Georgia passed an act making service of it a capital offense. Virginia was as angry as Georgia; and the Eleventh Amendment to the Constitution was introduced into Congress, passed by two thirds of both Houses, 5 March 1794, ratified by the States, and declared in force, 8 Jan. 1798. It reads: "The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state." This leaves the constitutional provision hanging in the air, unless construed as meaning "between a State *as plaintiff* and citizens of another State"; and thus the southern Confederacy made the corresponding article of its constitution read.

Chislehurst, chĭz'ĕl-hẽrst, England, a village in west Kent, with an ancient parish church, two district churches, Roman Catholic church, etc. The mansion of Camden Place was occupied from 1871 by Napoleon III, and the Empress Eugénie, and the former died there in 1873. There is a Runic cross in memory of the Prince Imperial. The remains of Napoleon III. and his son were removed from there to Farnborough in 1888. Pop. (1901) 7,429.

Chisleu, kĭs-loo, or **Kislev,** the ninth month of the Jewish year, commencing with the new moon in December or the latter part of November. See KISLEV.

Chiswick, chĭs'ĭk, England, a town and parish of Middlesex, six miles west of Hyde Park Corner, London. It has an ancient church, with Hogarth's tomb in the churchyard, and several schools, contains the gardens of the Royal Horticultural Society, and Chiswick House, in which Fox and Canning died. There are engineering works, breweries, market-gardens, etc. Pop. (1901) 29,809.

Chitaldrug, chĭt-ŭl'droog', or **Chitteldroog** (native, *Sitala Durga,* spotted castle), India, a town and fortress, capital of a district of the same name in the Nagar division of Mysore. The town is 126 miles northwest of Bangalore, and the fortress, occupying a cluster of rocky hills about 800 feet high, consists of a labyrinth of fortifications winding irregularly up from rock to rock to the summit, and guarding every accessible point. Inside the fortifications are a number of temples. The modern town stands at the northeastern base of the hills. Pop. 5,000.

Chitin, or **Chitine,** kī'-tin ($C_{15}H_{26}N_2O_{10}$), the horny substance which gives firmness to the tegumentary system and other parts of the *Crustacea, Arachnida* and insects; probably also the carapace of the *Rotatoria* consists of it. It is left when the above structures are exhausted successively with alcohol, ether, water, acetic acid, and alkalies. It is colorless and amorphous,

and is usually classed a proteid. It is dissolved by concentrated mineral acids without the production of color. It is not dissolved by solution of potash, even when boiling; neither does it give the characteristic reactions with Milton's or Schultze's tests.

Chiton, kī'tŏn, a genus of *Mollusca* and the common name of the same, the shells of which are boat-shaped, and consist of a median series of symmetrical plates, folding over each other, and implanted in the mantle, the marginal zone of which is studded with spicules. It is the typical genus of the family *Chitonidæ* of the class *Amphineura.*

This class is remarkable among the *Mollusca* in having certain of the organs distinctly segmented. The body is sole-shaped, symmetrical, and without distinct head or tentacles, but with a lateral fringe of gills. No eyes corresponding to those of snails are present, but very numerous eyes are scattered all over the back. The alimentary canal is much like that of a snail, being much convoluted, and provided at the anterior end with a muscular tongue and toothed radula. On the other hand the nervous system is unique in consisting of two pairs of longitudinal ganglionated cords, one of which, the pedal pair, is provided with transverse connective at intervals.

The chitons cling firmly to rocks, etc., by means of the powerful foot, many of them resisting the heaviest beat of the surf. Only very small species (*Chætapleura,* etc.) are found on the eastern Atlantic coast, but larger species occur in Florida and the Gulf of Mexico, while California has the giants of eight or ten inches of the genus *Cryptochiton.* Consult Hubrecht, 'Quarterly Journal of Microscopical Science,' 1882.

Chiton, kī'tŏn, the undergarment of the ancient Greeks. In the earliest times it was worn by the men only; in later times there were two forms, and the chiton was worn by both sexes. The Dorian chiton was sleeveless, reaching about to the knees, and usually left more or less open on the right side. The Ionian was a long tunic reaching to the feet, closed on the sides, sometimes sleeveless, but often with short or long sleeves. Both forms were usually worn belted in at the waist.

Chit'or, or **Chittore,** India, a town and fort of Hindustan, in the native state of Oodeypore, Rajputana, on the Gamneri River, about 70 miles northeast of the town of Oodeypore. The town was for several centuries capital of Oodeypore, and was far more prosperous and wealthy than it is at present. It still contains many temples and other well-constructed buildings. The fort, formerly considered one of the strongest in India, stands upon a high rock overlooking the town. Pop. 11,000.

Chitra. See AXIS-DEER.

Chitral, chĭt-räl', British India, a native state, having Yasin and Gilgit on the east, Swat, Dir, and Bajaur on the south, Kafiristan on the southwest, and the Hindu Kush mountains on the north and northwest. Through it flows in a southwest direction the Chitral or Kunar or Kashkar River, a tributary of the Kabul, and on it, in about lat. 36° N., stands the town of Chitral at a height of more than 5,000 feet above sea-level. The people are Moslems, but mostly speak a language closely akin to that of their pagan neighbors in Kafiristan. Upper Chitral, with its capital Mastuj, is closely connected with Gilgit. Lower Chitral enjoyed till recent times undisturbed independence; but in 1894 an English resident and small body of troops were surrounded and besieged in Chitral, the consequence of which was that in March 1895 an expedition was sent (the main body by the Swat valley, the other from Gilgit), which after some sharp fighting advanced triumphantly through extremely difficult country, relieved the besieged, and annihilated all opposition.

Chittagong, chĭt-ta-gŏng', India, district in the presidency of Bengal, Hindustan. The district has Tipperah on the north, the Chittagong Hill Tracts on the east, Arracan on the south, and the Bay of Bengal on the west. Its area is 2,563 square miles, and it has a population of about 1,300,000. The Blue Mountains, on the northeast, attain a height of 5,600 feet. The principal river is the Karnaphuli, or Chittagong. The level lands, chiefly on the coast, and the valleys are very fertile. The principal exports are timber, canvas, coarse cloths, and elephants. A considerable majority of the inhabitants are Mohammedans. The city of Chittagong, the capital of the district, is situated on the right bank of the Karnaphuli, 12 miles from its mouth and 220 miles east of Calcutta, and is the second port of Bengal. It consists of a series of detached houses on little hills. Although its climate is unhealthful, it is an important industrial and trade centre, among its exports being rice, jute, jute manufactures, and tea. Pop. 25,000.

Chittagong Wood, the wood of several Indian trees, especially of *Chickrassia tabularis.* It is a light-colored beautifully grained wood used by cabinet-makers. It is light in weight but does not wear well in changeable climates, as it warps in dry weather. The wood of *Cedrela Toona* receives the same name.

Chit'tam-wood, or **American Smoke-tree** (*Continus cotinoides*), belongs to the sumac family. It is a small tree with wide spreading branches growing to the height of about 40 feet. It flourishes during the months of April and May in Tennessee and Alabama and westward to Missouri and Indian Territory. A rich dye for commercial use is extracted from the orange-yellow wood, which weighs about 40 pounds to the cubic foot.

Chit'tenden, Hiram Martin, American military engineeer: b. New York 25 Oct. 1858. He has supervised engineering government works in the Yellowstone National Park and elsewhere, and has published 'The Yellowstone National Park: Historical and Descriptive' (1893); 'Reservoirs in the Arid Regions' (1897); 'Reservoir System of the Great Lakes' (1898); 'The American Fur Trade of the Far West' (1901).

Chittenden, Russel Henry, American educator: b. New Haven, Conn., 18 Feb. 1856. He was graduated at Yale in 1875, and took a course at Heidelberg. He became professor of physiological chemistry at Yale in 1882, and since 1896 has been director of the Sheffield Scientific School. He has written 'Digestive Proteolysis'; 'Studies in Physiological Chemistry,' and similar works.

Chittenden, Thomas, American colonial and State governor: b. East Guilford, Conn., 6 Jan. 1730; d. Williston, Vt., 24 Aug. 1797. He was one of the pioneers of Vermont, settling upon the New Hampshire grants in 1774, and acquiring a fortune from his lands. In 1778 he became Governor of Vermont, before its formal separation from New York was recognized. During the Revolutionary War the English and the Continental Congress receiver overtures from him, his terms being recognition of Vermont's statehood. He retired from public life in 1796.

Chittim. See KITTIM.

Chittoor, chit-toor', or **Chittur,** India, a town, capital of North Arcot district, Madras. It contains courts and public offices, an English church and a Roman Catholic chapel. Pop. 10,000. There is a town of the same name in the state of Cochin, Madras, with about the same population.

Chit'ty, Joseph, English lawyer and legal writer: b. 1776; d. London 17 Feb. 1841. He acquired great reputation by his legal text-books. These comprise a 'Treatise on Bills of Exchange' (1799); 'Treatise on the Parties to Actions and to Pleadings' (1808); 'Treatise on the Law of Nations Relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals' (1812); 'A Practical Treatise on the Criminal Law, Adapted to the Use of the Profession, Magistrates, and Private Gentlemen' (1816); 'Treatise on Commercial Law' (1818); 'Collection of the Statutes of Practical Utility' (1829-37); 'Treatise on Medical Jurisprudence' (1834).

Chiusi, kē-oo'sä, Italy, a town in the province of Sienna, 102 miles north-northwest of Rome, on an olive-clad eminence in the Val di Chiana, not far from the small Lago di Chiusi. In ancient times, under the name of Clusium, it was one of the 12 republics of Etruria, and the residence of Porsenna. When Italy was overrun by the barbarians, it fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana, Chiusi has begun to flourish again along with the whole district. It is in connection with the discovery of Etruscan antiquities, however, that the place is chiefly heard of. During the 19th century immense quantities of these remains were found in the neighborhood in the grottoes that served the ancient Etruscans as tombs. They consist chiefly of sun-dried black earthenware vases, ornaments, relievos, and carved stonework, and are preserved in the museums at Chiusi and Florence.

Chiv'alry (Fr. *chevalerie,* from *cheval,* Lat. *caballus,* "a horse"), a term which indicates strictly the organization of knighthood as it existed in the Middle Ages, and in a general sense the spirit and aims which distinguished the knights of those times. The chief characteristics of the chivalric ages were a warlike spirit, a lofty devotion to the female sex, a love of adventure, and a thirst for glory.

To explain the nature and origin of chivalry we must consider the character of the ancient German tribes. The warlike spirit was common to them with other barbarous nations; but there were certain traits in their character peculiarly their own. Among these was their esteem for women. This is dwelt upon by Tacitus, and is sufficiently apparent from the early native German historians. This regard for the female sex was diffused by them through every country into which they spread, though with considerable difference in the forms in which it developed itself. In France it became that refined gallantry for which the nation has been so long conspicuous; in Spain it assumed a more romantic and glowing character, displaying much of the fire of Oriental feeling; in Germany itself it became faithful and tender attachment to the wedded wife. Engrafted upon this primitive regard for woman amongst the Germanic tribes, the moral and æsthetic principles of the Christian Religion, its ideals of chastity, marriage and loyalty, and in particular the widespread veneration paid to the Virgin Mother of Christ, powerfully contributed to the development of the institutions of chivalry. We may be told, in answer to our claim of the peculiar regard for the female as a characteristic of the Teutonic tribes, that women were held in high esteem by the Romans. It is true that wives and mothers were treated with great regard by the Romans, and the history of no nation affords more numerous instances of female nobleness; but this esteem was rendered to them, not as females, but as the faithful companions and patriotic mothers of citizens. It had somewhat of a political cast. But this was not the case with the Germans. There is another trait of the German character which deserves to be considered in this connection, which is very apparent in their literature, and the lives of many individuals; we mean that indefinite thirst for something superior to the realities of life, that *sehnen,* to use their own word, which hardly admits of translation, which has produced among them at the same time so much excellence and so much extravagance. These three traits of the Teutonic race, their warlike spirit, their esteem for women, and their indefinable thirst for superhuman greatness, together with the influence of the feudal system and of the Roman Catholic religion, afford an explanation of the spirit of chivalry — an institution which, to many observers, appears like an isolated phenomenon in history, and leaves them in doubt whether to despise it as foolish or admire it as sublime. The feudal system divided the Christian Teutonic tribes into masses, the members of which were united, indeed, by some political ties, but had little of that intimate connection which bound men together in the communities of antiquity, and which has produced like effects in our own and a few preceding ages. They still preserved, in a great measure, the independence of barbarians. There was, however, one strong bond of union which gave consistency to the whole aggregate; we mean the Roman Catholic religion. The influence of a common religion was of great service to mankind, during the ages of turbulence and violence, in giving coherency to the links of the social chain, which were continually in danger of parting. To this cause is to be ascribed the great uniformity of character which prevailed during the ages of chivalry. The feudal system, besides, enabled the gentry to live on the labors of the oppressed peasants without the necessity of providing for their own support, and to indulge the love of adventure incident to their warlike and ambitious

character. If we now combine the characteristics which we have been considering — a warlike spirit, a lofty devotion to the female sex, an undefinable thirst for glory, connected with feudal independence, elevation above the drudgery of daily toil, and a uniformity of character and purpose, inspired by the influence of a common religion — we obtain a tolerable view of the chivalric character. This character had not yet quite developed itself in the age of Charlemagne. The courage exhibited by the warriors of his age was rather the courage of individuals in bodies. The independence, the individuality of character, which distinguished the errant knight who sought far and wide for adventures to be achieved by his single arm, was the growth of a later period. The use of the war-horse, which formed so essential an instrument of the son of chivalry, was not common among the Germans until the time of their wars with the Huns. They were, indeed, acquainted with it before, and Tacitus mentions it in his account of Germany; but it was not in common use among them till the period we have mentioned. After it was introduced, cavalry was considered among them, as among all nations in the early stages of their progress, much superior to infantry, which was, in fact, despised, until the successes of the Swiss demonstrated its superiority. In the 11th century knighthood had become an established and well-defined institution; but it was not till the 14th that its honors were confined exclusively to the nobility. The Crusades gave a more religious turn to the spirit of chivalry, and made the knights of all Christian nations known to each other, so that a great uniformity is thenceforward to be perceived among them throughout Europe. Then arose the religious orders of knights, the knights of St. John, the Templars, the Teutonic knights, etc. The whole establishment of knighthood assumed continually a more formal character, and, degenerating, like every human institution, sank at last into quixotic extravagances, or frittered away its spirit amid the forms and punctilios springing from the pride and the distinctions of the privileged orders of society. It merged, in fact, among the abuses which it has been one of the great labors of our age to overthrow. The decline of chivalry might be traced through the different forms which it assumed in different nations as distinctly as its development — a task too extensive for this work.

The education of a knight was briefly as follows: The young and noble stripling, generally about his 12th year, was sent to the court of some baron or noble knight, where he spent his time chiefly in attending on the ladies and acquiring skill in the use of arms, in riding, etc. This duty of waiting about the persons of the ladies became, in the sequel, as injurious to the morals of the page as it may have been salutary in the beginning. When advancing age and experience in the use of arms had qualified the page for war, he became an *escuyer* (esquire or squire). This word is generally supposed to be derived from *escu* or *scudo* (shield, *scutum*), because among other offices it was the squire's business to carry the shield of the knight whom he served. The third and highest rank of chivalry was that of knighthood, which was not conferred before the 21st year, except in the case of distinguished birth or great achievements. The individual prepared himself by confessing, fasting, etc.; religious rites were performed; and then, after promising to be faithful, to protect ladies and orphans, never to lie or utter slander, to live in harmony with his equals, etc. (in France there were 20 vows of knighthood), he received the *accolade,* a slight blow on the neck with the flat of the sword from the person who dubbed him knight, who at the same time pronounced a formula to this effect: "I dub thee knight, in the name of God and St. Michael (or in the name of the Father, Son, and Holy Ghost). Be faithful, bold, and fortunate." This was often done on the eve of battle, to stimulate the new knight to deeds of valor, or after the combat, to reward signal bravery.

Though no man of any reflection would wish for the return of the age of chivalry, yet we must remember that chivalry exercised, in many respects, a salutary influence at a time when governments were unsettled and laws little regarded. Though chivalry often carried the feelings of love and honor to a fanatical excess, yet the reverence paid to them contributed to prevent mankind, at this period of lawless violence, from relapsing into barbarism; and as the feudal system was unavoidable, it is well that its evils were somewhat alleviated by the spirit of chivalry. The influence which chivalry had on poetry was very great. The *troubadours* in the south of France, the *trouvères* in the north of the same country, the "minstrels" in Great Britain, the *minnesinger* in Germany, sang the achievements of the knights who received them hospitably. In Provence arose the "Courts of Love," which decided the poetical contests of the knights. At these, amorous songs (*chansons*), duets (*tensons*), pastoral songs (*pastourelles*), and poetical colloquies (*sirventes*), were performed. In Germany the chivalric spirit produced one of the most noble epics, the 'Nibelungenlied' (q.v.). It was the spirit of chivalry which led to the Crusades, and from the intercourse with the East which grew up during this period the wonders of Oriental enchantment were introduced into the romantic or chivalric poetry, and European literature received a great stimulus. Chivalric poetry, however, existed apart from any influence of this kind, and really begins with the mythological cyclus of King Arthur's round table and the feats of his knights, which furnished materials that found poetic treatment in various European countries. A second cyclus is that of Charlemagne and his paladins, his 12 peers, which remained a poetical foundation of chivalric poetry for many centuries. Alexander the Great also became a great hero of chivalric poetry. The cyclus of Amadis, which belongs, perhaps, exclusively to Spain, does not rest on any historical ground. For further information see the essay on chivalry, originally in the 'Encyclopædia Britannica,' written by Sir Walter Scott; Heeren's 'Essay on the Influence of the Crusades'; 'Mémoires sur l'Ancienne Chevalerie, par Lacurne de Sainte-Palaye' (2 vols., with engravings); Gautier's 'La Chevalerie'; Henne am Rhyn's 'Geschichte des Rittertums'; and 'Don Quixote.' See also DUELLING; MIDDLE AGES; TOURNAMENT.

Chivasso, kē-väs'sō, Italy, a town on the Po, 14 miles northeast of Turin. It was formerly strongly fortified, and contained the residence of the dukes of Montferrat. Pop. 10,000.

Chive, or **Cive,** a perennial herb (*Allium Schœnoprasum*), of the natural order *Liliaceæ*. It is a native of Europe, Asia, and the northern parts of North America, but has been introduced in temperate climates as a vegetable. It has small, flat, clustered bulbs which multiply laterally to form clumps. The leaves, which grow in dense profusion, are tubular, five to eight inches long; and the flowers, which are borne in umbels, are purplish, pinkish, or violet. Aside from the use of the leaves as a flavoring for soups, stews, salads, etc., the plants are frequently used for ornamental purposes, since they make excellent edgings for flower-beds. They are readily propagated by division, a process that should be performed as soon as the clumps become very dense. The plants do well in any good garden soil with no attention except weeding, and they may be clipped for use frequently during the growing season. Their flavor resembles that of onions.

Chizerots (shē-zė-rō) **and Burins,** bŭ-răń, one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They are found in the arrondissement of Bourg-en-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Though industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, often themselves indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer or well-to-do day-laborer become the wife of one of them, so that they mostly marry among themselves. From time immemorial, they have been field-laborers, cattle-dealers, butchers, and the like. Many of them are very good-looking, the young women in particular being handsome and clear-complexioned, with large black eyes.

Chladni, HLÄD'NĒ, **Ernst Florens Friedrich,** German physicist, one of the founders of the science of acoustics: b. Wittenberg 30 Nov. 1756; d. Breslau 4 April 1827. He adopted the profession of jurisprudence, which he practised first in his native town, and afterward at Leipsic, but his natural taste led him to study music, and to devote his leisure to physical science. The backward state of the theory of music compared with the other physical sciences early opened up to him a neglected mine of scientific discovery; and at the age of 19 he set himself resolutely to investigate it. By covering plates of glass with fine sand, and causing them to vibrate, he discovered the fundamental fact in the science of acoustics, that the communication of vibrations in material bodies is subject to constant mathematical laws. See SOUND. His scientific investigations led him to travel through the principal countries of Europe and visit its principal capitals. He invented the euphone about 1789 and clavicylinder 1800, instruments more curious than useful, in which musical sounds are produced by friction, and by the revolution of a glass cylinder causing the vibration of chords. His scientific works are of quite a different value. The first of them, 'Entdeckungen über die Theorie des Klanges,' appeared in 1787; 'Acoustics' (which he himself translated into French, 1809), in 1802; 'Neue Beiträge zur Akustik,' (1817); 'Ueber Feuer meteore,' (1820).

Chladni Figures. See SOUND.

Chlamydosaurus, klăm-ĭ-dō-sâ'rŭs. See FRINGED DRAGON.

Chlamydophorus, a genus of armadillos, containing the pichiciago. See ARMADILLO.

Chlamys, klā'mĭs. (1) In ancient Greek costume, a light and freely-flowing scarf or plaid, worn as an outer garment. It was oblong in shape, generally twice as long as its width, and was worn, according to taste or circumstances, in different ways. The chlamys of the youth was probably of a yellow color, while that of the soldier was scarlet. It was also carried by hunters and travelers, and some Romans are recorded as having adopted it. (2) In zoology, the name of a genus of coleopterous insects, belonging to the sub-tribe *Cyclica*, and the family *Chrysomelidæ*. There are but few North American species, and none of large size.

Chloasma, klō-az'mą, a peculiar pigmentation of the skin, of a yellowish, brownish to blackish shade, and due to a number of causes: (1) mechanical; (2) chemical; (3) thermal; (4) parasitic. Scratching is one of the most frequent mechanical causes. The irritants of mustard plasters, capsicum, cantharides,—all may cause an abnormal skin pigmentation. Sunburn is a frequent cause, a bringing out of the spots with greater vividness. Parasitic fungi have been known to cause it. In addition there are a large number of miscellaneous conditions associated with these liver spots. Pregnancy, menstruation, constipation,—one or all may emphasize their characters. Certain diseases, such as syphilis, Addison's disease (q.v.) in particular, and forms of anæmia are associated with excessive pigmentation. In only a small proportion of the cases has the liver anything to do with the condition.

Chlopicki, HLŌ-PĬT'SKĒ, **Joseph,** Polish general: b. Galicia 24 March 1772; d. Cracow 30 Sept. 1854. He served under Kosciuszko, during the first revolt of the Poles (1794), and then engaged in Napoleon's service, under whom he took part in the battles of Eylau, Friedland, Smolensk, and Moskowa. After the fall of Paris in 1814, he conducted back to Poland the débris of the Polish-French contingent, and was created general of division by the czar. On the outbreak of the Polish revolution of 1830, he was elected dictator, but soon resigned that office, fought at Grochow and Wavre, and after the cessation of hostilities, retired into private life.

Chlo'ral, a chemical substance resembling aldehyde in many of its properties, and obtainable from aldehyde by the action of chlorine gas. In its practical manufacture, however, it is formed by passing chlorine through cold absolute alcohol; a crystalline alcoholate of chloral is thereby formed, from which the chloral itself is afterward set free by the action of sulphuric acid. Chloral is a colorless liquid at ordinary temperatures, having the formula $CCl_3.CHO$. It freezes at about —100° F., and boils at 208° F. It combines directly with water, forming chloral hydrate (q.v.), $CCl_3.CH(OH)_2$, which is the substance commonly but incorrectly called "chloral."

Chloral Hydrate, a crystalline solid composed of trichloral aldehyde with one molecule of water. The crystals are single, colorless, and transparent rhomboids with an aromatic penetrating and smarting taste and slightly acrid odor. They are freely soluble in water, alcohol, and ether. Chloral hydrate is a powerful germicide but is rarely used as such save to preserve anatomical preparations. It is a vesicant and a local analgesic. In small doses it causes burning sensations of the stomach, but little general action. Full medicinal doses, 5 to 15 grains, cause a slowing of the pulse, dilatation of the arterioles, lowering of blood pressure, and slowing of the respiration. On the nervous system it acts as a depressant, causing sleep by direct action on the brain cells. Large doses cause poisoning with symptoms of collapse, coma with a feeble, thready pulse, lowering of temperature, cyanosis or lividity, cold perspiration, dilated pupils, and loss of reflexes. Death results from respiratory and cardiac paralysis. Treatment of poisoning is by rousing patient to maintain respiratory centre, artificial heat, artificial respiration, hot coffee by mouth or rectum, and cardiac stimulants. Chloral is particularly valuable in insomnia from overwork and in many of the convulsive disorders, titany, myoclonus, status epilepticus, and delirium tremens. Its action is possibly due to the formation of chloroform in the general circulation, by the action of the alkalis contained in the blood, in accordance with the equation $CCl_3.CH(OH)_2 + KOH = CHCl_3 + H_2O + CHO.OK$, the last formula in this equation being that of potassium formate. It is also useful in states associated with high arterial tension if the heart is not weakened. Within recent years a large number of allied drugs have been introduced. They have similar actions but are more palatable or are thought to cause less heart depression. Among these may be mentioned, chloralamid, chloretone, chloralose, and urethan.

Chloralamide, klō-răl'ą-mīd, or **Chloral For'mamide,** fôr'mą-mīd, a substance formed by the action of formamide upon chloral, and usually obtained in lustrous, colorless crystals with a slightly bitter taste. It has the chemical formula $CCl_3.CH\langle^{OH}_{NH.CHO}$ melts at 240° F., and is soluble in 20 parts of water and in a much smaller quantity of alcohol. It is not decomposed by dilute acids, but is decomposed by alkalis, and also by water at temperatures above 140° F. See also CHLORAL.

Chloralimide, klō-răl'ĭ-mīd, a substance occurring in long, colorless, needle-like crystals, with the formula $CCl_3.CH:NH$. It is insoluble in water, but dissolves readily in alcohol, ether, and chloroform. It is used in medicine as an antipyretic and analgesic, and must not be confounded with chloralamide (q.v.).

Chlorastrolite, klō-ras'-trō-līt, a mineral found in the form of rounded pebbles on the shores of Isle Royale, Lake Superior, and derived from the trap rock in the vicinity. It is bluish-green in color, with a hardness of 5.5 and a specific gravity of 3.18. According to Hawes it is an impure variety of prehnite, but for optical reasons Lacroix classes it under thomsonite. Its name is from the Greek and signifies "green star," in allusion to its color and its stellated structure.

Chlo'rates. See CHLORIC ACID.

Chlo'ric Acid, a colorless, strongly acid liquid, having the formula $HClO_3$ and a specific gravity of 1.28. It combines with bases to produce the salts known as chlorates. Potassium chlorate is formed directly when chlorine gas is passed through a warm, concentrated solution of caustic potash. By treating this salt with sulphate of ammonia and adding barium hydrate, barium chlorate, $Ba(ClO_3)_2$, is formed, from which chloric acid is set free by the action of sulphuric acid. Chloric acid has powerful bleaching properties, owing to the facility with which it parts with its oxygen. Paper that is dipped into a strong solution of the acid takes fire spontaneously upon drying. The most important salt of chloric acid is potassium chlorate, which is largely used in the preparation of oxygen gas, in the manufacture of matches, and in medicine. It crystallizes in monoclinic plates having a specific gravity of 2.35.

Chlo'ric Ether, a name given (1) to spirits of chloroform, a liquid consisting of one part of chloroform to nine of alcohol, and (2) to chloride of ethyl, $C_2H_5.Cl$, which is obtained by passing dry hydrochloric acid gas through alcohol.

Chlorides. See HYDROCHLORIC ACID.

Chlorim'etry, the art of estimating the quantity of chlorine present in bleaching-powder or any other hypochlorite. Several methods are employed, depending for their success upon the oxidizing power of chlorine. See CHEMICAL ANALYSIS.

Chlorine, klō'rĭn, a gaseous element, discovered in 1774 by Scheele, who named it dephlogisticated marine acid. The term "dephlogisticated" had exactly the same import as "oxygenated," which was soon afterward introduced by Lavoisier. Davy showed that the substance is not a compound of oxygen, but a simple body or element, and from its peculiar yellowish-green color the name "chlorine" was given to it. Chlorine gas is obtained by heating a mixture of hydrochloric acid and finely powdered peroxide of manganese, and may be collected either in bottles over warm water in the pneumatic trough, or by simply leading the delivery-tube to the bottom of the collecting-bottle, and allowing the chlorine to displace the air. The reaction is

$$MnO_2 + 4HCl = 2H_2O + MnCl_2 + 2Cl.$$

Deacon's process for the commercial manufacture of chlorine consists in passing a mixture of hydrochloric acid gas and hydrogen over tiles that are soaked in a copper salt, and then dried and heated to a temperature of about 700° to 750° F. At this temperature the hydrochloric acid gas is decomposed with the formation of water and liberation of chlorine; the copper salt being apparently unaffected by the action. Chlorine is now largely (and perhaps chiefly) manufactured by the electrolysis of a solution of chloride of sodium (common salt).

Under ordinary atmospheric conditions chlorine is gaseous, but it condenses into a mobile yellow liquid at a pressure of about four atmospheres. It also liquefies at the ordinary atmospheric pressure at about 28° F. below zero. It has the chemical symbol Cl, and its atomic weight is usually given as approximately 35.4 for H = 1. It is two and a half times heavier

than atmospheric air, and has an insupportable suffocating odor. When pure it occasions immediate death to an animal immersed in it; but even when largely diluted with common air it cannot be respired with safety. It occasions a severe sense of stricture at the breast, which renders it impossible to make a full inspiration. Chlorine is somewhat soluble in water, the solution having the color and odor of the gas. If the solution be cooled, long yellow crystalline needles deposit, consisting of a hydrate of chlorine. When exposed to sunlight the solution gradually loses its color, oxygen is liberated, and the water contains hydrochloric acid in solution. The great affinity of chlorine for hydrogen is one of its most characteristic properties, and is exhibited in a number of reactions. If equal volumes of hydrogen and chlorine gas be mixed in the dark and then exposed to diffused daylight, gradual combination takes place; and if the mixture be exposed to direct sunlight the gases combine at once with an explosion and produce hydrochloric acid. This is the only compound these substances form with each other, and it is one of the most important of the acids. When a lighted taper is immersed in a jar of chlorine, it burns with a smoky flame; this is due to the combination of the chlorine with the hydrogen only, and the liberation of the carbon. Similarly, when hydro-carbons like turpentine and olefiant gas are mixed with chlorine and a light applied, a ruddy flame with a copious deposition of carbon shows that the hydrogen and chlorine are alone combining. Several of the elements catch fire when immersed in chlorine, for instance, phosphorus, arsenic, antimony, and copper; while others combine with it at a higher temperature, sometimes with vivid combustion as in the case of potassium. The binary compounds of chlorine with the other elements are termed chlorides, and next to the oxides they are the most abundant and widely distributed substances in the earth, many of them being also of great importance for manufactures. Common salt, the chloride of sodium, is the most plentiful of all, and forms large rock masses in various parts of Europe, and occurs dissolved in the waters of the ocean and of many salt lakes. It is the ultimate source of all the hydrochloric acid and chlorine of commerce. Other chlorides, as of potassium, calcium, etc., are met with, but in no case nearly so abundantly as common salt. As a class, the metallic chlorides are crystallizable salts, readily soluble in water, some being even deliquescent. The chloride of silver, the subchloride of mercury, and one or two others are, however, insoluble in water, while a few are decomposed by water. From its wide affinities and great activity in the free state, chlorine is one of the most useful and powerful instruments with which the chemist deals. By it such metals as platinum and gold are attacked and made soluble in water, while its power over organic substances is very great, and has resulted in the formation not only of a number of compounds by simple union with it, but of a great number into which the chlorine has entered more intimately and produced what are called substitution compounds.

Chlorine is largely consumed in the arts. Thus it is used in the manufacture of potassic chlorate, in the conversion of the yellow to the red prussiate of potash, in the preparation of chloride of sulphur for vulcanizing, and above all as a bleaching and disinfecting agent. This last property is exercised by chlorine by virtue of its power of decomposing water by combining with the hydrogen and liberating oxygen, which latter substance is the true agent in the operation, and which converts the coloring matter into colorless compounds. Berthollet was the first to apply chlorine to the process of bleaching. The method of using it has been successively improved. It consisted at first in subjecting the thread or cloth to be bleached to the action of the gas itself; but the effect in this way was unequally produced, and the texture was sometimes injured. It was then applied in a dilute aqueous solution. The thread or cloth was prepared as in the old method of bleaching, by boiling first in water and then in alkaline lye; it was then immersed in the diluted chlorine, and this alternate application of alkali and chlorine was continued until the color was discharged. The offensive suffocating odor of the gas rendered this mode of using it, however, scarcely practicable; but the odor was found to be removed by a weak solution of potash; lime immersed in water, being more economical, was afterward substituted. Later a compound of chlorine and lime was employed, prepared by exposing slaked lye to chlorine gas; the gas is quickly absorbed by the lime, and the chloride of lime, or bleaching-powder, as it is called, being dissolved in water, forms the bleaching-liquor now generally employed. (See BLEACHING-POWDER.) In using it the cloth is first commonly steeped in warm water to clean it, and is then repeatedly washed with an alkaline solution so diluted that it cannot injure the texture of the cloth; the cloth is then washed and steeped in a very weak solution of chloride of lime, again washed, acted on by a boiling lye as before, and again steeped in the solution; and these operations are performed alternately several times. The cloth is lastly immersed in very dilute acid, which reacts on the bleaching-powder and liberates chlorine; this then attacks the coloring matter, and the cloth soon acquires a pure white color. It is next repeatedly washed with water to remove the last traces of the lime salts, and then it is exposed to the action of a hyposulphite in order to render inoperative any chlorine that may remain. (See ANTICHLOR.) The cloth is finally washed, dried, and dressed. When sulphuric acid is used to liberate the chlorine it is found more difficult, in the subsequent washing, to remove the calcic sulphate formed, on account of its sparing solubility in water. To avoid this, chloride of magnesia has been substituted for the chloride of lime. It is easily prepared by adding sulphate of magnesium to a solution of chloride of lime and straining off the clear fluid. It has the same bleaching power, is easily removed by washing, and is said to leave the cloth in a more supple state then when ordinary bleaching-solution has been employed. Another important application of chlorine gas and of bleaching-powder is to the destruction of disease germs. Acid vapors, sulphurous acid in particular, under the form of the fumes of burning sulphur, are often employed for that purpose; but chlorine is superior to any other agent, and is now widely employed for the purposes of fumigation and disinfection.

In medicine, chlorine gas dissolved in water is used extensively for bactericidal purposes. It is employed as a mouth-wash and for bathing

purposes, being both a deodorant and a bactericide; and internally has been used for its germicidal properties, particularly in typhoid fever.

Chloris, klō'ris. (1) The Greek goddess of flowers and the wife of Zephyrus, identical with the Flora of the Romans. (2) The daughter of the Orchomenian Amphion, the wife of Neleus and the mother of Nestor. (3) The daughter of the Theban Amphion and of Niobe. When the children of Niobe was killed she alone escaped along with Amyclas, and became so pale from terror that her former name of Melibœa was exchanged for that of Chloris.

Chlo'ris, or **Prairie Chloris** (*Chloris verticillata*), a genus of grasses, of which there are some 60 or more species, mostly natives of warm, dry countries. About 10 of these species are found on the prairies, from Kansas to Texas. *Chloris radiata* is a pretty annual grass frequently cultivated in greenhouses for the sake of its ornamental and curious appearance.

Chlo'rite Group, in mineralogy, a group of minerals crystallizing in the monoclinic system, exhibiting a green color from the presence of ferrous iron, and chemically definable as hydrous silicates of aluminum, ferrous iron and magnesium. They are usually secondary minerals, derived from pyroxene, amphibole, and other forms. They exhibit a marked basal cleavage suggestive of mica; but they differ from mica and its allies by not containing any considerable amounts of calcium or of the alkalis.

Chlorite Schist, shīst. As chlorite is a general name for green secondary hydrated silicates, containing alumina and iron, derived particularly from augite, hornblende, and biotite, so chlorite is used as a prefix to various names of rocks that contain such silicates, for example, chlorite schist. In the wide belt of Algonkian and Archæan rocks stretching from Labrador to the west end of Lake Superior are great areas of chlorite schists resulting from the alteration of sedimentary as well as igneous rocks.

Chlorodyne, klō'rō-dīn or -dēn, a proprietary mixture of uncertain composition, and best represented by the National Formulary formula, which is a mixture of chloroform, cannabis indica, morphine, and tincture of capsicum. Practically all of the chlorodynes on the market contain morphine, and hence are dangerous poisons. Their sale should not be permitted save on a physician's prescription.

Chlor'oform ($CHCl_3$, trichloromethane, methenyl chloride, terchloride of formyl), a heavy, clear, colorless, mobile, and diffusible liquid of a sweet burning taste and characteristic ethereal odor formed by the action of the sun's rays on a mixture of chlorine and marsh gas; also by the action of caustic potash on chloral or chloracetic acid, or by the action of nascent hydrogen on tetrachloride of carbon. It is prepared on a large scale by distilling water and alcohol with bleaching powder. Its vapor density is four times that of air. Its specific gravity should not be below 1.49, and it should be soluble in 200 volumes of cold water, and in all proportions in alcohol, ether, benzol, benzine, and fixed and volatile oils. It is volatile, even at low temperatures, boils at 140° F. and freezes at —94° F. It should not be exposed to the light, as it is liable to decomposition with the liberation of hydrochloric acid and chlorine.

As used in medicine it is a liquid consisting of 99 to 99.4 per cent by weight of absolute chloroform and 1 to 0.6 per cent of alcohol. It is not inflammable, but its vapor burns with a greenish flame. It is an excellent solvent for a variety of substances, as caoutchouc, resins, fats, alkaloids, etc. Medicinally it is used as an aqua, emulsion, liniment, spiritus, and pure U. S. P. chloroform. Its physiological action is allied to the alcohols, but it is much more energetic. Externally chloroform is an irritant, and if confined on the skin it can cause blistering. It is irritant to mucous membranes, and, taken into the stomach, causes a sense of warmth and burning with increased production of gastric secretions. In large doses it causes violent gastro-enteritis.

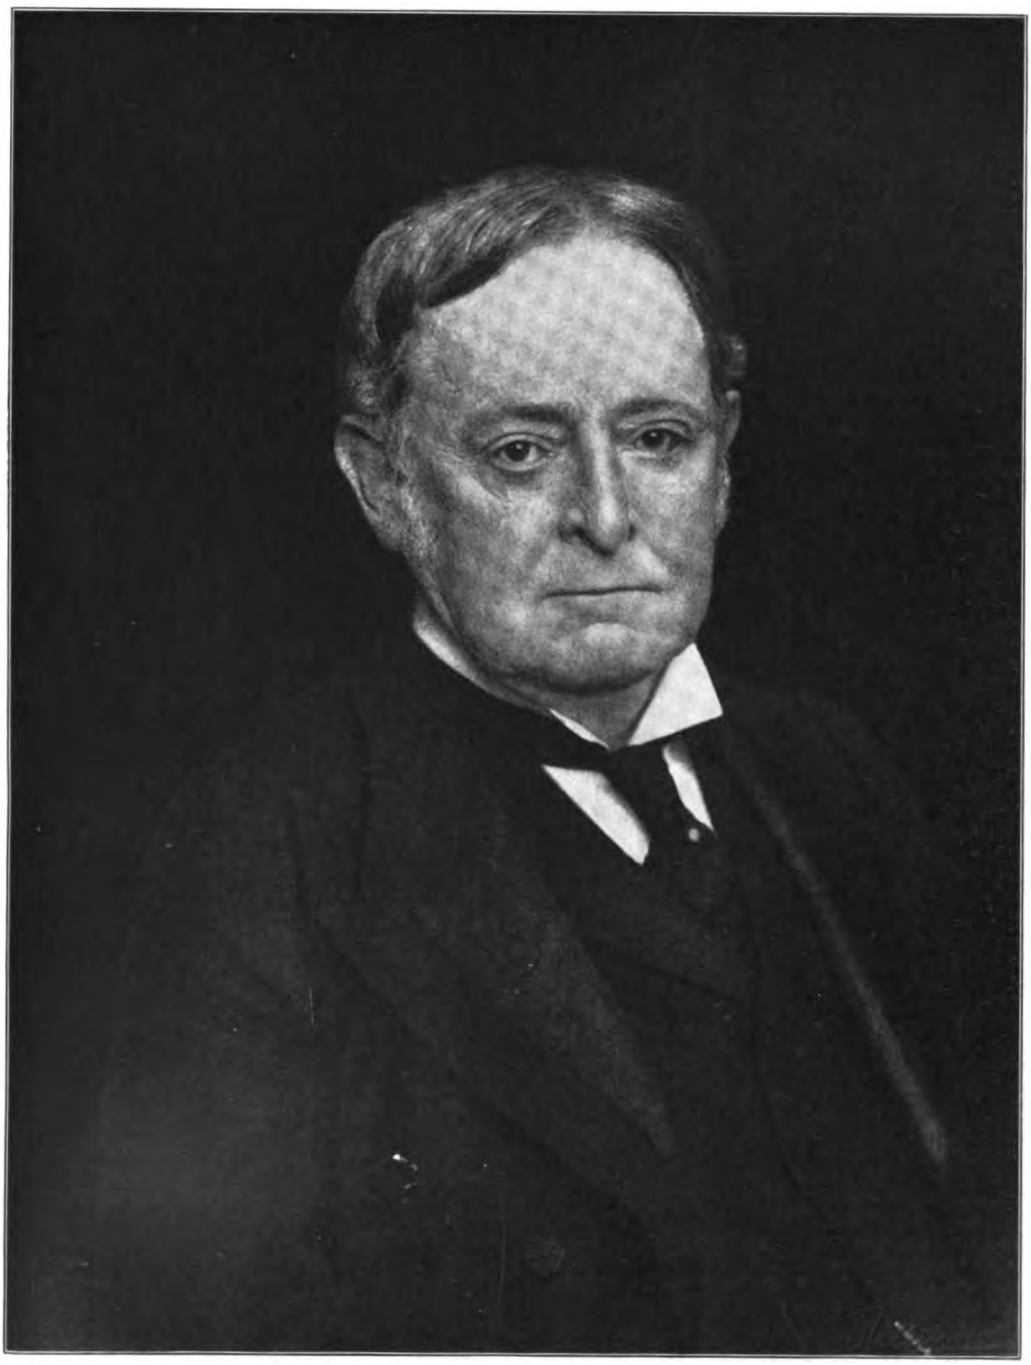
Its chief use in medicine is as a general anæsthetic, for which purpose it was first used by Simpson, of Edinburgh, in 1848. As an anæsthetic its vapor is inhaled; it thus enters the circulation through the blood circulating in the lungs. When so administered the stages of anæsthesia closely resemble those induced by others of the alcohol series, but in chloroform the anæsthesia is very rapid. There is first a stage of excitement, with heightened cerebral activities. This is soon followed by a gradual dissolution of the mental faculties, usually in an order the reverse of their complexity. Thus the highest faculties of judgment, memory, etc., are attacked first, then unconsciousness gradually sets in. The spinal cord centres are then affected; there may be some temporary irritation, which is followed by paralysis, and then by loss of sensation and of the reflexes. The automatic centres of breathing and the heartbeat are only slightly affected. There may be some lessening of heart action, following an initial stimulation, and similar respiratory changes. The patient thus in complete anæsthesia is motionless and senseless, unable to feel or move, his automatic functions of most vital importance to life-maintenance alone functionating. It is in this stage that operations are performed, although minor operations may be performed in the early stages of primary anæsthesia.

When the administration of chloroform is pushed too far, or there is a peculiar susceptibility to its effects, as in some individuals, poisoning results. It is usually rapid in onset, is attended with cyanosis, weak, trembling pulse, and reduction of blood pressure. The vasomotor system seems to be paralyzed, and death is due perhaps to this alone, although other factors seem to be involved at times. Following chloroform anæsthesia, nausea and vomiting are apt to occur. Chloroform is a safe anæsthetic, deaths to the proportion of 1:3,000 or 1:4,000 are said to occur; hence ether, which has a proportion of 1:16,000 is preferred by many. This is so particularly in America, whereas in Europe chloroform is preferred. See ANÆSTHETICS; ETHER.

Chlo'rophane, in mineralogy, a variety of fluorspar, or fluorite, which, when heated, shines with a green phosphorescent light. It is found at Trumbull, Conn., and in the mica mines of Amelia County, Va.

Chlorophyll, klō'rō-fil, the green coloring matter of plants. It plays an important part in the life of the plant, as it breaks up the carbonic

U of M



JOSEPH HODGES CHOATE.

Mau

acid gas taken in by the stomata of the leaves into its two elements, carbon and oxygen, returning the oxygen to the air, and converting the carbon with the water obtained from the roots into starch. Light is indispensable to the formation of chlorophyll, and hence arises the etiolation or blanching of plants by privation of light, either by the art of the gardener or from accidental causes.

Chlorophyllite, klō-rō-fil'īt, an alteration product of the mineral iolite (q.v.). The only difference in composition is a larger percentage of water, but there is a marked decrease in hardness, from 7 to from 1.5 to 3, and also in transparency. The characteristic blue color of iolite is changed to a dull green, while a basal cleavage is highly developed. Its specific gravity is 2.7. It is found at Unity, Me.

Chloro'sis, an anæmia occurring in young girls about the period of puberty and characterized by a low percentage of hemoglobin in the blood. It is common in blondes, and in ill-fed and house-confined individuals. The chief symptoms are sickly greenish pallor, hence the name green-sickness, marked debility, breathlessness, palpitation, and tendency to fainting. There is frequently mental depression, irritability, and often perversion of the appetite. The most characteristic changes are in the blood. Here the number of red cells may be normal or slightly diminished, but the percentage of hemoglobin is reduced one half or even more. There is no marked leucocytosis. Gastro-intestinal symptoms may be present. Constipation is the rule. There may be anæmic heart murmurs; the pulse is soft and full; and in many cases there is a low persistent fever. Headaches, neuralgias, and cold hands and feet are prevalent. The treatment is by means of open air, exercise, iron, arsenic, full diet, and pleasant occupation.

Chlorosis is also one of the most formidable diseases to which plants are liable, often admitting of no remedy. It consists in a pallid condition of the plant, in which the tissues are weak and unable to contend against severe changes, and the cells are more or less destitute of chlorophyll. It is distinct from blanching, because it may exist in plants exposed to direct light on a south border, but is often produced or aggravated by cold, ungenial weather and bad drainage. The most promising remedy is watering them with a very weak solution of sulphate of iron. Many forms of the disease exist, of which those of clover, onions, cucumbers, and melons are best known.

Chmelnizkij, Nikolaj Ivanovich, nē'ko-lī ē-vän'ō vĭch нмĕl-nĭt'skē, Russian writer: b. 1789; d. 1846. He contributed largely to the reformation and elevation of the Russian stage. Among his comedies are: 'The Babblers'; 'Air Castles'; 'The Waverer.'

Chmielnicki, нмē-ĕl-nĭt'skē, **Bogdan,** Cossack chief: b. 1593; d. 25 Aug. 1657. He was the son of a Polish nobleman, who settled among the Cossacks of the Ukraine. This people, who had long defended the eastern boundaries of Poland against the Tartars and Russians, were at that time subjected to grievous oppression. Their religion was persecuted, their freedom circumscribed, and the castle of Kudak, called the curb of the Cossacks, was built to restrain them. Thus exasperated, they seized Kudak and massacred the garrison, but were soon subdued. After their defeat at Kumejki, Bogdan was sent to the Polish court, where he was favorably received, but suspicion soon drove him forth, and finally made him a scourge of Poland. Availing himself of the hatred and prejudices of the Cossacks, he entered upon a conspiracy against the Poles, and sought the alliance of the khan of the Tartars. Chmielnicki became master of the Ukraine, and carried terror, devastation, and death as far as Lemberg and Zamosc. Under the new king, John Casimir, the war was continued with equal cruelty on both sides. Chmielnicki put himself under the protection of Turkey, of Russia (1654), and again under that of Poland (1656).

Choate, Joseph Hodges, American lawyer and diplomat: b. Salem, Mass., 24 Jan. 1832. He was graduated at Harvard University in 1852, and at the Harvard Law School two years later. After practicing law in Boston for a year he went to New York city, where he achieved remarkable success as a lawyer, becoming in 1884 a member of the famous legal firm of Evarts, Choate and Beaman. He won great distinction as a trial lawyer conducting many celebrated cases in State and Federal Courts and International tribunals. He successfully defended General Fitz John Porter, prosecuted the infamous Tweed Ring, appeared in the Tilden Will contest, the Chinese Exclusion cases, the Income Tax cases of 1894, and represented the Canadian government in the Bering Sea dispute. In 1856, he became active as a republican in supporting John C. Fremont. In 1894 he was president of the New York State Constitutional Convention. In 1896 he was a candidate for United States Senator but was defeated by T. C. Platt. President McKinley appointed him in 1899 to succeed John Hay as ambassador to the Court of Saint James. Mr. Choate is famous as an orator and shares with Chauncey M. Depew, the title of leading humorous after-dinner speaker of this country. Consult Clemens, 'Choate Story Book' (1900).

Choate, Rufus, American lawyer: b. Essex, Mass., 1 Oct. 1799; d. Halifax, N. S., 13 July 1858. He was graduated at Dartmouth College in 1819; was admitted to the bar and began practice in Danvers in 1823; removed to Salem in 1828; and was a member of Congress in 1830–4, resigning in the latter year. Removing to Boston in 1834, he rapidly acquired a large practice. He was successor of Daniel Webster in the United States Senate in 1841–5; resuming his legal practice in Boston at the expiration of his senatorial term. He traveled in Europe in 1850, and was a delegate to the Whig National Convention in Baltimore in 1852. After Webster's death Mr. Choate was acknowledged the leader of the Massachusetts bar. He made many political speeches, the most brilliant, while a United States senator, including those on the Oregon Boundary, the Tariff, the Fiscal Bank Bill, the Smithsonian Institution, and the Annexation of Texas. His style is peculiar and characteristic, but hardly to be commended as a model for imitation; it is rich, vivid and glowing, instinct with passion, and colored with all the hues of fancy, but sometimes, it must be admitted, a little extravagant and exaggerated. The most remarkable qual-

ity, however, in his written compositions, is the structure of his periods. These are not the short and compact statements, involving but a single proposition, in which most writers of our times express their thoughts; but they recall and renew the continuous sweep and long-resounding march of the prose writers of the 16th century. They are often of breathless length, containing clause after clause, modifying, enlarging, or limiting the leading idea. His 'Addresses and Orations' appeared in a sixth edition in 1891. See Brown, 'Life of Rufus Choate' (1870); Neilson, 'Memories of Rufus Choate' (1884); Whipple, 'Recollections of Eminent Men' (1886).

Chocks, pieces of wood employed on shipboard as wedges to support various articles liable to be displaced by the motion of the vessel. They receive different names according to the purposes for which they are used, as "anchor-chocks" to support the anchor; "rudder-chocks" to keep the rudder immovable, in the event of accident rendering it unmanageable. Chocks are also used to support casks, boats, and other curved objects.

Choc'olate (Mex. *chocolatl,* from *choco,* cocoa, and *latl,* water), a cake or paste prepared from the seeds of *Theobroma cacao,* made by mixing the seeds with water and grinding them very finely. When this is done by machinery, the mill is usually constructed of heavy metal rollers turning in a circular course upon a flat metal plate. A curved knife or scoop attached to the rollers returns the paste continually to be crushed and recrushed by the rollers until it becomes almost impalpable. The object of this is to render the nut, otherwise difficult of solution, readily diffusible in water or milk when used as a beverage. The paste, when unmixed, or mixed only with flour or other farniaceous material, is usually called cocoa, but when much sugar or spices such as vanilla, cinnamon, etc., are added, it bears the name of chocolate. The two names are much confounded commercially. Chocolate is molded into cakes, or sold in powder or flakes formed by simply drying the paste as it comes from the mill. The seeds or nuts contain a large proportion (30 to 50 per cent) of oily matter (cocoa butter). This may be partially removed or all retained in the chocolate. In the latter case much of it is mechanically adherent to the sugar or farinaceous matter. Chocolate was introduced from America to Europe by the Spaniards. It is highly nutritious, containing a large proportion of nitrogenous flesh-forming material. On this account it is used as portable food by many mountaineers. In the solid form, mixed with much sugar, cream, and various confections, it is largely used as a sweetmeat, and in pastry.

Choc'taw (properly **Cha'hta,** the chief "Chactas" in Chateaubriand's 'Atala' is an eponym of the tribe), one of the largest tribes of the great Muskhogean (q.v.) stock, and before its deportation the most advanced in husbandry and general culture of any except the Creeks. They were called "Flatheads" by the French (not to be confused with the northwestern tribe of that name), from a habit of flattening their children's skulls with bags of sand; and they had a burial custom of disinterring the corpses after a few days, cleaning the bones, and preserving them. They are rather short, stout, and slow, compared to the taller and more active Chickasaw (q.v.); and were nicknamed "tubbies," though not on that ground, but from the customary final word of their war-chiefs' names, meaning "killer." The Chickasaw was one of their subdivisions, or perhaps merely the more warlike and adventurous portion, till after the whole had crossed the Mississippi; and while using a dialectic language of their own for common service, still employed Choctaw for oratory. The Choctaw occupied central and southern Mississippi and western Alabama in three divisions, west of the Muskhogee; and in the 18th century their chief towns lay in two groups, one some 200 miles north of New Orleans (about the present Choctaw County, Miss.), and the other about half way from the Chickasaw to Mobile. These villages a century earlier had been numerous and widely distributed; they are stated at 40, and the tribe as having 2,500 warriors. It was first found by De Soto in his expedition of 1540. At their town of Mavila (Mobile, probably Choctaw Bluff, Clarke County, Ala., on the north bank of the Alabama), was fought perhaps the bloodiest and most destructive single battle ever known between red and white men on the continent. The village was burned, 20 of De Soto's men killed and 150 wounded, and many hundreds of Indians slain — the Spanish chroniclers say 2,500 to 3,000, which may be discounted. Tristan de Luna met them again in 1560. The French, in settling this region about 1700, came immediately in contact with them, and established friendly relations with them, contrasting strongly with the permanent hostility of the Chickasaw, against whom and the Natchez the Choctaw aided the French. The latter planted forts in their country, and sent missionaries among them. In the final struggle between France and England, however, the English won over a part of them, including the chief Red Shoes. After the Revolution, the Choctaw shared with the other Indians in the general treaty of Hopewell 28 Nov. 1785, by which the sovereignty of the United States was recognized, a portion of the Choctaw lands ceded, and they were "guaranteed" the possession of the rest. By 1800 some 500 of them had migrated to the Arkansas (Indian Territory), and it is said that the rest were much less unwilling to go than the Cherokees and Creeks. They did good service to the Americans in the Creek war 1813–14. In 1820, by the treaty of Doak's Stand, they ceded part of their lands for an equivalent amount on the Arkansas; and in 1830, by that of Dancing Rabbit Creek, they gave up the rest — 19,000,000 acres, or nearly 30,000 square miles, in the two cessions, for 20,000,000 acres in Indian Territory and $2,225,000 in money and goods. In 1837 they removed with the Chickasaw to their new lands, between the Arkansas and Canadian rivers on the north and the Red River on the south. How the Chickasaw first amalgamated with and then separated from them is told under CHICKASAW. They made good progress, received the missionaries of the American board and several Church denominations, were given a well-diffused school system, and established a government consisting of a head chief, a council of 40 chiefs, a two-chambered legislature, and a regular judiciary system with trial by jury. Like all the southern tribes, they were slaveholders, and in 1860 had some 5,000 negro

slaves. Their superintendent and agents were Southerners, and they joined the Confederate side in the Civil War. Though their land was not overrun, their progress was brought to a standstill, and their population reduced by a third; and after the War, they were for a time deprived of their rights. On being restored, they had to part with a section of their lands to the government, which settled other tribes there. For a time, a territorial government was formed, with the superintendent as governor; and they had to make heavy allowances to their emancipated slaves. In 1900 there were 10,321 Choctaws proper in the Territory, besides those who had taken up lands in severalty; and some hundreds still remaining in Mississippi. A grammar of their difficult language was published in 1870.

Choczim, HŌ'tsĭm (properly **Khotin**), Russia, a fortified town, on the right bank of the Dniester, opposite to Kaminiec, in Bessarabia. In 1718 the Turks caused it to be regularly fortified by French engineers; but it was taken by the Russians in 1730, 1769, and 1788. As it is completely commanded by the hills which surround it, its value as a fortress is now small. Its chief importance is as a military station. Pop. 16,000.

Chodat, shō-dä, **R.,** Swiss botanist: b. Moutier-Grandval, Jura-bernois, 6 April 1865. In 1889 he became a professor of botany in Geneva University and has been *doyen* of the Faculté des Sciences there, from 1898. He has contributed numerous professional papers to botanical journals, and has published many important monographs.

Chodkiewicz, HŌd-kē-ā'vĭch, **Jan Karol,** Polish general: b. Lithuania 1560; d. Chocim 27 Sept. 1621. He served against the Cossacks, defeated Charles IX. of Sweden in 1605, and afterward served against the Russians and the Turks.

Chodowiecki, HŌ-dō-vē-ĕts'kē, **Daniel Nicolaus,** German designer and engraver: b. Dantzic 16 Oct. 1726; d. Berlin 7 Feb. 1801. He was instructed in miniature painting by his father, and subsequently painted snuff boxes. He was encouraged to study enameling, and soon attracted attention by the beauty and finish of his productions, some of which came under the notice of the academy of Berlin, and procured him a commission to make a set of designs for their almanac. The manner in which he executed these established his reputation. He thenceforth devoted himself almost exclusively to designing and engraving; he produced the plates for Klopstock's 'Messiah,' 'Don Quixote,' Lavater's 'Physiognomy,' editions of Shakespeare, Voltaire, La Fontaine, and many other works.

Chodzko, kōdz'kō, **Jacob Leonard,** Polish scholar: b. Oborek 6 Nov. 1800; d. 1871. Having traveled as secretary of Prince Oginski through nearly all Europe, he established himself in 1826 at Paris, where he published a memoir of the prince, with an introduction entitled 'Observations sur la Pologne et les Polonais' (Paris 1827), and commenced collecting materials for a history of his country from the death of Augustus III. Afterward he published the 'History of the Polish Legions in Italy, Under the Command of Gen. Dombrowski' (1829). During the revolution of July 1830, Lafayette appointed him his aide-de-camp; and after the outbreak of 29 November of the same year in Warsaw, he acted as agent of the revolutionary government in France. He was an active member of the French-Polish and American-Polish committees, and after the failure of the revolution, as member of the national Polish committee of France.

Chœnix, kē nĭks, a measure of capacity among the ancient Greeks. Its size is variously given, and it is probable that it actually differed in the different states of Greece. Some accounts represent it as containing three cotylæ, or about 1.487 pints English; others make it equal to 1.982 pints; and still others give it as equal to 3.964 pints.

Chœrilus, kē'rĭ-lŭs, the name of several Greek poets, among whom Chœrilus of Samos is the best known. He lived in the 5th century B.C., was the contemporary and friend of Herodotus, and composed an epic poem, entitled Persica, celebrating the victory of the Greeks over Xerxes. The fragments of the poem still extant have been collected and explained by Näke (Leipsic 1817). Another Chœrilus, of Iasus, in Caria, is mentioned by Horace, but does not appear to have possessed much poetical talent. He formed part of the train of literary men who accompanied Alexander the Great on his expedition to the East.

Choir. 1. In religious worship, an organized body of singers. In ceremonial Christian religions, and more particularly in the ordering of services in the Church of England, the minor canons, vicars choral, and choristers, or other singers taken collectively, are spoken of as the choir. The choral body in the latter Church is usually divided into two sets of voices, the one sitting on the north and the other on the south side of the chancel, and are known by the respective titles of Cantoris and Decani from their nearness to the Cantor (or Precentor) and to the Decanus (or Dean). In most cathedrals and collegiate chapels, the Decani side is held to be the side of honor, the best voices are placed there, and all the verses or soli parts, if not otherwise directed, are sung by that side, which is also considered the "first choir" (coro primo) in eighth-part music. 2. In architecture, the eastern limb of a cruciform church or the eastern portion of any church. In the latter case it is more commonly styled the chancel (q.v.), and is frequently constructionally lower and narrower than the main part of the building. The ordinary daily services in a cathedral or collegiate church are held in the choir. While architecturally the term choir is applied to the entire portion of the church east of the crossing, the eastern limb is itself divided into three portions: (1) the "ritual choir," containing the stalls for the singers and comprising the western portion of the architectural choir; (2) the presbytery, next east of this, containing seats for the laity (a term sometimes applied to all of the choir east of the "ritual choir"); (3) the sanctuary, containing the altar and sedilia, and divided from the remainder by a low railing. In certain cases there is even a fourth division called the retro-choir, comprising one or more bays east of the sanctuary. These are sometimes, as at Lincoln, Truro, and York, of the same roof elevation as the rest of the choir, but more commonly parts of a lower

structure, as at Hereford, Winchester, and Salisbury. It should be noted that the "ritual choir," or place for the singers, does not invariably correspond with the architectural choir. Sometimes, as Winchester, Norwich, and Gloucester cathedrals, it includes the crossing and one or more bays of the nave, or again, as at Westminster Abbey, and in Spanish cathedrals generally, it is entirely in the nave, from the remaining portion of which it is separated by a massive wall or screen. In buildings where the ritual choir is entirely east of the crossing, the choir screen is placed between the eastern piers of the crossing. At Gloucester, Exeter, Lincoln, York, Southwell, and several other cathedrals, the organ is placed upon the choir screen. In several English cathedrals the choir is quite as long as the nave, and in some parish churches even longer, but the usual proportion of choir to nave is as one to three. In French churches the choir frequently terminates polygonally with encircling chapels and this termination is known as a chevet, but in England the square east end is the most common in Gothic churches, although in Norman ones the semi-circular apse is not infrequent. In the Middle Ages, the choir, as the most indispensable portion of the church, was erected first, the nave, regarded practically as a stately approach to the choir, was built later, a century or more sometimes intervening between the completion of the choir and that of the nave. At the present time the cathedral of Saint John the Divine in New York is being erected after the mediæval custom, the intention being to wait for some years after the completion of the choir before beginning work upon the nave.

Choir Invisible, The, a novel by James Lane Allen, published in 1897. It is one of his most popular and pleasing stories, and was enlarged from an earlier story called 'John Gray.' Its scene is the Kentucky of 100 years ago, and the fresh picturesque descriptions of pioneer life in Kentucky give the tale historical value.

Choiseul-Amboise, Étienne François, ā'tē-en frăn swä shwä-zėl-äñ-bwäz, Duc de, French statesman: b. 28 June 1719; d. Paris 7 May 1785. He entered the army in early life, and after distinguishing himself on various occasions in the Austrian War of Succession, returned to Paris, where his marriage with the daughter of the financier, Crozat, gave him the command of great wealth, and his intimacy with Madame de Pompadour furnished the means of gratifying his ambition. After having been ambassador at Rome, where he obtained from the Pope, Benedict XIV., the celebrated encyclical letter intended to appease the disputes which had arisen on the bull Unigenitus, and at Vienna, where he concluded with Maria Theresa the treaty of alliance against Prussia, he became in 1758 minister of foreign affairs. At the same time he was made a duke. He succeeded the marshal of Belle-Isle as minister of war in 1761, and the same year he became also minister of marine. His administration was distinguished by many useful reforms. He reorganized the army and navy, which the disasters of previous wars and the neglect of previous administrations had suffered to fall into decay; negotiated the famous Family Compact which reunited the various members of the Bourbon family, and restored Corsica to France. His fall was brought about in 1770 by a court intrigue, supported by Madame du Barry, the new favorite of the king. He was recalled to court on the accession of Louis XVI. in 1774, but not again intrusted with power.

Choiseul-Gouffier, goo-fē-ā, **Marie Gabriel Florent Auguste de,** Count of, French antiquarian: b. Paris 27 Sept. 1752; d. Aix-la-Chapelle 20 June 1817. He early displayed a particular interest in everything relating to Greece. His wish to visit this country was gratified in 1776, and in 1782 appeared the first volume of 'Voyage Pittoresque en Grèce,' which attracted much attention and procured him a seat in the French Academy in 1784. The two other volumes appeared in 1809 and 1820. The first was entirely revised by him before his death. The same year he was appointed ambassador to Constantinople, where he remained till 1791. The appointment of ambassador to London was then offered to him, but he remained at Constantinople and sent his official correspondence to the exiled French princes. This correspondence having fallen into the hands of the republicans the convention gave orders for his arrest, but he escaped by taking refuge in St. Petersburg, where Paul I. made him a privy-councilor, director of the Academy of Arts, and superintendent of the imperial libraries. He returned to France in 1802 and resumed his seat in the Academy. In 1814 he was made a peer of the realm. His antiquarian researches were chiefly inserted in the memoirs of the National Institute, and his very valuable collection of antiquities is now in the museum of the Louvre.

Choiseul-Praslin, prä-lăñ, **Eugène Antoine** (ė zhăn ăñ twăn) **Horace de,** French statesman: b. 23 Feb. 1837. He was first elected to the National Assembly in 1871, and has been several times a member of the chamber of deputies. He is considered one of the leaders of the Republicans. In 1871 he was minister plenipotentiary to Italy; in 1880 he became secretary of state in the ministry of foreign affairs; and in 1887 was sent on a botanical expedition to Ceylon and the United States.

Choisy-le-Roi, shwä-zē-lė-rwä, or **Choisy-sur-Seine,** France, a town in the department of Seine, seven miles south of Paris, on the left bank of the Seine. Its broad, straight streets, elegant houses, and fine avenues, with the proximity of the Seine, contribute to render it one of the most agreeable towns in the vicinity of Paris. In its cemetery is the tomb of Rouget de l'Isle, author of the 'Marseillaise.' It has manufactures of wax cloth, soap, chemical stuffs, glass, morocco leather, earthen-ware, porcelain, and vinegar, and some trade in wine, vinegar, coal, etc. Pop. 11,281.

Choke-cherry (*Prunus virginia*), so called from the astringent nature of the fruit, a shrub from 2 to 10 feet high, rarely a small tree, belonging to the natural order *Drupaceæ*. For commercial uses the wild black cherry (*Prunus serotina*), which is closely allied to *P. virginiana*, is valuable. Its wood is one of the best American woods for cabinet-making. The bark has medicinal properties as a pectoral tonic, and febrifuge. The range of choke-cherry is wide, flourishing along river banks and in rocky situations, from Canada to Florida, and west to Colorado and Texas.

Choke-damp, the name given by miners to the fire-damp resulting from an explosion of gas in mines. The following diagram is illustrative of the combustion of fire-damp, or carburetted hydrogen, of which the product is choke-damp, called also after-damp and black-damp:

Before Combustion. *Wght.*		Elementary Mixture. *Atoms.*	*Wght.*	Products of Combustion. *Wght.*	
8 carburetted hydrogen...	{	1 carbon	6	22	carbonic acid.
	{	1 hydrogen	1	9	steam.
	{	1 hydrogen	1	9	steam.

	{	1 oxygen	8		
	{	1 oxygen	8		
	{	1 oxygen	8		
	{	8 nitrogen	112	112	uncombin'd nit
152			152	152	choke-damp.

Choking, a stoppage caused by a morsel of food, a drop of liquid, etc., passing into the larynx or upper opening of the windpipe, instead of the gullet, or an obstruction of the œsophagus itself. It is usually followed by a violent fit of coughing which lasts, in slight cases, till the offending substance is expelled. Sometimes, however, a larger mass — for example, a half-chewed piece of meat — is drawn into the opening of the windpipe, completely blocking it, and arresting respiration altogether. This condition is one of extreme danger; the sufferer becomes purple in the face, and if not at once relieved will certainly and quickly die of suffocation. The obstructing substance is usually within reach, and may often be dislodged if a by-stander promptly pushes his forefinger to the back of the throat and attempts to draw the obstruction forward. A child may sometimes be saved by holding it up by the heels and shaking it, or slapping its back. If these measures fail relief may be obtained by means of a sharp-pointed knife promptly pushed into the windpipe to admit air to it below the obstruction. In the case of an animal, remove the obstruction with the hand when possible. Cause the animal to swallow the obstructing substance, if possible, by giving it water, oil or belladonna solution. Carefully push the obstruction down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases the gullet has to be cut into by a surgeon.

Cholagogue, kŏl'a-gŏg, a remedy that increases the flow of bile, as distinguished from an hepatic stimulant, which increases the production of bile. Most of the cathartics that stimulate peristalsis affect the gall bladder, causing it to empty itself more energetically. These may be classed in general as cholagogues. See CATHARTICS.

Cholera, kŏl'ĕr-a, an acute, infectious disease, endemic in some localities and epidemic in others, characterized by vomiting and purging of a peculiar rice-water-like fluid, and a stage of collapse.

Etiology.—The prime cause of cholera is one of the most perplexing questions with which scientists have had to deal, and even at this advanced period of scientific investigation it is not definitely known. The claim that it is caused by a germ is not accepted by all. Disease germs, which, according to their form, are known as cocci, bacteria, bacilli, vibriones, and spirilla, are among the smallest units of life; 30,000,000 of them, according to Prof. Max von Pettenkofer, of Munich, weighing only one milligram. In 1884 Dr. Koch claimed that the comma-shaped bacillus was the true cause of the disease, and this theory seems to have met with considerable favor, though it is not yet admitted as a scientific truth. In fact Dr. Koch himself, in an address delivered before the Imperial German Board of Health at Berlin, 30 Aug. 1884, admits that the true cause of cholera is not precisely known, though he invariably found it to exist. Dr. H. Vandyke Carter of London says that the real cholera germ, if such a thing truly exists, has yet to be found. He, too, says he found an organism resembling a vibrio rather than a bacillus, and this he did not find in all cases. He also claims that it would be irrational to suppose that an everywhere widely distributed organism like *Vibriofrugula* can alone be the essential cause of Asiatic cholera. His investigations were all in India, and he did not see an authentic specimen of this organism. Others assert that it is a specific disease originating in India, and the assertion is also made that cholera can arise spontaneously in other countries and is not dependent on a specific cause.

Dr. Koch says that the comma bacilli grow extremely rapidly and reach a maximum in two days; after that they commence to die, and other bacteria form in their place. Temperature has very little to do with their lives, however. They are said to live at temperatures ranging from —15° to 104° F. These bacilli are located solely in the intestines, as, according to Dr. Koch, none have been found to exist in the blood or in any of the other organs. In the lower section of the lower intestines they are found in greatest abundance, also in the dejecta, but not often in the vomit. It is said that the bacilli cannot live in the stomach, and the reason that most deaths occur on Monday and Tuesday is because those days succeed the one in which over-eating and -drinking is usually indulged in, and the bacillus is conveyed into the intestines by the undigested mass of food that passes into them.

How Bacteria Kill.—The question then arises, How is it that this bacterial vegetation in the intestines can kill a man? Bacteria not only consume substances, but also produce others of various kinds, many of which are of a very peculiar nature. Some are of a transient nature and emit an intense smell; others produce coloring matter or some poisonous substance. In the putrefaction of albuminous liquids blood poisons are formed which must be products of vital changes of these bacteria, as putrefaction is only a consequence of bacterial vegetation.

It is asserted that these comma bacilli destroy the blood corpuscles within a pretty wide range, and it is fair to conclude that they also destroy more or less of the surrounding tissues. Mr. Richards, a physician at Goalundo, in India, says that sometimes one can feed the dejecta to animals and do no harm; at other times the dejecta prove fatal and the animals die in cramps. The time required for such animals to die after eating the dejecta is from 15 minutes to two and a half hours.

This reasoning does not go to show that these animals die from a species of bacteria, but

from a poison of some peculiar nature generated from the cholera dejecta, and why this action does not occur in all cases is more than can be explained, unless it is influenced by the contents of the stomach. Some pathologists claim that death is produced by paralysis; others say by mortification of the epithelium and mucous membrane; and again it is said to be due to inspissation of the blood, produced by loss of water. It would seem, however, that death is caused, in many cases at least, by irritation of the nerve centres, and consequently by some peculiar brain lesion.

Dr. Koch concludes that the only way known at present to get rid of the infectious matter of cholera is to dry it, and thus kill the germ. A more important matter, granting the comma bacillus to be the true cause of cholera, would seem to be to learn how to dispose of it in the human stomach before it goes farther and terminates life, which it must surely do when it enters the intestine.

Cholera originated in the East Indies and was not known to migrate for 1,000 years. The oldest Sanskrit writings show that it was known many hundred years before the birth of Christ. In the 17th and 18th centuries there are abundant proofs of epidemics, but it did not spread into Europe until 1830. The Russians took it from India through couriers and stage-coaches. Another peculiarity of this disease is that when it was in Marseilles it broke out in Paris, jumping Lyons, the second largest town in France, notwithstanding the fact that quarantines were in full force.

A Miasmatic Disease.—The cholera germ, like the malaria bacillus, depends greatly upon a moist soil, and if it does not depend upon this, and is not a miasmatic disease, how can it be explained that in India, the home of cholera, it seldom, if ever, occurs on the mountain-tops, proving conclusively that it at least often occurs as a miasmatic disease and may be wholly independent of human intercourse. It must be remembered that in India the inhabitants drink the same water that they wash in, and, as a rule, are exceedingly careless, so it is easy to believe that cleanliness has a great influence in preventing the disease.

'The Lancet' of 15 Jan. 1885 says that a special commission was sent out from England to India to inquire into the cause of cholera, with particular reference to the theory of Prof. Koch that the comma bacillus is the true seed of the disease. The commissioners were Dr. E. Klein and Dr. Heneage Gibbs, both medical men of distinction and accomplished in physiological research. The result of their labors in the very home of cholera is tersely stated by Dr. J. N. Cunningham, the Sanitary Commissioner of the government of British India, when he says that their conclusions "are altogether subversive of the statements advanced by Prof. Koch as to the so-called comma bacillus being the cause of cholera."

Pathological Anatomy of Cholera.— After death the stomach contains more or less of the whey-like albuminous fluid and is full of cast-off epithelium. The small intestines usually contain a large quantity of the whey-like fluid and epithelium. The glands of Brunner, the solitary and agminated patches, are thickened and very prominent. The solitary glands of the large intestines are also infiltrated and swollen. The liver is more or less advanced in fatty degeneration. The kidneys have a pale, white appearance, due to the epithelium blocking the tubes. The bladder is empty and contracted. The lungs are congested. The right cavities of the heart are distended with blood, while the left cavities are empty and contracted.

Cholera is usually ushered in by vomiting, purging, and griping pains in the stomach, and death follows in from 1 to 24 hours. If life is retained longer than this time the patient may possibly recover. A large percentage of the cases die.

Treatment.— Opium, quinine, whiskey, sulphuric acid, camphor, chloroform, chlorodyne, carbolic acid, bismuth, hydrocyanic acid, chloral, and atropia are the favorite remedies. Brown Sequard says the most efficient remedy is the hypodermic injection of morphia with atropia. He, too, says this treatment will prevent an attack of cholera.

H. H. BIEDLER, M.D.
Dean, Baltimore University School of Medicine.

Cholera Infan'tum, an acute infectious disease of infants, due in large part to a definite micro-organism, the *Bacillus shiga,* or allied species, characterized by acute gastro-enteric inflammation, with nausea, vomiting, diarrhœa, temperature, wasting, and prostration. Death may result in a very short time. The child may be attacked suddenly, but it is more liable to occur in children who have been somewhat run down from a mild diarrhœa of indigestion. The child is then taken with the cholera-like diarrhœa, passing thin serous- or rice-water discharges, 10 to 20 a day. The temperature rises abruptly to from 103° to 105° F. and there is constant vomiting. There is rapid emaciation and prostration, the child having strength only to moan or cry with a sharp irritable sound. Dullness, stupor, and at times convulsions precede death. Treatment should be prompt and requires skilled medical attendance. Acute summer diarrhœa of infants is not necessarily cholera infantum. In fact cholera infantum is not a common disease, whereas the acute diarrhœas of children, resulting from tainted foodstuffs, is very common. Every case of summer diarrhœa, however, should receive vigorous treatment, because it offers an opportunity for the *Bacillus shiga* to develop cholera infantum.

Cholesterin, kō les'tĕr-ĭn ($C_{26}H_{44}O$), a substance found in bile, blood, etc., which may be obtained in the form of beautiful pearly crystalline scales, without taste or odor. It is widely distributed in the animal economy, being essential to the brain and nerve substance, and having been found in milk and many portions of the body, both as a normal and as a pathological constituent. Cholesterin was first obtained by Conradi, in 1755, from human gall-stones, in which it is often present in large quantities. It melts at 297° F. It is the chief constituent of lanolin (q.v.), a highly important oily substance that is obtained from the grease of sheep's wool.

Cholet, shō-lā, France, a town in the department of Maine-et-Loire, on the right bank of the Moine, 32 miles southwest of Angers. It has a tribunal of commerce, consulting chamber of manufactures, and communal college. Its manufactures include handkerchiefs and cotton goods, called *cholettes,* flannels, and woolen

stuffs. There are also wool and cotton spinning-mills, bleachfields, dyeworks, and tanneries. There is also a great trade in cattle, the markets for which are attended by a large concourse of buyers from other parts. Pop. 15,000.

Choliambus, kō-lī-ăm'bŭs (Greek, *choliambos,* the lame iambus; also called *skazon,* from *skazo,* to halt; or *versus Hipponacticus,* because the satirist Hipponax of Ephesus made use of it, or perhaps invented it), an iambic trimeter, the last foot of which, instead of being an iambus, is a trochee or spondee, which gives it a lame motion, as, for instance, Martial, l. i. epig. 3:

Cur in theatrum, Cato severe, venisti?
An ideo tantum veneras, ut exires?

We perceive, from the construction of the choliambus, that it may be applied with advantage to produce a comic effect. The Germans have happily imitated this verse, as well as all other ancient metres. An instance of a German choliambus is —

⏑ — ⏑ — — ⏑ — ⏑ — — ⏑
Der Choliambe scheint ein Vers für Kunstrichter.

Cholic (kŏl'ĭk) **Acid** ($C_{24}H_{40}O_5$), a non-nitrogenous acid produced by decomposing the true biliary acids with an alkali. It does not exist in bile ready formed. It is crystalline, sparingly soluble in water, but readily soluble in alcohol and ether. The cholates are rather obscurely crystalline; they are not very soluble in water, but rather more so in spirit. Both the acid and salts have a bitter taste.

Choline, kŏl'ĭn, a basic body found in both plants and animals. In animals it is apparently one of the reduction compounds of proteids, being a trimethyl oxyethyl ammonium hydroxide. It is of interest in medicine chiefly because of its close affinities to two very poisonous compounds, into either of which it may be converted. By oxidation it builds neurine, a highly poisonous body; and by hydration it becomes an alkaloid-like body closely resembling the plant alkaloid muscarine, from the poisonous mushroom *Amanita muscaria.* Thus choline may be one of the auto-intoxicating substances that may be developed in the human body if its normal metabolism is disturbed. It may also be a factor in the so-called ptomaine poisoning.

Cholmondeley, chŭm'lĭ, **Mary,** English novelist. Her fictions have been extremely popular and include 'The Danvers Jewels'; 'Sir Charles Danvers'; 'Diana Tempest'; 'A Devotee'; 'Red Pottage'; 'Love In Extremis.'

Cholochrome, kŏl'ō-krōm, or **Cholophæin,** the brown coloring matter contained in bile and in the intestines, and the substance coloring the fæces and the skin in jaundice.

Cholophæin, kŏl-ō-fē'ĭn. See CHOLOCHROME.

Cholos, shō'lōz, in Peru, the name for those who are partly of white, partly of Indian parentage, the most numerous class of the community.

Cholula, chō-loo'lā, Mexico, a city in the state of Puebla. It is 12 miles west of La Puebla, 60 miles southeast of the city of Mexico. The streets are regular and spacious, the houses mostly of one story, and flat-roofed. Though fallen from the importance it had attained in the early part of the 16th century, it still exhibits traces of its former greatness. Under the name of Chunultecol it was once the capital of an independent district, and the seat of the religion of the ancient Mexicans. It was the great centre of the Aztec worship. At that time it contained, it is said, 40,000 houses and more than 400 temples; one of these temples still remains, though in ruins. It is described by Humboldt as being built in the form of a pyramid, of four stories of equal height, in alternate layers of clay and sun-burned bricks; each side of its base measuring 1,440 feet, and its height in all 164 feet. At the present day it is so altered that it looks at a distance like a natural hill. On one of its highest platforms a chapel has been constructed, in the form of a cross, 90 feet long, with two towers and a cupola. Since the introduction of Christianity, this and other of its temples have been used for Christian worship. Pop. 10,000.

Chondrine, kŏn'drĭn, a substance containing carbon, hydrogen, nitrogen, oxygen, and sulphur, obtained from rib-cartilage by continuous boiling with water, exhausting with ether to remove fat, and drying. Its composition varies slightly according to the material made use of; it contains about 0.4 per cent of sulphur. It is a diaphanous horny mass, insoluble in alcohol, but softening and dissolving in hot water. From this solution it is thrown down as a bulky precipitate by acids, and by the salts of several heavy metals. By boiling with sulphuric acid it is decomposed into leucine, and with hydrochloric acid into a sugar-like body called chondroglycose. Nothing definite is known about its origin or function in the body. It has a marked general resemblance to gelatine, but it is distinguished by giving the precipitates just mentioned with the acids and salts. Infusion of nut-galls precipitates both.

Chondro'ma. See TUMORS.

Chon'dro-sarco'ma. See TUMORS.

Chondropterygii, kŏn-drŏp-tĕr-ĭj'ē-ī. Under this name were included by Cuvier the sturgeons, sharks, rays, lampreys, mud-fish, and lancelet, an assemblage of fishes so unnatural that the possession of fins and gills sums up nearly all they have in common. The term was adopted to give prominence to what seemed a fact of cardinal importance, namely, that the skeleton of the limbs was cartilaginous. In modern systems the *Amphioxus,* or lancelet, is the sole example of an order — *Leptocardii* (Müller) or *Pharyngobranchii* (Huxley) — in which the cranium is purely membranous and scarcely larger than the spinal canal; the spinal marrow is enclosed in a sheath, with only traces of division into vertebræ; and a heart is wanting, the circulation being maintained by the contractility of the blood-vessels. The glutinous hag (*Myxine*), the river lamprey (*Petromyzon*) and its larva (*Ammocœtes branchialis*), represent the order *Cyclostomata,* known also as *Marsipobranchii,* the gills being lodged in pouches. These two groups should, in the opinion of some, form two distinct classes of equal value with the remainder of the fishes, which are divided into the ganoids, or *Ganoidei;* the osseous fishes, or *Teleostei;* the *Selachii,* including the sharks and rays; and the *Dipnoi,* represented by the mud-fish (*Lepidosiren*). The last-named group comes under the *Chondrop-*

terygii of Cuvier, but it is now known to rank very high in the scale among fishes, and to be closely related to the amphibians or to the reptiles, inasmuch as its heart has two auricles, the other fishes having only one, and true lungs co-exist with gills. Again, while the skeleton of the sturgeon is nearly wholly cartilaginous, that of the other ganoids is well ossified, while the structure of the heart and sense organs removes the *Selachii* very far from the lancelet and the cyclostomatous fishes. The cartilaginous or embryonic condition of the skeleton may persist through life among the fishes in association with the highest as well as the lowest development in other respects. The Cuvierian group is therefore now distributed according to the sum of the characters, and the fishes included in it are not massed together simply because one point of structure is common to all.

Chondrostei, kŏn-drŏs'tē-i, an order of bony fishes of lowly and degenerate organization, formerly classed as cartilaginous ganoids. The internal skeleton is but little ossined, the vertebræ and most of the skull remaining in a state of pure cartilage; but the skull is enclosed by close-fitting dermal bony plates, which are peculiar in having a median in addition to paired series. The notochord is largely persistent. The mouth is small, and ventral in position; and the jaws very weak and toothless, or provided with minute teeth. In the gill-cover the opercular bones are reduced in number, and the branchiostegal rays absent or wanting. There are no true scales, but a small number of longitudinal rows of large bony plates, with granules on the intervening skin. The intestine is provided, as in the sharks, with a spiral valve. The elongated snout, stout body, large fins, and strongly heterocercal tail complete the aspect of these survivors of a once dominant race. There are two families, the *Acipenseridæ,* or sturgeons (q.v.), and the *Polyodontidæ,* or paddle-fishes (q.v.).

Chondrus, kŏn'drŭs, the genus of seaweeds to which carrageen or Irish moss belongs.

Chonos (chō'nōs) **Archipelago,** or **Guaytecas Islands,** a group of islands belonging to the Chilean province of Chiloe, lying off the west coast of Patagonia, mostly between lats. 44° and 46° S., and lon. 74° and 75° W. Two are large, but they are all barren and scantily inhabited. Magdalena is the largest island.

Chop-sticks (Chinese, *kwai-tsz,* "nimble or diligent lads"), two smooth sticks, about the thickness of a quill, of bamboo, wood, or ivory, which are used by the Chinese for conveying meat or vegetables, particularly rice, to the mouth. The chop-sticks are used in various manners, serving partially the purposes of a fork and a spoon. The most curious mode of using the chop-sticks is when a bowl of rice is brought close to the lips, the mouth held wide open, and the grain dexterously dashed into it with the chop-sticks, held one on each side of the forefinger, and plied with a rapid motion quite suggestive of the Chinese title.

Chopin, Frédéric François, frā'dē rĭk frăn swä shō-păn, Polish musical composer and pianist: b. Zelazowa-Wola, near Warsaw, 1 March 1809; d. Paris 17 Oct. 1849. His father was a Frenchman and his mother a Pole. After studying music in Warsaw he traveled through various cities of Germany and Austria, and finally settled in Paris in 1831. Here he became celebrated as a virtuoso and composer, and made the acquaintance of Liszt, George Sand, Berlioz, and other well-known persons. In 1837 and in 1848, he visited England, and in the latter year he also played in Edinburgh and Glasgow. He wrote numerous pieces for the pianoforte, of which he was called the poet, but he seldom composed for the orchestra. His music is largely based on various Slavonic rhythms. His mazurkas first introduced this style of music into France. His works include 19 nocturnes, 52 mazurkas, 27 études, 3 sonatas, 25 preludes, 13 waltzes, 12 polonaises, 5 rondos, 4 scherzos, 4 ballades, 4 fantaisies, a funeral march, several songs, etc. He united bold innovations with a classical style. See Karasowski, 'Frédéric Chopin,' English translation (1879); Liszt, 'Life of Chopin,' English translation (1877); Finck, 'Chopin and Other Musical Essays' (1889); Niecks, 'Chopin as Man and Musician' (1889); 'Life,' by Villeby (1892); Hunneker, 'Chopin: the Man and His Music' (1900).

Chopin, shō-păn, **Kate O'Flaherty,** American writer: b. St. Louis, Mo., 8 Feb. 1851; married Oscar Chopin, a New Orleans cotton factor, in 1870. Since his death she has lived in her native city. She has published 'At Fault' (1891); 'Bayou Folk' (1894); 'A Night in Acadie' (1897); 'The Awakening' (1899).

Chopin, chŏp'ĭn, a Scotch liquid measure containing two imperial pints. The chopin, in name at least, was derived from the French, with whom a similar measure was in use till the introduction of the metric system. The French *chopine* was not a uniform measure, but varied according to localities. That of Paris was a little over four fifths of an imperial pint.

Chopine, chō-pēn', an elevated shoe or clog, introduced into England from Venice in the reign of Queen Elizabeth, and which became the fashionable wear of court ladies during that reign. The Venetian chopines were made of wood covered with leather of sundry colors, white, red, yellow, and sometimes gilt. Some were of great height, the height of the chopine being regarded as a mark of the rank of the wearer. To such a degree of extravagance was this carried that women of rank could not walk without being supported. This silly fashion does not seem to have been carried to the same excess in England. Hamlet (act ii., scene 2) addresses one of the players, "Your ladyship is nearer to heaven than when I saw you last by the altitude of a chopine."

Chop'tank River rises in Kent County, Del., flows southwest into Maryland, and near the south extremity of Talbot County spreads into an estuary several miles wide and nearly 20 miles long, through which it empties into Chesapeake Bay; total course, 100 miles. It is navigable for sloops to the mouth of Tuckahoe River, a distance of about 50 miles.

Chopunnish, chō-pŭn'ĭsh, or **Nez Percé,** a tribe of North American Indians, also known as Nimapu, or Sahaptin, the principal tribe of the Sahaptian confederation, who now live on the Nez Percé reservation, in Idaho, and number 1,515. The name Nez Percé originated from the custom formerly followed of piercing the

nose. In the Nez Percé war the tribe was under the control of Chief Joseph, who forbade his men to interfere with any white non-combatants. See SAHAPTIAN INDIANS.

Choragic (kō-răj'ĭk) **Monument,** in ancient Greece, a monument erected in honor of one who had gained a prize as "choragus," or organizer of the play and chorus. The remains of two very fine monuments of this sort are still to be seen at Athens, namely, those of Thrasyllus and of Lysicrates, the last popularly called the Lantern of Demosthenes.

Choragus, kō-rā'gŭs, or **Choregus,** among the ancient Greeks, the musician who directed each of the choruses furnished by the 10 Attic tribes for the public festivals; also the citizens who defrayed the expense of each chorus. The person of the choragus was inviolable, as well as those of the members of the chorus. The choragus who was adjudged to have performed his duty best received an ornamental tripod, engraved by a skilful artist, and bearing the name of the tribe which had gained the victory, of the citizen who had paid the expense, and of the master who had trained the choir. These tripods were set up as public monuments on pillars or other structures. A street in Athens which contained a great number of such monuments was called the Street of the Tripods. The most remarkable of these monuments yet remaining is the choragic monument of Lysicrates. See CHORAGIC MONUMENT; CHORUS.

Cho'ral Service, a service with intoned responses, and the use of music throughout wherever it is authorized. The service is said to be partly choral when only canticles, hymns, etc., are sung; wholly choral, when, in addition to these, the versicles, responses, etc., are sung.

Choral Societies. A choral society is a body of amateur singers formed for the purpose of studying and performing large choral works. Formerly all chorus singers were professional musicians, and the chorus that took part in the production of an oratorio did not usually number over 40, while the orchestra was frequently larger than this.

To-day all choral societies consist of amateurs and are much larger than their professional predecessors, while the orchestra is only slightly increased in size. An average chorus numbers 150 to 200 voices, while the orchestra varies from 35 to 60 men. It is possible that the magnificent effect of the chorus formed to celebrate the centenary of Handel's birth by performances given in Westminster Abbey and the Pantheon in London in 1784 may have been a great factor in the formation of choral societies in England. This chorus was the largest that had ever been formed up to that time. It numbered 274 and the orchestra 251. At a subsequent festival in 1791 the chorus and orchestra were said to have numbered over 1,000, while for the Handel Festival held in the Crystal Palace in London in 1874 the chorus numbered 3,200 and the orchestra over 500.

It is very doubtful, however, whether such a large body of singers and players is very materially more effective than a smaller one. The impression on first hearing an enormous chorus is nearly always one of disappointment at the volume of sound. The explanation is made that the large hall necessary for such a large chorus and audience causes a loss of quantity of tone, but this is disproved by comparisons made at a Saengerfest held in Philadelphia, Pa. Here the effect of the entire mass chorus of 5,000 male voices was not much greater than that of a single society of 250 voices. There was a difference, of course, but the volume was not 20 times greater, not even twice as great.

A well-balanced chorus of from 200 to 500 voices is now generally acknowledged to be more effective and much easier to command than the overgrown chorus gotten together for a festival. Choruses of this size are very numerous in the United States, Germany, and England, where choral work, both religious and secular, is highly appreciated and supported; it is remarkable that France and Italy, both musical countries and more devoted to vocal than to instrumental music, do not cultivate choral music more generally. Even Berlioz in writing out his list of an ideal musical force to have at command makes his orchestra almost equal in numbers with his chorus, showing that he had a professional chorus in mind, and that therefore in his time (died 1869) a choral society of amateurs was perhaps unknown.

The Berlin Singakademie, still in existence and world renowned, was the first permanent choral society. Founded in 1791 with 27 members it now numbers 600. Mendelssohn was at one time its conductor.

In the United States the first choral society was the Stoughton (Mass.) Musical Society (1786), the outgrowth of a "sacred singing school" founded in 1724. The Handel and Haydn of Boston (1815) was of much greater importance, however, and is to-day one of the most important choral societies in the New World. Until 1847 the president of the society was its conductor, but with the increase of musical ability and criticism it was felt that the time-honored custom would have to be given up. Under Bergman (1852) and Zerrahn (1854) it increased in numbers and ability. Within the last few years under Mollenhauer (1901) a thorough reorganization took place and the society has recovered the position which it had to some extent lost.

The Cecilia Society, founded in 1900, under the direction of B. J. Lang, has done good work in the field of choral music.

In New York a number of choral societies, the Handel and Haydn, the New York Choral Society and the New York Sacred Music Society, dating from 1819 to 1849, fostered the taste for choral music. After this for more than 20 years no long-continued effort was made to carry on the work, until in 1873 Dr. Leopold Damrosch founded the Oratorio Society which, beginning with about 50 members, now numbers nearly 300. Walter Damrosch, son of Dr. Leopold Damrosch, succeeded him as conductor, and Frank Damrosch, another son, is the present conductor. The latter is also conductor of the Musical Art Society, devoted to the performance of older church music, and the People's Choral Union of 2,000 voices drawn from the laboring classes.

Philadelphia has had several notable choral societies, the Handel and Haydn, the Beethoven, the Cecilian and the Philadelphia Chorus, conducted by Henry G. Thunder, Michael H. Cross, Chas. M. Schmitz, and W. W. Gilchrist. These have all passed away, but in their stead is a new and vigorous chorus of 300 voices, founded in

1897 and conducted by Henry Gordon Thunder, son of Henry G. Thunder.

In Baltimore the Oratorio Society under Pache, and in Washington the Choral Society under Kaspar, are presenting standard works in an adequate manner.

In Chicago the Apollo Club (1872) under Harrison M. Wild, and in St. Louis the Choral Symphony Society (1870) under Ernst, are bending public taste toward the great choral works.

While the giving of music festivals involves the forming of a large chorus in conjunction with orchestra and soloists, it does not appear that such bodies of voices are appropriately styled choral societies in the strict sense; hence only passing mention is here made of the Springfield, Worcester, and Cincinnati festivals, all of which have large and efficient choruses conducted by Chadwick, Goodrich, and Theodore Thomas.

A difference, however, must be made between these choruses and the Bach Choir of Bethlehem, Pa. This unique organization of about 100 voices under the direction of J. Fred Wolle has devoted itself to the presentation of the works of John Sebastian Bach, and in the three festivals held in 1900, 1901, and 1903 has achieved a national reputation for itself. It produced the great Mass in B minor for the first time in America, besides giving the Matthew Passion, the Christmas Oratorio and other works in a most impressive manner. To some extent this was no doubt due to the unusual and reverential surroundings, the old Moravian town, the venerable church in which the performances were held, the announcement of the performance by a choir of trombones in the belfry. All these details no doubt helped greatly to create an atmosphere of simplicity and sincerity that affected the audiences that gathered from far and wide, but the real effect was the chorus work, which was done with an earnestness and devotion that were most impressive and caused the often inadequate solo and orchestra work to be forgotten.

HENRY GORDON THUNDER.
Conductor Philadelphia Chorus.

Cho'rale, a musical term borrowed from the German. It signifies a simple melody set in parts to be sung in harmony by a number of voices to sacred words, usually in public worship: a psalm tune. In Germany the chorale is frequently sung in unison. This was the ancient practice, adopted before the laws of harmony were well understood.

Chorazin, kō-rā'zĭn, Palestine, one of the cities in which Christ's mighty works were done, but named only in his denunciation (Matt. xi. 21; Luke x. 13). It was known to St. Jerome, who describes it as on the shore of the lake, two miles from Capernaum. Robinson locates it at the modern Tell-hûn, three miles northeast of Capernaum, but this location is doubtful.

Chord, (from the Greek word *chordē,* a string of gut). 1. In music, the simultaneous and harmonious union of different sounds, at first intuitively recognized by the ear, and afterward reduced to a science by the invention of the laws or rules of harmony. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord of *Trias harmonica perfecta,* is the basis of all harmony, and consists of a base note, or prime, with its third and fifth above. These three sounds are the distance of a third from each other. When the lowest third is the greater third, as above, the chord is a major chord; but when the lowest third is the lesser, the chord is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than a perfect fifth, the common chord admits of two inversions, according as one or other of its notes is made the base, or lowest note of the chord.

By adding another third above the common chord, a chord of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the chord of the seventh is produced on the fifth of the scale it is then called the dominant seventh, which is the most perfect species of the chord. It then consists of a major third, perfect fifth, and seventh, the minor, which is the next harmonic produced by nature above the fifth. The chord of the seventh may be formed also on any of the notes of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished seventh. The chord of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common chord, whose fundamental bass is a fifth below that of the seventh.

2. In geometry, a chord is the straight line which joins the two extremities of the arc of a curve; so called from the resemblance which the arc and chord together have to a bow and its string, the chord representing the string. The chord of a circular arc is obtained by multiplying the radius by twice the sine of half the angle which the arc subtends at the centre.

Chordata, kôr-dā'ta, the most advanced in development of the phyla, or branches, of the animal kingdom, the phylum which is characterized by the presence of a notochord (q.v.), and in its higher classes by the presence of a backbone and spinal cord. It includes all the vertebrates (mammals, birds, amphibians, reptiles, and fishes), and also *Amphioxus,* the ascidians, and *Balanoglossus* (qq.v.). Compare ADELOCHORDA.

Chorea, or **St. Vitus' Dance,** an acute convulsive disorder of childhood, characterized by sudden onset, irregular convulsive, non-rhythmical movements of the limbs or of the body and by a recovery usually spontaneous. There are many diverse conditions that have been called chorea in the past. There are strong reasons to believe that true chorea, however, is due to the action of some micro-organism; and, in view of the close relation it bears to rheumatic invasions in the same individual, the inference has been drawn by many serious students that chorea is a toxic disorder due probably to the same organism that causes acute articular rheumatism (Poynton & Payne). It occurs most frequently in the spring months,

in children from 5 to 15 years of age, and a nervous temperament seems necessary. The symptoms may be very slight, consisting of a grimace, or a sudden movement of the arms, causing the patient to drop anything held in the hands at the time. Or it may involve a large part of the musculature, especially the muscles of the extremities. It is non-symmetrical, the movements are sudden and jerky and non-purposeful, not representing any usual coordinated muscular act; hence the difficulty there is in imitating the movements. The attacks may begin in a few muscles, remain there, or spread widely. There may be slight or grave constitutional disturbances; some patients even die, although death is not a usual result in this country. In England, where rheumatic disorders seem to be more common, the disease seems to be more prevalent and more severe. The usual course of the disease is from four weeks to three months, but it may persist longer and even become chronic, although the chronic cases are probable forms of spasmodic tics. Treatment is very satisfactory. Rest, open air, nutritious diet, and some form of arsenic, are the general lines of treatment. Medical assistance is imperative, however, in view of the possible existence of heart lesions and other grave accompaniments of this affection. For hereditary chorea see HUNTINGDON'S DISEASE.

Chorion, kō'rĭ-on, the outermost of the membranes that surround the embryo. It is a most important structure in its developmental history as it comes into close contact with the decidua and is incorporated into the placenta, constituting the fœtal part.

Chorley, chôr'lĭ, **Henry Fothergill,** English critic and miscellaneous writer: b. Blackley Hurst, Lancashire, 15 Dec. 1808; d. London 15 Feb. 1872. His criticisms appeared mostly in the 'Athenæum' of London, displaying fine perception and exquisite taste in matters connected with literature and music. His novels, however ('Conti'; 'The Prodigy'; and 'The Lion'), are failures from the popular point of view, although finely written; and his plays, with the exception of 'Old Love and New Fortune,' are weak.

Chorley, a municipal borough and market town of England, in Lancashire, on the Chor, 20 miles northwest of Manchester. It consists of spacious well-built streets, and contains an ancient parish church, various other churches and chapels of modern date, together with a spacious town-hall, several large schools, club-houses, theatres, etc. The principal manufacture is that of cotton goods, but there are also bleaching, calico-printing, and dye-wood works, floor-cloth works, and iron foundries. In the vicinity are coal, lead, and iron mines, and millstone quarries. Pop. (1901) 26,850.

Choron, Alexandre Étienne, ä-lĕks-ändr ä-tē-ĕn shō-rôn, French musician: b. Caen 21 Oct. 1772; d. Paris 29 June 1834. He labored assiduously to promote musical education in France, founding his famous "Conservatory" in 1818. He wrote 'Principes de Composition des écoles d' Italie' (1808), and other valuable textbooks on music.

Cho'rus, originally a special feature in the Greek drama. During the most flourishing period of Attic tragedy the chorus was a troop of male performers, wearing masks, and representing male or female characters, who, during the whole representation, were spectators of the action. In the intervals of the action the chorus chanted songs, which related to the subject of the performance, and were intended either to augment the impression or to express the feeling of the audience on the course of the action. Sometimes it even took a direct part in the action by observations on the conduct of the dramatic characters, by advice, consolation, exhortation, or dissuasion. It usually represented a part, generally the oldest portion of the people, where the action happened, sometimes the counselors of the king, etc. The chorus was an indispensable part of the representation. In the beginning it consisted of a great number of persons, sometimes as many as 50; but the number of the tragic chorus was afterward limited to 15; while the chorus in comedy numbered 24. The exhibition of a chorus was in Athens an honorable civil charge, and was called choragy. (See CHORAGUS.) The leader or chief of a chorus was called coryphæus, who spoke in the name of the rest when the chorus participated in the action. The chorus was often divided into two parts, who sung alternately. The divisions of the chorus were not stationary, but moved from one side of the stage to the other; from which circumstance the names of the portions of verse which they recited, *strophe, anti-strophe,* and *epode,* are derived. But it cannot be determined in what manner the chorus sung. It is probable that it was in a sort of solemn recitative, and that their melodies, if we may call them so, consisted in unisons and octaves, and were very simple. They were accompanied by flutes. With the decline of ancient tragedy the chorus was omitted. Some modern tragedians, as Racine in France and Schiller in Germany, have attempted, with more or less success, to imitate or revive the Greek chorus. Shakespeare has employed devices founded on it.

Chorus, in modern music, is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs and concerted pieces for selected voices. The singers themselves are also called the chorus.

Chose, shōz, a thing, a chattel, a piece of property; the subject-matter of an action. Chose is used in divers senses, of which the four following are the most important: Chose local, a thing annexed to a place, as a mill; chose transitory, that which is movable, and may be taken away or carried from place to place; chose in action, otherwise called chose in suspense, a thing of which a man has not the possession or actual enjoyment, but has a right to demand by action or other proceeding; chose in possession, a thing which a person has not only the right to enjoy, but also its actual enjoyment.

Chosroes (kŏs'rō-ēz) **I.,** King of Persia: d. 579. He succeeded to the throne in 531, and his memory is still venerated in the East, where his virtues obtained him the titles of the Magnanimous and the Just. At his accession Persia was involved in a war with Justinian, which Chosroes terminated successfully, obliging Justinian to purchase peace by the payment of a large sum of money. In 540, however, jealous of the victories of Belisarius, the great general

of the empire, Chosroes violated the peace, invaded Syria, laid Antioch in ashes, and returned home laden with spoils. The war continued till 562, when the emperor again purchased peace by an annual tribute of 30,000 pieces of gold. The peace continued for 10 years, when the war was renewed with Justin, the successor of Justinian, when Chosroes was again successful. His zeal for the administration of justice sometimes led him to acts of cruelty; but he encouraged the arts, founded academies, and made a considerable proficiency in philosophy himself. His reputation obtained him a visit from seven sages of Greece, who still adhered to the Pagan religion; and in a treaty with Justinian he required that they should be exempt from the penalties enacted against those who continued to favor Paganism. It was in the reign of Chosroes that the Turks first became known to Europeans, first as friends, afterward as enemies, of the Persian king.

Chosroes II., king of Persia, grandson of the preceding. He ascended the throne in 591, on the deposition of his father. He was assisted by the Emperor Mauricius, and on the assassination of the latter by Phocas (602) he took up arms against the empire, and refused to make peace at the solicitation of Heraclius, the succeeding emperor. By a long series of successes he raised the Persian power to the highest point, and reduced the empire to extremity. Heraclius, however, taking courage from despair, succeeded in a series of brilliant campaigns in recovering his lost provinces, 622–7. Chosroes, repeatedly defeated, was completely overthrown in the great battle of Nineveh. He fled with his favorite wife Sira, but after witnessing the massacre of his numerous sons he was thrown into a dungeon and assassinated by command of his son Siroes.

Chota Nagpur, or **Chota Nagpore,** chō ṭa năg-poor′, British India, a division of Bengal, a commissionership which is divided into the districts of Lohardaga, Hazaribagh, Singbhum, Palamau, and Manbhum; area 26,966 square miles. It consists for the most part of an undulating plateau about 3,000 feet above the sea, and rising occasionally into ridges of hills which stretch from east to west. The drainage is received chiefly by numerous tributaries of the Subarna-rekha in the northeast, and by the north and south Coel and other streams in the south and west. Much of the surface is overrun with jungle, or covered with forests containing teak and other kinds of valuable timber. The soil in the plains consists of a red loam, and where under cultivation, produces excellent crops of wheat, barley, rice, pulse, cotton, and sugarcane. Coal occurs in various localities, and is worked in the Karharbari coal-fields in Hazaribagh. The trade, hampered by imperfect means of conveyance, is limited, and is nearly confined to grain, lac, coarse silk, oil-seeds, and other agricultural products. Pop. (1891) 4,628,792.

Chouans, shoo-äṅ, a name given to the royalist peasantry of Brittany and lower Maine, who carried on a petty warfare against the republican government from an early period of the French Revolution. The name Chouan was finally extended to all the Vendeans. The name was derived from the first chief of the Chouans, Jean Cottereau, who with his three brothers organized these bands in 1792, under the inspiration of the Marquis de la Rouaric, an ardent leader of the Royalists. Cottereau was the son and grandson of persons engaged in the manufacture of wooden shoes. He had joined a band of dealers in contraband salt, and acquired the surname Chouan from the cry of the screech-owl (*chat-huant*), which he used as a signal with his companions. He was killed in an engagement with the Republican troops, 28 July 1794. After the death of Jean Cottereau, the Chouans became quite lawless, engaging in guerrilla warfare and highway robbery. About 1800 they ceased to rob and terrorize, and, although, in 1815 an effort was made to revive the insurrection, they were suppressed by Gen. La Marque.

Chouans, The, a romance by Balzac, the novelist's first important work. The title, when it appeared in 1829, was 'The Last Chouan; or, Bretagne in 1800.' In 1846 it was rearranged in its present form. The author made a profound study of the scenery of Bretagne, and the manners of its people, before he wrote his romance; and his pictures of both scenery and people have the stamp of reality and truth.

Chough, chŭf, a bird (*Fregilus graculus*), belonging to the sub-order *Fregilinæ* of the crow family, and particularly the Cornish chough. The name is derived from the cawing of the bird. It is widely distributed over Europe, India, and northern Africa, living in great colonies in the faces of precipitous cliffs. The bill is long and slightly curved; feathers black; the claws long and hooked, enabling it to cling to the slight projections of rocks and stone walls. It is often tamed and kept as a household pet, but is now disappearing, giving place to the jackdaw.

Chousinga, chow'sĭn-gą, a gazelle-like Indian antelope, remarkable for the fact that the buck has four horns. See FOUR-HORNED ANTELOPE.

Chouteau, shoo-tō, **Auguste,** American pioneer: b. New Orleans, La., 1739; d. St. Louis., Mo., 24 Feb. 1829. He was from his early youth a fur trader, and in 1763 set out with his brother Pierre Chouteau (q.v.) to establish trading stations in the regions west of the Mississippi. On this trip they founded the city of St. Louis in 1764.

Chouteau, Pierre, pē-ār, American pioneer: b. New Orleans 1749; d. St. Louis 9 July 1849. He had few early advantages, but, becoming a fur trader, decided, in 1763, to extend his operations to the region beyond the Mississippi. With his brother, Auguste, he set out in 1763, joining a government expedition. He stopped in the heart of an unsettled country and founded, with his brother, the city of St. Louis.

Chouteau, Pierre, Jr., American fur trader, son of the preceding: b. St. Louis 19 Jan. 1789; d. St. Louis 8 Sept. 1865. He worked for his father and began trading in fur early in life. After establishing posts for the sale of skins throughout the trans-Mississippi region he purchased the fur-trading interests of John Jacob Astor.

Chowchow, a diminutive breed of Siberian sledge-dogs, improved and developed in China, whence they began to be imported into Europe and America at the beginning of the 20th cen-

tury. These dogs have the form and coat of their useful progenitors, and are very compact and sturdy of frame, and lively in disposition. The tail is carried tightly curled over the back. In color they are either all black, even to the tongue and inside of the mouth, or all white, blue, red, or yellow. This breed was not recognized in American bench-shows until 1902.

Chow-chow, a Chinese or pidgin English word meaning chopped up or broken and mixed. It is applied to a confection of mixed fruits made in China; to a mustard pickle of assorted ingredients made in India; and in the United States and Great Britain to a similar pickle usually compounded of chopped cabbage, green tomatoes, green or red peppers, spices, vinegar, mustard-seed, cucumbers, etc.

Chow'der (French *chaudière,* "a kettle"), a dish of French origin, composed chiefly of vegetables, pork, and fish or shell-fish, boiled together. Perhaps the most common form of chowder is that made from clams, either from the soft-shelled variety or the hard-shelled round clam or quahog. Chowder is a favorite dish on the New England coast and among the Newfoundland fishermen. A fish chowder is made as follows: Salt pork cut into small strips or dice is cooked for a few minutes in a deep iron kettle. Sliced or chopped onions are slightly browned in the pork fat, and onions and pork are then removed. A layer of sliced potatoes is laid in the kettle, then a layer of fish (small ones entire or large fish in slices), a layer of salt pork, one of onions, and so on alternately to the requisite amount. The fried salt pork and onions are also distributed through the mass, which should be seasoned throughout with salt, pepper, thyme, and savory. A very common ingredient is ship-bread or other hard crackers laid in between the other layers. A small quantity of water or of milk, or of both, is poured into the kettle, and the whole is boiled, without stirring, until cooked through. In adding the water or milk it must be remembered that chowder is a stew,— not a soup. Foreign cooks make a soup of clams, potatoes, onions, and tomatoes, which passes under the name of clam chowder. Genuine chowder is never disturbed until it is served, and in camps is portioned out, in layers, direct from the kettle.

Chrétien de Troyes, krā-tē-ĕn dė trwä, French trouvère: b. Troyes about 1150; d. about the end of the 12th or beginning of the 13th century. He translated Ovid's 'Ars Amandi' into French, and probably wrote some works based on the classics, but his fame rests upon the still extant romances of Arthur and the Knights of the Round Table, the materials for which were obtained from Geoffrey of Monmouth's rather credulous 'History of Britain.' They are entitled 'Iric et Guide'; 'Perceval le Gallois'; 'Le Chevalier au Lion'; 'Cliget'; 'Chevalier de la Table Ronde'; 'Lancelot du Lac'; and 'Guillaume d'Angleterre'; but the authorship of the last named is doubtful. Other two of his works, 'Tristan, ou le Roi Marc et la Reine Yseult' and 'Le Chevalier à l'Épée,' have been apparently lost. His language and versification were models for troubadours and romancers for a long time; and from him the Arthurian poets to the end of the 13th century borrowed episodes, themes, situations, characters, and all manner of poet's devices. Chrétien was a master of invention, fashioned for himself a competent literary vehicle, and made most effective use of his large knowledge of men and manners. See Förster, 'Christian von Troyes sammtliche erhaltene Werke' (1884).

Chriemhild, krēm-hĭlt. See KRIEMHILD.

Chrism, krĭzm, a mixture of olive oil with balm (*opobalsamum*), which, being blessed by the bishop, is used in the Roman Catholic Church in the administration of the sacraments of baptism, confirmation, holy orders, and extreme unction, and in certain rites; as in consecrating the instruments of the divine service, as the sacred vessels, church edifices, altar stones. The chrism of the Greek Church is compounded of olive oil and a great variety of spices. In the Roman Catholic Church the holy oils are blessed by the bishop on the Thursday of Holy Week.

Chrisom, krĭz'ŏm, the name of the white linen cloth laid by the priest on the child in Roman Catholic baptism, to signify its innocence. By olden usage it was generally presented by the mother as an offering to the Church, but if the child died before the mother was churched, it was used as a shroud. By a common abuse of words, Chrisom came to mean the child itself, being first applied in the old bills of mortality to denote such children as died within the month of birth.

Christ (Greek *Christos,* the anointed; *Messiah,* from the Hebrew, has the same signification). See CHRISTIANITY; JESUS.

Christ, Disciples of, a denomination of Christians in the United States commonly known as the Christian Church, or Church of Christ, and sometimes called Campbellites. In September 1809, Thomas Campbell, a Scotch minister of the seceders' branch of the Presbyterian Church, then living in western Pennsylvania, issued a "Declaration and Address," deploring the divided state of the Church, and urging as the only remedy a complete restoration of apostolic Christianity and the rejection of all human creeds and confessions of faith. The Christian Association of Washington, Pa., was formed for the purpose of promoting the principles set forth in this declaration. Mr. Campbell's son, Alexander, just from Glasgow University, Scotland, at once gave his splendid ability and learning to this new movement. It was not the intention of the Campbells to form a distinct religious body, but to effect the proposed reforms in the churches. Their plea was so opposed that they were compelled to act independently, and the first church in the new movement was organized at Brush Run on 4 May 1811. The Disciples maintained that having accepted the Bible as their only rule of faith and practice, and the only divine basis for the union of all Christians, they were led to reject infant baptism and adopt believers' immersion only. They observe the Lord's Supper each first day of the week, and heartily and practically accept and exalt the doctrine of the divinity of Christ. Their church policy is congregational, though they frequently hold conventions in the interest of world-wide missions, but not for legislative purposes. In 1900 the denomination had 6,528 ministers, 10,528 churches, and 1,149,982 communicants, besides

several universities and colleges of high rank, and a number of religious publications.

Christ, or **Criss-Cross Row.** See HORN-BOOK.

Christ in Art. The representations of the person of the Saviour which for a succession of ages have constituted one of the most important subjects of Christian art, and have occupied the highest genius, especially of Roman Catholic artists, are all evidently ideal. The attempt to represent the personal appearance of the Saviour can hardly be traced back further than the age of Constantine. The origin of Christian art, indeed, has been traced successfully to the catacombs of Rome, and is not to be considered as springing directly from Pagan art, although the great Italian masters of the Middle Ages may have derived much instruction from classical models; but the painting and sculpture of the early Christians were chiefly allegorical, representing the moral of the gospel parables, or similar symbolic representations of Christian doctrine, without regard to historical accuracy of portraiture. At a later period legends were invented of various likenesses of the Saviour having been preserved by miraculous or other remarkable means, but these stories are intrinsically weak and improbable, and are entirely destitute of external evidence. They are of such a nature as that King Abgarus of Edessa had a napkin sent him by the Saviour himself, in which he had caused his likeness to be miraculously impressed by placing his face in it. A portrait is said to have been similarly impressed on a handkerchief of St. Veronica, and St. Luke is said to have taken one himself. An apocryphal letter of Lentulus, the predecessor of Pilate, addressed to the Roman senate, contains a description of the person of Jesus. One of the earliest professed portraits of the Saviour is in the Calixtine Catacomb near Rome. He is represented with the hair parted on the forehead, and falling over the shoulders in long waving locks. In regard to this common notion it may be observed that when St. Paul wrote his first epistle to the Corinthians there were probably many Christians scattered over the world who remembered the personal appearance of the Saviour, and if this representation of it had been correct he would hardly have written to a Christian church that it was contrary to nature and a shame for a man to have long hair. The great painters of the Middle Ages, to whom we owe the ideal representation of Christ which has now become common in symbolical paintings, probably founded somewhat upon these early notions. A Christ of the 4th century with an oval face, Oriental features, parted hair, and a short straight beard, is said to have been the model of the Byzantine and Italian painters till the time of Michael Angelo and Raphael.

Christ, Order of, on the abolition of the Templars by Clement V., in 1312, King Dionysius of Portugal preserved the order in his dominions, but changed its title to that of The Knights of Christ, or The Order of Our Lord Jesus Christ. This arrangement was sanctioned by Pope John XXI. or XXII., in 1319. The seat of the order was transferred from Castro-Marino to Thomar in 1366. The new order afterward attained such power that King John III. was obliged to obtain an edict from Pope Hadrian VI., in 1522, by which the grand-mastership of the order became vested in the kings of Portugal.

Christ Church, College of, a notable institution in Oxford, England. In 1526 Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he chose for a new college, to be called Cardinal College, and which he intended to endow beyond that of any other in Oxford. On the fall of Wolsey, in 1529, the establishment came into the hands of King Henry VIII. In 1532 that prince founded it under the name of King Henry VIII.'s College, and in 1546 he once more re-established the college under the name of "Christ Church Cathedral in Oxford, or the Foundation of King Henry VIII., with a dean and canons, 60 students, 40 schoolboys, clerks, choristers," etc. The foundation is now subsisting, though it has undergone considerable modifications. According to the present statutes, which came into force in 1882, the students, who are equivalent to fellows, are divided into two classes, and are in number about 30, besides honorary students. There is also a body of scholars, over 40 in number, some of whom are elected annually from Westminster School, while others are chosen by open competition for proficiency in mathematics, physical science, or history. The students are appointed in the first instance for two years, but this term may be prolonged. There are also many exhibitioners.

Christadel'phians, a religious body that originated during the American Civil War, their founder being Dr. J. Thomas. They believe that God will raise all who love him to an endless life in this world, but that those who do not shall absolutely perish in death; that Christ is the Son of God, inheriting moral perfection from the Deity, our human nature from his mother; and that there is no personal devil Their chief newspaper in Great Britain is *The Christadelphian*, published in Birmingham. The works of Dr. Thomas and 'Christendom Astray' by Robert Roberts contain expositions of their religious views.

Christ'church, England, municipal borough in Hampshire, situated at the confluence of the Avon and Stour, about one mile from the sea. It is famous for its great priory church, dating in part from the early part of the 12th century. The church is over 300 feet long and contains a magnificent altar-screen. Fusee chains for watches used to be manufactured in Christchurch. Pop. (1901) 4,204.

Christchurch, New Zealand, a town, capital of the province of Canterbury, and the see of the primate of New Zealand, situated on the Avon River, seven miles from the sea, and is the terminus of the Great Northern and Southern Railway. A railway tunneled through the Lyttelton Hills connects it with Lyttelton, the nearest port. It contains a number of handsome buildings, including a fine cathedral, the government offices, St. Michael's church, the supreme court, hospital, museum, town library, lunatic asylum, convent, theatre, banks, clubhouse, and college, and has a flourishing trade and manufactures. Pop. (1901) 57,041.

Christen, krē'stĕn, **Ada.** See BREDEN, CHRISTINE.

Christian I., king of Denmark and Norway: b. 1426; d. Copenhagen 21 May 1481. He reigned from 1448 to 1481, and in 1479 founded the University of Denmark.

Christian II., king of Denmark, Norway and Sweden: b. Nyborg, Fünen, 2 July 1481; d. Kallundborg, Zealand, 25 Jan. 1559. He was grandson of Christian I. In 1501 he was named successor to the crown, and took part in the government of Norway, which he conducted with great severity.

On his accession to the throne in 1513 he signed a capitulation in favor of the privileges of the lay and clerical aristocracy in his dominions, including the independent administration of justice; but all his efforts were bent toward strengthening the royal power, particularly in Sweden, which refused to acknowledge him. To strengthen himself against Steen Sture, the administrator of Sweden, who had set himself in opposition to the union of Calmar formed in 1397 between Norway, Sweden, and Denmark, he married Isabella, sister of Charles V. of Germany, in 1515. He had already a mistress called Dyveke, the daughter of a Dutch woman who kept an inn in Bergen, Norway. She exercised a great influence over the king, and by her liberal spirit and knowledge of the institutions of Holland tended greatly to improve the administration of his government. She became a sort of prime minister, and had great influence in originating those wise laws which gained for this king the love of his subjects. But she incurred the hatred of the nobility, and in 1517 died of poison.

Soon after war broke out with Sweden, and making all the preparations and alliances in his power, Christian sent an army into Sweden commanded by Otto Krumpen, who defeated the Swedes in the decisive battle of Bogesund (Ulrikehamn), 19 Jan. 1520, in which Steen Sture, the administrator, was killed. Stockholm, under the command of the widow of Sture, stood a siege of four months, and on 4 November, Christian was crowned king of Sweden.

Subsequently Sweden revolted under Gustavus Vasa, who had expelled the Danish garrisons and been proclaimed administrator. To find the means of defense Christian convoked the Diet toward the close of 1522. Instead of attending it the nobles and prelates assembled at Wiborg in Jutland, proclaimed the deposition of Christian, and called his uncle, Frederick, to the throne. Christian fled to the Netherlands to claim the succor of his brother-in-law, Charles V. Gustavus, already master of Sweden, put an end to the union of Calmar in 1523, and was proclaimed king. Christian remained nine years in exile without obtaining aid from Charles, and then visited England and Germany, and adopted the Reformed faith. At length, with the assistance of Charles, he equipped a fleet in Holland, landed in Norway in 1531, and was proclaimed king by the Norwegian Diet, which had refused to recognize Frederick. The commander of the Danish fleet, a bishop, having offered him a safe conduct, he repaired to Copenhagen to negotiate with Frederick, who disavowed the admiral, and retained him prisoner. He was confined for 12 years in the Castle of Sonderburg, island of Alsen, in a dungeon of which the door was walled up, the only access being by the window, and his only attendant a Norwegian dwarf. In 1544 Christian III. somewhat relaxed the rigor of his confinement, and in 1549, on renouncing his right to the crown, he was permitted to reside in the Castle of Kallundborg in Zealand, where he was subjected to a less severe surveillance, until his death in 1559. His misfortunes were chiefly due to the enmity excited by his reforms, and his violation of the capitulation entered into at his coronation. See Behrmann, 'Kong Christiern II., Historie' (1815).

Christian III., king of Denmark and Norway: b. 1502; d. Kolding, Denmark, 1 Jan. 1559. He succeeded his father, Frederic I., and introduced the Reformed faith into Norway and Denmark. In his reign Norway was reduced to the status of a province.

Christian IV., king of Denmark: b. Frederiksburg, Zealand, 12 April 1577; d. Copenhagen 28 Feb. 1648. He was the son of Frederick II. and succeeded to the throne as a minor in 1588. He early gave numerous proofs of a sincere love of religion and justice, and a high esteem for science and art. He made his celebrated voyage to the North Cape to learn the boundaries of his kingdom and protect the rights of his subjects in that remote region from any foreign interference with their coasting trade. He was afterward, in consequence of the claims advanced by Sweden to Lapland, engaged in what is called the Calmar war with Charles IX. and his successor, Adolphus, and terminated it by an advantageous peace, in which he stipulated for the free navigation of the Baltic. In the Thirty Years' war he was beaten by Tilly at Lutteram-Barenberge in 1626, but afterward, in conjunction with Gustavus Adolphus, obtained the Treaty of Lübeck 1629. He has the merit of having laid the foundation of the Danish navy, extended the trade of his subjects to the East Indies, introduced a judicious system of finance, and fitted out several expeditions for the discovery of a northwest passage. He was succeeded by his son, Frederick III.

Christian V., king of Denmark and Norway: b. 15 April 1646; d. Copenhagen 25 Aug. 1699. He succeeded his father, Frederick III., in 1670, and carried on a long and fruitless war against Sweden.

Christian VI., king of Denmark and Norway: b. 30 Nov. 1699; d. 6 Aug. 1746. He succeeded his father, Frederick IV., in 1730.

Christian VII., king of Denmark and Norway: b. Copenhagen 29 Jan. 1749; d. Rendsburg, Holstein, 13 March 1808. He was the son of Frederick V., whom he succeeded in 1766. In the same year he married Caroline Matilda, sister of the British monarch, George III. He afterward traveled for three years in England, Germany, Holland, and France, and became a member of several learned academies. Youthful indulgences, however, had weakened his intellect, and obliged him to confide the charge of public business to his ministers, and more especially, it is said, to his favorite physician, Struensee, who, though he had gained the affections of Christian and his young bride, was very unpopular as a statesman, and made innovations which provoked the hostility both of the nobility and the army. Notwithstanding the unfortunate circumstances of Christian's reign,

several important improvements took place under it. Serfdom was abolished in the duchies, trade and commerce promoted, the Schleswig-Holstein Canal constructed, and excellent roads formed throughout the kingdom. Christian was succeeded by his son, Frederick VI.

Christian VIII., king of Denmark, and Duke of Schleswig-Holstein and Lauenburg: b. Copenhagen 18 Sept. 1786; d. there 20 Jan. 1848. He was chosen king of Norway in 1814, but unable to hold it against Bernadotte he abdicated in October of the same year. His reign was comparatively unimportant, the most notable event being the king's proclamation in 1846 that Schleswig and Holstein were inseparably united to Denmark. He was succeeded by his son, Frederick VII.

Christian IX., king of Denmark: b. 18 April 1818. He was the fourth son of the Duke of Schleswig-Holstein-Sonderburg-Glücksburg, and succeeded Frederick VII. as king of Denmark, 15 Nov. 1863. His second son was, in 1863, elected king of Greece, and his two eldest daughters married heirs-apparent of the crowns of Great Britain and Russia.

Christian, German prelate: b. early part of the 17th century; d. Tusculum, Italy, 25 Aug. 1183. He was made archbishop of Mainz in 1165. He was chiefly celebrated for his military exploits under Frederick Barbarossa, for whom he opened the way to Italy. He fell in battle endeavoring to rescue Pope Lucius III. from a hostile Roman army.

Christian, Charles, English engraver: b. London 1684; d. there 1725. His real name was Charles Christian Riesen. He was the son of a Dane. He is one of the most celebrated of gem engravers. One of his best works is a portrait of Charles XII. of Sweden.

Christian, Edward, English jurist: b. London 1774; d. Cambridge 1823. He was chief justice of the Isle of Ely, and law professor of Downing College, Cambridge. He was the author of various works, among which are treatises on the bankrupt laws, and on the game laws. He also edited an edition of Blackstone, to which he added numerous notes.

Christian, The, a novel by Hall Caine, published in 1897. For the most part the scene is laid in the London of to-day. The details of London life are spectacular, and the object of the book seems to be to show the inadequacy of London churches to save the city.

Christian Architecture, a style of architecture adopted for religious buildings after the introduction of Christianity. The Roman Early Christian style appeared first in basilicas and circular churches. The former were, doubtless, originally built on the model of the Roman basilicas, but the requirements of the new religion soon necessitated various modifications in the original plan. The Christian basilicas were constructed generally with three aisles; the central one broader than the others, the left or north being reserved for males, and the right or south for females. Sometimes we find five aisles. The building terminated in a semicircular apse. The decorations consisted of paintings and mosaics, used mainly in the apse. The pillars were generally of the Corinthian order. Symbols were largely introduced. These were the cross and the lamb, symbols of Christ, the dove, as typifying the Holy Spirit, and a fish, used as a symbol of Christ from the letters of the Greek word *ichthus*=a fish, forming the initials of the titles of our Lord, *Iēsous Christos, Theou huios, sōter*=Jesus Christ, the Son of God, the Saviour. The roofing was of beams with flat paneling, frequently gilt. The altar stood at the east end in front of the apse. The space round the altar was railed off and called the sanctuary. Adjoining the entrance was generally a narrow space called the Narthex. In the middle of a portico in front of the building was a bowl for washing the hands. A crypt was constructed under the altar for the reception of the bones of the patron saint. See also ARCHITECTURE.

Christian Brothers. See BRETHREN OF THE CHRISTIAN SCHOOLS.

Christian Brothers, College of, situated in St. Louis, Mo. In 1855 it was established and incorporated with power to confer degrees. The modern language department is given special attention, the pupils being required to converse and write in French, German, and Spanish. Practical engineering, mechanical and scientific draughting and designing are emphasized in the scientific department. Literary and musical courses are aided by the various organizations which contribute to the development of good taste. The graduates of this college are among the distinguished men of the country.

Christian Catholic Church. See DOWIE, JOHN ALEXANDER.

Christian Church, The, is really the Church established by Jesus Christ when he was here upon earth. All are considered members of this Church who have been baptized in the name of Christ, and who accept his doctrines and live in harmony with them. (See Matt. xxviii. 19, 20.) The first great increase was at Pentecost, when 3,000 people were converted; and shortly after, through the teaching of the apostles, 5,000 were added to the Church. (See 'Acts.') Stephen was the first to suffer martyrdom for Jesus Christ. Paul made three great missionary tours, established churches in many places, and the result of his work, aided by the 12 apostles and disciples, was the organic unity of the Church in the first period of the Christian Era.

Ancient Period, 30–750 A.D.—The first part of this period was distinguished by great simplicity of doctrine and life, and zeal in extending the kingdom of Christ. Important centres were established, but the gospel was largely confined to the middle and lower classes. Controversies arose between the Gentile and Jewish Christians, but not to such an extent as to arrest steady progress. The heretical sects, with Saturnius, Basilides, and others at their head, were of no serious injury. The chief defenders of Christianity were Aristides, a Christian apologist, Justin Martyr, Melito, Tatian, Hermas. This was the time of great persecutions. There were 10 in all, the most serious being under the emperors Nero, Decius, and Diocletian. The Scriptures were collected into a canon, and the Church made great advance in numbers and territory. The most important writers were Ignatius, Irenæus, Origen, Tertullian, and Clement of Alexandria. The more serious schisms were produced

through Felissimus, Novatus, and Miletus. The doctrinal controversies related chiefly to eschatology, human depravity, and the divinity of Christ. The Council of Nice (325 A.D.) was a great triumph for orthodoxy. It declared the essential Trinity of the Godhead, and settled for all time the divinity of Christ as a fundamental doctrine of Christian faith. The heresy of Arius was condemned. Persecution ceased, through the sympathy of the Emperor Constantine, who, in 313, removed all disabilities from Christians, and in 323 made Christianity the state religion of the Roman empire. Monasticism, a reaction against worldliness, increased rapidly. Julian the Apostate endeavored to revive paganism, but without avail. Pope Leo the Great greatly extended the authority of the Western Church. Mohammedanism paralyzed the Eastern Church for a time. Mohammed was born in Mecca, Arabia, 570; declared himself a prophet in 609; founded a new religion, based upon the Koran; conquered Arabia, and died in 632. He was succeeded by the caliphs, who conquered all north Africa, western Asia, and gained a foothold in Spain and the south of France. Mohammedanism was arrested in western Europe by Charles Martel, by the victory of Tours, in 732. The most important recent defeat of Mohammedanism in Europe has been the triumph of Russia over Turkey in the war of 1877, and the practical disruption of Turkey in Europe, and the liberation of the Christian provinces. Pope Gregory the Great ruled from 590 to 604. He organized orders, elaborated the Church festivals, and established a mission among the Anglo-Saxons. The Gospel spread rapidly through Great Britain and Germany. Christian art was patronized liberally by the Roman pontiffs. The close of the ancient period found the Latin or Western Church very vigorous and aggressive, but the Eastern Church in a stagnant condition.

Mediæval Period, 750–1517 A.D.—This period falls into three great divisions: From Charlemagne to Gregory VII. (750–1073); from Gregory VII. to the flight of the Pope to France (1073–1305); from time of the Pope's residence in France to Reformation (1305–1517). The Middle Ages were the transition from the ancient to the modern period. The most important political events, all of which had a bearing on the Church, were the end of the Greek exarchate in Italy; the destruction of the Lombard kingdom, the organization of the Frank empire under Pepin, rise of the new Germanic Church, division of the Mohammedan caliphate, decline of the Greek empire, and development of the new Roman empire in the West. Charlemagne was the greatest mediæval ruler. He was victorious over many northern tribes, and increased the territory of the Church to vast proportions. He was a liberal patron of learning, and authorized a Latin version of the Scriptures. Alfred the Great of England reigned from 871 to 901, and was as distinguished for learning as for his power to rule. The Russian monarchy was founded by Ruric in the middle of the 9th century. At this time the evangelization of heathen nations progressed rapidly. The Hungarians, Bulgarians, Bohemians, Moravians, Wends, and Scandinavians accepted Christianity. Great disorders appeared in the Church at this time. Strifes arose over the papacy, and the civil powers endeavored to dictate the appointments of bishops and the disbursements of ecclesiastical funds. The violent rule of the Mohammedans over Palestine excited the wrath of western Europe, and crusades were organized for the rescue of the country from the Moslems. There were seven crusades, extending from 1096 to 1272. Christian Europe failed, finally, to hold the country, but the general effect of the crusades was beneficial in the development of commerce, introduction of Oriental thought, and the knowledge of various Oriental sciences. Heretical movements were inaugurated through the Waldenses (1170); Wyclif (1324); John Huss (1373); the Moravian Brethren (1417). Mysticism greatly developed at this period (Tauler, Suso, Ruysbroek, Groot, Thomas à Kempis) and Savonarola (1480–97). Mendicant orders were established. The Inquisition was established in 1215 to check heresy.

The Modern Period, 1517 to the Present.—In the first quarter of the 16th century began the religious movement commonly called the Reformation. Martin Luther, born in 1483, a priest and Augustinian monk, began an agitation against the authority of the Pope. He published 95 theses against Rome, preached sermons and, in various ways sought to change some of the conditions which existed. He spread the Scriptures, which had previously been translated into German, and gained the co-operation of the German princes, and published sermons and other works against the Roman Catholic Church. Melanchthon was the chief doctrinal writer of the Reformation. Erasmus labored in the department of New Testament criticism, but never left the Church. The leading Swiss reformers were Zwingli in eastern Switzerland, and the learned and austere Calvin in western. Farel stood next to Calvin in Geneva. The English Reformation had King Henry VIII. on its side, through no pious motives, but because the Pope would not sanction his divorce from Catharine of Aragon. This was the great opportunity for which the Reformers of England had been waiting. Under the royal protection Protestantism grew rapidly, but received a set-back in Queen Mary's reign. Under Elizabeth the Reformation was placed on a firm foundation. The Puritans were a reaction against what yet remained of the old faith and practices in the Church of England. Arminius, born 1560, in Holland, opposed the chief tenets of Calvinism. The Synod of Dort resulted in the political triumph of the Calvinists, and the expulsion of the Remonstrants, until the death of Maurice (1630). The Thirty Years' war (1618–48) was confined to the continent, and established the territorial boundaries of the Protestant and Catholic nations. The Huguenots were the representatives of Protestantism in France. The Jesuits, organized by Ignatius Loyola, 1540, were established as an offset to the aggression of Protestantism. Deism prevailed to an alarming extent in England, its chief promoters being Hobbes, Herbert, Shaftesbury, Tindal, Bolingbroke, Hume, and Gibbon. They had strong antagonists (Baxter, Cudworth, Taylor, Wateland, Leland, Butler, Paley), but the general condition of the people was irreligious. Methodism, which was begun by John Wesley, born 1703, was a fervent religious movement. Charles Wesley, Whitefield, John Fletcher, Joseph Benson, and Adam Clarke were strong coadjutors.

German Rationalism arose in 1750, through the teachings of Wolfe, Semler, and the example of the Prussian court. It is now in decline, through the labors of Tholuck, Neander, Hengstenberg, Ullman, and others. The Evangelical Alliance (1846) has sought to promote the unity of Protestant Christians in all parts of the world, and, to a corresponding degree, the victory over skepticism. The Old Catholics, a Roman Catholic reaction against the Vatican Council of 1869, were organized into a Church in 1870; Döllinger, Huber, and Friedrich were at their head. They have made but little progress.

The American Church.— The colonization of North America in some parts sprang from religious motives. The colonists sought freedom here because of the oppressions at home. Periods of American Church history: (1) From 1607–60, revival and progress. (2) 1660–1720, trial, disputes with Great Britain, religious decline. (3) From 1720–50, great revivals. (4) From 1750–83, political agitation, freedom from British rule. (5) From 1783 to the present, extensive revivals, separation of Church and state, abolition of slavery, evangelization. The Protestant Episcopal Church was founded by the James River Colony (1607); its first General Convention was in 1785; it ratified the 39 Articles in 1832. The Puritan Pilgrims landed at Plymouth in 1620, and began the development of Congregationalism. The Cambridge Platform was established in 1648. The Reformed (Dutch) Church was established in 1628 in New Amsterdam (New York). The first independent organization was in 1771. The Baptists began in Providence, R. I., in 1639, through Roger Williams. The Reformed (German) Church was organized in 1741. The Lutherans were established first in New York in 1669; the first Synod was held in 1748. The Presbyterians were organized at the close of the 17th century. The first Presbytery was established in Philadelphia in 1706, and the first General Assembly in 1789. The first Methodist Society in the United States was established in New York in 1766, and the first Conference was held in Philadelphia in 1771. The Reformed Episcopal Church was organized in New York in 1873, under Bishop Cummins. The Roman Catholic Church in the United States was first established in Maryland through immigration in 1632. The Episcopal see of Baltimore was established in 1789. For statistics of the American churches see the separate articles.

Christian Endeavor, Young People's Society of, a society distinctly religious in all its features; organized 2 Feb. 1881 in Williston Church, Portland, Maine, by the Rev. Francis E. Clark, D.D. From one small association it has expanded into over 57,000 societies, in all parts of the world, with an aggregate membership (1900) of 3,500,000. In addition to the main organizations in the United States it has been found necessary to form branches, among which are the Juniors, organized 27 March 1884, at Tabor, Iowa, by the Rev. J. W. Cowan and Miss Belle Smith; the Intermediate, organized by the Rev. A. Z. Conrad of Worcester, Mass.; and the Mothers', suggested by Mrs. Amanda B. Fellows of Chicago, and organized in April 1893 at Topeka, Kan., by Mr. F. C. Barton. Among other special branches are the Life Savers', instituted by the Rev. S. Edward Young at the United States Life-Saving Station at Asbury Park, N. J.; the Travelers' Christian Endeavor Union, organized at Philadelphia, 14 Nov. 1892, for work among commercial travelers; the Floating societies for work in the United States navy and among seamen generally; and various other organizations whose fields of labor lie among the Chinese, the Indians, convicts in prison, etc. The first Christian Endeavor Society in England was organized in 1887, and was followed by similar ones in other countries, and the constitution has been printed in over 30 different languages. The movement is not a denominational one. Any society belonging to an evangelical Church, which adopts the leading principles as set forth in the constitution, including the prayer-meeting pledge, and which guarantees these principles by the name Christian Endeavor either alone or in connection with a denominational name is admitted to all the privileges of the organization. In the United States the Presbyterian Church has the largest number of societies; in England the Baptists lead; while in some parts of Canada and Australia, the Methodists are in advance of all others. In some of the American States, the Disciples of Christ, and in others the Congregationalists, claim the largest number.

The distinctive features in the Christian Endeavor movement are its work among the young people, leading them to consecrate their lives to the active service of God; the weekly prayer-meetings, which each member takes a solemn pledge to attend regularly (unless unavoidably detained), and to take part in; and the reconsecration meetings held once a month, at which special efforts are made to see if each one has been faithful to his pledges. The amount of good accomplished in training the young people in the practical work of Christianity and fitting them to take up the work of those dropping out of active service can never be fully estimated. The World's Union of Christian Endeavor held its first triennial convention at Washington, D. C., in July 1896, which was attended by representatives from all over the world. Rev. Dr. Clark was elected president, and Rev. W. J. L. Closs of Australia was made the first secretary of the new organization. The United Society of Christian Endeavor is a bureau of information, which simply seeks to spread the idea of the movement throughout the world. Its headquarters are in Boston, and John Willis Baer is the secretary.

FRANCIS E. CLARK.

Christian Era, the era or epoch introduced by the birth of Christ. It was calculated back about the year 532, by a monk, Dionysius Exiguus (the latter word, meaning little, being assumed either because his stature was diminutive or because he modestly believed his mental powers small, which they were not). Dionysius was a resident of Syria. It is thought that he fixed the advent too late by four years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in 4 B.C. J. W. Bosanquet considers that it was in 3 B.C. The Christian Era is sometimes called the Dionysian era. The Rev. Charles Force Deems, D.D., an eminent American clergyman, in his 'Jesus,' places the birth "about the beginning of August, 6 B.C., 747 A.U.C.

Christian Knowledge, Society for the Promoting of, the oldest and greatest of the great religious associations connected with the Church of England. It is popularly referred to as the

«S. P. C. K.» It was founded in 1698, although it did not receive its present name till 1701; and had for its objects:

'1. To promote and encourage the erection of charity schools in all parts of England and Wales; 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honour of God, and the good of mankind, by promoting Christian knowledge both at home and in other parts of the world by the best methods that should offer.' These objects it has never ceased to pursue, chiefly directing its efforts to Great Britain and the colonies; partaking at once of the nature of an educational association, a missionary society, a Bible society, a religious tract society, and an emigrants' spiritual aid society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to above $250,000 a year. The publishing and bookselling business shows in some years total sales of $450,000; the works published being in very various departments of literature, and including several admirable series on Early Britain, Diocesan Histories, Ancient History from the Monuments, Early Chroniclers, &c.

The Protestant missionaries who labored in the south of India in the 18th century were supported chiefly by this society, and it is now chiefly engaged in supplying to the mission-field throughout the world needful religious literature in the vernacular. Besides translations of the Bible and Prayer-book, it provides for pioneer missionaries, grammars, dictionaries, reading-books, and general literature, to instruct them in the languages which they will have to use. In Scotland a similar society was organized in 1709, and in 1902 had an annual expenditure of $25,000.

Christian Science. For a definition of Christian Science it is sufficient to quote one that has frequently been used and which will be acceptable to Christian Scientists generally: «The foundational truths of Christian Science are the reality and allness of God, the unreality and nothingness of matter, the spirituality of man and the universe, the omnipotence of good, the impotence of evil. The demonstrative actuality of Christian Science essentially distinguishes it from all other religions of the age.» As presented in 'Science and Health with Key to the Scriptures,' by Mary Baker G. Eddy: «The physical healing of Christian Science results now, as in Jesus' time, from the operation of divine Principle, before which sin and disease lose their reality in human consciousness, and so disappear as naturally and as necessarily as darkness gives place to light, and sin to reformation. Now, as then, his mighty works are not supernatural, but supremely natural. They are the sign of Immanuel, or 'God with us'—a divine influence ever present in human consciousness, and repeating itself, coming now again, as was promised aforetime,

> To preach deliverance to the captives (of sense),
> And recovering of sight to the blind,
> To set at liberty them that are bruised."
> (*Preface*, p. xi.)

Its purpose is not to supplant primitive Christianity, but to render our understanding of it more practical. It is the claim of Christian Scientists that Jesus proved what man may do through absolute reliance upon God, and Mrs. Eddy teaches how it may be done.

The principal mission of Christian Science is to give an enlarged spiritual explanation of the infinite personality of God as Spirit, to define the very nature and essence of God, and thereby increase mortals' faith and trust in Him. Christian Scientists believe that God should be recognized in all the affairs of men.

The history of Christian Science dates back to 1866, the year of Mrs. Eddy's discovery, and the growth of the movement during subsequent years has been so rapid that the denomination now commands a position of wide influence and power. Mrs. Eddy, the recognized discoverer and founder of Christian Science, began to win followers in 1867. In 1875 she published 'Science and Health with Key to the Scriptures,' the text-book of Christian Science, which has passed through more than 290 editions of 1,000 copies each. In 1879 she founded the first Christian Science Church, and in 1881 she opened a college for the teaching of Christian Science, called the Massachusetts Metaphysical College, where she personally taught about 5,000 students, who passed through this college. In 1883 she established the first denominational periodical and became its editor.

In Mrs. Eddy's personal history there is nothing mysterious or concealed. She has never made any miraculous claims. Her life has been simple, her girlhood, save for its eager religious questioning, not unusual. She was born in a little village in New Hampshire, sheltered by the hills that rose to the soft blue skies, and sentineled by oak and pine and hemlock. Here the Baker homestead stood, and here Mary Baker's girlhood days were spent. To this charming New Hampshire village, now greatly changed, come small parties of Christian Scientists during the summer months, eager to tread the paths familiar to the beloved founder of their faith. These visits are a remarkable evidence of the love which Mrs. Eddy has inspired, and bespeak the power of her influence over so many hearts.

She comes of that mixed English and Scotch Puritan ancestry which formed so much of the best of New England's stock. Some of her forefathers were men of mark in war and statesmanship. Gen. Knox, of Revolutionary fame, was a relative of her father, and among others of her ancestors were Sir John Macneil, who fought at Lundy's Lane. Mary Baker's father was a man of sturdy piety and strict probity. Of Mrs. Eddy's mother the little that has been recorded leaves the impression of one of those New England mothers whose strict notions of propriety were tempered by an innate sweetness of temperament. From her brother, Hon. Albert Baker, who was nominated for a congressman by the largest vote ever polled in New Hampshire (dying, however, before his election), Mrs. Eddy derived her knowledge of Greek, Hebrew, and Latin. Charity and benevolence ruled the household. Mrs. Eddy speaks of her childhood's home as «one with the open hand, where the needy were ever welcome.» From such a family and such a home, full of the beautiful simplicity of the rural life of early New England, came the only woman in history who has ever founded a great religious denomination.

Doctrinal questions early engaged her eager

and active mind. In her book, 'Retrospection and Introspection,' she has described how she cast from her the doctrine of predestination, in which belief she had been carefully nurtured by her Calvinistic parents. Her soul revolted from what she regarded as the inhumanity of extreme Calvinism, and before the meeting, where she applied for church membership, she bravely disavowed a belief in those tenets. Thereafter she was active in church work, engaging in much speaking and writing. Three years she spent in Scripture study in the preparation of her work, 'Science and Health.'

Of this period she writes: "For three years after my discovery I sought the solution of this problem of mind-healing; searched the Scriptures, read little else; kept aloof from society, and devoted time and energies to discovering a positive rule. The search was sweet, calm, and buoyant with hope, not selfish nor depressing. I knew the principle of all harmonious mind-action to be God, and that cures were produced, in primitive Christian healing, by holy, uplifting faith; but I must know its science, and I won my way to absolute conclusions, through divine revelation, reason, and demonstration. The revelation of truth in the understanding came to me gradually, and apparently through divine power." ('Science and Health,' p. 109.)

The love in which Mrs. Eddy is held by Christian Scientists — and there is no mistaking the reality or genuineness of the affection — is called forth by what she has wrought, and goes out to her as the bearer of a great spiritual message. This is expressed in the speech and writings of Christian Scientists and is a constant tribute to the wisdom and success of her leadership. It is true that they regard her as the greatest woman of her time; considered in her relation to religious truth, the greatest of all time. But this is very different from fulsome adulation, or from the vulgar attribution of miraculous powers.

The total number of Christian Science churches and societies, here and abroad, in June 1903, was 769, showing the remarkable increase of 228 in three years. Greater New York has nine Christian Science churches; Chicago, six; Minneapolis, four; Milwaukee, three. The doctrines of Christian Science have secured a firm foothold in Great Britain and Germany, and the present indications are that the growth of the denomination in those conservative countries will be as rapid as in the United States and Canada. The directory of practitioners published in a recent issue of the official organ of the denomination includes the names of persons in 49 States and Territories of the United States, including Hawaii, the Philippine Islands, and Porto Rico; England, Ireland, Scotland, Wales, Canada, France, Germany, Italy, Switzerland, Australia, Mexico, China, and the Bahamas. Besides the churches there are many free reading-rooms — more than 450 in the United States alone. These reading-rooms are a feature of the denomination, and are to be found in many of the cities abroad where Christian Science has found lodgment.

The First Church of Christ, Scientist, in Boston, Mass., was finished in 1894 at an expense of over $250,000 and was dedicated free of debt, in fact it was necessary to issue notice that no more contributions would be received. It is known as the "Mother Church," all the other churches being branches of this one. This was the first church devoted to the uses of the denomination, and all the others have, therefore, been built within nine years, a very remarkable growth.

In recent years the growth of the congregation in attendance at the Mother Church has been so great that branch churches have been established in Roxbury, Cambridge, and Chelsea, but the relief thus gained has not been sufficient, and work has recently been commenced upon a larger building which will have a seating capacity of 5,000 and will cost over $1,000,000.

The denomination, numerically, is very evenly distributed. The "Directory of Christian Science Practitioners" in 'The Christian Science Journal' shows that there is hardly a city in the Union but contains within it one or more adherents of the faith who devote their entire time to healing the sick. Then, too, the Board of Lectureship, comprising well-known and representative men and women, is a growing and efficient means of spreading a knowledge of the new doctrines.

The Mother Church in Boston included in June 1903, according to official figures, 27,796 members, 3,696 of whom had been added since the preceding June. Membership in this church is not confined to Christian Scientists residing in Boston.

The growth of the denomination has not been due to any effort on the part of Christian Scientists to proselyte from or misrepresent other denominations, but rather to the fact that the practical application of the teachings of Christian Science has proved beyond contention to thinking people who have investigated the subject that salvation is possible and within the reach of all who faithfully and earnestly strive for it. It is not the purpose of Christian Scientists to interfere with those who are satisfied with their religious beliefs, nor do they seek to force their views upon those who do not agree with them.

The nine years succeeding the building of the Mother Church have constituted a period of great activity and growth, especially in the way of church-building, and in many of the smaller cities and towns, as well as in the larger cities of the country, large and in some instances quite expensive edifices have been erected. It is an unwritten law of the denomination that a church building shall not be dedicated until it is paid for. Some congregations have built chapels to which they propose to add churches as the need arises; others have purchased old churches or family mansions, which they have remodeled and refurnished to meet their requirements, while a number have bought sites on which building operations will shortly be begun. In all this activity there is evidence of the great outlay of time, services, and money, which are given not only cheerfully, but eagerly; and all this has gone on at a steadily increasing pace, to which one can as yet see no probability of interruption. Early in 1904 there was in course of construction in Concord, N. H., a fine church edifice which represents a gift of $120,000 by Mrs. Eddy to the Christian Scientists of her home city.

Organized Christian Science is perhaps less than seven years old in England. From 1894 to 1897 its meetings in London were confined to drawing-rooms, but in the latter year a regular meeting-place was engaged. But it was not until

1899 that First Church of Christ, Scientist, in London, was formed, followed later by Second Church of Christ, Scientist.

In Germany there has been some progress. Berlin has a church organized some time ago with the permission of the authorities, as is usual in such cases. In that city is a Christian Science reading-room maintained by the church organization. The question of the new faith came up in the Reichstag, and the imperial secretary of state then said: "I warn earnestly against using the power of the state against such things."

Wherever established, the Church numbers among its adherents men and women of distinguished intellectual ability. There as here, they are largely recruited from the professional ranks — judges, lawyers, doctors. Critics of the new denomination have frequently noted that the membership of the Church represents the "upper classes" — the classes which socially are near the apex, but while this is in some measure true, it is not to be understood that the Christian Science Church is "a rich man's church." On the contrary it is most democratic, and its members have been drawn from almost every rank and condition of society.

Practically all the adherents of Christian Science have been healed of severe and chronic sickness which in past years impoverished many of them or rendered the transaction of business and the earning of more than a meagre livelihood a physical impossibility. These people, now being restored, through the recovery of their health, to their legitimate place in the business and social world, give an air of prosperity to the congregations of which they are members.

A distinctive feature of the religious services of the denomination is the "Wednesday evening meeting" at which testimony is given by those who have been healed of physical disease or reformed from the practice of sinful habits, through the operation and practice of Christian Science. It is proverbial that every religious reformer has had to overcome prejudice and opposition, and in this regard the founder and leader of Christian Science is not an exception.

It should be remembered that there are no personal pastors in the Christian Science churches. This rule is observed with a view to the emphasizing of truth rather than personality. The place occupied in other churches by pastors is filled by trained and educated leaders called readers.

In the early years of Mrs. Eddy's work she met much opposition from those to whom it seemed impossible that the healing work of Jesus and the apostles should be revived, but this opposition and the prejudice from which it sprang is becoming less and less each year until Christian Science has now taken its place as a practical and beneficent religion, and it is so regarded by a constantly increasing and ever loyal constituency.

Certainly few teachings have made greater progress in the world than the faith to which the name of Mrs. Eddy is linked. Christian Science is no mere exclusive tenet, held by a small knot of believers. It is a growing and important faith, ranking in the number of its adherents with the great established denominations of Protestantism. Entertain what views its critics may of the basic doctrine advanced under the name of Christian Science, certainly the charge of fanaticism cannot be in any way successfully maintained.

In a quiet, undemonstrative way its adherents have gone about their task; there has been no proselyting, in the usual sense of that term; there have been no sensational sermons, such as attract vast metropolitan audiences. With none of these adventitious aids to the spread of its doctrines, Christian Science has made extraordinary progress. It has moved like an army and, ere the world was aware of it, the great host had taken its place among the foremost of the established religious orders of the universe. Consult the works of Mrs. Eddy and the 'Christian Science Journal' (Boston).

ARCHIBALD MCLELLAN,
Editor Christian Science Journal.

Christian Union Churches, an American denominational union, organized in 1865, composed of members of all varieties of orthodox belief. Their creed is simple, covering the headship of Christ, sufficiency of the Bible, and right of local Church government. They have a membership of about 30,000 and fully 150,000 adherents, and are located chiefly in the older western States. In 1899 they had approximately 183 ministers, and 294 churches. They are in affiliation with the Christians.

Christian University, a co-educational institution in Canton, Mo.; organized in 1853, under the auspices of the Disciples of Christ; reported at the end of 1899: Professors and instructors, 22; students, 150; volumes in the library, 1,000; grounds and buildings valued at $40,000; productive funds, $18,000; benefactions, $1,200; income, $5,000; number of graduates, 227; president, Clinton Lockhart, A.M., Ph.D.

Christian Woman, A, a novel by Emilia Pardo-Bazán. In this interesting tale the author presents a very realistic picture of modern Spanish life, into which are introduced many current social and political questions.

Christian Year, The, by John Keble, an English divine. The book is a small volume of religious poems, which first appeared in 1827. It contains a thought or thoughts, expressed in poetic form, for each day of the year. The poems have all the polish and simplicity which come from classical study and artistic workmanship. The book, at once, became popular, and has held favor ever since. Cardinal Newman said of this work: "It was the most soothing, tranquilizing, subduing work of the day. If poems can be found to enliven in dejection and to comfort in anxiety, to cool the oversanguine, to refresh the weary, and to awe the worldly, to instill resignation into the impatient and calmness into the fearful and agitated, they are these." See KEBLE, JOHN.

Christiana Case. On 11 Sept. 1851, Edward Gorsuch of Maryland, his son, a party of friends, and a United States deputy marshal, having secured a warrant from a Philadelphia commissioner for the arrest of a fugitive slave (alleged to have been Gorsuch's own son), came to Christiana, Lancaster County, Pa., approached the house where the fugitive had taken refuge, and demanded possession of him, firing two shots at the house. The neighborhood was aroused, and several armed colored men appeared on the scene, as also did Castner

Hanway and Elijah Lewis, Quakers, who tried to persuade both parties to disperse. The deputy marshal ordered them to join his posse; they urged him to withdraw for his own sake; Gorsuch and two of his party fired on the colored men, who returned the fire, killed Gorsuch and his son, and forced the rest to fly. The fugitive slave escaped. The two Quakers were indicted for treason; the grand jury found bills against them; and they were tried 24 November before Justice Grier of the supreme court. Among the counsel for their defense were Thaddeus Stevens and T. L. Cuyler; the chief argument was by J. M. Read. The absurdity of the accusation was so great that the Democratic judge charged emphatically for the prisoners, and the jury acquitted them without leaving the box.

Christiancy, Isaac Peckham, American editor and diplomatist: b. Johnstown (now Bleeker), N. Y., 12 March 1812; d. Lansing, Mich., 8 Sept. 1890. He was one of the founders of the Republican party and espoused its cause as editor of the 'Monroe Commercial.' In 1875 he was chosen United States senator from Michigan, and in 1879 became minister to Peru.

Christiania, krēs-tē-ā'nē-ạ, Norway, capital, city and port, province Aggershuus or Christiania, at the head of the long narrow inlet called Christiania Fjord, about 60 miles from the open sea or Skager Rack. High hills rise around it on all sides, excepting toward the bay, but at considerable distances, particularly on the north. The most interesting building in the town is the fine old castle of Akershus (built about 1300), with its church and planted ramparts, crowning a point jutting out into the fjord, and commanding a fine view, but of no military value. On a gentle elevation, and in the midst of a beautiful park stands the royal palace — a massive square building, without any architectural ornament, but commanding delightful views of the fjord and its beautifully winding shores. The hall in which the Storthing holds its sittings is a very plain building. The other public edifices are the military academy, cathedral, university, etc. Attached to the university is a museum, containing a fine collection of antiquities. The climate of Christiania is delightful. It is screened from violent winds; and even in winter, though the cold is severe, the weather is seldom variable, but bright and settled, and free from damp and fog. In summer it is warm but not sultry, with a light and buoyant atmosphere. The few manufactures of the city consist of woolen cloth, iron-ware, tobacco, paper, leather, soap, spirits, glass, etc. There are also some extensive breweries. The exports are principally timber, deal planks, and iron. The environs of the city are exceedingly beautiful, the approach to it by the magnificent fjord, at the head of which it is situated, exciting the admiration of all visitors. The fjord is frozen for upward of two months in the year, for about 20 miles from Christiania to the sea; and the harbor is generally locked up for three or four months. Pop. 203,337.

Christianity, the religion instituted by Jesus Christ. Christianity, as it now exists in our minds, has received, from the influence of national character, of the spirit of the time, and the thousand ways in which it has been brought into contact with politics and science, a variety of impure additions, which we should first separate in order to understand what it is in reality. There could be no better means of attaining a correct understanding of it than to investigate, historically, the religious principles which Jesus himself professed, exhibited in his life, and labored to introduce into the world, if the investigator could avoid giving the coloring of his own views to his explanation of the records of the origin of Christianity. But the most honest inquirers have not entirely succeeded in so doing. Even the Christian theologians of the present age, though divided less by the spirit of creeds and parties than of scientific methods and philosophical speculations, dispute respecting the principle that constitutes the basis of the religion of Christ. This principle appears, by its effect upon the numerous nations, differing so greatly in intellectual character and cultivation, which received Christianity at first, to have been a universal truth adapted to the whole human race, and of a divine all-uniting power. The Jews believed in a living God, the Creator of all things, and, so far, had just views of the source of religion. The Greeks, besides developing the principle of the beautiful in their works of art, had laid the foundations of valuable sciences applicable to the business of life. The Romans had established the principles of law and political administration, and proved their value by experience. These scattered elements of moral and intellectual cultivation, insufficient in their disunited state to bring about the true happiness and moral perfection of man in his social and individual capacity, were refined, perfected, and combined by Christianity, through the law of a pure benevolence, the highest aim of which is that of rendering men good and happy, like God, and which finds in the idea of a kingdom of heaven upon earth, announced and realized by Christ, all the means of executing its design. His religion supplied what was wanting to these nations — a religious character to the science of Greece, moral elevation to the legislative spirit of Rome, liberty and light to the devotion of the Jews — and, by inculcating the precept of universal love of mankind, raised the narrow spirit of patriotism to the extended feeling of general philanthropy. Thus the endeavors of ancient times after moral perfection were directed and concentrated by Christianity, which supplied at the same time a motive for diffusing more widely that light and those advantages which mystery and the spirit of castes had formerly withheld from the multitude. It conveyed the highest ideas, the most important truths and principles, the purest laws of moral life to all ranks; it proved the possibility of perfect virtue through the example of its Founder; it laid the foundation for the peace of the world through the doctrine of the reconciliation of men with God and with each other; and, directing their minds and hearts toward Jesus, the Author and Finisher of their faith, the crucified, arisen, and glorified Mediator between heaven and earth, it taught them to discern the benevolent connection of the future life with the present. The history of Jesus, and the preparations of God for his mission, afforded the materials from which Christians formed their conceptions of the character and tendency of their religion.

The first community of the followers of Jesus was formed at Jerusalem soon after the death of their Master. Another at Antioch in Syria first assumed (about 65) the name of Christians, which had originally been given to them by their adversaries as a term of reproach; and the travels of the apostles spread Christianity through the provinces of the Roman empire. Palestine, Syria, Asia Minor, Greece, the islands of the Mediterranean, Italy, and the northern coast of Africa, as early as the 1st century, contained societies of Christians. Their ecclesiastical discipline was simple and conformable to their humble condition, and they continued to acquire strength amidst all kinds of oppression. At the end of the 2d century Christians were to be found in all the provinces, and at the end of the 3d century almost a half of the inhabitants of the Roman empire and of several neighboring countries, professed this belief.

From the first council of the Church held in Jerusalem, before the apostles dispersed to teach all nations, the followers of Christ strove to keep united, to preserve the faith and discipline left them by their Founder. When any person or persons of influence advanced a teaching which seemed to Christians to be not in accord with the faith as given to them by Christ, it was customary to call together the bishops, as at Jerusalem, and discuss the disputed questions, in order to learn by traditional and historical evidence the truth. Such meetings or assemblies when called by the Bishop of Rome were known as General Councils, but if by any other bishop they were called provincial councils. Certain scholarly men who were zealous in the cause of Christianity gathered together the authoritative teachings and generally accepted traditions of the times, and thus left on record the history of the first years of Christianity from theological and dogmatic points of view. These men are styled fathers or doctors of the Church. The teachings of the councils and the fathers were potent factors in fostering unity among Christians. Those who did not accept the teachings of the councils were called heretics.

Christianity was introduced among the Goths in the 4th century, and spread among the other Teutonic nations in the west and north of Europe, and subjected to its power during the 7th and 8th centuries the rude warriors who founded new kingdoms on the ruins of the Western empire. Meanwhile, however, it was losing ground in Asia and Africa before the encroachments of the Saracens, by whose rigorous measures hundreds of thousands of Christians were forced into Mohammedanism, the heretical sects which had been disowned by the orthodox Church being almost the only Christians who maintained themselves in the East.

During the progress of Mohammedanism, which, in Europe, originally extended only to Spain and Sicily, the Roman popes, who were advancing systematically to full ecclesiastical superiority in the west of Europe, gained more in the north, and soon after, in the east of this quarter of the world, by the conversion of the Slavonic and Scandinavian nations (from the 10th to the 12th century), than they had lost in other regions. For the Mohammedans had chiefly overrun the territory of the Eastern Church, which had been since the 5th century no longer one with the Western (Latin) Church, and had by degrees become entirely separate from it. In the 10th century it received some new adherents by the conversion of the Russians, who are now its most powerful support. But the Crusaders, who were led partly by religious enthusiasm, partly by the desire of conquest and adventures, to attempt the recovery of the holy sepulchre, gained the new kingdom of Jerusalem, not for the Greek emperor, but for themselves and the papal hierarchy. The confusion which this finally unsuccessful attempt against the infidels introduced into the civil and domestic affairs of the western nations gave the Church a favorable opportunity of increasing its possessions and asserting its claims to universal monarchy. But, contrary to the wishes and expectations of the rulers of the Church; the remains of ancient heresies were introduced into the West through the increased intercourse of nations and by the returning Crusaders, and new ideas of another sort were also propagated, springing from the philosophical spirit of examination of some of the schoolmen.

Wickliff in England and Huss in Bohemia began attacks on the popes and bishops because of abuses which had crept into the Church. Their action led to a revolt against ecclesiastical authority which resulted in many leaving the Roman Catholic Church. In regard to the movement that took place in the next century, and in which Luther was the great actor, we refer the reader to the article REFORMATION, and the articles relating to it. The Reformation is naturally regarded with widely different sentiments by Protestants and Roman Catholics. But that this great change in the Church has restored Christianity to its original simplicity and purity the most zealous Protestant will not assert, any more than the reflecting Catholic will deny the necessity that then existed for some reform — a necessity which indeed resulted in the holding of the Council of Trent. On this subject a Roman Catholic writer remarks that "The true and Catholic Reformation, long desired, but delayed by many difficulties, was taken up and successfully accomplished by the Council of Trent (1545–63)."

No one can claim, rightfully, the name of Christian unless he is a believer in the divinity of Jesus Christ, but Christianity or the teachings of Jesus Christ are believed and practised by many who do not believe that Jesus Christ is God.

Christian'ity and Is'lam: the Bible and the Koran, the title of a work by the late Dean of Winchester, William Richard Wood Stephens, published in 1877. This book presents the estimate of Mahommet's mission and its results, which seems fair to a conservative English Churchman. It is his desire to do justice to the teachings of the Koran, and to make a full admission of the inherent defects and vices of the races over whom the influence of this code of faith and conduct has certainly been salutary, and even spiritualizing. That is, he attributes to blood the evil tendencies and characteristics too often attributed to religion.

Christian'ity in China, Tartary and Tibet, a work by the Abbé Huc, published in 1857–8. It is a curiously interesting and elaborate history of the presence in the Chinese empire of Christian missions from the time of the Apostles to the end of the 17th century. The author

was a Roman Catholic missionary in China, 1840–52. By shaving his head, dyeing his skin yellow, and wearing a queue and Chinese costume, and by a thorough command of the Chinese language, he was able to travel not only in China Proper but in Tibet and Tartary. He published in 1850 an exceedingly interesting account of his travels during 1844-6, and in 1854 a work on the Chinese empire. His first work related marvels of travel which aroused incredulity; but later researches have amply shown that this was unjust. The final work, connecting the history of the Chinese empire with the maintenance through centuries of Christian missions, is a work of great value for the history of the far East.

Christians, Christian Connection, etc., the name of a denomination in the United States and Canada, adopted to express their renunciation of all sectarianism. They have become well known in all parts of the country, the number of their churches being estimated at over 1,000, with more than 250,000 communicants. Each church is an independent body: they recognize no creed, no authority in matters of doctrine: the Scriptures, which every individual must interpret for himself, are their only rule of faith: admission to the Church is obtained by a simple profession of belief in Christianity: speculative belief they treat as of little importance, compared with virtue of character. In New England they separated principally from the Calvinistic Baptists: in the southern States from the Methodists; and in the western from the Presbyterians. There was therefore at first a great diversity of opinion and practice among them, each church retaining some of the peculiarities of the sects from which it seceded. To maintain a connection between the different churches, one or more conferences are formed in each State, consisting of members delegated from each church. There are now more than 70 of these conferences, which again form, by delegation, the United States General Christian Conference. They have several periodical works, and several institutions of learning, Antioch College being the most celebrated. They consider Christ as the Son of God, miraculously conceived, whose death was a ratification of the new covenant, not a propitiatory sacrifice; and the Holy Ghost or Spirit as the power or energy of God, exerted in converting the wicked and strengthening the good. They hold to the inspiration and divine authority of the Bible, which they allow everyone to interpret for himself.

Christians of St. John, a sect of religionists found in Asiatic Turkey, chiefly in the neighborhood of Bassorah. They profess to follow the teaching of John the Baptist, and are wrongly called Christians since they reject Christ, and are practically heathens, whose deities are darkness and light. They are called also Mendeans, Mendaites or Mandaites, and Sabians.

Christians of St. Thomas, the name of a sect of Christians on the coast of Malabar, in southern India, to which region the apostle St. Thomas is said (by a tradition that has little to justify it) to have carried the gospel. The facts of their history are not well made out. They originally belonged probably to a body of Christians who, in the year 499, united to form a Syrian and Chaldaic Church in eastern Asia, and who were adherents of the doctrines taught by the heretic Nestorius. At an early date (7th century) the Persian Church had adopted the name of Christians of St. Thomas, and the Christians of Malabar received bishops from Persia. Latterly the Christians of St. Thomas gained the position of a military caste which locally had considerable power. When the Portuguese gained a position in Malabar these Christians were forced to join the Roman Catholic Church (1599). But in 1653 many of them renounced this union, and having in 1665 received a bishop sent by the patriarch of Antioch, they have since belonged to the Jacobite body of eastern Christians. The Church is now under seven bishops with a patriarch at the head; and the adherents number about 300,000. They give communion in both kinds, and in some other matters differ from the Roman Catholic Church. They allow the consecration of a married layman or deacon to the office of priest. Their churches contain no symbols nor pictures except the cross. Their liturgy is similar to the Syrian, and the Syrian language is used in it. At present they are, under the British government, free from any ecclesiastical restraint, and form among themselves a kind of spiritual republic, in which the priests and elders administer justice, using excommunication as a means of punishment. See 'The Indian Empire,' by Sir W. W. Hunter.

Christiansand, krĭs'tē-ān-sānd, Norway, a city in the southern part of the country, situated on a sandy plain. It was built by Christian IV. in 1641; and has been the capital of its province or stift since 1684. It has several dockyards, a good harbor, much used for refuge, and a considerable trade in timber, pitch, stockfish (salted cod), fish-oil for curriers, salmon, mackerel, and lobsters, the latter chiefly for the London market. Shipbuilding is a considerable industry. Christiansand has a cathedral and grammar-school, and is the residence of a bishop. The streets are wide, straight, and regular; the houses are built of wood and detached, presenting altogether a remarkably colonial appearance. The inhabitants are noted for their tall stature. Pop. 13,000.

Christianstedt, krĭs'tĭ-an-stĕt, Danish West Indies, a seaport in the island of Santa Cruz, situated on the north shore. The harbor is difficult of access, being encumbered with many shoals, one of which stretches out nearly two miles to seaward in a northeasterly direction. This city is the capital of the Danish West Indies. Pop. 9,600.

Christie, krĭs'tĭ, **Francis Albert,** American theological writer: b. Lowell, Mass., 3 Dec. 1858. He was educated at Amherst College and studied theology at the universities of Berlin, Heidelberg, and Marburg 1889-93. Since September 1893 he has been professor of Church history at Meadville (Pa.) Theological School. He has written on theological and historical themes for various periodicals.

Christie, James, English clergyman: b. Otterburn, Northumberland, 14 July 1837. He was the son of a Presbyterian pastor at Otterburn, whom he succeeded in the pastorate in 1862, and since 1870 has been pastor of the Fisher Street Presbyterian Church at Carlisle. He has held several important professional posts,

being moderator of the Presbyterian Church of England in 1901, and has published 'Men and Things Russian'; 'Northumberland'; 'The Moderator's Wander-Jahr.'

Christie, James Elder, Scottish artist: b. Guardbridge, Fifeshire, 5 Jan. 1847. He received an art training at South Kensington, and the Royal Academy. He was awarded a gold medal at South Kensington in 1875, and another from the Academy in 1877 for historical painting. Among important works by him are 'Tam O'Shanter' (1879); 'Pied Piper of Hamelin' (1881); 'A Lion in the Path' (1888); 'The Four Maries' (1889); 'The Red Fisherman' (1893); 'Gather Ye Rosebuds.'

Christie, Richard Copley, English scholar: b. Lenton 22 July 1830; d. Ribsden 9 Jan. 1901. He was educated at Oxford, studied law and practised his profession 1857–77. He was professor of political economy at Owens College, Manchester, 1854–66, and was chancellor of the diocese of Manchester 1872-94. After retiring from his profession he gave much time to bibliographical research, and besides contributing to the 'Dictionary of National Biography' he published 'Étienne Dolet, the Martyr of the Renaissance' (1880); 'Old Church and School Libraries of Lancashire' (1885); 'Letters of Sir Thomas Copley.' He gave to Owens College the Christie Library, opened in 1898, and at his death bequeathed his library of 75,000 volumes to the same institution. See 'The Athenæum,' 19 Jan. 1901.

Christie, William Henry Mahoney, English astronomer: b. Woolwich 1 Oct. 1845. He was a graduate of Trinity College, Cambridge, and for a long time assistant in the Royal Observatory of Greenwich. On the retirement of Airy (q.v.) as astronomer royal in 1881, Christie was appointed his successor, a position which he still holds. He has written a 'Manual of Elementary Astronomy' (1875), but is best known for his spectroscopic work with the Greenwich Equatorial, especially that relating to the motion of stars in the line of sight.

Christie Johnstone, a story by Charles Reade, published in 1855. The story, by turns pathetic and humorous, abounds in vivid and dramatic scenes of Scotch life by the sea.

Christina, krĭs-tē'na, queen of Sweden: b. Stockholm 9 Dec. 1626; d. Rome 19 April 1689. She was a daughter of Gustavus Adolphus, and her education was conducted in a masculine manner. After the death of Gustavus in 1632 the States-General appointed guardians to the Queen Christina, then but six years old. These were the five highest officers of the crown, who were intrusted at the same time with the administration of the kingdom. The education of Christina was continued according to the plan of Gustavus Adolphus. She learned the ancient languages, history, geography, politics, and renounced the pleasures of her age in order to devote herself entirely to study. In 1644 she took upon herself the government. A great talent for business, and great firmness of purpose, distinguished her first steps. She terminated the war with Denmark, and obtained several provinces by the treaty concluded at Brömsebro in 1645. She then, contrary to the advice of Oxenstiern, who hoped to gain, by the continuance of the war, still greater advantages for Sweden, labored to re-establish peace in Germany, in order to be able to devote herself uninterruptedly to the sciences and the arts of peace. France, Spain, Holland, and England sought her friendship. She promoted commerce by wise legislation, and patronized the learned and literary institutions. She declined to marry her cousin, Charles Gustavus, but induced the States-General in 1649 to designate him for her successor. In 1650 she caused herself to be crowned with great pomp, and with the title of king. From that time she neglected her ancient ministers, and listened to the advice of ambitious favorites. The public treasure was squandered with extravagant profusion. Distinctions were conferred upon the undeserving, and jealousy produced murmurs, complaints, and factions. In this state of confusion the queen declared her intention of abdicating the crown. The old ministers remonstrated with so much energy that the queen desisted from her resolution. She now grasped with more firmness the reins of government, and occupied herself again with study, bought paintings, medals, manuscripts, books, maintained a correspondence with many learned men, and invited several to her court. Descartes, Grotius, Salmasius, Bochart, Huet, Chevreau, Naudé, Vossius, Conring, Meibom, appeared in Stockholm, and the queen conversed familiarly with them on literary and philosophical subjects. But new troubles occurred; and Christina, who loved whatever was uncommon, resumed her determination to resign the crown.

In 1654 she assembled the States-General at Upsal, and in their presence laid aside the insignia of royalty to surrender them into the hands of Prince Charles Gustavus. She reserved to herself a certain income, entire independence, and full power over her suite and household. A few days after she left Sweden, and went to Brussels, where she made a secret profession of the Roman Catholic religion, which she afterward publicly confirmed in Innsbruck. From here she went to Rome, which she entered on horseback in the costume of an Amazon, with great pomp. When the Pope Alexander VII. confirmed her she adopted the surname of ALESSANDRA. In 1656 she visited France, where her dress and manners produced an unfavorable impression, but her talents and knowledge were generally admired. She offered to mediate between France and Spain; but Mazarin declined the offer, and succeeded in accelerating her departure from France under various pretexts. After the death of Charles Gustavus in 1660, the queen made a visit to Sweden, under pretence of wishing to arrange her private affairs; but it was soon perceived that she had other views. As the crown-prince was very young, she declared that in case of his death she should lay claim to the throne. This project was unfavorably received and she was compelled to sign a formal act of abdication. About this time she aspired to the Polish crown, but the Poles took no notice of her wishes. Finally she returned to Rome, where she passed the remainder of her life in the cultivation of the arts and sciences, giving way at times to fits of sensual indulgence. She was interred in the Church of St. Peter, and the Pope erected a monument to her with a long inscription. She had asked only for these few words: *Vixit Christina annos LXIII.*

Christina, Maria, queen of Spain, daughter of Francis I., king of the Two Sicilies, and mother of Isabella II., the dethroned queen of Spain: b. Naples 27 April 1806; d. Havre 22 Aug. 1878. She was married to Ferdinand VII. in 1829, and took an active part in the affairs of Spain from 1830 to 1854. As queen-regent she governed arbitrarily, and in 1854 she abdicated.

Chris'tison, Sir **Robert,** Scottish physician and toxicologist: b. Edinburgh 18 July 1797; d. 23 Jan. 1882. He was graduated in medicine at Edinburgh University in 1819, and subsequently studied in London and Paris. He was appointed to the chair of medical jurisprudence in Edinburgh in 1822, shortly after his return to Scotland, and in 1832 was promoted to those of materia medica and clinical medicine, but resigned them in 1877 and 1855 respectively. He was twice president of the Royal College of Physicians, president of the Royal Society of Scotland, and ordinary physician to the queen in Scotland. He was created a baronet in 1871. The most important of his published works is his 'Treatise on Poisons' (1829); but he also wrote 'Granular Degeneration of the Kidneys' (1839); and a commentary on the 'Pharmacopœias of Great Britain' (1842).

Christmas, the feast of Christ's birth, observed by the Christian Church annually on the 25th of December. It was, according to many authorities, not celebrated in the first centuries of the Christian Church, as the Christian usage in general was to celebrate the death of remarkable persons rather than their birth. The death of the martyr Stephen, and the massacre of the innocents at Bethlehem, had been already long celebrated, when, perhaps in opposition to the doctrine of the Manichæans respecting the birth of the Saviour, a feast was established in memory of this event in the 4th century. In the 5th century the Western Church ordered it to be celebrated forever on the day of the old Roman feast of the birth of Sol, though no certain knowledge of the day of Christ's birth existed. Among the German and Celtic tribes the winter solstice was considered an important point of the year, and they held their chief festival of Yule to commemorate the return of the burning-wheel. The holly, the mistletoe, the Yule log, and the wassail bowl relate more to paganism than to Christianity. In the East Christmas was celebrated on 6 January. As told in the Gospel of St. Luke, Christ was born during the night, and therefore divine service was performed in the night of 24-25 December, from which circumstance Christmas is called in German Weihnachten, a contraction of the old German ze wih nahten, on the holy or consecrated nights. The feasts of the martyr Stephen and the evangelist St. John were united with it, and a feast of three days' continuance was thus formed. In the ecclesiastical year this festival gives name to a period extending from the first Sunday of Advent to the feast of Epiphany, 6 January. In the Roman Catholic Church priests are allowed to celebrate three masses against the rule which prevails every other day in the year. In the Greek and Roman Catholic churches the manger, the holy family, etc., are sometimes represented at large. Most Christian churches celebrate this great festival in some way, and practically the entire community in Christian countries, including Jews and non-churchgoing people nominally classed with Christian populations, join in its social observance. In the United States, England, and other countries business is commonly suspended, although in Scotland this is only partially the case. The custom of making presents at Christmas is derived from an old heathen usage; but it has become consecrated by ages, and contributes greatly to make this festival an interesting event to families. The sending of Christmas cards by way of friendly greeting and remembrance has grown up within a period of some 50 years. The Christmas-tree has been traced back to the Romans. It went from Germany to Great Britain, and is almost universal in the United States, where the customs of so many nationalities meet and gradually blend into common usage.

Christmas-box, a box containing a present at Christmas; hence a Christmas gift. The custom of bestowing Christmas-boxes arose in the early days of the Church, when boxes were placed in the churches for the reception of offerings; these boxes were opened on Christmas Day, and their contents distributed by the priests on the morrow. In England the giving of Christmas-boxes led to the popular observance of what is called Boxing-day; that is, the first day after Christmas, when presents are made by the well-to-do to servants, messengers, and persons of humble condition.

Christmas Carol, a song in celebration of Christ's birth, sung especially at Christmas-time. Such carols, as well as many of a more secular but always joyous nature, have been long popular among the people of many nations. In France they are known as noëls, and various good collections of them have been published from time to time. Consult: Sandys, 'Christmas Carols, Ancient and Modern.'

Christmas Island, the name given to three oceanic islands, of which the most important is situated about 250 miles south by east of the western extremity of Java. This island, which is supposed to have been originally a coral atoll, and to have been raised by volcanic forces, rises to the height of nearly 1,600 feet, and is in shape an irregular quadrilateral of about 30 miles in circumference, having an area of about 20 square miles. It was annexed by Great Britain in 1888, and a settlement has been formed on it for the purpose of developing beds of phosphate.

Christiansund, krĭs'tē-ạn-sŭnd, Norway, a seaport on the northwestern coast, capital of the bailiwick of Romsdal, 82 miles southwest of Trondhjem, on three islands, or rather rocks, which enclose its beautiful land-locked harbor. The trade of the place is considerable, and the town itself is fast rising into importance. The principal export is dried cod, chiefly for the Spanish and Italian markets. From its singular position there are scarcely any regular streets in Christiansund, and the communication between one part of the town and another is kept up chiefly by water. The town was founded in 1734 by Christian VI. of Denmark. Pop. (1900) 12,050.

Christol'ogy, that branch of the study of divinity which deals directly with the doctrine

of the person and work of Christ. See CHRISTIANITY; JESUS.

Christophe, Henri, ŏn-rē krēs-tōf, king of Haiti: b. Grenada, West Indies, 1767; d. 8 Oct. 1820. He was an African slave who received his freedom as a reward of faithful service. On the outbreak of the negro insurrection in St. Domingo, 1801, he became one of its leaders, and attracted by his energy and ability the attention of Toussaint l'Ouverture, who conferred upon him a divisional military command. After the deposition of Toussaint, Christophe served under his successor, Dessalines, and waged a war of increasing ferocity against the French, who, in 1803, were compelled to evacuate the island. In 1811 Christophe obtained undisputed possession of a portion of the island, and had himself proclaimed as Henri I., king of Haiti. His reign was that of a sanguinary despot, occasioning ultimately a successful revolt of his black subjects, whereupon he committed suicide.

Chris'topher, Saint, a saint whose name and worship are celebrated, but whose history is little known. He is reported to have been a native of Syria or Cilicia, who was baptized by Saint Babylas, bishop of Antioch, and received the crown of martyrdom in Asia Minor about the middle of the 3d century. Relics of him are found in several places, principally in Spain. The Eastern Church celebrates his festival on 9 May; the Western on 25 July. His intercession was particularly sought in the time of the plague. Christopher literally means "bearer of Christ." He is represented as a giant, bearing the child Jesus upon his shoulders over a stream, which refers to a legend of this saint.

Christopher North, pseudonym of **John Wilson** (q.v.).

Christopher's, St. (commonly called St. Kitt's), West Indies, an island of the Lesser Antilles, 100 miles northwest of Guadeloupe, discovered by Columbus in 1493, 23 miles in length, averaging about five miles in breadth, and having an area of 65 square miles. It produces sugar, potatoes, tomatoes, yams, onions, and other vegetables, as well as pineapples, bananas, custard-apples, cocoanuts, and various other fruits. Mount Misery, the highest elevation, rises 4,100 feet. The flora and fauna are similar to those of the West Indies generally, among the latter being a species of small monkey. The climate is considered to be very healthy. This island is divided into nine parishes, Basseterre being the capital. It was colonized by the English in 1623. Pop. 31,000.

Christop'ulos Athana'sios, Greek lyric poet: b. Kastoria, Macedonia, 1772; d. Wallachia 29 Jan. 1847. He studied medicine, and the sciences at Budapest, and finally settled at Hermannstadt in Transylvania. An epicurean in every sense of the word, and unconcerned for the fate of his country, he lived only for the gratification of his appetites and celebrated sensual indulgences in his 'Erotika and Bacchika,' or 'Love and Drinking Songs,' which have been several times collected and printed under the title of 'Lyrika.' Though partly modeled upon Anacreon and the songs of Piron, Desaugiers, and other French authors, they display so much ease and simplicity, tenderness and grace, as to give their author a high place among the poets of his nation, and entitle him to the name of the modern Anacreon.

Christ's Hospital (generally called the Blue-coat School, from the costume of the pupils), a school in London, founded by Edward VI., for supporting poor orphans. There used to be from 1,000 to 1,200 boys and girls at this establishment receiving instruction, board and clothing, the girls being comparatively few in number. The ages varied from 8 or 10 to 15 or 16, five of the best scholars being sent each year to Oxford and Cambridge. An entirely new scheme of management came into operation in 1891, according to which the preparatory school (established in 1683 at Hertford) has 120 pupils, the boarding-school for boys 700, and the girls' school 350; a day-school for 600 boys, and another for 400 girls, being also provided for. New hospital buildings are being erected at Horsham. Entrance to the Hospital Schools is partly by nomination or presentation, partly by competition; and in regard to two thirds of the scholars, fees ranging from £10 to £20 may be charged if the parents or relatives are judged to be able to contribute to the child's education and maintenance. Numerous exhibitions and prizes still remain, including exhibitions to the universities. The great hall at Christ's Hospital is a splendid room of great size, and remarkable for some very fine pictures. Camden, Stillingfleet, Coleridge, Charles Lamb, and other distinguished men received their education at Christ's Hospital.

Christ's Thorn, a small thorny shrub of the order *Rhamnaceæ*, or buckthorn family. It is common in the southeast of Europe and Asia Minor, especially in Palestine. The fruit has a singular appearance, resembling a head with a broad-brimmed hat. The spines are long and sharp, growing on slender vine-like branches which are easily plaited, the flowers rose-shaped. The plant derives its name from its being believed by many to be the plant from which the crown of thorns was made which was placed on the head of our Saviour. The fruit is called jujube.

Christy, krĭs'tĭ, **Charles,** American minstrel: b. New York 1828; d. Kansas City, Mo., 13 Feb. 1897. He was an actor from boyhood, supporting Forrest and Macready as well as singing on the minstrel stage. He later became a theatrical manager.

Christy, Howard Chandler, American illustrator: b. Morgan County, Ohio, 10 Jan. 1873. He was educated in the public schools of Duncan's Falls, Ohio; went to New York in 1893 and since then has been continuously engaged in illustrating for the leading periodicals, 'Scribner's Magazine,' and 'Harper's Magazine' especially. Several collected portfolios of his drawings have lately been published.

Chro'mates. See CHROMIUM.

Chromat'ic, in music, a succession of semitones, ascending or descending. The chromatic semitone is the interval between any given note and that same note raised by a sharp or lowered by a flat. The chromatic scale consists of 13 tones, the 8 scale tones and the 5 intermediate. It is believed by some that the term chromatic was adopted because the Greeks were in the habit of designating the intermediate tones by characters of various colors.

Chromatin, krō'ma-tĭn, a substance in the nucleus of a cell which is readily stained by certain reagents, such as carmine, hæmatoxylin, and suffranin, so as to be distinguished from the other substance called achromatin or linin. This chromatin is made up of minute spherical or rod-like particles called "chromosomes." The latter bodies in the course of cell-division are of equal size in the same cell, and their number is the same in all the cells of all the tissues of the same species. The chromatin particles are of especial interest because they are supposed to be the bearers of heredity, and are thus supposed to form the physical basis of this unknown property of organic life. See HEREDITY.

Chromatophore, krō'ma-tō-fôr, a pigment cell. The possibility of change of color in the chameleon, frogs, the squid, etc., is due to certain cells in the cutis which are filled with pigment. These pigment-cells are called chromatophores, and under the stimulus of light may expand or contract. When expanded they are highly ramified, and when contracted are roundish. The pigment differs in different individuals and in different parts of the body, being yellow, brown, black, and at times even red or green. In the goby (a fish), the chromatophores, which are yellow or greenish-yellow when distended, become orange when contracted; while the orange or red ones, when shrunk, become brown or even black. In the same fish a still different kind of chromatophores are filled with iridescent crystals of marvelous delicacy, which in expansion become visible as spots of metallic sheen. It is on the distribution and different depth in the skin of the chromatophores that the pattern of markings of the skin of changeable animals depend. The common squid is very beautifully tinted, and under the microscope the chromatophores can be seen dilating and contracting, giving off a remarkable play of all the colors of the rainbow. The value of this power, which is under control, is that it gives the animal means of concealment by adapting its color to that of its surroundings.

Chromatrope, krō'ma-trōp, or **Chromotrope,** -mō-, a toy consisting of a disk painted with arcs of circles in brilliant colors in such a manner that when the disk is revolved centrifugal or centripetal streams of color seem to flow through it. The term is also applied to an attachment for a magic lantern, by which, on the revolution of two painted disks of glass, kaleidoscopic effects are projected onto the screen.

Chro'matype, a photographic picture in which the paper employed has been sensitized by some of the salts of chromium.

Chrome Green, the green oxide or sesquioxide of chromium, forming a green pigment used by enamelers. It is also employed by dyers and calico-printers as a mordant. A hydrated variety, $Cr_2O_3.2\,H_2O$, used for the same purposes, is known as "Guignet's green" or "emerald green." "Arnaudon's green" contains some phosphoric acid in addition. These are now used instead of the poisonous greens prepared from arsenic as a base. See CHROMIUM.

Chrome Iron Ore. See CHROMITE.

Chromic Acid. See CHROMIUM.

Chromite, or **Chromic Iron,** the only important ore of the metal chromium and the source of all of the chromium salts. Chemically considered, it is a chromate of ferrous iron $FeCr_2O_4$, but it is usually classified by mineralogists among the oxides of the spinel group as a compound of iron protoxide, with chromium sesquioxide, having the formula $FeO.Cr_2O_3$. The metals are often in part replaced by magnesium, aluminum, and ferric iron, as in the variety magnochromite from Silesia and mitchellite from Webster, N. C. The composition of the mineral thus approaches the chromiferous variety of spinel, picotite. Chromite has a hardness of 5.5 and a specific gravity of 4.32 to 4.57. It is usually a granular-massive, black, opaque, metallic mineral, much resembling magnetite. It has, however, a dark-brown streak and is readily distinguished from all black minerals by fusing it with borax and salt of phosphorus, the bead thus obtained assuming an emerald-green color on cooling. It is further identified by its invariable occurrence in serpentine or olivine rocks. It is often disseminated in grains, or rarely in small octahedral crystals, and thus upon the disintegration of the rock the grains are washed into the streams and adjoining bottom-lands. Prior to 1884 it was extensively mined near Baltimore, also at Texas, Pa., and in California, but the domestic production in 1902 fell to $4,567, while ore to the value of $582,597 was imported into the United States in 1902, chiefly from Asia Minor. The large deposits in Quebec, Yancey County, N. C., and in many other localities will no doubt be important sources of supply in the future.

Chromium, krō'mĭ-ŭm (Gr. χρώμα, "color," in allusion to the colors exhibited by its compounds), a metallic element discovered in 1797 by Vauquelin, in the native chromate of lead of Siberia, and afterward found combined with iron. The metal itself has never been prepared in large quantities, but it can be obtained by the reduction of the oxide by carbon in the electric furnace. It is also obtained by heating the anhydrous sesquichloride of chromium with zinc, potassium, or sodium. Chromium is extremely hard, of a grayish-white color, and less fusible than platinum. Its chemical symbol is Cr, and its atomic weight is 52.1 if O = 16, and 51.7 if H = 1. Its specific gravity is from 6.5 to 6.8, and its specific heat is about 0.1, though the latter constant has not been determined with precision. Once separated from oxygen, it does not readily combine with it again. It oxidizes superficially, however, upon being heated in air, and it decomposes steam at a red heat.

Chromium forms four different oxides, whose formulæ are respectively CrO (chromium monoxide); Cr_2O_3 (chromium sesquioxide); $CrO.Cr_2O_3$ (chromo-chromic oxide); and CrO_3 (chromium trioxide). Of these the first two act as bases, each yielding a series of salts with various acids. Those salts that are derived from the monoxide, CrO, are called "chromous" compounds; while those that are derived from the sesquioxide, Cr_2O_3, are called "chromic" compounds. Chromium sulphate, $Cr_2(SO_4)_3$, forms a series of alums with the sulphates of potassium and ammonium, the element behaving in this respect like aluminum. (See ALUM.) Chromo-chromic oxide is not chemically active. Chromium trioxide, CrO_3, dissolves in water with the formation of an acid, H_2CrO_4, which is called

"chromic acid," and is of great interest to the chemist. Chromic acid forms a series of definite salts that are known as "chromates." One of the best known of these is chromate of lead, $PbCrO_4$, which is used as a pigment under the name of "chrome yellow," and is formed by precipitating chromate of potassium by a soluble salt of lead. Potassium bichromate, $K_2Cr_2O_7$, or $K_2CrO_4CrO_3$, is another extremely important salt of chromic acid; it is used as a depolarizer in electric batteries, as a bleaching and oxidizing agent, and as a convenient starting-point in the manufacture of many of the chromium compounds. It possesses the peculiar property of rendering gelatine insoluble upon exposure to light, and for this reason it is used in various photographic processes.

Chromium is used to some extent in the manufacture of steel, as it is found that the addition of less than 1 per cent of chromium materially increases the strength, hardness, and elasticity of the product.

In medicine chromic acid and potassium bichromate are used. The acid is employed as a caustic; the bichromate is now rarely employed because of its irritant properties.

Poisoning by chromium compounds is similar to that caused by other metallic poisons. The drinking of battery fluid is the usual mode. There is severe gastro-enteritis, nausea, vomiting of yellowish bloody matter, diarrhœa, pain, colic, tenesmus, great prostration, muscular cramps, rapid and feeble pulse, bloody urine (perhaps suppression of this secretion), feeble and irregular breathing, with coma or convulsions preceding death. A fatal ending may occur in from 4 to 15 hours. At times this result may be delayed, and symptoms referable to degenerative processes in the liver and kidneys appear. Treatment is by prompt and continued washing of the stomach. Bismuth subnitrate is indicated in the after treatment, which is symptomatic.

Chromium, or Chrome Steel. See CHROMIUM.

Chromo-lithography, a method of producing a colored or tinted lithographic picture, by using various stones having different portions of the picture drawn upon them with inks of various colors and so arranged as to blend into a complete picture. Sometimes as many as 20 different colors are employed. It was invented by Alois Senefelder, of Prague, between 1796 and 1800. An outline drawing is first traced, and then transferred to the various stones, one for each color. The artist puts in the colors, with soap, of the tints required. Next the slab is put upon a press and carefully damped with a sponge, after which the oil color is applied with a leather roller. The parts of the slab which contain no drawing, being wet, resist the ink, while the drawing itself, being oily, repels the water while retaining the color. In printing, the lighter shades are printed off first and the darkest last. See LITHOGRAPHY.

Chromotype See CHROMATYPE.

Chro'mosphere, the gaseous envelope which exists round the body of the sun, through which the light of the photosphere, an inner envelope of incandescent matter, passes. During total eclipses it is observed that a red-colored envelope surrounds the sun, and shoots up to great distances from the surface. It seems to have been first recognized by Secchi; and the projecting portions of it are commonly described as "red-colored protuberances" and "red flames." To this red envelope the name "chromosphere" was given by Lockyer. The light from it is much fainter than that from the photosphere; and till 1868, when M. Janssen and Mr. Lockyer almost simultaneously pointed out a method of viewing it, it was never seen except during eclipses. See SUN.

The spectrum of the chromosphere was first observed in 1868 during the Indian total eclipse, and it was found to consist of a number of bright lines, and conspicuous among them those of hydrogen. The light of the chromosphere was thus proved to be due to vast flames or masses of incandescent vapor or gas, hydrogen forming a large part of the whole.

Since the invention of the Janssen-Lockyer method of observing, as it is called, very remarkable advances have been made in our knowledge of solar physics, discoveries quite unthought-of having followed. The observations are made by means of a combined telescope and spectroscope. A spectroscope is substituted for the eye-piece of the telescope, the slit of the spectroscope being placed at the principal focus of the object-glass of the telescope. The slit is capable of being moved in such a way that any particular band of the image formed by the object-glass of the telescope may be examined by the spectroscope. The spectroscope employed for the purpose of examining the chromosphere must have the greatest possible dispersive power, and requires for this purpose a very long train of prisms.

As was mentioned above, the spectrum of the chromosphere consists of a series of bright lines. The breadth of a bright line of the spectrum is not sensibly increased by increasing the dispersive power of the spectroscope, but the contrary is the case with a continuous spectrum, which is extended by dispersion. Thus the latter becomes weakened, while the former maintain their brightness and become more visible in comparison with the others. The slit of the spectroscope being aranged so as to take in a band, either tangential or radial, close to the edge of the image of the sun formed by the object-glass of the telescope, it is found that the bright lines of the chromosphere are perfectly visible, in spite of the light of the continuous spectrum proceeding from the inner portion of the disk. Further, it has been found possible, by using a spectroscope of the very highest dispersive power, and by opening the slit sufficiently wide, to see the whole of one of the protuberances at once, and by this means to watch its motions and its changes. To understand this the reader must consult the article SPECTROSCOPE. He must recollect that a continuous spectrum consists of an enormous number of images of the slit, placed side by side, and in ordinary cases slightly overlapping each other. If we could employ an infinitely narrow slit we should have an infinite number of infinitely narrow images, and no overlapping whatever. But suppose a light to consist of only two or three colors, say light from a source capable only of giving the two bright lines C and F, that is, one in the red and another in the blue part of the spectrum. It is

easy, even with a slit of sensible width, to keep the two from overlapping, and we shall see without any confusion the two bright lines or bands at different parts of the spectrum, darkness intervening. Now imagine a flame or tongue of fire starting up from the sun's surface, and let the spectroscope be directed on its image in the telescope; there will be only portions of the slit illuminated by it, portions corresponding to the shape of the flame; and if the flame contain only light of the bright line C and F, there will be seen two images of the flame at the points of the spectrum belonging to these colors. The observations of these flames by Mr. Lockyer has furnished us with what may be considered at present as a very complete knowledge of the atmosphere of the sun, though doubtless there is yet much to be discovered by the daily observation of them that is now carried on; and the same method applied to the sun's spots has proved not less fruitful. We can give only a few of the results here, but the reader will find an account full of interest in Mr. Lockyer's papers communicated to the Royal Society, and printed in abstracts in the Royal Society's 'Proceedings' for 1869 and 1870. He will also find in the 'Proceedings' for the same date an account of the experiments of Frankland and Lockyer on gaseous spectra, undertaken with the view of determining some questions of great importance relating to phenomena observed in the course of the researches under consideration. Latterly, by methods specially devised, excellent photographs of the protuberances or flames have been obtained.

The chromosphere and its prominences, when examined with the telespectroscope (as the instrument just described is called) exhibits, as we have said, a spectrum of bright lines, due to incandescent gases. The most elevated portions consist entirely, or almost entirely, of hydrogen, the lightest of the gases. Lower down are found the gases or vapors of the heavier metals,— of sodium, magnesium, barium, iron, and others. The lower the layer of the chromosphere examined, the more dense is the spectrum filled with lines of metals, and in the prominences the red hydrogen flames tower high above all.

From minute displacements of well-known lines in the spectrum (see SPECTRUM ANALYSIS) motions are inferred of the incandescent bodies from which these lines are proceeding. On this principle motions of the fixed stars have been determined. Thus Sirius is receding from us at the rate of 20 miles per second, while Arcturus is approaching us at the rate of 50 miles per second. The principle applied to the results of the spectroscopic examination of the prominences of the chromosphere shows that they are due to enormous outbursts of gases and vapors from the sun. These gases are projected outward with extraordinary velocity, and in their neighborhood vast cyclones are observable. It is also proved by applying the same principle that the spots on the sun's surface are due to, or at least are accompanied by, vast up-rushes and down-rushes of gaseous matter.

Chron'ic (Gr. *Χρόνος*, "time"), a term applied to diseases which are of long duration, and mostly without fever. It is used in opposition to the term "acute," which is applied both to a pungent pain and to a disease which is attended with violent symptoms, terminates in a few days, and is attended with danger. On the other hand, a "chronic" disease is slow in its progress and not so generally dangerous.

Chron'icle, a history recounting in order of time all details which observation or tradition has furnished the author. It may be a universal history, or may deal with a single epoch, nation, city, or individual. Some chronicles have been preserved from early ages; the Old Testament Chronicles (q.v.) are a type of such. An important ancient chronicle, discovered on the island of Paros in 1627, and known as the 'Chronicle of Paros,' is an outline of Greek history, originally covering the period from the reign of the legendary Cecrops, king of Athens (1582 B.C.) to 264 B.C. The last part, from 355 B.C., is now lost. It omits many important political and military events, and deals more fully with the art and festivities of the people. In the early Christian ages, ecclesiastics were generally the authors of the chronicles; for example, Eusebius, bishop of Cæsarea, collected from other historical works his 'Chronicle of Ancient History.' Hieronymus of Stridon translated it into Latin in the 4th century, and other continued it. Many historical works of the Byzantine historians are also chronicles. Most of the mediæval chronicles were by monks, especially by the Benedictines, who usually began their story with the creation of the world, and gave an abridged history of the events from the first chapter of Genesis to the immediate subject of their narrative. In their statement of facts they in general knew little distinction between fabulous and true history, were not inclined to question much either visions or miracles, and were accustomed to dwell as long on unimportant as on momentous events. Chronicles are valuable for determining historical facts when, like that of Eusebius, they contain materials from older works which are now lost, or when they relate events contemporary with a writer, and of which he was a witness; and they are always valuable as an illustration of the spirit of an age and the sentiments of a people. It is through them that nearly all the history of the Middle Ages has been preserved. Every European people has numerous mediæval chronicles.

Among the German chronicles may be mentioned that of Regino, abbot of a monastery in the forest of Ardennes, whose work extends from the Christian era to 907; that of Hermannus Contractus, entitled 'A Chronicle of the Six Ages of the World,' to the year 1054; that of Lambert von Aschaffenburg, which recounts the period from the beginning of the world to 1050 in brief, and from 1050 to 1077 in detail; that of Godfrey of Viterbo, giving a universal history to the year 1186, written partly in prose and partly in verse, and entitled 'Pantheon'; and a chronicle found in the collection of Pistorius, composed by an Augustinian monk, which extends from the Christian era to 1474. These were written in Latin and, with many other Latin chronicles, were col-

lected and published at Hanover in a series of volumes entitled 'Monumenta Germaniæ Historica.' The oldest historical book in the German language is a rhyming chronicle, consisting of 83,000 verses, written by Ottokar von Horneck, in the 13th century, and of nearly the same antiquity are the chronicles of Rudolf von Ems and Jansen Enekel, both having the form of poems, and furnished with notes by their authors. France is rich in chronicles, universal and particular, written in Latin, French, and various provincial dialects. It was the fancy of the earliest chroniclers to give to France a Trojan origin. Eginhard, the son-in-law of Charlemagne, chronicled the deeds and talents of that emperor in his 'History of Charlemagne.' The first of the chroniclers who wrote in the popular language of France was Geoffroi de Ville-Hardouin, who lived in the 12th century, and was an actor in the events which he describes. The 'Chronicles' of Froissart (q.v.) embrace the events occurring from 1325 to 1400 in England, Scotland, France, Spain, Brittany, and the Low Countries, setting forth in detail the feasts, spectacles, and all the pageantry, of feudal times, and enlivened throughout by Froissart's shrewd comments and observations. Of the strictly English chronicles, the earliest is that by Geoffrey of Monmouth, a monk of the 12th century, tracing the history of Britain through a series of imaginary kings, from Brutus, a son of the Trojan Æneas, who founded the British state many centuries before the Christian era, to Cadwallader, who was said to have lived 689 A.D. There is also the 'Anglo-Saxon Chronicle,' extending from the beginning of the Christian era to the death of King Stephen (see ANGLO-SAXON LITERATURE). The collection of chronicles edited by Holinshed in 1577 embraces a history of England to that year, a history and description of Ireland by Stanihurst, and a history of Scotland translated by Hector Bœthius. 'The Chronicle of the Kings of England,' by Sir Richard Baker, published in 1643, is a history of England from Roman times to the death of King James I. It was a very popular work, and was afterward continued to the death of George I., but is not now considered accurate history.

Chronicle of the Kings of England. See CHRONICLE.

Chronicle of Paros. See CHRONICLE.

Chronicles, Books of, the last of the historical books of the Old Testament, forming only one book in the Hebrew canon. Its arrangement after the Books of Kings, and its division into two parts, is the work of the Septuagint (q.v.). The Hebrew name means "words," or, rather, "acts of the days," and is thus much the same as our "journals" or "annals." The title given to it by the Seventy was "Paraleipomena," meaning either "remains" (of other historical works), or "things omitted." The usual and very appropriate name "Chronicles" was given to it by Jerome. According to its contents the book forms three great parts: (1) Genealogical tables interspersed with geographical, historical, and other remarks (1 Chr. i.–ix.). (2) The history of the reigns of David and Solomon (1 Chr. x.–2 Chr. ix.). (3) The history of the kingdom of Judah — excluding that of Israel — from the separation under Rehoboam to the destruction of the Jewish state by the Chaldæans (2 Chr. x.–xxxvi.), with a notice in the last two verses of the permission granted by Cyrus to the exiles to return home and rebuild their temple. The Chronicles accordingly traverse nearly the whole field of Old Testament history, and present many points of contact with the earlier scriptures, historical and prophetical, more especially, however, with the books of Samuel and of Kings. How far the author of the Chronicles may have made use of these books cannot be determined, but that he did not solely rely upon them is evident from the number of titles of books referred to by him as authorities, sometimes on matter not contained in Samuel and Kings, or, if mentioned in them, yet with greater brevity than in the Chronicles. A considerable portion of the matter contained in the Chronicles is much the same as that in Samuel and Kings, but many particulars recorded in these books are entirely passed over, while others are more fully related in the Chronicles. A certain quantity of matter also is peculiar to the Chronicles. That these books form one of the latest compositions of the Old Testament cannot admit of doubt. Its reference, already mentioned, to the decree of Cyrus respecting the restoration is sufficient evidence of this. With regard to the author there is not the same certainty, but strong arguments can be adduced to prove that Chronicles and the Book of Ezra are by one hand, and a common opinion is that Ezra was the author of both.

Consult Movers' 'Kritische Untersuchungen über die Biblische Chronik'; Keil, 'Apologetischer Versuch über die Chronik'; and the commentaries of the German writers, Bleek-Wellhausen, König, Wildeboer, etc.

Chronicles of the Canongate, a collection of Sir Walter Scott's stories published in two series. The first series (1827) contains 'The Highland Widow,' 'Two Drovers,' and 'The Surgeon's Daughter'; the second series (1828) contains 'The Fair Maid of Perth.'

Chronicles of Clovernook, a story by Douglas Jerrold, published in 1846. Clovernook is a "hamlet wherein fancy has loitered away a truant hour"; and under the guidance of the "Hermit of Bellyfulle" the author explores Clovernook, and discourses of it. The book charms by its quiet humor, the grace of its fancy, and the benevolence which characterizes even its satire.

Chronicles of Froissart. See CHRONICLES.

Chronicles of the Schönberg-Cotta (shĕn'-bĕrg kŏt'tä) **Family,** a novel by Mrs. Elizabeth Charles, published in 1863. It is the story of a family during the period of the Reformation in Germany, as told chiefly by Friedrich and Else, the oldest children. The book is written with an effort after the archaic style, and has much of the simplicity and directness of the old chronicles. It is interesting and has proved a great favorite, though accurate scholarship finds fault with its history.

Chron'ogram, a device by which a date is given in Roman numerals by printing certain letters of an inscription larger than the others; as in a motto of a medal struck by Gustavus Adolphus in 1632: ChrIstVs DVX; ergo trIVMphVs. The value of C and the other capitals equals 1632, MDCXVVVVII.

Chronograph, krŏn'ō grăf, the name given to various devices for measuring and registering very minute portions of time with extreme precision. Benson's chronograph is, in principle, a lever watch with a double seconds hand, the one superimposed on the other. The outer end of the lowermost hand has a small cup filled with a black viscid fluid, with a minute hole at the bottom, while the corresponding end of the uppermost is bent down so as just to reach the hole. At the starting (say) of a horse race, the observer pulls a string, whereupon the bent end of the upper hand passes through the hole and makes a black mark on the dial, instantly rebounding. Again, as each horse passes the winning post the string is redrawn and a dot made, thus marking the time of each horse. This chronograph registers to one tenth of a second. Strange's chronograph is connected with the pendulum of an astronomical clock, which makes a mark on a sheet of paper at the beginning and end of each swing. By touching a spring on the appearance (say) of a particular star on the field of a telescope, an intermediate dot is made, and by measuring the distance of this from either of the extremes, the exact time can be ascertained to 1-100 of a second. Schultze's chronograph, in which electricity is applied, is yet far more precise, registering time to 1-500,000 part of a second.

Chronol'ogy, the science of dates, or of arranging events in order of time. Two steps in human progress were requisite for its existence: the invention of material records, since memory would not transmit exact sequences of events on any considerable scale; and the adoption of some recurrent astronomical period, neither too short nor too long, as a measure of time. The pictograph, developed into a system of writing, and the Peruvian quipu, or knotted cord, are the chief of the former. The fixing of the year by the Babylonian astronomers was the only feasible specimen of the latter: the month being too short for a measure of long periods, and even the year becoming too formidable in numbers for the limited counting power of the ancients. Between the creation of these raw materials, however, and the construction of a simple and universally applicable system for even one country, thousands of years elapsed in which the chaos of unsystematic systems is still the difficulty and often the despair of antiquarians.

For a satisfactory chronology there is a third requisite,—a fixed epoch to count from, no matter what: as in Babylonia the accession of Nabonassar; in Greece the hypothetical institution of the Olympian games; in Rome the imaginary foundation of the city; in Christendom the arbitrarily fixed birth of Christ; with the Mohammedans the Hegira of the Prophet, etc. But, obvious as this seems, it is in fact a very late device of civilization. Herodotus and Thucydides, in the most splendid intellectual age of Greece, wrote history without a date, or any apparent recognition that one was needed. The sequence of events was preserved; but that these need be related to an arbitrary point in the past is an artificial conception, created by the accumulation of practical inconveniences. These would seem to have differed in each country which independently invented it: the scientific and business ones in Assyria, historical in Greece, administrative in Rome. Others borrowed the system when its utility was manifest; but older societies were satisfied with a ruder scheme. Their science and business was alike undeveloped; their historical sense was satisfied with a few dramatic episodes, and even the order of events was heroically confounded; and when it became necessary to keep public records, their unit was a reign, or they dispensed with units altogether and dated by some notorious event. Thus the Babylonians dated their business and official tablets "the year he brought Nannar of Nippur into a house," "the year he overran Karkhar," "the year he overran Karkhar a second time," "the year divine Bur Sin became king, etc.; on exactly the same principle as a modern mother dates events in the year the second child had the measles. Dating by the year of a certain king's reign is a natural system, still preserved in English statutes: they are not the laws of 1663 or 1860, but "4th Car. II.," "24th Victoria," etc.

In Assyria, as early as the 14th century B.C., a system was begun of dating by "eponyms," or the names of the chief officers of state, in annual succession, with the chief events in the year; each new king's name being entered on his accession. Thus: "Edsur-sarabe governor of Gozan. Revolt in city of Ashur. In month Sivan sun was eclipsed." (Three intervening entries.) "Pan-ashur-lamur governor of Arbela. Revolt in city of Gozan. Pestilence." In Rome, it was "in the consulate of" certain persons; in Athens, "in the archonship of"; and so on. Obviously, if the regular succession of functionaries is preserved for a long time, as in Assyria it was for centuries, it will furnish a perfect chronology provided one date can be fixed in the series. This has been done in several cases, and the chronology of some sections of ancient history has been accurately reconstructed over long periods. The most certain authentication is by some astronomical phenomenon whose date can be fixed by calculation; and several of these priceless data are casually mentioned by old records or historians. Thus, the mention by an Egyptian papyrus of a rising of Sirius, in connection with the overflow of the Nile, fixes the accession of Usertesen III., fifth king of the 12th dynasty, between 1876 and 1873 B.C.; the oldest certain year-date or approximate date in history yet discovered, and by a happy chance, in a country the most empty of chronological data. (The accuracy of Naram-Sin's date as near 3750 B.C. is still a battle-ground.) The most usual of these phenomena recorded are eclipses of the sun, from the terror inspired by the darkening of the sky; fortunately for history, as the mention of them has furnished several invaluable dates. The Assyrian eponym canon for several centuries has been fitted with accurate dates by the eclipse recorded in the first entry above, 763 B.C.; the same one is mentioned in the Bible (Amos viii. 9) as occurring in the reign of Jeroboam II. Even when we cannot be certain by itself which eclipse was meant, it is rare that other synchronisms do not fix the limit. Thus, an important date in the kingdom of Lydia is determined by an eclipse which was either 610 or 585 B.C., and other circumstances make the latter date probable.

When positive evidences fail, the only method of research is by *synchronism*, or fixing the date of an event by its connection with some

other event or person of known date. Fortunately, the records afford considerable help in this, if less than could be wished: they mention international battles, captures, treaties, appeals, threats, correspondence, etc., where one date must apply to both. Noted examples of this are the biblical records as to relations of Palestine with Assyria, Egypt, Tyre, etc.: sometimes confusing events and dates, occasionally confounding persons, and needing correction from other sources, but still of extreme value. Another specimen is the Assyrian "synchronous history" of the relations between Assyria and Babylonia, a tablet of about 800 B.C. When we come down to classic times, these synchronisms are the very basis of historical work on those periods. There is also a synchronism of arts, products exchanged between countries, systems of writing, etc., and even to some extent of institutions; which, though demanding expert knowledge and careful judgment, is often of the first value. On this basis much of the Homeric and pre-Homeric history of Greece is taking shape, and even the origins of China can perhaps be related to Babylonia.

The chronological sense of different races presents extreme diversities; but it is fairly accurate to say that none of the older ones had any appreciable amount except the Babylonians, and that in them and their pupils, the Assyrians, it was early and remarkably developed. Their dated records (in the primitive fashion above) go back to the third millennium B.C. at least; the Assyrians eponym canon antedates by many centuries any similar attempt elsewhere; and the Babylonians were much the first to adopt an epoch. On the other hand, their co-founders of the earliest civilization, the Egyptians, were utterly destitute of it; and the dates in their history back of the time of close contact with Babylonia, where synchronism can be utilized, are almost pure guesswork. Beyond 2000 B.C. the divergences of estimated Egyptian dates among the most authoritative scholars vary from 500 to 1,500 years, and even down to 1500 B.C. there is often 100 or 200 years' difference; and only the vaguest inferential proof is available. The Hindus, the Chinese, the Jews, the Greeks, were nearly as devoid of chronological instinct. The case of the great Greek historians has been mentioned; and the vague Jewish "forty years," for a generation or an indefinite long time is familiar and not conducive to accurate chronology.

The obscurity due to lack of dates in general was of course enhanced by the fact that each state counted from its own events or persons, so that in place of one problem, the historical antiquary has scores. The chief method — for many ages the only one — by which this Babel of chronologies was finally reduced to uniformity over large areas was political absorption and the disuse of provincial systems. Even when fixed epochs came to be adopted, though the continuity of history was assured, the international confusion was not lessened nor comparative chronology made easier, as each selected a different epoch; and the same remedy only was operative here. Nor, indeed, for some time did even the individual system become the accurate instrument of research it is now; for the succession was not at first of years, but of annual magistrates, as with the Assyrians, Athenians, and Romans, sometimes more vaguely of kings and priests. Moreover, with one dubious exception the date of the epoch was not that of its adoption, but centuries back; and the dates affixed by the new system to former events were often wildly fanciful, as was that of the very event which furnished the starting point. The first epoch ever used, so far as known, was the accession of Nabonassar of Babylonia 747 B.C.; it is generally believed to have been used from the beginning, but this is less probable now than formerly. The Roman era was the foundation of Rome, somewhere about 750 B.C. according to Roman writers; it is not known when it was first adopted, but probably not before the 2d century B.C. The Greek reckoning was from the alleged foundation of the Olympic games in 776 B.C., quite as apocryphal as the other; it was first used as a basis of calculation by Timæus of Sicily in the 3d century B.C. It furnishes a scientific one when the year of the Olympiad is mentioned, which is not always, so that a margin of three years is left. Note the curious fact that all three epochs begin within a quarter century or so of each other, though the last two are merely guesswork. It seems incredible that the year, apparently the most simple and obvious of natural units, was first suggested and used in 194 B.C. by Eratosthenes, the great Greek editor, mathematician, geographer, and chronographer. Of course it had been employed for thousands of years as a unit within other units, such as reigns, but not alone in sequence from a fixed epoch. The Olympiad, however, for reasons given below, held its own till the middle of the 5th century. Even after the official adoption of the Christian era,— which, like its predecessors, antedated its use by centuries,— centuries elapsed still before it was employed to the exclusion of other systems. Many other methods of dating, local or ecclesiastical, flourished beside it, and made nearly as much labor necessary in modern as in ancient times to synchronize dates. An acquaintance with these is indispensable to the study of the chronicles, charters, and other legal and Church documents of the Middle Ages.

Still another cause of the imperfection of early chronological methods was the difficulty found by the masses in grasping large numbers. Hence, it became the practice to divide the time into cycles of a small number of years, and number by the years in a cycle. The Olympiad was a refined form of this. Our own system of reckoning by centuries is another, only by its decimal form it expresses both ideas at once. Instead of saying "the 3d year of the 20th century," as "the 3d year of the 40th Olympiad," we say a term of addition, and say "nineteen hundred(s) and three." The Chaldæans had their saros of 6,585⅓ days, or 18 years; the Romans, their indiction of 15; and the Chinese and other Asiatic nations still use a cycle of 60. The European cycles, however, as the metonic of 19 years still used for computing Easter, were mostly used to regulate the calendar rather than to compute dates; but they are often extremely useful as an additional method of verifying these.

Babylonian: Era of Nabonassar.— This prince seems for a very brief time to have thrown off the Assyrian yoke and restored Babylonian independence. It was almost immediately lost; but he succeeded in imposing a new dating system which convenience main-

tained, or else later gratitude looked back to him, under the glories of Nabopolassar and Nebuchadrezzar, as the pioneer of Neo-Babylonian greatness. At any rate, the era is fixed at 26 Feb. 747, from astronomical data collected in Chaldæa by Callisthenes, a general of Alexander the Great. It is the basis of the once famous Canon of Kings, or Mathematical Canon, preserved in Ptolemy's works, and previous to the era of archæology our one source of Mesopotamian history. The Alexandrian Greeks also used this era till their adoption of Julius Cæsar's reformed calendar, 25 B.C. The Babylonian year was different in length from the Julian of 365¼ days, and the conversion of Nabonassar years into years B.C. is a matter of delicacy, necessitating a knowledge of the month and day for certainty. Tables have been drawn up for this purpose.

Olympiads.— It is now pretty generally admitted that the early lists of victors in the Olympic games are fictitious, and that the foundation of the games cannot be assigned a date, our first authentic knowledge beginning with the 6th century B.C.; but this is indifferent to the method of calculation which assumes a beginning in 776 B.C. They were celebrated every fourth year in the summer solstice; and as the Olympic year began sometimes with the full moon before and sometimes with the one after the solstice, to save trouble and perpetual recomputation it was reckoned as beginning the 1st of July. Hence, the Olympic years cannot be synchronized with ours year by year; the second half of the one corresponds with the first half of the other, and the month must be known for accurate conversion. Therefore, in years before Christ, when the event happened between January and June, inclusive, subtract the number of the Olympic year from 776. Thus: the oligarchy of the Four Hundred was deposed in June Ol. xcii. 1: $4 \times 91 + 1 = 365$; $776 - 365 = 411$ B.C. Socrates was executed in May Ol. xcv. 1: $4 \times 94 + 1 = 377$; $776 - 377 = 379$ B.C. If it took place in the latter part of the year (as did the immense majority of the familiar incidents in Greek history — all the great battles, for physical reasons, the deaths of Pericles and Cleon, etc.), subtract the sum as aforesaid from 777. Thus, the battle of Platæa was fought in September Ol. lxxv. 2: $4 \times 74 + 2 = 298$; $777 - 298 = 479$ B.C. If the year is after Christ, subtract the number of the Olympic year from 776 in the first case, from 777 in the second. The Olympiad was only used by historians; it is never found on coins or inscriptions. A new Olympiad was instituted by the Roman emperors, beginning with 131 A.D., and is used on some coins and inscriptions, but struck no deep root.

Macedonian Era, or Era of the Seleucidæ: also called by the Jews *Era of Contracts*, because their Syrian governors compelled them to use it in civil business, and styled by the writers of the Books of Maccabees the *Era of Kings.*— This epoch dates from the foundation of the Syro-Mesopotamian monarchy by Seleucus Nicator, Alexander's general; assumed to begin with his occupation of Babylon 311 B.C., 12 years after Alexander's death. It was used not only in the Seleucid empire, but by the Greek states on the east coast of the Mediterranean generally; was followed by the Jews till the 15th century, and is said to be in use by some Arabians even yet. It was the great Eastern date for many centuries; but it is one of the most difficult to convert into terms of Christian years, from the astonishing variety in the beginnings of the year (which in different countries and among different sects varied from the vernal equinox to 28 October), and from the variation in length of year, some using the Egyptian year of 365 days, some the Julian of 365¼. The usual computation is to place the beginning of 312 Seleucid on 1 September in the Julian year preceding the first of our era. Therefore, to reduce a Seleucid date to ours, subtract 311 years 11 months.

Era of Alexander.— This is used by some Greek historians, dating from his death 325 B.C.

Era of Tyre.— This begins 19 Oct. 126 B.C. To reduce it to our era, subtract it from 126 if B.C., subtract 125 from it if A.D. This date is used only on medals and in the acts of some councils.

Era of Rome.— The date of the foundation of Rome, as related to the Olympiad epoch, is differently assigned by different authors: by Fabius Pictor at Ol. viii. 1, autumn (747 B.C.); by Polybius at Ol. vii. 2 (750); by M. Porcius Cato at Ol. vii. 1 (751); by Verrius Flaccus at Ol. vi. 4 (752); by Terentius Varro at Ol. vi. (753). As all the dates were figments, each Roman writer followed which he chose, and sometimes varied from one to another. Livy generally follows Cato, sometimes Fabius Pictor; Cicero follows Varro, as does Pliny, in general; Dionysius of Halicarnassus follows Cato. The modern writers usually follow Varro, supported by Censorinus, who specifically says the festival of the Palilia in April was the anniversary of the foundation. The Romans had two kinds of year: one for business, public or private; and the consular year, which their annalists follow. The former began with the calends of January. The latter had no fixed time of beginning, but commenced with the installation of the consuls, which happened as chance and politics dictated; it is the one generally used by the Latin and Greek historians down to the 6th century A.D., however. But in the computations of the Roman era the year begins with 21 April. After Cæsar's regulation of the calendar, the year began with January, much to the disgust of the Roman poets, who thought the spring was the real beginning, as, of course, it is.

Cæsarean Eras.— Several attempts were made to establish time eras from actions of Cæsar and Augustus, one of them very successful. The *Cæsarean Era of Antioch* commemorated Cæsar's victory at Pharsalia 48 B.C.; it was used by Evagrius in his 'Ecclesiastical History.' The Syrians and Greeks, however, placed its beginning 11 months apart. The Julian Era began 1 Jan. 45 B.C., and commemorated the reformation of the calendar by Cæsar. The *Era of Spain* or *of the Cæsars* commemorated the completion of the conquest of Spain by Augustus, and began 1 Jan. 40 B.C.; for many centuries it was the one era of Spain and Portugal, and generally of the Roman provinces subdued by the Visigoths, not only in the Iberian peninsula, but in southern France and in Africa. Several of the councils of Carthage, and that of Arles, also dated from this, though after the 9th century the year of the Incarnation was usually joined with it. It was not disused in Castile till 1382, and in Portugal not altogether till 1422 or later. The calendar being Julian,

all its dates are reduced to ours by merely subtracting 38. There was an *Era of Actium,* commemorating that battle, fought 3 Sept. 31 B.C. The Romans began it 1 Jan. 16 Julian (30 B.C.); the Egyptians, 29 August; the Eastern Greeks (who used it till the 9th century), 2 September. The latter called it the *Era of Antioch* (not the one mentioned later), and that city struck medals with it. There was also an *Augustan Era,* beginning 27 B.C., the year in which Augustus received that title.

Jewish Eras.— The Jews came under foreign rule before they had invented an epoch, or even developed periodic magistrates; and their annals, except for synchronisms, are nearly as baffling as the Egyptian. Their first internal chronology is after the Macedonian era was forced on them by the Seleucid officials; their religious matters, however, were regulated by their own calendar, in which the civil and sabbatical year began (as now) about the autumnal equinox, the ecclesiastical and legal year about the spring equinox. They also made computations of the time from the Creation (see paragraph below), but their dates do not depend on it till modern times. After the Dispersion they were obliged to conform to the periods of other nations, in order to have their festivals celebrated uniformly; and they adopted a cycle of 84 years (a transformed Greek cycle). The time of its beginning is not certain, one author placing it at 162, and another at 291 B.C. In 46 B.C. the Christians adopted it, and used it partially till the Council of Nice; they then, and the Jews in 360 A.D., substituted the metonic cycle of 19 years, which the latter still employ. Till the 15th century they continued to date from the Macedonian era; since then they have adopted a Creation era, which they date 3,760 years 3 months B.C. Their dates cannot be reduced to ours without expert knowledge of their involved calendar.

Creation Eras.— To emphasize their separation from paganism, and avoid participation in pagan observances connected with the calendar, the Christians early began to reckon time from the supposed date of the creation of Adam according to the Jewish Scriptures. Aside from its resting only on the adding up of impossible and inconsistent genealogies, the problem was further confused by there being three texts of equal authority to work from,— Hebrew, Samaritan, and Septuagint,— all irreconcilably variant. One author collects 120 different computations of the true date; another says he has collected over 200; and 300 have been reckoned; and the estimates vary over 3,500 years, from 3,483 to 6,984 years before the Christian era. None of them have any scientific standing, but for two centuries the Christian world generally accepted as a working hypothesis Archbishop Usher's (1650) figure of 4004 B.C., which is still used in some Bible appendices and similar works. Several earlier ones, however, obtained considerable footing, and two of them are not yet disused. It is of course as useful as any other arbitrary point, like the Olympic Games or the foundation of Rome; and has the advantage of requiring only one continuous figure, in place of a break in the centre like the Christian era. But its controversial character, and the satisfaction of marking off the time after Christ's coming as the beginning of a new era, have caused the latter system to supplant it. Of the others, the chief are: (1) *Era of Constantinople,* still employed in the Greek Church, and used by the Russians till the time of Peter the Great. This begins 5,508 years 4 months before the Christian era. The civil year begins 1 September; the Church year on the spring equinox or 1 April. To find the current year corresponding to a Constantinople year, if the event took place before 1 September, subtract 5,508 from the date; if later in the year, subtract 5,509. (2) *Era of Alexandria.* This was adopted by the Christians of Alexandria on the computation of Julius Africanus, who reckoned 5,500 years from the creation of Adam to the birth of Christ, but placed the latter three years earlier than the current reckoning, so that our era would begin 5503 Alexandrian. After the accession of Diocletian in 284, however, they dropped 10 years, both from the year since the Creation and since the Incarnation, making in fact two eras instead of one. To convert this era into our own, in the first 8 months of the year subtract 5,502 up to and including 5786 Alexandrian, after that date, 5,492; in the last 4 months, 5,503 and 5,493, respectively. This era was used by the Coptic Church till the 15th century, and is still retained in the Abyssinian. (3) *Era of Antioch.* The Syrian Christians, early in the 4th century, adopted Julius Africanus' reckoning as above, but dropped 10 years from it as the Alexandrians had already done; placing the Incarnation, however, as in our own era, three years later than the Alexandrian. As regards the Creation, therefore, the two eras are seven years apart up to Diocletian's time, and then coincide; as regards the Incarnation, the Antioch is three years less before that time and seven years later after it. Dates in this system are reduced to ours, as in the reformed Alexandrian calendar above.

Era of Diocletian, subsequently named Era of Martyrs.— At the same time that the Alexandrians changed their Creation era as above, they established a new and shorter one from the accession of Diocletian, 29 August (first of the Egyptian year) 284. The second name given implies that an attempt was made to start it from 303, the date of Diocletian's edict of persecution, but if so it was unsuccessful, as indeed a mere perpetuation of a strife was likely to be. The era is still used by the Copts of Egypt and the Abyssinians. The change from the Egyptian to the Julian calendar, and the peculiar complications it has introduced into the conversion from that era to ours, are too intricate to detail here. To make the change, add to their date 283 years 240 days in common years; if the date is between 30 August and the end of the year in the one before leap year, add 283 years 241 days. But the Ethiopians do not reckon the years continuously from the beginning: at the end of each 532 years (that is, 28×19, or the solar and lunar cycles multiplied together) they begin again with 1.

The Christian Era.— It is not generally realized how modern this epoch is in general use. It was introduced into Italy 533 A.D. by Dionysius Exiguus ("the lean"), a Roman abbot; was not introduced into Gaul (France) till the 8th, and not in current use there till the 9th; and came into use in England only in the latter part of the 8th. In Latin countries the current scheme before that was the cycle of indiction (below). Any uniform date is so useful that

its defects may be overlooked. That of having a double set of numbers, forward and back, is not serious. Perhaps the chief inconvenience in calculating backward is that of calling the year preceding the era 1 B.C. instead of 0; thereby making the leap years on the backward series fall on the odd years, 1, 5, etc., or else making 7 years between the first one previous and the first one after. Astronomers rectify this by calling the first year previous 0. For the different dates on which the beginning of the year has been placed, see CALENDAR. Dionysius fixed the birth of Christ in 754 of the Roman Era, but he began the year 1 with the Annunciation, 25 March of the year preceding. In ecclesiastical and common usage it has begun at Christmas, Easter, 1 March, and other dates. In England from the 7th to the 13th century it was on Christmas; in the 12th the Annunciation began to be used as well, and from the 13th till 1752 remained paramount. The different beginnings of the year must be carefully taken into account in studying mediæval history.

Cycle of Indiction.— This was a period of 15 years, whose object has been already explained. It was generally used in the Western or Latin empire for several centuries before the Christian Era became general. It began in the year 313, or was referred to that year as a start. There were three, differing only as to the beginning of the year: (1) The Constantinopolitan, beginning in September, like the Greek year; generally used in the Eastern or Greek empire, and sometimes in France. (2) The Imperial or Constantinian, attributed to Constantine the Great, called also the Cæsarean. It began 24 September, and was used by old French and English chroniclers. (3) The Roman or Pontifical, beginning on Christmas or 1 January as custom varied; often used in papal bulls, and sometimes in old French writers. To find the number of any year in the Indiction, add 3 to the date (our era), divide by 15, and the remainder is the number. If the remainder is 0, the year is the fifteenth or last of the cycle.

Armenian Era.— This starts from the Council of Tiben, 9 July 552, when the Armenian schism began by condemnation of the acts of the Council of Chalcedon. The Armenian civil year is the Egyptian year of 365 days. out of all measure with others; their ecclesiastical year begins 11 August, and has the Julian calendar. They also use the Creation Era of Constantinople along with their own, dating documents with both on occasion. In business with Europeans they employ our era and our year. To convert their civil dates to our era, multiply the number of Armenian years by 365; add the number of days from 1 January to the given date; subtract 176; the remainder will be the number of days from 1 Jan. 553 to the given date; reduce this to Julian years, add 552, and this gives the date in the Julian year, old style. Add the requisite number in the Gregorian calendar if desired. In ecclesiastical reckonings, add 551 years 223 days. In leap years, if the date is between 1 March and 10 August, subtract one day from the above.

Mohammedan Era.— This commemorates the Hijra or Hegira (flight) of the Prophet from Mecca to Medina, 622 A.D. It does not, however, date from the flight, but from 68 days previous, 16 July, or as some have it, 15 July. The methods of computation are too complicated and uncertain to be given here: Mohammedan chronology is one of the most treacherous of subjects, and even experts disagree and go astray.

Persian or Gelalæan Era.— This begins with the accession of Yezdegird III. to the throne of Persia, 16 June 632. Till 1079 the Persian had the random Egyptian year, 365 days without intercalation; it was then reformed by Omar Khayyam, the great poet and astronomer, under Malek Shah, to a degree almost as accurate as the Gregorian. There were seven successive leap years once in four years, but the eighth was deferred till the fifth year. This method was once universal in Persia, and is still followed by the Parsees of India. Owing to the days of error accumulated by the old year, the day of beginning is thrown back, so that the Persian year can be converted into ours by adding 631.

Hindu Eras.— The philosophers divided the duration of the world into four *yugs* or ages, of which three are past, and the present corrupt one, the *kali-yug*, is alone historical. It begins 3101 B.C. and includes several others in use. The Era of Vikramaditya, from a Hindu Augustus who may or may not be historical, is reckoned from 57 B.C. This monarch is generally attributed to the 5th or 6th century if real, and the epoch is thought a sidereal one. The Era of Salivahana is 78 A.D. This is used in southern India, and commemorates an equally dubious ruler. The Fusli Era, used in revenue transactions all over India, is not uniform, but the most usual begins 590 A.D.; it seems to be a Mohammedan one, and to correspond roughly to the Hegira. The Bengali Era is another of the sort, and is set at 631. There are also others which are used in different provinces. The 60-year cycle is employed, its date being variously set.

Chinese Chronology.— This rests on cycles of 60 years, the mathematical tribunal fixing their start at 2277 B.C. But since 163 B.C. the Chinese writers have used periods called Nien-hao, each beginning with the accession of some emperor, and named after him, as with English laws, and ending when he or some successor chooses to begin a new period. Tables of Nien-hao are therefore needed to identify the years.

FORREST MORGAN,
Connecticut Historical Society.

Chronom'eter (Gr. Χρόνος, "time"+*μέτρον*, "measure" = "time-measurer"), an instrument designed to measure time with great accuracy, and much used in scientific work and for the determination of longitude at sea. The marine chronometer bears a strong superficial resemblance to a watch, except that it is larger and is mounted upon gimbals, so that the motion of the ship may affect it as little as possible. In its mechanism it differs from a watch chiefly in the design of its escapement and balance-wheel. The usual form of escapement, as invented by Le Roy about 1765 and greatly improved by Earnshaw and Arnold some 15 years later, is shown in Fig. 1.

In the ordinary watch the balance-wheel is in connection with the train of wheels leading from the mainspring continuously, or nearly so; but in the chronometer it is free from these during the greater part of the time, so that its natural period of vibration is more nearly realized. A is the escape-wheel, which is in gear with the other wheels of the instrument and is prevented from free rotation by means of the locking-pallet, D. B is a disk (technically

known as the "impulse-roller") secured to the same staff, or axis, as the balance-wheel. F is the "detent spring," which serves to return the light frame, G, and the locking-pallet, D, to the position they have in the illustration, after the detent has been tripped by the balance-wheel. A set screw is provided for preventing the locking-pallet, D, from being drawn too far into the escape-wheel, but this has been omitted in the illustration for the sake of greater clearness.

When the mechanism is in the state shown, the balance-spring should be free from strain; but the balance-wheel is moving with its maximum velocity in the direction (let it be supposed) of the arrow, so that in another instant the discharging-pallet, H, will trip the detent by momentarily withdrawing the locking-pallet, D. The escape-wheel, A, is then free to rotate until again arrested by the locking-pallet, D; but as it does so it engages the impulse-pallet, C, and accelerates the balance-wheel. After the escape-wheel has been arrested by the locking-pallet, the balance-wheel continues its excursion until the energy of its motion has all been expended in winding up the balance-spring. The balance-spring then preponderates, and the wheel returns to the opposite extreme of its swing without disturbing the locking-pallet, D; the discharging-pallet, H, merely raising the light gold spring, E, as it passes the detent. In most chronometers the balance-spring is made in the form of a helix instead of a flat spiral.

The balance-wheel is also compensated for change of temperature, though this feature can hardly be said to constitute a point of difference between a chronometer and a watch, since practically all of the better grades of watches are now similarly compensated. The effect of an increase of temperature upon the rate of a chronometer (or watch) is of a dual nature. If the instrument keeps correct time at one temperature, then, unless some mode of compensation is provided, it will lose time at all higher

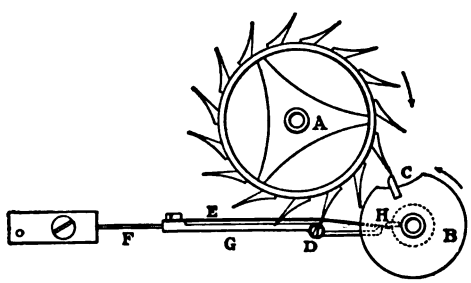

FIG. 1.—Chronometer Escapement.

temperatures, because (1) the strength of the balance-spring is less at higher temperatures, and (2) the wheel itself is greater in diameter on account of its natural expansion, so that it has a greater moment of inertia, and hence responds more sluggishly to the action of the balance-spring. To counteract these effects as far as possible, certain weights are provided along the rim of the wheel and the wheel is so designed that as the temperature rises these weights are automatically thrown nearer to the axis of rotation. The moment of inertia of the wheel is thereby reduced, and the wheel is caused to respond to the weakened spring with precisely the same readiness as before. The essential parts of the balance-wheel of a marine chronometer are shown in Fig. 2. The rim is

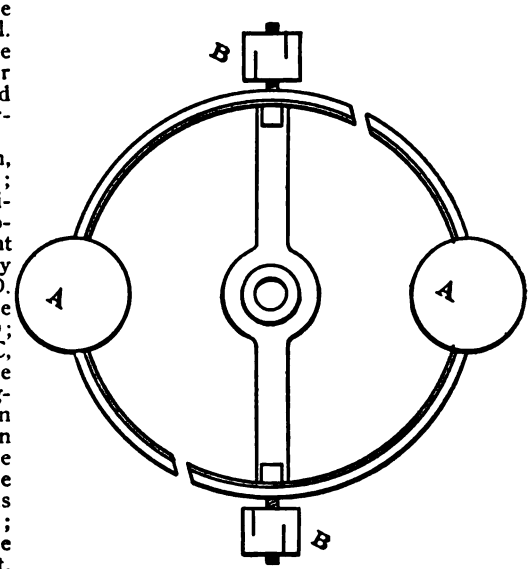

FIG. 2.—Balance Wheel of Marine Chronometer.

divided by transverse cuts into two equal, semicircular segments, each of which is supported near one end; and it is built up of two concentric metal strips, of which the inner is steel, while the outer (which is twice as thick) is of brass. As the temperature rises the brass expands more than the steel, so that the rim-segments are deflected inward, and the weights, AA, are caused to approach the axis (or "staff") of the wheel. The two masses AA must always be opposite one another, in order that the balance may not be thrown out of poise; but they are slotted so that they may be slid along the rim. If a chronometer keeps correct time at one temperature, but loses at a higher temperature, the compensation is not sufficient, and the masses AA must be shifted toward the free ends of the rim-segments. If it gains at the higher temperature it is over-compensated, and the masses AA must be shifted toward the fixed ends of the rim-segments. In practice it is found to be impossible to adjust the masses so that the instrument shall be perfectly compensated at all temperatures. In fact, the theory of the balance shows that there are only two temperatures at which the chronometer can be expected to keep correct time, though these two may be selected arbitrarily, and the instrument adjusted accordingly. In marine chronometers the temperatures so selected are usually 45° and 90° F., and at intermediate temperatures the instruments will gain. Hartnup, the director of the Liverpool Observatory, concluded, as the result of experiments upon 1,000 chronometers, that the error in rate from imperfect compensation may amount to 1.5 seconds per 24 hours at temperatures 15° F. above or below either of the points at which the balance is standardized, when the balance-spring is of steel. With palladium springs the error is smaller. When the

balance has been compensated for temperature as accurately as possible, the moment of inertia of the wheel is adjusted so that the chronometer will keep correct time at the standard temperatures, by means of the slotted nuts BB. These turn upon screw-threads that are secured to the rim near the central arm, where their positions will not be sensibly affected by changes of temperature. If they are caused to approach the rim, the moment of inertia of the wheel is lessened, and the chronometer runs faster; and *vice-versa*. The slots in BB are provided so that the nuts may grasp their screws spring-tight, and so avoid backlash. (For full information on these matters and many others connected with time-pieces, consult F. J. Britten's 'Watch and Clockmakers' Handbook.')

Chronoscope, krŏn'ō-skōp, an ingenious instrument, due to Sir Charles Wheatstone, for the purpose of estimating the duration of certain luminous phenomena, such as the electric spark, which according to ordinary means of measurement, appear absolutely instantaneous. It is founded on what is known as persistence of the impression on the retina of the eye. When a burning stick is whirled rapidly through the air a line of light is seen, the impression that the eye receives from the bright point in one position remaining long after the point has moved to a new position. Wheatstone views the electric spark in a small steel mirror revolving with enormous, but measured, velocity, and having a motion arranged, so that, were the light permanent, the object would appear to describe a complete circle. If then the phenomenon be instantaneous, a mere point of the circle will be seen, but if it have a duration shorter than the time of a revolution of the mirror, but still not infinitely short, the image will stretch out into an arc of the circle proportionate in length to the duration. The principle has been employed to show the discontinuity of certain flames which from persistence of vision appear continuous. These, when viewed in a mirror revolving rapidly, appear as a number of points or streaks of light arranged at intervals along the circle.

Chrosperma, krō-spĕr'mą, a monotypic genus of plants of the natural order *Melanthaceæ;* the bunch-flower. The single species (*Muscætoxicum*) is commonly known as fly-poison, so called from its deadly effect on flies and similar insects. It abounds in dry sheltered soil from Arkansas and Tennessee eastward along the seaboard of the United States, in some sections reaching high altitudes.

Chrudim, Hroo'dēm, Austro-Hungary, a town and capital of a circle of the same name of Bohemia, situated 62 miles southeast of Prague on the river Chrudinka. It is a walled town and contains an old church and a Capuchin convent. It has manufactures of cloth; and the horse markets held here are the most important in the empire. Pop. 13,000.

Chrysal (krĭs ąl) **or the Adventures of a Guinea,** a satirical novel by Charles Johnstone, published in 1760. Chrysal, the spirit inhabiting a guinea, passes through many hands, from the prince's to the beggar's, and tells its own story, which is chiefly the adventures of those in whose possession it is for the time being.

Chrysalis, krĭs'ą-lĭs, the pupa stage in butterflies, succeeding the caterpillar. During this time the insect eats no food, living upon the fat stored up by the larva. (See PUPA.) The chrysalids of butterflies differ from the pupæ of moths in being often ornamented with brilliant golden spots which have given origin to the name "chrysalis" or "aurelia." Also the body is often strengthened or protected by tubercles situated on the head, back, and sides. They are either suspended head downward by the tail, or rest horizontally, with a thread passing around them to hold them securely. Many, if not most, chrysalids are protected from observation by their colors, which harmonize with the color of the object to which they are attached. Thus, the chrysalis of the milkweed butterfly (*Anosia archippus*) which is suspended among the pale-green leaves of the milkweed and does not hibernate, is of a pale-green tint; while those of *Papilio turnus,* or of *Pieris,* are gray, and so spotted with light and dark marks as to harmonize with the neutral tints of the boards or fence to which they are attached. These colors and markings are apparently due to the effects of light and shade. These tints are determined at the period when the caterpillar is about to pupate, or become a chrysalis, when the integument is soft and moist. Poulton found, by subjecting the partly formed chrysalis to artificial surroundings of different colors, that the breeding boxes, when lined with black paper, produced dark chrysalids; when lined with white, light-colored, or green ones, or when lined with gilt, they produced chrysalids of a distinctly golden color, more completely so than occurs in nature.

Certain chrysalids have been found to exhibit negative phototropism (q.v.); that is, are directly sensitive to light. They will, while suspended by the tail, change their position if sunlight strikes them, and move so as to keep in the shade, from a pendant to a horizontal position, through an angle varying in different species of from 45° to 70° or even 90°. Too much light, especially direct sunlight, seems to be injurious to them, and the movement is one of protection.

Chrysanthemum, krĭ-săn'thę-mŭm, a genus of herbs and sub-shrubs of the natural order *Compositæ.* The very numerous species are natives mostly of the cooler parts of the northern hemisphere, but some have become introduced and established in the southern hemisphere as weeds, having escaped from gardens. They are generally hardy, white or yellow-flowered, annual or perennial, and of easy cultivation. Except *C. cinerariæfolium* and *C. coccineum,* the flowers of which are used to make insect powder (q.v.), the species have small economic use, though some, notably *C. leucanthemum,* the ox-eye daisy, is a troublesome weed upon badly managed land in the United States. *C. segetum,* the corn-marigold, and *C. frutescens,* the marguerite, are cultivated for ornament, especially in Europe, where they are native.

But the most important species are *C. indicum* and *C. morifolium* (*C. sinense* of some botanists). These are the parents of the popular autumn flowers known as "mums" and chrysanthemums, the varieties of which in Europe and America are numbered by thousands, and vary greatly in size, form, and color. So great is the

U of A

CHRYSANTHEMUM

Uof M

diversity that fanciers speak of the varieties as belonging to certain types, of which 11 are recognized: Single, double, large, small, few-flowered, many-flowered, anemone-flowered, and various forms of the ray flowers, such as incurved, reflexed, etc. The size ranges from the "pompon," which may be less than an inch in diameter, to the "show," which may exceed eight inches in diameter. But with all this range of form and color the varieties are almost scentless, or have a somewhat disagreeable odor. These varieties are mainly cultivated under glass, since they do not reach perfection in the open air. They are propagated almost wholly from cuttings, which are taken from the parent plant after it has flowered. The cuttings are grown in a cool greenhouse until spring, when the young plants, then in pots, are placed in partial shade for the summer and kept as stocky as possible. In autumn they are forwarded until they blossom, after which they are destroyed, new cuttings having been taken.

For exhibition purposes the plants are watched and tended with the most minute attention, the superfluous buds and stems being removed while still tiny. Sandy or clayey soil is found useful by various growers, but whatever its character it must be rich and rather porous. Attention to fertilization, watering and cultivation are essential. For out-door culture the large-flowered varieties are unsuited, but the hardy pompons, which are usually free-flowering, are more satisfactory. Though the season of the indoor chrysanthemum is only about six weeks long, this flower ranks fourth in importance in the United States as a commercial flower, about $500,000 worth being used annually.

The literature dealing with this flower is voluminous, probably ranking next in extent to that dealing with the rose. Eighty-three books are listed by C. Harman Payne in the 'Catalogue' of the National Chrysanthemum Society (1896). Other references to literature are given under the title Chrysanthemum in Bailey's 'Cyclopedia of American Horticulture,' which should be consulted for descriptions of various species, types, etc., and for methods of propagation, cultivation, and management. Consult also: Scott, 'The Show Chrysanthemum and Its Cultivation'; and Bulletins 112, 136, and 147 (1896–8), of the Cornell University Agricultural Experiment Station.

Chrysarobin, krĭ-să'rō-bĭn, a neutral principle extracted from goa-powder, a substance found deposited in the heart wood of *Vouacapoua araroba.* It is an extremely irritating substance and is not used internally. Externally, combined with an ointment base, it is useful in a number of chronic skin affections.

Chryseïs, the daughter of Chryses, a priest of Apollo. She was captured by the Greeks in the Trojan war, and became the portion of Agamemnon. When he refused to restore the daughter at the request of her father, Apollo listened to the prayer of his priest, and sent by his arrows pestilence and death into the Greek camp. Agamemnon found himself obliged to yield up the maiden, but then robbed Achilles of the fair Briseïs. Hence arose the dissension between these heroes which so long delayed the conquest of Troy, and with which the story of the Iliad opens.

Chryselephantine, krĭs"ĕl-e-făn'tĭn, in Greek art, statues which were overlaid with ivory and gold. The frame or body of the statue upon which the ivory plates were fastened was usually of wood, and the gold was used for the garments and hair. The most celebrated of these statues were the colossal works of Phidias, of which the largest was the Pallas of the Parthenon, 26 cubits high, representing the goddess in armor covered with a long robe.

Chryses, a name appearing several times in Grecian legend: (1) a priest of Apollo, who, according to Homer, came to the Grecian camp to ransom his daughter Chryseïs, who had become the prize of Agamemnon. (2) The son of Neptune and Chrysogeneia, and the father of Minyas. (3) Was the son of Minos and the nymph Pareia. He lived on the island of Paros with his brothers Eurymedon, Naphaleon, and Philolaus, and was put to death by Hercules because he had, in concert with them, murdered two of his companions. (4) A son borne by Chryseïs to Agamemnon after her return to her father, but alleged by her to be the son of Apollo. He assisted his step-brother and step-sister, Orestes and Iphigenia, in murdering King Thoas.

Chrysippus, Greek Stoic philosopher of Cilicia: d. about 206 B.C. He was distinguished for his skill in disputing. He was the principal opponent of the Epicureans, and is said to have written 700 different works, mostly of a dialectical character; but of these no complete work is extant. He died at a great age.

Chrysis, a priestess of Juno, who by falling asleep suffered the sacred fire to destroy the temple of her goddess, and was at last burned herself.

Chrysobalanæ, krĭs-ō-băl'a-nae, a plant family closely allied to the *Rosaceæ,* of which it is sometimes considered a sub-order, comprising 12 genera, with 180 species, all trees or shrubs. Many of them, as the cocoa-plum, produce edible fruits. So do several species of west Africa, the seeds of which are sometimes substituted for or used to adulterate sweet almonds, which they resemble in taste and appearance. From the seeds of a member of the family growing in the Himalayas an oil is extracted.

Chrysoberyl, krĭs-ō-bĕr'ĭl (Gr. Χρυσοβήρυλλος, "golden beryl"), a native aluminate of glucinum (or beryllium), having the formula $GlO.Al_2O_3$, and crystallizing in the orthorhombic system. It is transparent or translucent, with a vitreous lustre and a green or yellow color. The variety alexandrite (q.v.) is green by daylight and columbine-red by artificial light. The finer varieties are used as gems. It has a hardness of 8.5 and a specific gravity of from 3.5 to 3.84. Chrysoberyl occurs in Brazil, in Ceylon, in the Urals, and in Ireland; and in the United States it has been found in Maine, Connecticut, and New York. See also CAT'S-EYE.

Chrysocolla, krĭs-ō-kŏl'la, a hydrated silicate of copper, having the formula $CuSiO_3 + 2H_2O$. It is cryptocrystalline and usually occurs in opal-like or earthy masses, or as incrustations, or not infrequently with botryoidal surface. When pure it is translucent and of sky-blue color, but when impure it is often opaque and dull green, brown or black. Its hardness varies

with its composition, from 2 to 4, and its specific gravity from 2 to 2.2. Its lustre varies from vitreous and shining in the pure mineral to dull and earthy. It is found in copper mines in all parts of the world, especially in Cornwall, England, Australia, and Arizona. The chrysocolla of the ancients, meaning "gold glue," was apparently a body used to facilitate soldering. The name is still applied to borax which is thus used. Malachite, the green carbonate of copper, was doubtless confused with chrysocolla.

Chrysogonum, krĭs-ō-gō'nŭm, a monotypic genus of the natural order *Compositæ*. It is found throughout the eastern seaboard of the United States, in dry soil, from southern Pennsylvania to Florida, blossoming in April and July. It is a perennial herb with large heads of tubular and radiate flowers.

Chrysolite, krĭs'ō-līt (Gr. *κρυσόλιφος* "bright yellow stone"), a native silicate magnesium and iron, sometimes also containing titanium, nickel, or tin. It occurs massive and granular, and also in orthorhombic crystals. It is transparent or translucent, and usually green or yellow in color, with a vitreous lustre. It has a specific gravity of from 3.27 to 3.57 (according to its composition), and a hardness of from 6.5 to 7. Chrysolite occurs in volcanic rocks, as in basalt and basaltic lavas, and it is also found in dolomite and in certain varieties of limestone. The finest crystals of the mineral come from Brazil and Egypt, and are known as "precious chrysolite." They are used to a certain extent as gems, and are sometimes confused with the emerald. Chrysolite readily passes by alteration into serpentine, and numerous large beds of the latter mineral are known to have originated in this manner. It is abundant in crystalline grains in some meteoric irons and stones. Peridot and olivine (qq.v.) are names frequently used for varieties of chrysolite.

Chrysoloras, Manuel, Greek scholar: b. about 1355; d. Constance, Germany, 15 April 1415. He was the first who, in modern times, transplanted Greek literature into Italy. The Emperor John Palæologus sent him in 1391 to Italy and England to ask for assistance against the Turks. Having thus become known in Italy he returned there about the year 1395, and was appointed professor of Greek literature at Florence, where he collected around him a great number of scholars of all ages and ranks, and excited universal enthusiasm as much by his dignity and the grace of his elocution as by the extent of his learning. From his school proceeded Leonardo Bruno, Poggius, Francis Philelphus, and other distinguished revivers of classical studies. He afterward taught with equal success at Milan, also at Pavia and Venice, and lastly at Rome. Pope Gregory XII. employed him in public affairs, and sent him with others to the Council of Constance, where he died in 1415. He should not be confounded with his nephew and companion in Italy, John Chrysoloras.

Chrysomelidæ, krĭs-ō-mĕl'ĭ-dē, an extensive family of small beetles which have a hemispherical or ovate form, small, sunken head, and antennæ widely separated. All, and especially the typical genus *Chrysomela*, are very gaily colored,—blue, green, golden, or a mixture of brilliant tints. The most elegant American species (*C. scalaris*) has the head, thorax, and under side dark green, while the wing-covers are silvery white, ornamented with small green spots on the sides and a broad irregular stripe down the middle of the back; the legs and antennæ are rust-red, and the wings rose-colored. These beetles inhabit trees, bushes, and plants, feeding, in their larval state, on the leaves. They include many species, as the potato-bug and the elm-leaf beetle, which do vast damage. Their eggs are laid on the leaves, and the grubs, which as a rule are protected by disagreeable odors and exudations, go into the ground to transform, and there spend their pupal life. The family is a very large one and is spread all over the world. See LEAF-BEETLES.

Chrysophanic (krĭs-ō-făn'ĭk) **Acid,** the yellow coloring matter of rhubarb. It can be obtained direct from rhubarb by exhausting with benzol and purifying the crude product. It crystallizes in fine yellow tables. It is hardly soluble in water, but dissolves in ether, benzol, etc. With potash it gives a fine purple solution, and thus affords a delicate test for the presence of alkalis. It is also soluble, without decomposition, in strong sulphuric acid. Its acid properties are rather obscure.

Chrysophyllum, krĭs-ō-fil'ŭm, a genus of the sapadillo family (*Sapotaceæ*), consisting of trees with milky juice, alternate leaves with numerous transverse closely aggregated ribs, and golden hairs on the under surface. In the West Indies the fruit (*cainito*) is esteemed a delicacy under the name of star-apple, which is fleshy, with several one-sided cells, or by abortion, with one. Seeds nut-like. Natives chiefly of southern United States, Africa, and India.

Chrysoprase, krĭs'ō-prāz, a variety of chalcedony, colored apple-green by nickel oxide and prized as a semi-precious stone. It became popular a few years ago because of Queen Victoria's fondness for it. Silesia and Siberia long furnished a small supply, but recent discoveries in California have made it abundant and cheap. It also occurs in Oregon and North Carolina.

Chrysopsis, krĭ-sŏp'sĭs (from the Greek, signifying "of a golden aspect"), a genus of about 20 species of the natural order *Compositæ*, comprising nearly 30 species, natives of North America and Mexico. Commonly known as the golden aster.

Chrysostom, Dion (surnamed COCCEIANUS), Greek orator: b. Prusa in Bithynia about 99 A.D. He was first a Sophist, then a Stoic, and rose into high repute as an orator under Domitian. That tyrant, however, took offense at his freedom of speech, and he was obliged to save himself by flight. He was afterward highly esteemed by Nerva and Trajan. About 80 of his orations are still extant. They are written in an affected style, but notwithstanding form a valuable contribution to our knowledge of ancient philosophy. They appeared first in a collected form at Milan in 1476.

Chrysostom, John, Saint, archbishop of Constantinople, greatest of the Greek Fathers of the Church: b. Antioch, the capital of Syria, about 347. His cognomen, the golden-mouthed (*chrysostomos*), he owes to his extraordinarily rich, fervid, and persuasive eloquence. In his youth

he attended the school of Libanius, a celebrated Pagan sophist, was his favorite disciple, and would have been his successor had he not been won for the service of the Church by his pious mother Anthusa. In accordance with the general usage of that time, he did not receive baptism till he had attained maturity, and then he lived devoted in religious contemplation and studious seclusion in a desert place for six years. There the austerities he practised undermined his strength, and being called back to Antioch by the bishop, he was ordained deacon in 381 and presbyter in 386. By his zeal, his urbanity, and his eloquence, he won to the Church, heretics, pagans, and Jews in great numbers; and his fame spreading to the capital city of the Eastern empire, he was, with the approval of the Emperor Arcadius chosen to be archbishop of Constantinople in 397. Here he led in the episcopal palace the life of an ascetic, eschewing the pomp and luxury of his predecessors, and out of the revenues of the see maintained numerous charities. Meanwhile his homilies or pulpit discourses, which are still extant, were even a stronger attraction for the masses than the shows of the amphitheatre. But he had many rivals, who left no means untried to blacken his character, his reputation for piety, zeal, disinterestedness, and for orthodoxy, and his life was accordingly full of trials and vicissitudes. His enforcement of the Church's laws regarding the relations between ecclesiastics and the female inmates of their households; his deposition of bishops for simony and licentiousness; the restraints he put upon the vagrant habits of the monks, called forth a host of enemies, who brought against him the charge of sympathizing with heretical monks of the Nubian desert who had been excommunicated by their ecclesiastical superior, Theophilus, patriarch of Alexandria. Theophilus now added himself to the malcontents of Constantinople, and he called a synod of bishops to be held in the imperial city to judge Chrysostom. But because of the menacing attitude of the common people, who were to a man loyal to their archbishop, the synod had to be held in the neighboring city of Chalcedon. To this synod Chrysostom was four times summoned, to reply to the charges that were to be made against him, but he ignored the summons, and was declared guilty of favoring the heresies of Origen. By order of the emperor Arcadius he was exiled to Nicæa in Bithynia; but so great was the commotion of the common people in Constantinople when the decree of banishment was published, that the emperor, alarmed, ordered his recall. The re-entry of Chrysostom to the city was attended with all the pomp of a Roman triumphal procession, and he abated no jot of his zeal for the repression of the evils of Church and state. His language was, as it had ever been, sufficiently emphatic, sufficiently plain-spoken, but his enemies put in circulation a spurious version of the opening passage of his first discourse after his return: he was reported by them to have commenced his address with these words in denunciation of the empress Eudoxia: "Herodias is again furious; Herodias again dances; she once more demands the head of John." The report was false, but the fate of Chrysostom was sealed. Barbarian troops were brought into the city to overawe the commons while another synod was in session in the city: it confirmed the decree of the synod of Chalcedon. By decree of the emperor, Chrysostom was banished to Cucusus, a place in Mt. Taurus. The people of Constantinople, not to be restrained by the garrison of Gothic mercenaries in the city, set fire to the cathedral and the senate house on the day the decree was published; and Chrysostom, though absent, was a more formidable power than ever: his correspondence with bishops, both in the East and West arrayed the whole Catholic Church against Theophilus and the court of Arcadius. Indignant at the contumacy of the exiled archbishop, Arcadius ordered his transfer to a more inhospitable region still, the desert of Pityos: he died on the way thither at Comana, in Pontus, 14 Sept. 407, being then in his 60th year. His day in the calendar of the Greek Church is 13 November; in that of the Latin Church, 27 January. His last words are reported to have been "God be in all things praised." His works that are still extant are very voluminous, and they fully justify the high repute he enjoyed, both as an orator and an expounder of the Scripture books and of points of doctrine. They consist of homilies or discourses suggested by or illustrating passages of Scripture; commentaries on the sacred books; epistles, and treatises on the truths of religion, virtues and vices, etc.

Chrysotile, krīs'-ō-tīl, a variety of the mineral serpentine, occurring in silky fibres that are flexible and easily separated. It is commonly greenish in color. Its specific gravity is about 2.22, which is sensibly less than that of ordinary serpentine. It occurs abundantly in Canada, where it is known as "bostonite" and "asbestos." See ASBESTOS.

Chrystler's Farm, Battle of, the most discreditable American defeat, as Chippewa was the most brilliant victory, of the War of 1812, was fought 11 Nov. 1813. The expedition prepared in the summer and fall of 1813 at Sackett's Harbor, on Lake Ontario, to descend the St. Lawrence and capture Montreal, started 17 October under bad auspices. Aside from insufficient resources and the lateness of the season, the personnel was hopeless. The commander-in-chief alone would have ruined it. This was Maj.-Gen. James Wilkinson, termed by Scott, "an unprincipled imbecile," a mere cunning jobber, of neither military talent, firmness, nor even character to be respected, and despised by all the other officers. He had been appointed for the curious reason that New Orleans was not thought safe in his hands. Furthermore, he was prostrated with lake fever, as was his second in command, Morgan Lewis. Boyd, the third, was so incompetent that Jacob Brown, the one able fighting general, had threatened to leave the army rather than serve under him. Men cannot fight without leaders. The flotilla, battered by contrary winds, began the descent of the river 5 November. From this on, the British made progress slow and dangerous. Capt. Mulcaster, an able and daring naval officer, with several gunboats, harassed the rear, and 800 regular infantry co-operated with him, pouring musketry and artillery fire on the expedition from the opposite bank whenever possible, besides the batteries at Prescott. Brown's and

Macomb's brigades were landed on that side to clear the road; and by 10 November the flotilla had reached the Long Saut, and anchored for the night at Chrystler's Farm on the Canadian side. The next morning Brown marched down beside the rapids with his brigade, and Boyd was ordered to take the rest of the troops, some 2,000, with six field pieces, and guard the rear. Brown reported all clear, and the fleet was about to run the rapids when Boyd reported that the enemy was advancing in order of battle. Wilkinson was sick in bed and could give no orders; so was Lewis; and Boyd was left to fight his own battle. He did it as a weak commander usually does, by detachments, which the British crushed in detail, though they had but 800 against 2,000. The battle lasted from about 2.30 to 4.30, when Gen. Covington was killed and his brigade driven back in disorder. Then the whole American line gave way and retreated in haste. Wilkinson reported 102 killed and 237 wounded, and the British claim to 100 American prisoners is more likely to be true than Wilkinson's report of none. The British reported 22 killed, 148 wounded, and 12 missing. The American troops hurriedly re-embarked; the next morning the flotilla ran the rapids to Cornwall. There Wilkinson learned that his colleague, Wade Hampton, had ended operations for the season (see CHATEAUGAY), and at once went into winter quarters. Consult Henry Adams, 'History of the United States,' Vol. VII., chap. 8.

Chu-Hi, choo-hē', Chinese scholar and philosopher: b. 1130; d. 1200. As a student of the Chinese classics, he became widely known through his interpretation of the doctrines of Confucius, and became one of the founders of the Chinese school of speculative philosophy. He had a large number of disciples among the scholars, and they, under his direction, compiled a history of China in 59 books, which is still a standard work.

Chu-Kiang, choo-ke-äng', or **Canton, River,** the "Pearl River" of the Chinese, is the lower part of the Pe-Kiang, and has a navigable channel of about 300 miles. Opposite Canton it is about one fourth mile wide, and is crowded with shipping up to 1,000 tons burden; larger vessels must tie up at a point 15 miles below. About 40 miles below Canton it is called "Boca Tigris," or "The Bogue."

Chub, a name given to various species of fishes of the family *Cyprinidæ* (q.v.), of which the river chub (*Hybopsis kentuckiensis*) and the creek chub (*Semotilus atromaculatus*) are the most important in the United States. The name is also sometimes applied to the roach (q.v.), and more rarely to certain marine fishes, as the rudder-fish. The river chub is abundant in rivers and creeks throughout the eastern United States, and may be known by its orange-colored fins and the tuberculate head of the males in spring. It reaches a length of 10 to 12 inches, and is a favorite with the less ambitious anglers in certain regions. The creek chub, or horned dace, is even more widely distributed, and inhabits brooks rather than rivers. It resembles the roach, but has a black spot in front of the dorsal fin and does not exceed a foot in length. The large black chub (*Acrocheilus alutaceus*), of the Pacific coast rivers, is known locally as chiselmouth, squaremouth, and hardmouth. The English chub (*Squalius cephalus*) is a much larger fish, attaining a length of two feet and a weight of eight pounds, and lives in mountain brooks as well as in rivers. It is a game fish of considerable importance.

Chub-mackerel, a fish (*Scomber colias*), found in immense numbers in the Mediterranean Sea. It is the "Spanish mackerel" of England.

Chubb, Thomas, English controversialist: b. East Harnham, near Salisbury, 29 Sept. 1679; d. Salisbury 7 Feb. 1747. He was a mechanic who employed his leisure in the acquisition of knowledge from the best English books which he could procure. In 1715 he published 'The Supremacy of the Father Asserted,' the perspicuity and argumentative skill of which obtained for it much notice. Of course a production assailing the orthodox faith did not pass without reply, and a controversial warfare commenced which lasted as long as his life. In 1730 he offered to the world his thoughts on a variety of topics, moral and theological, in thirty-four tracts, collected in a 4to volume, of which book Pope in a letter to Gay speaks with great respect. Various publications followed, for example, 'A Discourse Concerning Reason'; 'The True Gospel of Jesus Christ Asserted'; 'Inquiry into the Ground and Foundation of Religion,' etc.

Chubb Lock (so called from the name of the inventor), one of the most intricate of the many-tumbler locks which were first made in England by Barron in 1774. The locks of Chubb have obtained their celebrity partly from their superior workmanship, having more tumblers than usual, with the addition of a lever called the "detector," which is so fixed that, while it does not act under the ordinary application of the key, it cannot fail to move if any one of the tumblers be lifted a little too high, as must be the case in any attempt at picking. The bolt becomes immovably fixed, and thus, while rendering all further attempts at picking useless, gives notice that such an attempt has been made on the next application of the proper key. To draw the bolt after it has been tampered with, it is necessary only to turn the key a little farther forward, as in the process of overlocking; this pushes up a tooth at the end of the detector, restoring the lock to its original position, and the key is then free to turn in the ordinary way. These locks, which were patented as far back as 1818, maintained the reputation of being invincible until the celebrated locksmith Hobbs, of the United States, in 1851 succeeded in picking the most intricate locks of English workmanship, such as Chubbs, Bramahs, and Cotterills.

Chubut, choo-boot', Argentina, a territory in the northern part of Patagonia, so named from a river which drains a large part of the surface. Its area is about 90,000 square miles. Its principal interest lies in its Welsh settlement, which has remained almost wholly Welsh-speaking. The first settlers, 151, arrived in July 1865. Epochs in its history have been the abandonment of the colony in 1867; the subsequent return from New Bay; a 20 months' nearly complete isolation from the outer world, terminated in 1871. The principal town, Rawson, is situated about five miles from the Atlantic Ocean, and has a population of a few hundreds. English grain and roots are produced, and salt of good quality is found.

Chuck'-Will's-Wid'ow, a large, nocturnal bird (*Antrostomus carolinensis*) related to the whippoorwill, common in the Southern States of the Union. The name is an attempt to reproduce the note of the bird. It is fully 12 inches in length, and is one of the largest of American song-birds, and when uttering its call, opens its mouth enormously. The eggs are laid upon the ground, little or no attempt being made to form a nest. The bird is a voracious eater of insects, its large bristled mouth fitting it for catching flying objects.

Chuckwal'la. See LIZARD.

Chufa, choo'fa. See NUT-GRASS.

Chu'kor, or Chicore, a partridge (*Caccabis chukor*), the favorite game-bird of the foothills of the Himalayas.

Chumbul', a large river of Hindustan. It rises in Malwa, in the Vindhya Mountains, about 50 miles south of Oojein, flows north, enters Rajpootana, through which it runs northeast, and falls into the Jumna about 90 miles southeast of Agra, after a course of over 650 miles.

Chunam', in India, a name given to a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.). It is also used for plaster, being mixed with fine sand by wetting, and sometimes with various other materials added. It makes a plaster of great durability, capable of being highly polished, and suitable for decorative work.

Chunar-Ghur, chŭn-är'gėr, India, a town, fortress, and invalid station in Hindustan, 17 miles southwest of Benares, on the Ganges. The fortress stands on a lofty rock rising abruptly from the river. Chunar was stormed by the British in 1764, and formally ceded to the East India Company in 1768. Pop. 12,000.

Chung-King, chŭng-kĕng', China, a city in Szechuen, on the Yang-tze-Kiang, at its junction with the Kia-ling. It was declared open in 1890, and has acquired a thriving trade. There was a rebellion of the natives here in 1896–8, which checked progress. A railroad to centre at Chung-King is projected, and valuable coal-mines are to be worked. Pop. about 125,000.

Chuprah, chŭp-rä', or **Chaprah,** India, a town of Hindustan, in Bengal, on the Gogra, near its junction with the Ganges, 32 miles west-northwest of Patna. It is narrow, but extends along the river for four miles. It has government courts and offices, government English school, and is a station of the German Lutheran Mission. Pop. (1901) 45,400.

Chuquisaca, choo-kē-sä'ka, Bolivia, a department in the southeastern part of the country, bounded on the north by the department of Santa Cruz, on the east by Brazil, on the south by the department of Tarija, and on the west by the departments of Oruro and Potosi. Its area is variously estimated at from 40,000 to 73,000 square miles, the southern boundary of Bolivia not having been definitely determined The eastern portion is mostly level, the mountainous parts being in the west. There are large forests and grazing lands, and the soil, where cultivated, is found good for agriculture. Mineral deposits exist, the most valuable being silver, of which some is mined. Among the other productions are wheat, coffee, sugarcane, and cacao. The capital of the department, and also of the republic, is Sucre (q.v.). The population is about 285,000, embracing 80,000 civilized Indians and 8,000 whites, the rest being wild Indians.

Church, Albert E., American mathematician and military officer: b. Salisbury, Conn., 1807; d. West Point, N. Y., 30 March 1878. He was educated at West Point and was professor of mathematics there 1834–78. His mathematical works include 'Elements of Differential and Integral Calculus' (1842); 'Elements of Analytical Geometry' (1851); 'Analytical Trigonometry' (1857); 'Elements of Descriptive Geometry' (1865).

Church, Alfred John, English translator and author: b. London 29 Jan. 1829. He was educated at Lincoln College, Oxford; was ordained in the English Church in 1853, and after holding several head masterships, was professor of Latin in University College, London, 1880–8; and rector of Ashley, Gloucestershire, 1892–7. Beside publishing translations of Tacitus and Livy, he is the author of 'Stories from Homer' (1877); 'Stories from Virgil' (1878); 'A Traveler's True Tale, after Lucian' (1879); 'Stories from the Greek Tragedians' (1879); 'Stories from the East' (1880); 'The Story of Jerusalem' (1880); 'The Story of the Persian War' (1881); 'Stories from Livy' (1882); 'Roman Life in the Days of Cicero' (1883); 'The Chantry Priest of Barnet' (1884); 'With the King at Oxford' (1885); 'Two Thousand Years Ago, or the Adventures of a Roman Boy' (1885); 'Carthage' (1887); 'The Count of the Saxon Shore' (1887); 'Three Greek Children' (1888); 'To the Lions' (1889); 'Burning of Rome' (1891); 'Pictures of Roman Life and Story' (1892); 'Early Britain'; 'Bacon'; 'Callias'; 'Heroes of Chivalry'; 'Lords of the World'; 'Helmet and Spear'; 'Spencer'; etc. His books have been widely read in America.

Church, Arthur Herbert, English chemist: b. London 2 June 1834. He was educated at King's College, London, the Royal College of Chemistry, and Lincoln College, Oxford. He was professor of chemistry in the Royal Agricultural College, Cirencestor, 1863–79; and has filled the same position in the Royal Academy of Arts from 1879. He is the discoverer of the animal pigment known as turacin, and of churchite, a native cerium phosphate, and has published 'Precious Stones' (1883); 'English Earthenware' (1884); 'The Laboratory Guide' (7th ed. 1894); 'Food' (16th thousand, 1901); 'Josiah Wedgewood' (1894); 'Color'; 'Guide to Corinium Museum.'

Church, Benjamin, American soldier: b. Duxbury, Mass., March 1639; d. Little Compton, R. I., 17 Jan. 1718. He commanded forces with distinction in King Philip's war and in the famous battle of 1675 with the Narragansetts won renown. He captured and executed King Philip in 1676. 'Entertaining Passages Relating to King Philip's War' were compiled from his notes by his son Thomas.

Church, Benjamin, American physician: b. Massachusetts about 1710; d. 1776. He was graduated at Harvard; became noted for his patriotic writings during the decade preceding

the Revolutionary War, and was a leader in the "Boston tea-party." He secretly corresponded in cipher with the British, and, being detected, failed to exculpate himself. He was lost at sea while on a voyage to the West Indies.

Church, Francis Pharcellus, American editor: b. Rochester, N. Y., 22 Feb. 1839. He was the first publisher and editor of the 'Army and Navy Journal'; afterward, with his brother, he established and edited the 'Galaxy' magazine. He is a leading editorial writer on the New York *Sun*, with which he has been connected for a quarter of a century and is still a proprietor of the 'Army and Navy Journal.' He has published 'Life of Ulysses S. Grant' (1899); and 'Life of John Ericsson' (1891).

Church, Frederick Edwin, American landscape painter: b. Hartford, Conn., 4 May 1826; d. New York 7 April 1900. His earliest productions were views of the Catskill Mountains, among which he resided, and a view of East Rock, near New Haven, which attracted very favorable notice. In 1855 he visited South America, and found in the magnificent scenery of that country materials for several of his most admired pictures. After his return he executed his 'View of Niagara Falls from the Canadian Shore,' regarded by many as the most successful representation of the great cataract. Among his other works are 'The Heart of the Andes'; 'Cotopaxi'; 'Morning on the Cordilleras'; 'Under Niagara'; 'The Icebergs'; and 'Sunrise on Mount Desert Island.' After a visit to the Holy Land in 1868 he painted 'Damascus' (1869); 'Jerusalem' (1870); 'The Parthenon' (1871).

Church, Frederick Stuart, American artist: b. Grand Rapids, Mich., 1842. He studied at the National Academy of Design, and since 1885 has been a full member thereof. He has achieved note as a realist and is well known as a painter of figures and animals.

Church, George Earl, American soldier, engineer and explorer: b. New Bedford, Mass., 7 Dec. 1835. He was a member of the Scientific Exploring Expedition in South America in 1858; served in the Army of the Potomac 1862–5; and was war correspondent in Mexico for the New York *Herald* 1866–7. He made explorations in South America 1868–72; was United States commissioner to visit and report on Ecuador 1880; represented American Society of Civil Engineers at London Congress of Hygiene and Demography in 1891, and was president of the Geographical Society of the British Association in 1898. He is now resident in London where he is vice-president of the Royal Geographical Society.

Church, Irving Porter, American civil engineer: b. Ansonia, Conn., 22 July 1851. He was educated at Cornell University and has been professor of applied mechanics and hydraulics in the College of Civil Engineering there, from 1892. He has published 'Statics and Dynamics for Engineering Students' (1886); 'Mechanics of Materials' (1887); 'Hydraulics and Pneumatics' (1890); 'Notes and Examples in Mechanics' (1892).

Church, John Adams, American mining engineer: b. Rochester, N. Y., 5 April 1843. He was graduated from the Columbia School of Mines in 1867, was professor of metallurgy in Ohio State University 1878–81, and was four years in the service of Li Hung Chang in Mongolia, engaged in developing silver mines. He has published 'Notes on a Metallurgical Journey in Europe'; 'The Comstock Lode'; 'Report on Artesian Wells in Arizona.'

Church, Richard William, English clergyman: b. Lisbon 25 April 1815; d. London 9 Dec. 1890. He took a first-class at Oxford in 1836, and soon after was elected to a fellowship at Oriel. From 1853 to 1871 he held the rectory of Whatley, near Frome. In 1871 he became dean of St. Paul's Cathedral, London. In 1854 he published 'Essays and Reviews,' and thereby took rank almost at once as one of the most graceful and scholarly writers of the day. His university sermons 'Human Life and its Conditions' (1878); 'The Gifts of Civilization' (1880); and 'The Discipline of the Christian Character' (1885), are profound contributions to religious thought. Other works by him are 'Life of Anselm' (1871); 'The Beginning of the Middle Ages' (1877); 'Dante: an Essay' (1878); 'Spenser' (1879); 'Bacon' (1879); 'The Oxford Movement' (1891); 'Miscellaneous Essays'; 'Occasional Essays.' See 'Life and Letters of,' (1896).

Church, Samuel Harden, American writer: b. Caldwell County, Mo., 24 Jan. 1858. He is a railway official in Pittsburg, Pa., and has written 'Oliver Cromwell: a History' (1874); 'John Mannaduke,' a romance (1897); 'Corporate History of the Pennsylvania Lines West of Pittsburg' (1898–1900).

Church, William Conant, American journalist: b. Rochester, N. Y., 11 Aug. 1836. He became the publisher of the New York *Sun* in 1860, and was war correspondent of the *Times* (1861–2). In conjunction with his brother Francis (q.v.) he established the 'Army and Navy Journal' (1863), and the 'Galaxy' magazine (1866), and has been a contributor to the 'Century' and other periodicals.

Church. This word probably comes from the Greek *kyriakos*, dedicated to the Lord; the Scottish *kirk* and German *kirche* are forms of the same word. It has various meanings; in its widest sense it denotes the whole community of Christians, and was thus used by the New Testament writers. In more restricted significations it denotes a particular section of the Christian community differing in doctrinal matters from the remainder, as the Roman Catholic Church, the Protestant Church, etc.; or to designate the recognized leading church of a nation, as the English, Scotch, or French Church. It is applied in a sense which is manifestly too narrow, when it denotes merely the officers of the church, or clergy. In yet another sense it signifies the building in which Christians assemble for the worship of God, and, referring the reader to the separate articles on the sects into which the community is divided, we shall confine ourselves here to a few remarks, historical and descriptive, on *church* as denoting the edifice appropriated to Christian worship. When in the time of Constantine the persecuted Christians emerged from their meeting-places in upper rooms and in the Roman catacombs to bask in the sunshine of imperial favor, no buildings could be found fitter for their purposes than the

basilicas of Rome. The basilica was generally in the form of a parallelogram, with a semicircular apse at one end, which was raised, being approached by a semicircular range of steps. In the centre of this apse was the raised seat of the quæstor or other presiding magistrate; on each side, upon the steps, were places for the assessors, or those engaged on the business being transacted. In front of the apse was placed an altar, where sacrifice was performed before undertaking public business of any importance. The area of the building was divided by two rows of columns, the central division or nave being by far the broadest; over the two smaller divisions or aisles a gallery was often raised. In the small and dark Pagan temple there was neither room nor light enough to conduct Christian worship, but in such a building as above described, the whole congregation of the faithful could meet and take part in the act of worship. The bishop naturally took the place of the quæstor, the priests that of the assessors. The altar on which the pious Pagan poured his libations at the commencement of important business served equally well for the celebration of Christian rites. When in course of time the separation between laity and clergy became complete, the apse was railed off and appropriated to the use of the clergy, then the raised part on which the altar stood was separated by pillars called *cancelli*, and not allowed to be profaned by the multitude. Another change was the introduction of a choir, or enclosed space in the centre of the nave, round three sides of which the faithful congregated to hear the gospel read from two pulpits built into its inclosure on either side, or to hear the services read or sung by the inferior clergy, who occupied its precincts. As time wore on other modifications were introduced; on the erection of new buildings, the symbolic form of the cross was generally adopted as the most suitable for a Christian building; the arms of the cross (the transept) were railed off by rows of columns as the main building had been; at the point of intersection of the transept with the nave a tower was raised, which was at times surmounted by a small spire; frequently two towers were placed at the angles of the entrance end of the edifice. Over the greater part of Europe the style which came to be usually adopted for ecclesiastical buildings was the pointed Gothic, as lending itself more readily to a more majestic and ornamental treatment than the graceful Greek with its columned portico and rounded tower. Circular churches, which were popular at an early date, have found little imitation. The structures which are among the most notable in point of size or historic interest are alluded to in the article on CATHEDRALS. The ordinary churches are generally long rectangular buildings, without transepts, and the tower is placed so as to form the principal entrance, or at one of the angles of that end of the church. Of late years a taste for a superior style of building to that hitherto prevalent has sprung up, even among the dissenting bodies in England and the Presbyterians of Scotland. See ARCHITECTURE.

Church, an Organization of Christians. As understood to-day there are two widely different opinions regarding the meaning of a church, and both claim the New Testament as authority, (1) that Jesus Christ established a definite Church with a code of laws pertaining to belief and government; (2) that he gave us only moral instruction and no definite laws of belief or discipline. Under (1) may be classed those who claim that Jesus Christ established only one Church, and that the churches mentioned by Paul and others of the early missionaries, as recorded in the New Testament, were all parts of the one Church. Still others hold that the Christian Churches of the New Testament were each separate and distinct in government, but one in faith. The Roman Catholic, Greek, Church of England, and all Christian organizations with any generally recognized form of government, whether by presbyters or by the congregation, may be classed under (1). Under (2) will come all who hold that to observe the moral code as taught by Jesus Christ is all sufficient, hence this division need not be treated under the head Church.

The Roman Catholic definition of Church is: "The congregation of all the faithful, who being baptized, profess the same doctrines, partake of the same sacraments, and are governed by their lawful pastors under one visible head on earth, the Bishop of Rome." This implies unity of faith, morals, and government. The Greek definition is the same except they do not recognize as the visible head the Bishop of Rome. The Church of England definition is: "A congregation of faithful men, in which the pure word of God is preached, and the sacraments be duly administered in all those things that are of necessity requisite to the same." In the further authorized explanation of this definition it is shown that the government is given to the bishops without any authoritative head. The same definition is in general use by all other Christian Churches, but in some the government is vested in presbyters, elders, or officers acting as elders; in others the government rests in the congregation or members of the church.

Under the names of the various Christian denominations may be found further information regarding particular doctrines and forms of government.

Church-ale, formerly a church festival in England at which ale was drunk liberally; also the ale brewed for such a festival. The name is obviously compounded like bridal = bride-ale, scot-ale, clerk-ale, bid-ale, etc. The church-ales were usually held upon Whitsuntide, and two persons were chosen beforehand to preside over the feast, and divide out the victuals and drink voluntarily contributed by the parishioners. Sometimes the drink which had been brewed from malt given by the parishioners was sold about Whitsunday at the church for the support of orphans and poor, the repair of the church, and similar objects. The practice of holding church-ales with the corresponding games was denounced by the Puritans, and is not overlooked in Stubbs' 'Anatomie of Abuses.'

Church and State in the United States. That an indispensable function of any government is the conservation of public morals, and that an indispensable method of achieving it is to enforce the public exercise of some religious forms, seemed axiomatic to most people in the 17th century. The tenet that religion is best

promoted by leaving it to individual discretion was first evolved, naturally, by groups whose best hope was immunity, not establishment. These differing circumstances in the English colonies, with change of views from experience and change of policy from gain or loss of power, resulted in four chief attitudes of the colonial governments toward religion: (1) the establishment of a specific Church, and the taxation of the entire community to support it; (2) restriction of suffrage to church-members, without specifying the church — "theocracy"; (3) requirement of some church form and steady parish service in communities, without establishment of a specific church or disfranchising individuals; (4) entire religious liberty.

The first type is found in the chief Southern colonies and New England. Virginia came first, then Carolina before its division, the "Fundamental Constitutions" (see CAROLINA, ORIGINAL CONSTITUTION OF) merely shaping in this respect the provisions of Charles II.'s charter; lastly Maryland in 1691, after overthrowing the tolerant proprietary government. Each, from the nature of the case, established the Church of England. In New England the form of establishment was peculiar and *quasi*-casual; it was not statutory nor specific, but rested on local taxation to support a church which, owing to circumstances, was at first always the Calvinistic Congregational Church. When other church bodies began to grow, this taxation was remitted to all who supported a church of their own; those who were not thus *bona fide* contributing members to another church paid their cess to the Congregational as before. The second type is represented exclusively by the early Massachusetts Bay and New Haven colonies. The former, 18 May 1631, when as yet there was no popular representation in the colony, enacted "that no man should be admitted to this body politic but such as are members of some of the churches within the limits of the same." This restricted suffrage to one fourth the adult males, and was repealed 3 Aug. 1664. The latter, 4 June 1639, agreed "that church members only shall be free burgesses, and they only shall choose among themselves magistrates and officers" for public business. This, of course, perished with the absorption of the New Haven into the Connecticut colony, in 1662. The third type has but one representative, New York, including the Jerseys. This was "the Duke's" (afterward James II.) constitution, and is not the only ground for a less harsh judgment on him than prevails. The fourth type includes Rhode Island, the product of a quarrel with Massachusetts theology and politics, in which the founder's views developed by force of circumstances as he went on; Maryland, founded by a Roman Catholic who would not have been allowed to establish his own religion; Pennsylvania, equally limited to seeking immunity from persecution; and Georgia, founded late by an enlightened philanthropist.

The Revolution swept away all vestiges of establishment. The Constitution of 1787 provided against a danger not likely to recur. Article VI. enacts: "No religious test shall ever be required as a qualification to any office or public trust under the United States." This, however, did not touch the real likelihood if bigoted sectarians should control the government; the State conventions held to ratify the Constitution, urged a clause to guarantee full religious liberty; therefore the First Amendment begins: "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." Even this does not in the least debar individual States from doing it; but most of their constitutions decisively prevent that, not only by direct prohibition, but by enacting that no appropriation of public money shall be made to sectarian institutions. The stability of this provision, the impossibility of evading it, and its incalculable public value, have been proved many times over in the past half century. Sects holding the balance of power in States, or controlling their political managers, have striven desperately to support their institutions by public funds, and managers would have been glad to bribe their support with the money, but the evasions have been very few and insignificant. In the early years of the Union, efforts were occasionally made to have the legislatures enact some test to confine the government to Christians, for fear of atheistic or Jewish control; or to Protestants, in fear of Catholic supremacy; but the absurdity of the first two, and the impolicy of the last, as well as the improbability of its need, have prevented any approach to success. The only serious problem that has arisen on this point is due to Mormonism, where the claim to free exercise of their religion and its dictates is complicated by one of its ostensible revelations enjoining polygamy. The question is clearer if we imagine its enjoining thuggee, or other forms of crime directly subversive of public order. The community must decide how far a practice, not a mere theoretical belief, is inconsistent with its interests, and prohibition of anti-social acts is not interference with freedom of religion. In 1882 Congress prohibited polygamy under severe penalties; and the supreme court held this not in conflict with the constitutional provision above cited.

Church Army, a religious organization founded in London in 1882, with the object of training workingmen for church work among the laboring classes, to raise the lower classes of society, and to assist the deserving poor. The work is carried on through mission houses, labor homes, and by means of prison and workhouse committees.

Church Calendar. A systematic method of arrangement of the feasts of the Christian Church has long been in use, and the record of the time of these feasts is called the Church Calendar. Many of the feasts of the Church occur on a fixed day of the month, as Christmas, 25 December; All Saints', 1 November; Assumption, 15 August, and the feasts of the saints. The "movable" feasts are regulated from the feast of Easter Sunday. (For Easter see CALENDAR.) The fiftieth day after Easter Sunday is "Pentecost"; the eighth day after "Pentecost," "Trinity Sunday," etc. The fasts, except those of Lent, are regulated by the feasts, the records of which are found in the calendar. See also CALENDAR.

Church Discipline, the practice of the Christian Church in dealing with such of its office-bearers and members as have by public scandal caused hindrance to its common spiritual life. Its Scripture authority, resting on such passages as Matt. xvi. 19; xviii. 15 (*et seq.*),

is further enforced in Paul's epistles and in the gospel and epistles of John. Discipline, in the ecclesiastical sense, means the laws which are intended to govern the subjects of the Church in their conduct, as distinct from dogmas or articles of faith, which affect their belief. These laws may be based upon the Scripture and tradition or they may be the outgrowth of the condition of the times.

Church of England. See ENGLAND, CHURCH OF.

Church, Fathers of the (*patres ecclesiæ*), teachers and writers of the ancient Church, who flourished after the time of the apostles and apostolic fathers (the immediate disciples of the apostles), from the 2d to the 6th century. This name is also sometimes given to the teachers and writers of the following centuries, down to the schoolmen, who begin with the 12th century. A large number of their writings have been preserved, and have been published by modern scholars. The knowledge of their lives and their works constitutes a particular science, called patristics. The fathers of the Church introduced the Greek and Roman learning into Christian treatises, and many of them were as able as they were learned. Most of the earlier fathers of the Church, before their conversion to Christianity, were rhetoricians or advocates, which accounts for several peculiarities, as well in their method of disputing as in their style. The object of their writings is to defend the Christian religion and the Christian community, refute the Jews, pagans, and heretics, explain the Holy Scriptures, set forth the doctrines of their faith, and the rules of their morality, also the history of Christianity and the Christian Church, and impart instruction to the people. The contents of these writings, therefore, are apologetic, exegetic, dogmatic, moral, historical, polemical, or ascetic. The fathers of the Church are divided into two chief classes — Latin and Greek. The most celebrated among the Greek fathers are Clement of Alexandria, the first who philosophized on Christianity; Origen, distinguished for his homilies and his apologetic and exegetic writings; Eusebius, who wrote the first history of Christianity; Athanasius, who had a decided influence upon the formation of the Christian dogmas; and Chrysostom, the most admired of the ancient Christian orators. The most distinguished among the Latin fathers are Tertullian, a writer of great originality; Augustine, a man of a peculiar and vehement mind, the oracle of the Western Church; Ambrose, distinguished as a Christian orator; and Jerome, a man of much learning, and particularly happy in explaining the Holy Scriptures, whose efforts, however, contributed much to awaken in the West an admiration for the renunciation of the world and the celibacy of priests. Migne's Patrologiæ Cursus Completus gives the works of the fathers and many later writers in 388 volumes. Translations are contained in the 'Library of the Fathers of the Holy Catholic Church,' edited by Pusey, Keble, and Newman; and in the Ante-Nicene Christian Library. See also Farrar, 'Lives of the Fathers' (2 vols.).

Church of God, an American Christian sect which originated in Harrisburg, Pa., 1830, in a movement in which John Winebrenner, previously a minister in the German Reformed Church, was most prominent. A new society was organized by him, and others who accepted his views, which took the name of the Church of God. It exists principally in Pennsylvania and the Western States. The government of the Church of God is Congregational, with a supervising Church Council, composed of the preachers in charge, the elders, and deacons. Associations, or conferences of Churches, called Elderships, meet annually, and a General Eldership meets every three years. The church holds the doctrines of the Evangelical churches, with baptism by immersion only, subsequent to faith it practices feet-washing; the administration of the Lord's Supper in the evening; all the instrumentalities of revivals; and protests against the traffic in intoxicating drinks. In 1900 there were 460 ministers, 580 church edifices, and 38,000 communicants. The church property was valued in the same year at about $750,000. The denomination publishes several newspapers, and sustains a college at Findlay, Ohio. See WINEBRENNER.

Church of God in Christ, a recognized body of Mennonites, one of the 12 sects in the United States, about 500 in number. They differ slightly from the regular Mennonites in matters of church government. See MENNONITES.

Church Government, the regulation and ordering of spiritual matters, or those pertaining to the discipline and work of the Church. Four leading views are at present entertained regarding church government. The first three agree that the rudiments of a scheme of church government are laid down in the New Testament. They differ, however, as to what that scheme is, much the greater number believing it to be Episcopacy, though one large minority are in favor of Presbyterianism, and another in favor of Congregationalism. The fourth view, which has not a large number of advocates, is that no scheme of government was laid down in the New Testament, applicable to all times and places, but that the church has the power of adapting its government to the special circumstances in which it finds itself at any particular time. See CHURCH, AN ORGANIZATION OF CHRISTIANS.

Church of the New Je'rusalem, the name taken by a body of Christians who base their belief on the teachings of Emanuel Swedenborg. This sect was founded in 1787, 12 years after the death of Swedenborg, by 15 of his ardent disciples. The founders of the church claim that Swedenborg had a special revelation which authorized him to teach,— as real a command to go forth as was given to the apostles. The system of Christian Doctrine held by this church differs in distinctive points from that held by other Christian churches. They believe of God that he is the creator of all things, that Jesus Christ is God, and that God is all truth, all beauty, all good. The Scriptures are held to be revelations from God through man; and the teachings regarding the future life, are direct revelations from persons of the other world to Swedenborg himself.

The church was established first in England, then the United States, Canada, and in a few places in other parts of the world. In the United States and Canada there are 107 societies, 95 ministers, and about 6,500 members. The active members of the church claim that in

the United States and Canada there are altogether about 12,000 believers. For a fuller account see NEW JERUSALEM CHURCH; see also SWEDENBORG, EMANUEL.

Church History, the history of any church, but especially of the Christian Church. Church history naturally divides itself into four periods: From the advent of Christ to the time of Constantine; from Constantine to Mohammed, or by the arrangement of Mosheim and others, to Charlemagne; from Mohammed, or alternately from Charlemagne to the Reformation; from the Reformation to the present time. This division of the subject is not always followed; some authors regard the great periods in Church history, as: Foundation, Persecution; Extension; Reformation. See CHRISTIAN CHURCH, THE.

Church-rate, in England, a rate raised for the purpose of repairing and sustaining the church, churchyard, and for similar objects. It was made by the churchwardens with consent of the parishioners, who fixed the amount, but could not refuse it altogether, as in that event the churchwardens were empowered to levy a rate for necessary purposes. The rate, though applicable for repairs to parish churches only, was requirable from parishioners of all religious denominations. This often gave rise to complaints, and these led to repeated proposals for its commutation or entire abolition. This last, so far as the rate was compulsory, was effected in 1868.

Church, States of the, the Pope's dominions in Italy. They arose with the grant of Pepin, king of the Franks, in 754, who bestowed on Pope Stephen II. some districts which the Lombards, against whom Stephen II. solicited Pepin's assistance, had taken from the Exarchate of Ravenna. Charlemagne confirmed this grant in 774, and in return received the title of Roman Emperor from Leo III. in 800. The wise policy of the Popes in conferring favors on the Normans in Lower Italy secured to them in these vassals staunch protectors of the holy see. The structure of the papal power was fully completed in 1075 under Gregory VII. The dominions of Matilda of Tuscany were added to the states of the Church by her request, and the Popes maintained possession of them against all the claims of the German emperors. The papacy removed a dangerous neighbor belonging to the house of Hohenstaufen by raising the house of Anjou to the throne of Naples in the year 1265. The frequent revolutions of the Romans and the influence of the French led the Popes of the 14th century to transfer their residence, from 1305 till 1376, to Avignon, which Clement VI. bought of Joanna, queen of Naples and countess of Provence, in 1348. As this change of residence was made, it was charged under the influence of the king of France, it never obtained the full assent of the Romans and Germans, and anti-popes were sometimes elected by the opposing factions, and the welfare of the Church as well as of the state suffered by their mutual hostilities. After 20 years of exile the Popes returned to Rome. Julius II. added Bologna to the papal dominions in 1513, and Ancona in 1532. The Venetians were obliged to restore Ravenna. Ferrara was also recovered from Modena in 1598, and Urbino was bequeathed to the papal chair in 1626 by its last duke, Francis Maria, of the house of Rovera. The wise administration of Sextus V. restored internal order toward the end of the 16th century; but the extravagance and family partialities of some of his successors created fresh disorder. Subsequently Naples renounced her feudal obligations to the papal chair. After the successes of the French in Italy the Pope was forced at the Peace of Tolentino, 13 Feb. 1797, to cede Avignon to France, and Romagna, Bologna, and Ferrara to the Cisalpine republic. An insurrection in Rome against the French, 28 Dec. 1797, caused the annexation of the states of the Church to the Roman republic. Pius VI. died in France. The victories of the Russians and Austrians in Italy favored the election of Pope Pius VII., 14 March 1800, who, under the protection of Austrian troops, took possession of Rome. By the concordat concluded in 1801 with the First Consul of the French republic the Pope again lost a great part of his temporal dominions. In 1807 France again declared war, and the provinces of Ancona, Urbino, Macerata, and Camerino were added to the kingdom of Italy. The possessions of the Church beyond the Apennines were all that remained to the Pope. On 2 Feb. 1808, a French corps of 8,000 men entered Rome; the remainder of the papal states were added to France, and a pension of 2,000,000 francs settled on the Pope, whose ecclesiastical power was guaranteed by Napoleon. The decree of 17 May 1809 put an end for the time being to the ecclesiastical state. The Pope was held a prisoner in France until the events of 1814 again permitted him to take possession of his states. Pius VII. was succeeded by Leo XII., who reigned from 1823 till 1829. He was succeeded by Pius VIII., who, in his turn, was succeeded by Pius IX. in 1846. The first acts of this Pope were characterized by such a liberal spirit that diplomatic Europe was surprised. The events of 1848 caused the Pope to pause in his advanced policy, which so dissatisfied the extreme liberal party that they drove Pius IX. from Rome, and the reins of government fell into the hands of Garibaldi, Mazzini, and Avezzano (1849). Some few months afterward the French government, resolving to restore the papal authority, sent Gen. Oudinot with an army against Rome. Defeated in their first attack on the city, the French began a siege in regular form, and in a month's time were masters of it. Pope Pius did not return to Rome, however, until the following year.

After the Austro-Italian war of 1859 the papal see was stripped of the greatest part of its territorial possessions. Embracing before that date an area of 17,218 square miles, with 3,124,668 inhabitants, the Roman territory was then reduced to 4,891 square miles, and 692,106 inhabitants. Of the former legations and delegations into which it was subdivided only five remained, namely — Rome and the Comarca, Viterbo, Civita Vecchia, Velletri, and Frosinone. From 1860 to 1866 the papal government was sustained by the presence of a French army, which was withdrawn in 1866 upon the King of Italy binding himself by treaty to respect the integrity of the Roman states. In 1867, however, revolutionists numbering 15,000, belonging to the Italian party of action, entered the papal territory, headed by Menotti Garibaldi. They made but

little progress until the elder Garibaldi placed himself at their head. Napoleon III., at the earnest prayer of the Pope, sent an army to protect the city against the violence of the revolutionists, who had now surrounded it. On 28 October the French entered Rome, and Garibaldi, beginning to perceive that he would be hemmed in by the regular Italian forces under Cialdini, thought of retreating. An advanced section of the papal troops came in contact with the Garibaldians (3 November), and were likely to have suffered severely had not two French battalions, armed with the Chassepot rifle, come speedily to their aid. Garibaldi, with 4,000 men, retreated into the Italian territory, where they were disarmed. A strong force of French troops were left in occupation of Civita Vecchia after peace was restored, and the Pope seemed as secure as ever. But the outbreak of the Franco-German war changed the aspect of affairs. The French army of occupation left Rome on 30 July 1870, and the Pope was at the mercy of his powerful neighbor, Victor Emmanuel, king of Italy, who, seizing the opportunity, marched upon Rome and took it by force of arms. In September the Italian troops occupied Rome. In October the states of the Church were incorporated with the kingdom of Italy, a plebiscite was held under bayonet-rule, the count of which resulted in 133,681 in favor of the Sardinian occupation and 1,807 against it. In the beginning of July 1871, Rome became the seat of the Italian government and the residence of the court.

Church Temperance Society, a national organization of the Anglican Church in the United States. It was founded in New York in the year 1881, and its object is to promote temperance by means of high license. It seeks to influence state legislators and municipal authorities, and it has done most effective work in providing substitutes for the saloon. The organization in the United States follows, in a measure, the methods used for several years by the Church of England Temperance Society.

Churchwarden, one of two Episcopalian parochial officers chosen annually at the Easter vestries. In Anglican Churches in the United States the wardens are usually elected by the parishes; in England the custom prevails of the rector appointing one warden and the parish the other. Their duties are to protect the building of the church and its appurtenances, to superintend the ceremonies of divine worship, and the proper distribution of alms, etc.; to form and execute parochial regulations, and generally to act as the legal representatives of the parish. They usually attend to the secular affairs of the parish.

The term "churchwarden" is also given to a long-stemmed clay tobacco-pipe much used in Great Britain. A famous "make" of this class of pipes is located in the town of Broseley, in Shropshire.

Church'ill, Charles, English satirical poet: b. Westminster, February 1731; d. Boulogne, France, 4 Nov. 1764. He took orders in the Established Church, but reflected very little credit upon his clerical profession. He won his fame with 'The Rosciad,' a satire upon the actors of the time, in which only Garrick and some few popular actresses are praised. His capacity for ridicule was so great that 'The Ghost,' 'The Farewell,' 'The Conference,' 'The Author,' and 'The Prophecy of Famine,' proved exceedingly popular. He is almost without a peer in his special field.

Churchill, John, Duke of Marlborough. See MARLBOROUGH.

Churchill, Randolph Henry Spencer, LORD, English statesman, third son of the 7th Duke of Marlborough: b. 13 Feb. 1849; d. London 24 Jan. 1895. He was educated at Merton College, Oxford, and having entered Parliament in 1874 as member for Woodstock, by 1884 he had risen to the position of a recognized leader of the Conservative party, and in 1885 became Indian secretary in Lord Salisbury's government. His tenure of this office was rendered notable by the annexation of Upper Burma. On the defeat of Gladstone's Irish bill in 1886 Churchill became leader of the House of Commons and Chancellor of the Exchequer, posts which he unexpectedly resigned in December 1886. He was a brilliant though at times rather violent personality in British politics. His opinions were mainly Conservative, but he often found himself in opposition to the official leaders of that party; and for some time he acted as the leader of what was known as the Fourth Party, consisting of four members who adopted a somewhat independent position. He married in 1874 Jennie Jerome, a daughter of Leonard Jerome, of New York. In July 1900, Lady Randolph Churchill married George Cornwallis West.

Churchill, Winston, American novelist: b. St. Louis, Mo., 10 Nov. 1871. He was graduated from the United States Naval Academy in 1894, and became an editor of the 'Army and Navy Journal' the same year. After serving as managing editor of the 'Cosmopolitan' magazine, he turned his attention to fiction. He has written: 'The Celebrity' (1898); 'Richard Carvel' (1899); 'The Crisis' (1901); 'Mr. Keegan's Elopement'; 'The Crossing' (1904).

Churchill, Winston Leonard Spencer, English soldier and author: b. 30 Nov. 1874. He was the son of Randolph H. S. Churchill (q.v.), and was educated at Harrow and Sandhurst Military College. He served with the Spanish forces in Cuba, and in the English army during a part of the Boer war 1899–1900. He has published 'The Story of the Malakand Field Force' (1898); 'The River War' (1899); 'Savrola' (1900); 'London to Ladysmith, via Pretoria' (1900); 'Ian Hamilton's March' (1900.)

Churchill River, a river of the Northwest Territories of Canada, which rises in La Crosse Lake, forms or passes through various lakes or lake-like expansions, the largest being Big or Indian Lake, and enters Hudson Bay near Fort Churchill, after a northeasterly course of about 800 miles. It is called also Missinnippi, English and Beaver. Except by means of frequent portage, it is not navigable.

Churching of Women, a rite founded on the Mosaic injunction found in Levit. xii. 6-8, and as practised in some denominations, is now a giving of thanks for the birth of a child. The first mention of the subject as a usage in the Christian Church is found in the pseudo-nicene Arabic Canon, but no prescribed form is given.

In the Greek Church the presentation of the child is made on the 40th day after birth, according to Luke ii. 22. The Roman Catholic Church imposes no obligation upon its members in this respect, but recommends it as a laudable and pious custom. The form is prescribed by the Roman Catholic ritual. The priest sprinkles with holy water the woman who kneels at the altar-railing and holds a lighted candle, and having recited the 23d Psalm, he puts the end of his stole into her hand and says: "Come into the temple of God; adore the Son of the Blessed Virgin Mary, who has given thee fruitfulness in child-bearing." The priest then says a prayer of thanksgiving, blesses her, and sprinkles her with holy water in the form of a cross. The rubric of the Roman Catholic ritual reserves this rite for women who have children born in wedlock. The Anglican Church provides in the prayer book a prescribed form for the ceremony. The Congregational, Presbyterian and other churches either ignore, or declare that there is no scriptural warrant for the rite.

Churchus, a deity worshipped by the ancient Prussians. It presided over food and drink.

Churl, chėrl (Saxon *ceorl*) in modern usage, a rude, boorish person, but in Saxon England, the term denoted a common freeman. The rank of the churl, or ceorl, steadily declined until finally the only important distinction between churl and serf was that the former might choose his own master. The better class of churls sometimes found their way into the class of theyns, or thanes, corresponding to the knights of post-Conquest times, while the others became the villains of the Norman feudal organization. 'Domesday Book' makes no mention of the word ceorl.

Churn, a vessel in which cream is agitated to separate its buttery globules in a solid mass from the fluid portions. The length of time usually occupied by this process, and the fatigue consequent upon working those machines by hand, have caused the ingenious to produce numerous modifications in form and size. Some may be worked by dogs in the way a squirrel-wheel is driven; others may be worked by horse-power; and in some cases steam is the motive power. The ordinary plunge-churn, with its cylindrical box, its straight rod projecting downward through the cover and attached below to the dasher, has been greatly improved by an arrangement by which the air is introduced into the cylinder at every stroke by a tube run right along the handle, with a valve at its end which opens as the dasher rises and closes as it sinks. The air is thus dashed through the cream, separating it into innumerable small particles, and throwing it into a state of foam. A box form of churn, with dashers attached to a rod passing horizontally through the box, and driven by a winch, is frequently used. Less common kinds are those in which the whole body of the machine is set in motion, such as the rocking-churn and the barrel-churn. A churn on the centrifugal principle has been introduced into Sweden. Though the rapid completion of the process of butter-making is the principal end in view, it is a well-known fact that butter suffers seriously by too rapid a process. When butter forms in about 45 minutes it is sure to be good; when it appears sooner it is soft; when later, strong-tasted. See BUTTER; DAIRY.

Churrus, chŭr'rŭs, the resinous exudation of the leaves and flowers of Indian hemp, *Cannabis indica.* It is used by the natives of India as an intoxicating drug. According to Jaffur Shurreef, a man covers himself with a blanket and runs through a field of hemp early in the morning; the dew and gum of the plant naturally adhering to it are first scraped off and the blanket afterward washed and wrung. Both products are boiled together and an electuary formed. The smoking of five grains of it will produce intoxication.

Churubusco, choo-roo-boos'kō, **Battle of,** one of the principal engagements of the Mexican war, took place 20 Aug. 1847. Contreras (q.v.) was won in the early morning, Churubusco in the forenoon and early afternoon, of that day, but they are quite distinct battles. The main road north to the city of Mexico, via San Augustin and San Antonio, an elevated paved causeway, converges with that on the west from Contreras and Coyoacan at Churubusco, a village six miles south of the capital and a mile northeast of Coyoacan. Just north of it runs east and west the little stream called Rio Churubusco, crossed by the main road at a bridge fortified with a bridge-head; there was a strong bastion 75 to 100 yards on a side, with embrasures sweeping the San Antonio road. Along the sides were cornfields, maguey plantations, hedges and thickets, and irrigating ditches full of water. In the western part of the village, southwest of the bridge-head, on the Coyoacan road, was the Convent of San Pablo, a massive building with walls so thick that field-pieces could make no impression on them, defended on two sides by strongly built bastions with six or eight heavy guns, and the building itself an impregnable cover for musket-fire. Around it was a flooded moat, in front were cornfields and thickets. The two points to be carried were the convent and the bridge-head; and since, after the rout at Contreras, this was the last place where the Mexicans could make a stand short of the city of Mexico, the resistance was likely to be desperate. The wreckage of Contreras was being pursued by Pillow and Twiggs along the Coyoacan road; and Worth, having turned the works at San Antonio on the main road, had captured a considerable body of the enemy, and was advancing along the causeway. Santa Anna threw a battalion into the convent, placed five guns and a heavy body of troops at the bridge-head, and posted several regiments along the north bank of the stream. The first assault was made on the convent. Bennet Riley's and Persifor F. Smith's brigades, Dimick's and Taylor's batteries, attacking it from the west and south, were received with a storm of shot and shell from the guns in embrasures and barbette; and as they struggled out of the cover they were swept by the musket-fire from the building itself, with heavy loss. Seizing a line of adobe buildings 60 yards from the convent, they opened fire under that protection and held it till the time for advance. Meantime Worth's division, with Pillow, Cadwalader, Garland, Clarke, and others, had charged down the causeway, blocked for several hundred yards with loaded wagons, and through the fields to the bridge-head. Broken into irregular fragments by the hedges and ditches, they were twice repulsed with tremendous loss by the

plunging fire of the Mexican guns; but Shields had moved north from Coyoacan and, after a fierce combat, which nearly overwhelmed him, he was reinforced by Lee and Sumner, carried the river line, and moved east against the rear of the bridge. In danger of having their retreat from the capital cut off, the Mexicans lost nerve, and a third charge from the Americans carried the head with a rush. Thence they turned southwest against the convent; the American artillery was still battering it on the other side; a sally from the garrison was driven back and, as the fire slackened, both divisions of the Americans entered it from opposite sides at the same time. The American forces in this battle numbered a little over 7,300; the Mexican numbers are uncertain, but probably about 25,000. The American losses at Contreras and Churubusco together were 1,053, not over 100 at Contreras. The Mexican loss was 2,637 prisoners at both, and probably 2,000 at least killed and wounded at Churubusco. Consult Wilcox, 'History of the Mexican War' (1892.)

Chusan (choo'sạn) **Archipelago,** a group of islands off the east coast of China, the largest being the island of the same name, which is about 21 miles long, and from 6 to 11 broad, with a population of about 200,000. Its surface is finely diversified by hill and dale. The rocks are evidently volcanic; and the soil, often very fertile, is under good cultivation, for the most part by spade husbandry. On the same slope may be seen, in different stages of their growth, wheat, tea, sweet potatoes, cotton, and tobacco. There are several towns on the island; the capital is Ting-hae, a walled town of about two miles in circumference. From its situation near the mouths of the Yang-tse-kiang, which forms the great channel of communication with the heart of the empire, Chusan is considered as the key of southern China, and was accordingly taken possession of by the British on two occasions during the first Chinese war. Notwithstanding the great mortality among the British troops during their occupation of the island, the climate is still considered healthy.

Chutia Nagpur, choo'tē-ạ nāg-poor'. See CHOTA NAGPUR.

Chutney, chŭt'nĭ, a condiment compounded of sweets and acids, much used in the East Indies, and thence introduced into England and the United States. Ripe fruit, raisins, spices, herbs, chillies or cayenne, lemon-juice, vinegar, etc., are the ordinary components, which are pounded, well boiled together, and then bottled for use. It is much eaten in India with curries, stews, etc.

Chuz'zlewit, Martin, the principal character in Charles Dickens' novel of that name.

Chyle, kīl, the liquid mixture of food-stuffs taken up by the lacteals from the intestine in the course of digestion. It is not a definite substance, its composition varying very widely according to the character of the ingested food. See DIGESTION; LACTEALS.

Chyme, kīm, a pulpy mass into which food in the stomach is resolved by the action of the gastric juice and by the contraction of the stomach. This mass is grayish in color, and the previous texture or nature of the aliment can be no longer distinguished. It passes by the pylorus into the intestinal canal, where it is mixed with the pancreatic juice and the bile. The thinner parts of it are absorbed by the slender tubes termed "lacteals." The liquor thus absorbed, which is called "chyle," (q.v.), is of a white color; it passes through the glands of the mesentery, then enters the thoracic duct, and is conveyed by it into the blood at the junction of the left jugular with the left subclavian vein. Chyle is an opaque milky fluid, mild to the taste. By standing for some time one part of it coagulates, another portion is coagulated by heat. The chyle, after mixing with the lymph conveyed by the absorbent vessels, is received into the blood, which has returned from the extreme vessels before this passes to the heart. All traces of it are very soon lost in the blood, as it mixes perfectly with that fluid. It is probable, however, that its nature is not immediately completely altered. The blood passing from the heart is conveyed to the lungs, where it circulates over a very extensive surface presented to the atmospheric air, with the intervention of a very thin membrane, which does not prevent their mutual action. During this circulation the blood loses a considerable quantity of carbon, part of which, it is probable, is derived from the imperfectly assimilated chyle, as this, originating in part from vegetable matter, must contain carbon in larger proportion than even the blood itself. See DIGESTION; LYMPH; NUTRITION.

Cialdini, Enrico, ĕn-rē'kō chäl-dē'nē, Italian military officer: b. Castelvetro, Modena, 10 Aug. 1811; d. Leghorn 9 Sept. 1892. By his share in the insurrection of 1831 was forced to escape to France, and in 1835 passing over to the Spanish service, he fought against the Carlists and was made colonel. When Charles Albert headed the Italian rising in 1848, he was employed by the Sardinian government to reduce the volunteers to discipline, and fought at the head of his new regiment in the brief campaign of 1849. In the Crimea he commanded a division of the Sardinian contingent; and on his return was appointed aide-de-camp to the king. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi. In the war of 1859 the victory at Palestro was his chief exploit. In 1860 he defeated the papal army at Castelfidardo; in 1861 Gaeta and Messina yielded to him. Created Duke of Gaeta, and for a few months governor of Naples, he had to act against Garibaldi in the second Sicilian expedition (1862). In 1864 he became a senator; and in the war of 1866 occupied Venice almost without a blow. In 1876 he was sent as ambassador to Paris, but he retired in 1881, and received the post of one of the two generals of the army.

Ciampi, chäm'pē, **Ignazio,** Italian poet and historian: b. Rome 1824; d. 1880. From 1874 till his death he was professor of modern history in the University of Rome. Among his poetical works are some imitations of the Russian Pushkin; an epic, 'Stella'; and two volumes of 'Various Poems.' He wrote several works on the history of literature, also biographies and histories of special periods. His principal work appeared posthumously: 'Modern History,' from 1492 to the Peace of Westphalia.

Ciampi, Sebastiano, Italian scholar: b. Pistoia 30 Oct. 1769; d. Florence 14 Dec. 1847.

Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; owing to some misunderstanding with his colleagues, he accepted in 1818 a professorship at Warsaw, and returned to Italy in 1822, a prebend having been conferred on him in Poland, which enabled him to devote himself to literary studies at Florence. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages, and of the history of Poland.

Ciampoli, Domenico, dō-mā'nē-kō chām-pō'lē, Italian novelist: b. Atezza in Abruzzi 25 Aug. 1855. His stories and romances are to a great extent pictures of life among the peasantry and mountain folk of southern Italy. He has also written romances of a less local character: 'Diana'; 'The Unknown.' He has devoted special study to Slavic literature, and published several volumes on that subject.

Cibao, se-bā'ō, a mountain range in the central part of Santo Domingo; length about 20 miles. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Japan. Gold was found there in 1494, by Ojeda.

Cibber, sīb'bėr, **Caius Gabriel,** Danish sculptor: b. Flensborg, Holstein, 1630; d. London 1700. He visited England during the protectorate of Cromwell, and met with such encouragement as to induce him to settle there. He was employed to execute the bas-reliefs on the pedestal of the London Monument. The work, however, by which he is principally known are his figures of Raving and Melancholy Madness, formerly erected above the gate of the old Bethlehem Hospital, and now in the new hospital, St. George's Fields. He was the father of Colley Cibber (q.v.)

Cibber, Colley, English dramatist and actor: b. London 6 Nov. 1671; d. there 12 Dec. 1757. He was a son of C. G. Cibber (q.v.) and the sculptor's second wife, Jane Colley. He made his appearance at Drury Lane Theatre in 1689. In 1695 appeared his first comedy, 'Love's Last Shift,' which met with great success. In this piece he played the part of Novelty, a fashionable fop. This character is found in most of his pieces, and in the representation of it he was likewise distinguished. His dramatic celebrity is founded chiefly on the 'Careless Husband,' which even obtained the approbation of his declared enemy, Pope. This piece, though without novelty in the characters, and without invention in the plot, is a good picture of the manners and follies of the time. His comedy, the 'Non-juror', an imitation of Molière's 'Tartufe,' adapted to English manners, appeared in 1717, and was directed against the Jacobites. It was very successful, but drew upon him many enemies, whose number he increased by his conduct as director of Drury Lane Theatre, from 1711. His appointment as poet-laureate in 1730 gave full play to the raillery of his enemies. Cibber had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him on every opportunity. Besides writing original works for the stage, he adapted a great number of others, the acted Richard III. being one of those that have passed through his hands. In 1750 he quitted the theatre, and published the 'Apology for the Life of Colley Cibber,' written with spirit and candor, and containing many entertaining anecdotes and judicious remarks.

Cibber, Susannah Maria (Arne), English actress: b. London February 1714; d. there 30 Jan. 1766. She was the sister of the celebrated Thomas Arne (composer of 'Rule Britannia'), who taught her music, and introduced her in one of his operas at the Haymarket Theatre. She was so much of a favorite with Handel, that he composed pieces expressly adapted to her voice, and used to instruct her in singing them. In 1734 she married Theophilus Cibber (q.v.), but was soon after separated from him. She subsequently made her appearance in tragedy. Her beauty and her talents gained her universal admiration. Garrick is said to have exclaimed when informed that she was dead, "Then tragedy has expired with her." She is buried in Westminster Abbey.

Cibber, Theophilus, English actor and dramatist: b. 26 Nov. 1703; d. Oct. 1758. He was the son of Colley Cibber (q.v.). Among his plays are: 'The Lover' (1730); 'Patie and Peggy' (1730); 'The Auction.' The 'Biography of English and Irish Poets,' which appeared under his name, was from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt.

Cibol, sīb'ōl, a perennial plant (*Allium fistulosum*) of the onion genus, a native of Siberia, with hollow stems larger than those of the chive. It was formerly cultivated in Great Britain for culinary use, but it has been superseded by more palatable species. See Onion.

Ciborium, sī-bō'rī-um, the sacred vessel, of silver or gold or silver-gilt, and often incrusted with precious stones, in which the sacred host or sacramental bread is reserved. Its liturgical name is pyx. In the language of architecture, ciborium is the name of the canopy which overhangs the high altar of a church.

Cibrario, Luigi, loo-ē'jē chē-brä'rē-ō, Italian historian and politician: b. Turin 23 Feb. 1802; d. Salo 1 Oct. 1870. He studied law, entered the service of the State, and soon distinguished himself by his historical investigations. In 1848, when Italy rose against the Austrians, Charles Albert appointed him commissioner at Venice and a senator of Sardinia. In 1852 he was made minister of public instruction, and ultimately, in 1855, minister of foreign affairs. In 1839 he published his 'Della Economia Politica del Medio Evo'; in 1840, his 'Storia della Monarchia di Savoia'; and in 1847, his 'Storia di Torino.' He published numerous other works on history, numismatics, and miscellaneous subjects.

Cicacole, sīk-ą-kōl'. See Chicacole.

Cicada, sī-kā'dą, a large insect of the order *Hemiptera,* sub-order *Homoptera,* and family *Cicadidæ,* known by its broad head, protuberant eyes, sucking beak, and a well-developed ovipositor. The male cicada makes a shrill noise by means of a special apparatus at the base of the abdomen or hind-body. The loud, piercing notes issue from a pair of structures or cavities on the under side of the body, which act somewhat as two kettle-drums or "timbals," each cavity being covered by a tense membrane which is rapidly vibrated by means of two special mus-

cles within. The sound is variously modified by adjacent smaller disk-like sounding-boards, which increase and transmit the sound vibrations caused by the movement of the membrane. The sound is modified by the semicircular disks, one on each side projecting from the metathorax over the "mirrors," cover-plates, or sounding-boards, one on each side, and which, when closed, deaden the sound, or, if open, allow it to escape in greater volume. This apparatus appears to be homologous with the "ears" of the locusts or common grasshoppers. Cicadæ have an incomplete metamorphosis, the young (nymphs) being like the parents, but without wings; they live attached by their beaks to the roots of trees, etc. The female deposits her long, slender, cylindrical eggs in gashes in twigs made by her saw-like ovipositor. From 400 to 600 eggs are laid, the process requiring about 45 minutes. The 17-year cicada (wrongly called 17-year locust) is the longest-lived of any known insect, as the grub or nymph lives for over 16 years sucking the roots of forest trees, often several feet below the surface; in the late spring it finishes its transformations, and usually at the last of May or the beginning of June, issues in enormous numbers from the ground. This appearance of a 17-year brood in a given area has been recorded as far back as 1633. At the present time each year has its brood or broods, each limited, as a rule, to a well-defined district. Of such broods there are 30, occurring over a large area in the Atlantic and Central States. In southern New England a brood periodically appears near Fall River and on Martha's Vineyard, as well as in Connecticut, while in Rhode Island its first appearance known in history was in the first week in June 1903, in the town of Coventry, near Tiogue reservoir. The southern limits are northern Georgia and the western limits are eastern Nebraska and Kansas. Besides this 17-year brood there is a 13-year brood, which is more southern, the dividing line being about latitude 38°; this appears to be a temperate variety. The male is very short-lived and takes no food. The females live for several weeks and deposit their eggs about the middle of June in New York and West Virginia. The young hatch, dropping to the ground about six weeks after the eggs are laid; it then burrows into the soil and begins to pierce the rootlets of trees. The nymph molts about once a year or oftener, and Riley estimates the number of molts at from 25 to 30, while there are six stages of growth before the imago or winged state is assumed. Consult: Riley, 'The Periodical Cicada' ('Bulletin 8 U. S. Department of Agriculture'); Marlatt, 'The Periodical Cicada' (Ibid. 14).

Cicatrization, sik"ạ-trĭ-zā'shŏn, the process of healing in the skin of an ulcer or a wound. Where a solution of continuity of the skin is made the blood is thrown out into the gap, the edges of the wound are gummed together by serum, and, springing from both sides of the wound, new connective tissue is formed. This new connective tissue gradually fills the wound with a white glistening mass, the cicatrix. This contracts, and all that may be left of the wound is a white shiny strip of new connective tissue.

Cicely, Sweet, a plant of the United States belonging to the natural order *Umbellifer,* a perennial herb growing from fleshy, clustered, thickish roots. There are about 15 species in North America, western South America, and eastern Asia, grouped into the genus *Washingtonia,* so named in honor of George Washington. Eleven of the 15 are natives of the western United States. They are related to chevril (q.v.) on one side, and to *Scandix* on the other. The smoother sweet cicely (*W. longistylus*) grows in the woods of southern Canada, through Dakota, eastward to North Carolina, southward to Tennessee and Alabama, and westward to Kansas, and on elevations to the height of 4,200 feet. The roots have a rich spicy taste and odor, resembling anise. The sweet cicely of England (*Myrrhis odorata*), although common about buildings, is an imported plant, probably from central Asia. It is fragrant, and its odor is supposed to be particularly agreeable to bees, therefore hives are rubbed with the herb to attract them.

Cicer, sī'sẹr, a genus of the natural order *Leguminosæ,* of the tribe *Viciæ,* of which the chick-pea (q.v.) is a representative.

Cicero, sĭs'ẹ-rō, **Marcus Tullius,** Roman orator: b. Arpinum 106 B.C.; d. 7 Dec. 43 B.C. His father, who lived in retirement, devoted to literary pursuits, was the friend of the first citizens of the republic. Among this number was the celebrated orator Crassus, who attended to the education of the young Cicero and his brother, Quintus, selected teachers for them, and directed their studies. The perusal of the Greek authors, together with poetry, oratory, and philosophy, occupied the first years of Cicero's youth. He made one campaign under Sulla, in the Marsic war, and after his return availed himself of the instruction of the academician Philo, and of the celebrated orator, Molo, and employed several years in acquiring the knowledge requisite for an orator. He witnessed the barbarities of Marius and Cinna, and the proscriptions of Sulla. Cicero, at that time 26 years old, appeared before the tribunals, at first in civil suits, afterward in a criminal process, in which he defended Sextus Roscius of Ameria, who was accused of parricide by Chrysogonus, a freedman of Sulla. He conducted this defense with courage, confuted the accusers, and obliged the judges to acquit the accused. After this brilliant display he remained a year in Rome, and undertook another suit. But debilitated health obliged him to travel; and he went to Athens, still the centre of science, and here he resided in the house of an academician, was visited by the philosophers of all the schools, and profited by the instruction of the masters of oratory. He also undertook a journey to Asia, and remained some time at Rhodes, where he likewise visited the most distinguished orators, and took part in their exercises. On his return to Rome his displays of eloquence proved the value of his Grecian instruction, and his rivals, Hortensius and L. Aurelius Cotta, were forced to yield to him the palm of oratory. At the age of 30. he engaged in public business, became quæstor of Sicily during the prevalence of a scarcity of food at Rome, and managed to convey a large quantity of corn from thence to the capital, though it was difficult for him so to do without exciting the displeasure of the Sicilians. It was an honorable day for Cicero when the ambassadors from

Sicily appeared before him with the request that he would conduct their suit against their governor, Verres. He showed himself worthy of the confidence of an oppressed people, and appeared against this powerful robber after having himself collected proofs of his crimes in Sicily. He was opposed by the celebrated Hortensius. The crimes of Verres are painted in the liveliest colors in his immortal speeches. Seven are preserved, but only two of them were delivered. After this suit Cicero was elected to the office of ædile (70 B.C.). Though possessed of only a moderate fortune, he managed by well-timed liberality to gain the affections of the people while he held this office, and at the close of 67 B.C., was elected first prætor. But in order to obtain the consulship on which he had now fixed his eyes, it was necessary to obtain the friendship of the great. With this view he joined the party of Pompey, the head of the nobility and the first citizens of Rome, became his panegyrist and most zealous adherent.

Catiline at that time began to plan his conspiracy against the republic. He was accused of extortion in his government of Africa, and Cicero was on the point of undertaking his defense when they became rivals, being both candidates for the consulship. Cicero's merit prevailed over Catiline's intrigues and the envy of his enemies. He was chosen consul unanimously, and entered on his office in 63 B.C. He succeeded in defeating the conspiracy of Catiline (q.v.), after whose fall he received greater honors than had ever before been bestowed on a Roman citizen. He was hailed as the savior of the state, and the father of his country (*parens patriæ*), and thanksgivings in his name were voted to the gods. But Cicero's fortune had now reached the culminating point, and soon was to decline. The conspirators who had been executed had not been sentenced according to law, and Cicero as chief magistrate was responsible for the irregularity. When at the close of his consulship he stood up, according to custom, to render an account of his administration, he was stopped by the tribune, Metellus Celer, on the ground that having put Roman citizens to death without a hearing, he himself was unworthy of being heard. Accordingly he was only able to pronounce the celebrated oath, "I swear that I have saved the republic." Cæsar was always his opponent, and Pompey feared a citizen who loved liberty too much to be favorable to the triumvirs. Cicero saw his credit gradually decreasing, and even his safety threatened. He therefore occupied himself more than ever with science, wrote the history of his consulate in Greek, and composed a Latin poem on the same subject, in three books. At last Clodius, Cicero's enemy, caused a law to be renewed, declaring every one guilty of treason who commanded the execution of a Roman citizen before he had been heard in his own defense. The illustrious ex-consul put on mourning, and appeared, accompanied by the *equites* and many young patricians, demanding the protection of the people. Clodius, at the head of armed adherents, insulted them repeatedly, and ventured even to besiege the senate. Cicero upon this went into voluntary exile, leaving Rome in 58 B.C. Clodius in the meantime procured new decrees, in consequence of which Cicero's country seats were torn down, and a temple of freedom built on the site of his house at Rome. His wife and children were exposed to ill treatment.

The audacity of Clodius, however, became equally insupportable to all, and Pompey encouraged Cicero's friends to have the orator recalled to Rome. The senate declared that it would not attend to any business till the decree which ordered his banishment was revoked. Through the zeal of the consul, Lentulus, and at the proposition of several tribunes, the decree of recall passed the assembly of the people in the following year, and Cicero returned after an absence of 10 months. The assembled senate received him at the gates of the city, and his entry resembled a triumph. But all power at Rome was now in the hands of the triumvirs, Crassus, Pompey, and Cæsar, and for the next few years Cicero was more of an onlooker than an actor, and even submitted to praise and flattery what he disliked and despised. At the age of 54 he entered the college of the augurs. The death of the turbulent Clodius, who was slain by Milo, delivered him from his most dangerous opponent. He defended the perpetrator of this act, who was his friend and avenger, in an eloquent speech; but the presence of Pompey's soldiers, and the tumult of the friends of Clodius, confused him while delivering it. At this period the senate appointed him governor of Cilicia (52 B.C.). Cicero conducted a war while in this office with good success, repulsed the Parthians, and was greeted by the soldiers with the title of imperator. As soon as his term of office had expired he returned to Rome, which was threatened with serious disturbances owing to the rupture between Cæsar and Pompey. Dreading the horrors of a civil war, he endeavored in vain to reconcile the rivals. Cæsar advanced toward Rome, and Pompey was forced to flee with the consuls and the senate. Cicero, not anticipating this sudden approach of Cæsar, was still in Italy. Cæsar saw him at Formiæ, but was not able to gain him over; for although convinced that the party of Cæsar was likely to prevail, and although his son-in-law, Dolabella, was one of Cæsar's confidants, he was prompted by his sense of honor to return to Pompey. After the battle of Pharsalia and the flight of Pompey he refused to take the command of some troops who had remained at Dyrrhachium, but returned to Italy, which was governed by Cæsar's representative, Antony. This return was attended with several unpleasant circumstances, until the conqueror wrote to him, and soon after received him graciously (47 B.C.).

Cicero now devoted himself entirely to literature and philosophy. He was divorced from his wife, Terentia, to enable him to marry Publilia, a beautiful and rich heiress, whose guardian he was; but this union was not happy, and was speedily dissolved. In 45 B.C. the death of his daughter, Tullia, occurred, and affected him very painfully, as he had been devotedly attached to her. The assassination of Cæsar opened a new career to the orator. He hoped to regain great political influence. The conspirators shared with him the honor of an enterprise in which no part had been assigned him; and the less he had contributed to it himself, the more anxious was he to justify the deed, and pursue the advantages which it offered. But Antony took Cæsar's place. Even in this turbulent year Cicero found leisure for literary occu-

pations, and, among other labors, completed his work, 'De Gloria,' which was lost as late as the 14th century. He determined on going to Greece, where he could live in safety; but soon returned to Rome, and composed those admirable orations against Antony, delivered in 43 B.C., known to us by the name of "Philippics," and which are equally distinguished for eloquence and patriotism. His implacable enmity toward Antony induced him to favor young Octavianus, who professed to entertain the most friendly feelings toward him. With him originated all the energetic resolutions of the senate in favor of the war, which the consuls and the young Cæsar were conducting, in the name of the republic, against Antony. Octavianus having possessed himself of the consulate, and formed an alliance with Antony and Lepidus, after the death of the two consuls, the power of the senate and of the orator yielded to the arms of the triumvirs. Cicero was at last convinced that liberty was at an end. At Tusculum, whither he had retired with his brother and nephew, he learned that his name, at Antony's demand, had been added to the list of the proscribed. He went in a state of indecision to the seacoast, and embarked, but contrary winds drove him back to the shore. At the request of his slaves he embarked a second time, but soon returned to await his fate at his country seat near Formiæ. "I will die," exclaimed he, "in my country, which I have more than once saved." His slaves, seeing the neighborhood already disturbed by the soldiers of the triumvirs, endeavored to convey him away in a litter, but soon discovered the murderers at their heels. They prepared for combat; but Cicero, feeling that death was unavoidable, ordered them to make no resistance, bent his head before Popilius, the commander of the murderers, who had once been saved by his eloquence, and suffered death more courageously than he had borne misfortune. He died in his 64th year (43 B.C.). His head and hands were, by the orders of Antony, affixed to the same rostrum from which the orator, as Livy says, had poured forth eloquence unequaled by any human voice.

Cicero's eloquence has always remained a model. After the revival of learning he was the most admired of the ancient writers; and the purity and elegance of his style will always place him in the first rank of Roman classics. The style of his philosophical writings, without oratorical ostentation, breathes the pure Attic elegance which some of his contemporaries wished also to see in his orations. The orator is seen, however, in his prolix and comparatively unanimated dialogues. His philosophical works, the principal part of the contents of which is taken from the Greek, and which combine academic and stoic doctrines and principles, possess very unequal interest for us. Thus, for example, his work, 'De Natura Deorum,' is for us only a collection of errors; the 'Tusculanæ Quæstiones' are full of the subtleties of the Athenian school; his work, 'De Finibus Bonorum et Malorum,' likewise belongs to this somewhat dry dogmatic philosophy. On the other hand, his works on practical morals have maintained their full value. The book, 'De Officiis,' is to this day the finest treatise on virtue inspired by pure human wisdom. The pleasures of friendship and old age have likewise been excellently set forth in 'De Amicitia' and 'De Senectute.' Of his political work 'De Republica,' a considerable part was brought to light by Mai, and published in Rome in 1822. Cicero wrote the six books, 'De Republica,' in his 54th year. In these he endeavored to show by what policy, what resources, and what morals, Rome had obtained the dominion of the world. His 'De Divinatione' and 'De Legibus' are instructive monuments of antiquity. The same philosophical spirit is evident in all his oratorical treatises, particularly in the most important of them, 'De Oratore,' although this contains as little of utility for us as the 'Claris Oratoribus,' 'Topicis,' 'De Partitione Oratoria,' etc. The most interesting of all Cicero's works for posterity are his 'Epistolæ Familiares' and 'Ad Atticum,' which give a more exact and lively idea of the state of the republic than any of his other works, and display most strongly the characteristic traits of the author. See Middleton, 'Life of Cicero' (1741); Forsyth, 'Life of Cicero' (1864); Levin, 'Lectures on the Philosophy of Cicero' (1871); Trollope, 'Life of Cicero' (1880); Nisard, 'Notes sur les lettres de Cicéron' (1882); Gasquy, 'Cicéron jurisconsulte' (1884); Causeret, 'Sur la langue de la rhétorique dans Cicéron' (1886); Davidson, 'Life of Cicero' (1894); Boissier, 'Cicéron et ses amis' (5th ed. 1895).

Cicerone, sĭs-ẹ-rō′nē, one who, in Italy, and particularly in Rome, shows and explains to strangers curiosities and antiquities; hence, in general, a guide. The talkativeness of such attendants procured them the name ciceroni, in jocular allusion to Cicero. This term is falling into disuse, the official designation, servitore di piazza, or simply guida (guide), being used instead.

Cicisbeo, chē-chēs-bā′ō, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the cicisbeo, who even attended at her toilet, to receive her commands for the day. The custom is the more extraordinary, from the natural jealousy of the Italian, who seemed to change his character completely after marriage.

Ciconia, sĭ-kō′nĭ-a, the genus of birds to which belongs the common stork, the type genus of the family *Ciconiidæ*.

Cicuta, sĭ-kū′tạ, a poisonous genus of umbelliferous plants commonly known as water-hemlock or cowbane. The plant is a dangerous poison, said to be fatal to cattle that eat it. Persons are known to have died from eating the root, which is white and fleshy. It may be the *koneion* (hemlock) of the Greeks, which Socrates and other persons condemned to death were required to drink. *C. maculata* is the most dangerous species in America. The genus has no general involucre to the compound umbels, and the partial involucres consist of several awl-like bracts. The common or tree hemlock, *Conium maculatum,* is also a poisonous umbellifer, with a stem from two to four feet high, hollow, striated, and spotted with purple; leaves large, much divided, and fetid when bruised; and with unilateral partial involucres, marks by which

the common hemlock is readily distinguished from the water-hemlock, and from any other species of the *Umbelliferæ*. It is indigenous in most temperate climates, and is extensively used in medicine, being given internally as a sedative, and applied externally to sores, ulcers, etc., in the form of a poultice or ointment. The Latin *cicuta* was the true hemlock. See HEMLOCK; WATER-HEMLOCK.

Cid, El, ăl thĭd or ĕl sĭd, the popular name of a Spanish national hero, Rodrigo (or Ruy) Diaz: b. Bivar about 1040; d. 1099. Legend and tradition have somewhat obscured the character of the historical Cid, but the main facts of his life are well established by Spanish and Arabic records. He first appears in national history when Sancho, the eldest son of Ferdinand I., and king of Castile, was at war with his brother, Alfonso; at this time he was already known as the *Campeadon* (the champion), a name which he won probably by vanquishing in single combat the champion of Sancho of Navarre. In the war with Alfonso Sancho was victorious, and this success was owing to the Cid, to whom he had given the command of his forces. Alfonso was taken prisoner, and it remained only to overcome the obstinate resistance of Zamora, where Sancho's sister, Urraca, ruled. Before the walls of this city Sancho was assassinated, and Alfonso was called to the throne. It is asserted — but the historical evidence here is not complete — that before recognizing Alfonso's authority the Castilian nobles required of him an oath that he had no part in his brother's murder, and that it was the Cid who administered this oath, in 1073. Whatever the facts, Alfonso must have thought it wise to conciliate the good-will of the Castilian grandees until at least his own position became secure, as he gave his cousin Jimena (or Ximena), daughter of the Count of Ovideo, to the Cid in marriage. The marriage contract, dated 1074, is preserved at Burgos. Later the king, taking advantage of a pretext that the Cid had attacked the Moors without obtaining the royal consent, banished him. Old wrongs which the king still remembered probably furnished the real motive. Then began that career of "soldier of fortune," which, idealized by tradition, has made the Cid the perfect cavalier of Spain. He first offered his services to the Christian Count of Barcelona, and, when refused by him, to the Moorish king of Saragossa, who accepted the offer. The Cid remained in Saragossa till 1088, fighting against Moors and Christians alike, and rising to unusual distinction and power. In 1088 the attention of Mostain, the king of Saragossa, was drawn to the city of Valencia, then under the protection of King Alfonso. The Almoravides, a new Moslem sect from northern Africa, defeated Alfonso in battle, and caused him to withdraw his protection from Valencia, and the governor of the city appealed to Saragossa for help. The Cid was sent to the aid of the city in command of an expedition which proved successful, and he established himself in Valencian territory. As the recognized protector of the lawful king, in reality, the suzerain of Valencia, he received a generous tribute; but it is clear that he had already resolved, when opportunity offered, to secure the city for himself. Meanwhile he skilfully held off, now by force, now by ruse, all other competitors, Christian and Moslem alike: including among these King Alfonso, whose territories he once wasted with fire and sword. As head of an independent army, he made successful forays in all directions; despoiling, levying tribute, garrisoning strongholds, and strengthening his position in every way, and in 1094 finally became master of Valencia itself. He successfully held the city till 1099, when the troops he had sent against the Almoravides were utterly routed, few escaping, and he already enfeebled in health, died, it is said, of grief and shame. His widow held Valencia for two years longer.

The Cid very soon became the favorite hero of popular songs. It is probable that these songs were at first short stories in rude metrical form; and that the epic poems, dating from about 1200, used them as sources. The earliest of the epic poems is 'The Poem of My Cid,' based upon history, but with a large amount of legendary matter. Its date is probably about 1200. It is one of the best of mediæval folk epics, its characters being drawn with clearness and simplicity. Another poem of about the same date, 'The Legend or Chronicle of the Youth of Rodrigo,' is of inferior merit, though not without fine passages. Two centuries and more after these poems we meet with the 'Romances' or 'Ballads of the Cid.' The earliest of these do not in their present form far antedate 1500. These ballads are derived from all sources, but chiefly from the Cid legend, which is here treated in a lyric, and popular tone.

These ballads make Jimena (or Ximena) Gomez the wife of the Cid, and tell the legendary story of her father (Don Gomez), insulting the Cid's father, of the Cid's revenge by killing Don Gomez, of Jimena's pursuit of the Cid demanding justice of King Ferdinand, and the final reconciliation through marriage. De Castro, in his drama, 'The Youth of the Cid,' drew his material from the ballads, but added love and the conflict between affection and the claims of honor in the mind of both Jimena and the Cid. Corneille, based his drama, 'The Cid,' upon that of Castro, using the same plot and the same struggle between love and duty on the part of the hero and heroine. Corneille condensed De Castro's 'The Cid,' gave it dramatic unity, and added greater dignity and nobility to the verse. His drama, when first put on the stage in France (1636), met with immediate success.

Ci'der, the expressed juice of apples; a beverage, the quality of which depends principally on the following particulars: Kind of fruit, condition of the fruit when ground, manner of grinding and pressing, method of producing fermentation, and precautions to be taken against its excess.

The Kind of Fruit.— The characteristics of a good cider apple are a red skin, yellow and often tough and fibrous pulp, astringency, dryness, and ripeness at the cider-making season. When the rind and pulp are green, the cider will always be thin, weak, and colorless; and when these are deeply tinged with yellow, it will, however manufactured, or in whatever soil the fruit may have grown, almost always possess color and either strength or richness. The most certain indications of the ripeness of apples are the fragrance of their smell and their spontaneously dropping from the trees. When they are in this

state of maturity on a dry day (all the better if the weather is cool and bracing), the limbs may be slightly shaken and partly disburdened of their golden store; thus taking such apples only as are ripe, and leaving the unripe longer on the trees, that they also may acquire due maturity. They must be carefully gathered to avoid bruising, as mold rapidly fixes upon the edges of every wound of a fruit gathered in autumn, and communicates a disgusting flavor to the juice. The only artificial criterion for ascertaining the quality of an apple for cider is the specific gravity of its must, or unfermented juice; or the weight compared with that of water. This indicates with very considerable accuracy the strength of the future cider. Its weight and consequent value are supposed to be increased in the ratio of the increase of saccharine matter. The strongest and most highly flavored cider which has been obtained from the apple was produced from fruit growing on a shallow loam, on a limestone basis. All the writers on the subject seem to agree that calcareous earth should form a component part of the soil of a cider orchard. A dry and somewhat loose soil is preferred.

Condition of the Fruit.— Fruit should be used when it has attained full maturity, and before it begins to decay. Each kind of apple should be manufactured separately, or at least those kinds only should be mixed which ripen about the same time. The longer the fruit remains on the tree without decay or being injured by frost the better, for not only is the perfect maturity of the juice an important consideration, but the colder the weather, short of actual frost, the more quiet and equable will be the fermentation. When gathered the apples should be carefully stored in some shady, cool room, and placed in heaps to undergo a further ripening, and acquire more saccharine matter while losing a considerable quantity of watery juice.

Grinding, etc.— This operation should be deferred till December, if possible. It is absolutely essential that the weather should be cold, even slightly frosty, to counteract the tendency to rapid fermentation. The apples should be reduced by the mill as nearly as possible to a uniform mass, in which the rind and seeds are scarcely discoverable, and the pomace should be exposed to the air. It has been ascertained that, by exposing the reduced pulp to the operation of the atmosphere for a few hours, the specific gravity of the juice increases from 1.064 to 1.078. For fine cider the fruit should be ground and pressed imperfectly, and the pulp then exposed 24 hours to the air, being spread and once or twice turned, to facilitate the absorption of oxygen; it should be then ground again, and the expressed juice added to it before it is again pressed. The best method of grinding the apples is to employ cylindrical rollers placed so near each other as to crush them. They are fed from a hopper above them, from which the apples pass between a pair of fluted or toothed cylinders, by which they are torn and partially crushed before reaching the more perfectly crushing apparatus below. The mass is then powerfully pressed, and the cider is run into casks.

Fermentation.— The vinous fermentation commences and terminates at different periods, according to the condition and quality of the fruit and the state of the weather. The best thing whereby to judge of the proper moment to draw the liquor from the scum and sediment is the brightness of the liquid which appears after the discharge of fixed air has ceased and a thick crust has collected on the surface. The clear liquor should then be drawn off into another cask. If it remains bright and quiet, nothing more need be done to it till the succeeding spring; but if a scum collects on the surface it must immediately be racked off again, as this would produce bad effects if suffered to sink. Among the precautions used to prevent excessive fermentation is stumming, which is fuming the cask with burning sulphur. This is done by burning a rag impregnated with sulphur in the cask in which the liquid is to be decanted, after it has been partly filled, and rolling it so as to incorporate the liquid with the gas.

Cienfuegos, thē-ān"foo-ā'gōs, **Nicasio Alvarez de,** āl'bä-rēth dā, Spanish poet: b. Madrid 14 Dec. 1764; d. Orthez, France, July 1809. He studied at Salamanca at the time when the modern school of Spanish poetry was founded there by Cadalso and Melendez. He attached himself to this school, and in 1798 laid the foundation of his literary fame by the publication of a collection of poems. Shortly after he became editor of the government newspapers, *La Gaceta* and *El Mercurio,* and was appointed to the department of foreign affairs. He was in possession of this office when the war of Independence broke out. Madrid was occupied by the French, and Cienfuegos, having both offended Murat by an article in *La Gaceta* and taken part in the insurrection of May 1808, was brought to trial and condemned to death. At the intercession of some influential friends the sentence was commuted to banishment to France. His tragedy, 'Pitaco,' had procured his admission to the Spanish Academy. He also wrote the tragedy of 'Idomeneo,' and the comedy of the 'Magnanimous Sisters.' His tragedies are considered his best works.

Cienfuegos, thē-ān"foo-ā'gōs, Cuba, a city in the province of Santa Clara, on the south side of the island. Its harbor, which is one of the finest in the West Indies, was visited by Columbus on his first voyage, and was surveyed by Ocampo in 1508. The town was settled by refugees from Santo Domingo in 1819. Here the revolutionist Narciso Lopez planned to make his first demonstration on 4 July 1847. In recent years its commercial progress has been rapid, and it is now the second seaport of Cuba. Some of the sugar estates in the neighborhood are very large, and conducted on the most approved modern plan; in fact, Cienfuegos is the centre of the sugar trade on the Caribbean coast. It is a city of attractive, well-shaded streets, and substantially built houses. One of its plazas is the largest in Cuba. Among the principal buildings are the governor's house, market, railroad station, and military and government hospitals. Water from the aqueduct is supplied to 42 per cent of the dwellings; from wells, to 47 per cent; from cisterns, to 7 per cent. There are social clubs, a theatre, etc. The city is lighted by gas and electricity. The climate from May to November cannot be highly commended, the air having an excess of moisture, and the temperature ranging from 75° to 98° F. The winter months, however, are very agreeable, winds from the north prevailing, and

the temperature ranging from 60° to 78° F. during the day, with cooler nights. Cienfuegos is connected by rail with Sagua la Grande, on the opposite coast; with Santa Clara, the western terminus of the Cuba Company's main line to Santiago; with Havana, etc. By steamer it is in regular communication with New York, as well as with ports of the southern coast of Cuba from Santiago to Batabano. The population (United States War Department census, 1899) is 30,038. Occupied dwellings number 4,967. Number of inhabitants engaged in trade and transportation, 3,065; in agriculture, fisheries, and mining, 901; in personal service, 4,004; in manufactures and mechanical industries, 3,221; in professional service, 294; without gainful occupation, 18,553. Total school attendance 3,832. Number of persons able to read 18,052, or 60 per cent — a higher percentage in this respect being found among Cuban cities only in Havana (66 per cent) and Puerto Principe (62 per cent). Foreign-born are 11.6 per cent of the city's population. The white people number 19,220; negroes, 3,068; mixed, 7,401; and Chinese, 349. For a time during the Spanish-American war the harbor of Cienfuegos was blockaded by Admiral Schley.

Cieza, thē-ā'thạ, Spain, a town in the province of Murcia, and 24 miles northwest of the city of Murcia, on an eminence near the right bank of the Segura. It has spacious streets, a large church and ancient tower, manufactures of linen and hempen fabrics, and a trade in corn, wine, oil, and silk. Pop. 14,000.

Cigar (of uncertain etymology; it cannot be connected with any West Indian speech, and the derivation at present most common among scholars is from Sp. *cigarra,* cicada, in allusion to a similarity of outline; Sp. *cigarro.* Also incorrectly spelled *Segar),* a compact roll of tobacco, for smoking. This form was borrowed by the Spanish invaders from the Indians of Cuba. When the Spaniards found that tobacco would grow elsewhere, they transplanted it to their possessions in the Philippines and in other localities. The Manila cheroot is the common method of smoking tobacco in the Far East. This cheroot is cut off evenly at both ends and is shorter than American cigars. Rolling tobacco into cigars was not generally practised in Virginia and the Carolinas for a long time after the settlement of those sections by the English, for there the Indians invariably smoked their tobacco in pipes, but finally the convenience and superior flavor these rolls possessed made their use quite common some years before the Declaration of Independence of the American colonies. In Cuba, Mexico, and Central America and, in fact, in all Spanish-speaking countries, the use of a pipe to this day is a rarity, the inevitable *cigarro* or *cigarette* ("little cigar") being found constantly in use.

The moist climate, the character of the soil, and the peculiar preservative qualities of the air make Cuba the true home of the perfect cigar. There are but half a dozen valleys, mostly in the western end of the island, where the finest cigar tobacco is grown and cured, the most important being the Vuelta Abajo district. Perhaps the next best comes from Porto Rico. The removal of the duty on manufactured cigars from that island in 1903 flooded the United States with cigars from there, many of them very inferior. In order to avoid paying the high duties on Cuban-made cigars, the device was early tried of bringing the tobacco over to the small island of Key West, a part of the State of Florida, separated from Cuba by only an 80-mile-wide strait. It was thought that the climatic conditions there would be so similar to those of Cuba that an equally fine cigar could be made there, while the importation of the tobacco in bulk cut down the duties very materially. The "Key West" cigar is much cheaper than the one made in Cuba, but the flavor, for some reason, is inferior. The manufacturers even brought cigarmakers from Cuba to Key West, so that so far as possible the product might be the same as the original, but in vain. It has been discovered by experts of the department that in Ohio and Texas are certain areas which possess a soil so similar to that of the celebrated Vuelta Abajo district of Cuba that it is possible to raise tobacco there that will equal the Cuban. Samples of the leaf grown there and submitted to dealers in New York and Philadelphia, who were not told where it came from, proved to be so similar to that of Cuba that it was pronounced pure Havana leaf of the best quality. The pioneer in the manufacture of Key West cigars was Gen. J. H. Gregory, who gained his military title in the first war for Cuban independence, and was familiar with the internal resources of Cuba.

Tobacco comes to the cigar manufactories in bundles, that intended for wrappers being kept separate. The best tobacco for wrappers is grown in Sumatra. Connecticut wrappers are also much used, being supple and tough. The best cigars made within the limits of the United States are undoubtedly those of Cuban tobacco manufactured in Key West, with a Connecticut wrapper. Those with Virginia, Carolina, Pennsylvania, and other tobaccos as a filler, with the Connecticut wrapper, are of inferior quality, but sell in large quantities, because of their cheapness. The operative spreads the filler leaf on his bench, with a small quantity of the wrapper beside him. He rolls the filler into the proper shape and firmness, then deftly cuts a portion of leaf to form a wrapper, winds the wrapper about the filler, and secures the ends with paste. This is the standard method. Some poorer grades are made by machinery, but the results are not satisfactory and hand-made cigars are still the best and most expensive. Scattered throughout the United States are thousands of large and small factories for the manufacture of cigars, many of them using little machinery. In 1901 there were 6,914,639,012 cigars and 2,728,153,697 cigarettes made in this country. The production of cigarettes has decreased since 1896, when it was 4,967,444,232, the greatest number ever made, and exceeding the number of cigars for that year by over 900,000,000. The reason for this is the persistent fight constantly waged against the cigarette as injurious, most States having stringent laws regulating its sale. The value of this finished cigar product to the makers is probably about $250,000,000 annually, the consumer paying about $750,000,000 for it. This does not include the imported article, about 75,000,000 coming from Cuba (1903) and 125,000,000 from Porto Rico and the Philippines. There are some few thousands

of cigarettes imported from Egypt and Turkey, though most of those called so are made in this country from American tobacco. Altogether the number of cigars and cigarettes made or brought into the United States at present is about 13,000,000,000. For further details, including the preparation of tobacco-leaf, see the article TOBACCO.

Cigarette. See CIGAR.

Cignani, chēn-yä'nē, **Carlo,** Italian painter: b. Bologna 15 May 1628; d. Forli 6 Sept. 1719. He was a pupil of Albano. He knew how to compose, like the Caracci, and to distribute his figures in such a way that his paintings appear larger than they really are. His finest fresco paintings are at St. Michael in Bosco, at Bologna, in ovals supported by angels, and in the saloon of the Farnese Palace, where he represented Francis I. of France touching for the king's evil. In his painting of the Assumption, at Forli, he has imitated the beautiful Michael of Guido in the cupola at Ravenna, and other fine conceptions of this painter; but in other pieces he made Correggio his model. He does not so often introduce foreshortenings as the Lombards; and in his outlines and drapery he possesses a finish peculiar to himself. His pencil is powerful, and his coloring lively. Clement XI. conferred on him several marks of distinction. His paintings have been engraved by various artists.

Cignaroli, Giovanni Bettino, jō-vän'nē bĕt-tē'no chēn-yä-rō'lē, Italian painter: b. Salo, near Verona, 1706; d. Verona 1 Dec. 1770. His best works are in the cathedrals of Pisa, Bergamo, Mantua, and in the churches of his native city and of Ferrara. He educated a numerous school at Verona, and received several invitations to visit foreign courts, which he invariably declined. In style he resembled Carlo Maratti, but formed himself on the works of Guido and Correggio. He was a man of literary culture, and wrote with discrimination and taste on various subjects.

Cilia, sĭl'ĭ-ą (Latin, "eyelashes"), small, generally microscopic, hair-like organs or appendages, averaging $\frac{1}{3000}$ inch in length, found on the surface of the tissues of most animals, and in some vegetable organisms (as algæ), chiefly on tissues which are in contact with water, or which produce fluid secretions. They are constantly in a state of active movement, and communicate to the fluid with which they are in contact a corresponding motion. This is called vibratile or ciliary motion. In most of the lower aquatic animals the respiratory function is aided by means of the vibratile cilia; many animalcules move by a similar mechanism; and in the highest classes of animals cilia have a share in the performance of some important functions.

Ciliata, sĭl-ĭ-ā'tą, a group of *Protozoa,* and to which belong most of the *Infusoria* (q.v.). The body is covered with cilia, and it is either free or stalked and attached to submerged plants, etc. The group comprises the most specialized *Protozoa,* including the trumpet-animalcule (*Stentor*), the bell-animalcules (*Vorticella* and *Epistylis*). In these one-celled animals there is for the first time in the animal kingdom, as we ascend from the simplest organisms, a permanent aperture (cytostome) corresponding to the mouth of the higher animals, and an œsophagus (cytopharynx), and the undigested or waste portions of the food are cast out at a fixed point or opening (cytopyge), usually not detected when not used. There is also in the *stentor,* etc., a definite spiral muscle, while nettling bodies (trichocyst), like minute rods, in rare cases occur, and are supposed to be defensive in their nature. The ciliate infusoria reproduce by fission, budding, and also by conjugation, molting in the origin of spores or embryos. Certain forms are parasitic; thus the skin disease called eczema has been attributed to the presence of parasitic *vorticellæ,* and a flattened oval free form occurs in the large intestines of men ill with diarrhœa.

Cilicia, sĭ-lĭsh'ĭ-a, in ancient geography the region between Pamphylia and Syria, lying south of Mount Taurus. The inhabitants of the coasts were formidable as pirates, and even disturbed the Ægean and Ionian seas. The inhabitants of the northern portion lived in part a nomadic life; those in the east were devoted to agriculture. Alexander made Cilicia a Macedonian province; it then passed to the Syrians. Pompey subdued its piratical inhabitants. The mountainous parts were left in the hands of the native princes; the rest, in 67–6 B.C., was constituted a Roman province, of which Cicero was proconsul in 51–50 B.C.

Cimabue, Giovanni, jō-vän'nē chē-mä-boo'ā, Italian artist: b. Florence 1240; d. there about 1302. Two Greek artists, who were invited to Florence by the senate to paint a chapel in the church of Santa Maria Novella, were his first masters. Although these artists handled the pencil awkwardly, they however taught him, according to ancient tradition, the proportions which the Greek artists had observed in their imitations of the human figure. Attentive to their instructions, Cimabue studied principally the fine antique statues. He was the first to point out to succeeding painters the elements of the *beau ideal,* the memory of which had been extinguished during several centuries of disorder. It is true the paintings of Cimabue do not exhibit that harmonious distribution of light and shade which forms the chiaroscuro. His coloring is dry, flat, and cold; the outlines of his figures intersect each other on a blue, green, or yellow ground, according to the effect which he had in view. He had no idea of linear and aërial perspective. His paintings are, properly speaking, only monochromes. But these faults, which are to be attributed to the infancy of the art, are compensated for by beauties of a high order — a grand style, accurate drawing, natural expression, noble grouping, and a fine disposition of his drapery. His best paintings are in the church of Santa Maria Novello at Florence, and in the Sacro Convento at Assisi. He may be considered the link between the ancient and modern schools of painting. Cimabue evinced a generous appreciation of Giotto, whom tradition says he discovered drawing figures on the smooth surface of a rock while tending his sheep, and whom he took with him to Florence, and instructed with such success that the pupil soon excelled his master. It should be added that there is very little corroborating testimony regarding the works

attributed to him by Vasari, and a recent destructive critic has written in the 'Nineteenth Century' for March 1903, "All, then, that we know about this Cenni di Pepi is that he was a distinguished Florentine artist; that he was nicknamed Cimabue; that he flourished in the closing years of the 13th century and the early years of the 14th, and that he executed a mosaic and an altar-piece at Pisa, of which the latter has disappeared and the former has been entirely renewed."

Cimarosa, Domenico, dō-mā-nē'kō chē mä rō zā, Italian composer: b. Aversa, near Naples, 17 Dec. 1749; d. Venice 11 Jan. 1801. He received his first musical instruction from Sacchini, entered the conservatory of Loretto, where he imbibed the principles of the school of Durante, and studied with great assiduity. He soon displayed his superiority in the 'Sacrificio di Abramo,' the 'Olimpiade,' and other compositions. At the age of 25 he had already gained the applause of the principal theatres of Italy. He was invited to St. Petersburg (where he remained four years) and to several German courts to compose heroic and comic operas. In the latter he particularly distinguished himself by the novelty, warmth, humor, and liveliness of his ideas, and by a thorough acquaintance with stage effects. Among his 120 operas the most celebrated are: 'Penelope'; 'Gli Orazj e Curiazj'; and 'Artaserse,' among the *opere serie;* and among the *opere buffe,* 'L'Italiano in Londra'; 'L'Amor Costante'; 'Il Pittore Cariginо'; and many others. His comic opera, 'Il Matrimonio Segreto,' excited general enthusiasm, and received the signal honor of being performed twice on the same evening, at the desire of the Emperor Leopold. From Vienna he went to Naples, and became involved there in the revolutionary commotions. He died from the effects of the ill treatment which he had been subjected to in prison. His bust, by Canova, was placed in the Pantheon at Rome in 1816 by the side of those of Sacchini and Paesiello.

Cimbri, sĭm'brī, a tribe which inhabited Jutland (the Chersonesus Cimbrica), whence they sallied, together with the Teutones, and became among the most formidable of the enemies of Rome. In the year 114 B.C., when the Romans were already masters of a part of the eastern Alps, in the present Carniola, Istria, etc., and had established themselves in Dalmatia and Illyria, along the coast, immense bodies of barbarians suddenly made their appearance, who overcame the consul Papirius Carbo in the country now called Styria; but instead of entering Italy they proceeded to the north, and soon after, jointly with the Tigurians, entered the territory of the Allobroges. The Romans sent two armies, commanded by the consuls L. Cassius and M. Aurelius Scaurus, to oppose them, but both were defeated — the former by the Tigurians, the latter by the Cimbri. Even after this success the victors did not enter Italy, but overran Gaul with three bodies, consisting of Teutones, Cimbri, and Ambrones. Two new armies, with which the consul C. Manlius and the proconsul Q. Servilius Cæpio hastened to oppose them, were likewise defeated beyond the Rhodanus. The Romans lost, according to Aetius, 80,000 men. While Rome placed her last hope in Marius, the barbarians overran the other western countries of Europe. Gaul suffered severely, but the Iberians and Belgians repulsed the invaders. Upon this they resolved to descend into Italy. The Teutones and Ambrones were to enter on the western side of the Alps, the Cimbri and Tigurians on the east. After Marius had waited the approach of the first during three entire years, and had accustomed his troops to their appearance, he routed them completely (102 B.C.) in two days — on the first day the Ambrones, on the second the Teutones — at Aix in Provence. The Cimbri, on the other hand, who had driven back the consul Catallus on the Adige, and had spread themselves along the Po, demanded land of the Romans, but were totally routed by Marius at Vercelli 101 B.C. About a century after this the Cimbri sent (from the Cimbrian Chersonesus) an embassy to the Roman emperor Augustus, to offer him presents and to ask pardon for what they had previously done against the Romans. The nationality of the Cimbri is a disputed point. Similarity of name led the ancients to identify them with the Cimmerians, but this view is no longer held. Some authorities believe them to have been of Germanic, others of Celtic race. Their name certainly has a great resemblance to that of the Celtic Kymri; and their armor and customs, according to Plutarch and Strabo, were very different from those of the Germans. "All these circumstances," says Schmitz, in Smith's 'Dictionary of Greek and Roman Geography,' "render it in the highest degree probable that the Cimbri were a Celtic or Gallic and not a Germanic nation."

Cim'brian Panic, The, a Roman panic after the annihilation of five armies by the Cimbrians 105 B.C. This panic rose to its climax after the terrible defeat of Cæpio, the consul in Gallia Narbonensis.

Cimburgis Lip, The, often called the "Austrian Lip" (q.v.). It came from Kaiser Maximilian I., and was inherited from his grandmother Cimburgis, a Polish princess, who married Kaiser Friedrich III.

Cimex Lectularius, sī'mĕks lĕc-tū-lār'ę-ŭs. See BEDBUG.

Cimicifuga, sĭ-mĭ-sĭf'ū-ga, from the Latin, "to drive away," so named because certain species are used to drive away bugs and other insects. The plant is a genus of the crow-foot family, comprising about 20 species, natives of North America, Asia, and Europe. The best known American species, because of their medicinal properties are the bugbane (*Cimicifuga americana*) (q.v.) and the black-snakeroot or black cohosh (*C. raceomsa*), supposed to be an antidote for the venom of serpents.

In medicine cimicifuga is used largely by the eclectics as a digestant, cardiac tonic, and uterine stimulant. Its active principles have never been thoroughly determined and little is known of its physiological action as determined by exact pharmacological experiment.

Cimmerian (sĭ-mē-rĭ'an) **Bos'phorus,** an ancient name for the Strait of Kaffa.

Cimmerians, sĭ-mē'rĭ-anz, a tribe half-mythical, half-historical, described first in the Odyssey as dwelling beyond the ocean-stream, in thickest gloom, unvisited by Helios. Hence the term, "Cimmerian gloom." From Herodotus we learn that they originally inhabited the coun-

try between the Borysthenes and the Tanais, but expelled by the Scythians, they traveled along the shores of the Euxine, passed through Colchis and over the Halys, and entered Asia to the west of that river. Against this it is urged that the route by the Euxine would be impassable for a nomadic people, the Caucasus running down to the very shores of that sea. The sum of our certain knowledge respecting this people is, that they seem to have been the chief occupants of the Tauric Chersonesus (the Crimea), where they had a large city, near which were fortifications enclosing the isthmus by an earthen wall.

Cimolian (sĭ-mō'lĭ-ăn) **Earth,** or **Cimolite,** sĭm'ō-līt or kĭm'ō-līt (from Kimolos, one of the Cyclades, in the Ægean Sea, where it is still to be found), a hydrated silicate of aluminum, apparently formed by the decomposition of augite. It is of a light color, compact, and somewhat slaty. Water soon splits it up; when ground with water it forms a thick cream. In classical times it was used as a soap for cleaning delicate fabrics, and by the bath-keepers. It is mentioned by Aristophanes in this connection. It is used in the island as a detergent.

Cimon, Athenian general and statesman: b. about 502 B.C.; d. Citium, Cyprus, 449 B.C. He was a son of the great Miltiades. He fought against the Persians in the battle of Salamis 480 B.C., and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke. The return of Aristides to Athens soon after left Cimon at the head of the whole naval force of Greece. He conquered the pirate-island of Scyros, subdued all the cities on the coast of Asia Minor, pursued the Persian fleet up the Eurymedon, destroyed more than 200 of their ships, and then, having landed, on the same day entirely defeated their army 469 B.C. He employed the spoil which he had taken in the embellishment of Athens, and in 463 reduced the revolted Thasians; but the popular leaders, beginning to fear his power, charged him on his return with having been corrupted by the king of Macedon. The charge was dropped, but when Cimon's policy of friendship to the Lacedæmonians ended in the latter insulting the troops sent by Athens to their aid, his opponents secured his banishment. He retired into Bœotia, and his request to be allowed to fight with the Athenians against the Lacedæmonians in 457 at Tanagra was refused by the suspicious generals. Eventually Cimon was recalled at the instance of Pericles to conclude a peace with Lacedæmon. He died while besieging Citium in Cyprus.

Cinapusen, sē-nä-poo'sän, or **Cinapuran Islands,** a cluster of 10 islands of the Tawi group, Sulu Archipelago, lying southwest of the island of Sulu; area 13 square miles. The islands are covered with tropical vegetation, and are mostly resorted to for fishing by natives of neighboring islands. Tabawan, the largest of the cluster is, however, thickly populated; the inhabitants carry on a considerable pearl fishery. They were at one time notorious pirates, but since the destruction of their settlements by a Spanish fleet, have been harmless and inoffensive. The islands now belong to the United States and are a part of the Military Department of Mindanao.

Cinchona Bark, the bark of several species of *Cinchonaceæ* (q.v.). The following are the most important: *Chinchona flava cortex,* yellow cinchona bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flat cinnamon-colored pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from *C. calisaya,* which grows in the peculiar cloudy regions of the Andes. *C. pallidæ cortex,* pale cinchona bark, from *C. condaminea.* It occurs always in quills covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchonine. Two hundred grains of the bark yield about one grain of alkaloid. *C. succirubra* appears to thrive in India. The bark occurs in flattened rough-fibrous, dark-brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains about equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than 1½ grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion, and tincture. The pale bark is contained in *tinctura cinchonæ composita* and in *mixtura ferri aromatica.* The cinchona barks contain, besides the alkaloids, certain acids having astringent properties, and are valuable as tonics in cases of great debility. Cinchona barks rich in quinine generally contain much lime, and their solutions are precipitated by sodium sulphate. See QUININE.

Cinchonaceæ, sĭn-kō-nā'sē-ē, a well-marked order of plants, almost exclusively found within the tropics. Its leaves are simple, entire, opposite, with interpetiolary stipules. The flowers are usually arranged in panicles or corymbs. The calyx is adherent, with a definite number of divisions or none. The corolla is superior, tubular, and regular, with a definite number of divisions. The stamens arise from the corolla, all on the same line, and alternate with its segments. The ovary is inferior, surmounted by a disk, usually two-celled, occasionally with several cells; the style is single, inserted, sometimes partly divided; the stigma usually simple, sometimes divided into a number of parts. The fruit is inferior, dividing into halves, or not dividing, and dry or succulent; sometimes it is many-celled. Many of the species of this order are of considerable importance, being largely used in medicine, acting as tonics, febrifuges, emetics, and purgatives. The species of *Chinchona* yield Peruvian bark. An extract, with some sweetness and a more astringent taste than terra japonica, and called by the Malays gambier, is obtained from the *Uncaria gambir.* Ipecacuanha is the root of *Cephäelis ipecacuanha,* a little, creeping-rooted, semi-herbaceous plant, found in the damp forests of Brazil. Coffee is the seeds of a plant of this order, the *Caffea arabica.* A few species bear an edible fruit, such as the genipap of South America, the nahil peach of Sierra Leone, and the voa-vanga, a good dessert fruit in Madagascar. Among dyeing plants there is the

Oldenlandia umbellata, whose roots are the chay-root (q.v.) of commerce.

Cincinnati, Ohio, county-seat of Hamilton County, in the extreme southwest of the State, one of the great commercial and manufacturing centres of the Union, tenth in nominal rank, and seventh or eighth in fact. It is situated on the north bank of the Ohio River, almost exactly half way from its origin at Pittsburg to its mouth at Cairo, Ill., about 465 miles by water from each and 315 by rail from the former, and 369 from the latter; and is a station on every trunk line of railroad in the Middle West, being the main terminal of the Cincinnati Southern, Cincinnati, Hamilton & Dayton, Chesapeake & Ohio, and a number of others. It is 138 miles by water from Louisville, and 1,631 from New Orleans, against 114 miles and 1,210, respectively, by rail; 764 miles by rail from New York, and 270 miles from Chicago.

Topography.— Cincinnati occupies the northern half of a circular amphitheatre of hills about two and a half miles in diameter, bisected east and west by the Ohio River — which here makes a great southward sweep. In the southern half, bisected north and south by the Licking, lie its Kentucky suburbs, respectable cities themselves. The northern semicircle rises from the river in two great terraces, sloping northward to a third level at the summit; originally quite distinct, now much confused by grading. The lower platform is a bluff about 65 feet above low water, the second 50 to 100 feet higher, the crest-hills 150 to 300 feet higher yet, or about 475 feet at the summits — Mount Adams, Mount Lookout, Mount Auburn, Fairview Heights, etc.— giving a noble prospect of river and country. Four of these hills can be reached by inclined plane cable railways used in the main for the lifting of the electric cars. They are cut by ravines, and much of the heavy original woods has been left intact, while the remaining ground has been occupied by miles of the finest residence streets in America, parked with shrubbery, lawns, and flower gardens. On the western side of the city from north to south runs Mill Creek, the remains of a once huge glacial stream, whose gently sloping valley half a mile or more wide, forms an easy path into the heart of the city, and was an indispensable factor in determining its position; highways, canals, and railroads come through it, and the city's growth has pushed much farther up this valley than in other directions. The railroad stock yards are on its eastern slope. Cincinnati extends for about 14 miles along the river front, to a width of about five in an irregular block north from it, but attains a width of six or seven miles at the extreme point along the creek valley. The total area thus far in the city limits is 42½ square miles; much more is legitimately a part of it.

Municipal Conditions.— The site of the city is a glacial moraine of gravel and boulders, cut through by the Ohio; there is therefore little bottom land, and has been from the first little of the malaria which was long such a scourge and reproach to western settlements; and this, with the moderate climate, averaging about 75° in summer and 34° in winter, and the easy sewerage down the slopes into the Ohio and away from the city, has given it excellent sanitary conditions, its death-rate falling from 21 per 1,000 in 1890 to 19 in 1900, and 18 at present. The city owns its own waterworks and 449 miles of mains. The water is pumped from the Ohio River into reservoirs in Eden and Third Street Parks, having a capacity of 106,000,000 gallons, the daily consumption being about 44,000,000 gallons. The system is now being extended at an approximate cost of $10,000,000, and will when completed draw its supply from the Kentucky side of the Ohio opposite California about eight miles up the river and beyond all contaminating sources. The extension includes a complete mechanical filtration plant at the new reservoirs, which will have a capacity of 350,000,000 gallons. With the completion of the new waterworks perfectly pure water will be delivered direct to the consumer. The city has 641 miles of streets, of which 391 miles are paved with macadam, granite, asphalt, etc.

Interior, Suburbs, etc.— The bottom level below the bluffs, along the riverside, is of course the seat of the river shipping business, and has as well the usual fringe of low quarters; it is paved and there is a broad "public landing" fronted by floating docks, wharf-boats, etc. Above are the wholesale and then the retail business streets, with great extent and variety of fine business architecture, and gridironed with electric roads, of which there are some 225 miles within the city limits. The principal lines converge at or near Fountain Square (see below), and connect with a ring of beautiful suburbs, within and without the city limits, unsurpassed in America. To the north are Clifton, Avondale, Mount Auburn, Vernonville, College Hill, Winton Place, Linwood, Elmwood, Hartwell, Lockland, Glendale, Norwood, Oakley, Walnut Hills, Mount Lookout, etc.; across the river, over which, on three bridges, the electric lines run, are numerous cities and towns, including Covington, Ludlow, and Milldale to the west of the Licking, and Newport, Bellevue, Dayton, and, far beyond, to the east, Fort Thomas, a leading army post. The section lying to the north and east of the canal which intersects the plateau at the foot of the suburban hills is largely occupied by Germans, from which circumstance it is frequently referred to as "over the Rhine." The river is crossed by five bridges, each more than half a mile long, one exclusively for railway traffic, two for highway, and two for both; the truss-bridge of the Cincinnati Southern to Ludlow — costing $3,348,675, with one of the longest spans in the world — the cantilever of the Chesapeake & Ohio to West Covington; the great wire suspension bridge to Covington, designed by John A. Roebling, and completed in 1867 at a cost of $1,800,000, and two wrought-iron bridges to Newport, one of them used by the Louisville & Nashville R.R.

The original town was laid out as a checkerboard, with streets four rods wide, the conventional form of the artificial American town; but the irregular surface and individual tastes have given them greater variety since, and no city has a finer field for picturesque architecture. The older residence streets were monotonous rows of low brick houses, but the newer ones have a remarkable variety both of form and material. A local freestone and blue limestone are much used in building, as well as brick with steel framing. The most notable public buildings, besides churches mentioned below, are the gov-

ernment building (post-office, custom-house, etc.) of brick and iron with sawed freestone facing, 180 feet by 50, and costing $5,200,000; the county court-house (Romanesque), replacing the one destroyed by the mob in 1884, with the jail in the rear, the whole occupying an entire square; the beautiful city-hall, completed in 1893 at a cost of $1,266,956.10; the city hospital, of eight buildings around a central court, occupying a square of nearly four acres, and costing over $700,000 exclusive of grounds; the city workhouse, the university buildings, the Chamber of Commerce, one of H. H. Richardson's last designs; the magnificent Music Hall, the gift of Reuben R. Springer and others; the Romanesque public library, costing $675,000; the Masonic Temple (Byzantine), Odd Fellows' Temple, Y. M. C. A. Building, Art Museum, the Queen City, Cincinnati and Phœnix clubs, Lafayette and Third National Bank buildings, Rookwood Pottery, St. Francis Xavier's College, a splendid structure; the Central Union depot, the city markets, and the sky-scrapers of 15 to 20 stories, one of which, the Ingalls Building, is the tallest concrete structure in the world, as well as smaller but admirable bank and other business buildings. Of public monuments, by far the most artistic is the Tyler-Davidson Fountain, with a surrounding esplanade, on Fifth Street, between Vine and Walnut, in Fountain Square, the centre of most of the street car lines. It was presented to the city by Henry Probasco in 1871, having been cast at the Royal Foundry in Munich at a cost of $200,000, and is regarded as the finest fountain in the world, and one of the world's chief art treasures. The equestrian statue of President William Henry Harrison (first governor of Ohio), the statues of Garfield, Lincoln, Hecker and McCook, and the Fort Washington monument also adorn the city.

Parks, Cemeteries, etc.— The park system comprises 540 acres, in three large bodies on the hills and seven smaller ones. The largest is the superb Eden Park, containing 210 acres, on Mount Adams in the northeast centre, containing the two main city reservoirs made to look like lovely natural lakes; there is also a high water tower with steps to the top, commanding a matchless prospect. The Art Museum and Art School, the gift of C. W. West, Joseph Longworth, David Sinton, R. R. Springer, and others, two beautiful buildings costing $450,000, is within the grounds, which are entered by a mediæval gateway, Elsinore, much admired. The next largest park, and equally picturesque, is Burnet Woods in the north centre, with about 160 acres; it contains the grounds, 30 acres in extent, of the University of Cincinnati (q.v.), and another exquisite lake. The zoological gardens, northeast of Burnet Woods, with 60 acres of wild natural beauty, is the home of a varied collection of wild animals and birds, regarded as the best in the country. Lincoln, Washington, and Hopkins are the finest of the smaller parks. Most of the 20 cemeteries are in the northeast, though one or two are in the extreme southwest; but the one superb burial ground, one of the largest and most charming in the country, is Spring Grove Cemetery, about six miles north on the western slope of Mill Creek Valley, with 600 acres of fine landscape gardening and native beauty, and reached by an avenue 100 feet wide. It has a bronze statue as a soldiers' monument, and a number of magnificent and costly mausoleums.

Amusements, Clubs, etc.— Cincinnati's large German population, with the healthy taste of that element both for recreation and music, has given it a foremost place in these lines. Music is cultivated in a number of well patronized institutions, the College of Music and the various conservatories, and the biennial May festivals are an indispensable part of the city's higher life and are known throughout the world. Other important features of the musical life are the permanent symphony orchestra, the Apollo and Orpheus clubs and a large number of German singing societies. The grand Music Hall is a monument of the munificence of Reuben Springer, who founded it and gave part of its endowment; it is 500 feet by 300, has a seating capacity of over 4,000, and its organ is one of the largest in the country. There are also the Grand, Robinson's, and Heuck's Opera houses; the Walnut Street, Columbia, Lyceum, and People's theatres, the Auditorium, College and Greenwood halls, the Turner and Arbeiter halls, etc. The chief clubs are the Queen City, Business Men's, Phœnix, Cincinnati, Cuvier, Country, Commercial, and Literary. The Cincinnati Gymnasium has extensive suburban athletic grounds and owns a fine city building. There are two favorite summer resorts on the Ohio, one on the Kentucky shore called the Lagoon, and Coney Island, some miles up the river. Chester Park, near Spring Grove Cemetery, is also a well-equipped resort.

Business Interests.— The position of Cincinnati as a midway port on the great central channel of one of the most fertile districts of the world, added to its location on a platform above the floods which washed away its rivals, was the origin of its greatness; but that river traffic has greatly declined since the advent of railroads. Even yet, however, it is invaluable for the transportation of bulky freight — coal, ore, iron, lumber, salt, etc.— to manufactories, and the distribution of its products to the Ohio and Mississippi and their tributaries. A number of regular packet lines still run to Louisville and the Mississippi ports as far as New Orleans, up the Ohio to Pittsburg, to the Big Sandy, Cumberland, Tennessee, and Green, the Red, White, Arkansas, Yazoo, etc., covering 1,200 miles of the Ohio, 850 of the Mississippi, and 2,000 of tributaries. About 100 vessels a year register for this inland commerce, with a tonnage of some 18,000; but there is a much greater commerce than this indicates, as one towboat will push many barges in front of it, a method peculiar to western rivers. The government improvements, dredging and lighting the channel, have greatly aided to keep this navigation alive. Furthermore, by the Miami Canal to Lake Erie at Toledo, much heavy raw material is still brought in at rates the railroads cannot meet. The immense railroad business has already been referred to. Sixteen roads enter Cincinnati; the passengers of most of them come into the Central Union Depot at Central Avenue and Third Street; but a few, of which the Pennsylvania, and Cincinnati, Hamilton & Dayton are chief, have separate stations. The Cincinnati Southern road, 338 miles long, was built and is still owned by the city, and is operated by the Queen & Crescent route under lease.

The trade and manufacturing interests of the city are enormous, even beyond the proportion of its size. It has 13 national banks, clearings aggregated $1,154,647,600 for 1903. It has also a number of State and private banks. The building and loan associations, which had grown to number 309 in 1902, are being largely absorbed by new and strong trust companies and savings banks. The slaughtering and packing of meats, especially pork, has long been and is still one of the leading branches of commerce, the city packing more than half the meat product of the State. Cincinnati holds the first position in this country in sales of pig-iron, the total yearly receipts and sales for direct shipment amounting annually to nearly $50,000,000. The number of industrial establishments is about 8,000, employing a capital of about $135,000,000, and 110,000 workmen, and occupying real estate valued at $65,000,000, with an annual product of $315,000,000. The value of commodities received (latest estimate of Chamber of Commerce) was $545,000,000, while the value of the principal commodities shipped was $505,061,615. According to the census of 1900, the greatest single branch is iron work, including pig, castings, foundry and machine-shop products, and architectural iron work, $12,384,848; others, men's clothing (factory-made), $11,950,648; slaughtering and meat packing, wholesale, $9,532,057; distilled liquors, $9,419,687; factory-made boots and shoes, $8,788,424; carriages and wagons, and their material, $7,233,048; tobacco products, $6,768,467; malt liquors, $6,387,383. Other great products are leather and leather goods; furniture, lumber, timber, and woodworking products; coffee and spices, roasted and ground; saddlery and harness; pickles and preserves; undertakers' goods; musical instruments; soap and candles; electrical supplies; flour and grist; plumbers' supplies; patent medicines; and society regalia, costumes, banners, etc., in which Cincinnati heads the United States. Other products number hundreds, many curious and interesting.

Educational Institutions, Libraries, Newspapers, etc.— Cincinnati has a thorough system of public schools, with 52 grammar schools (including one for deaf-mutes), and three public high schools, the Hughes, Walnut Hills, and Woodward; with about 850 teachers; and 15 private academies and secondary schools, besides several score of Catholic parochial schools. For higher education, the chief is the University of Cincinnati, expanded from the old McMicken University, the capstone of the system of public instruction, with affiliated law, medical, and dental departments, and in connection the famous observatory now located on Mount Lookout — one of the earliest in the United States, with an 11-inch refractor and a new meridian circle, and with a notable record in the investigation of double stars. The university buildings are in a 30-acre space set off by the city in Burnet Woods Park. The Ohio Mechanics' Institute, one of the most important educational forces in the city, has a large, thoroughly equipped building and library, and maintains both day and night schools, attended by hundreds, in which regular classical, literary, and scientific instruction and courses of lectures are given. There are also half a dozen medical and surgical schools, besides training schools for nurses in the hospitals; two other dental colleges; a night law school; several business colleges and schools of expression; Lane Theological Seminary at Walnut Hills (1832), famous for Lyman Beecher and Calvin E. Stowe, and for its slavery dissensions; two Roman Catholic colleges, St. Francis Xavier (1840), and St. Joseph's (1873); 5 Catholic seminaries for the education of priests, and 6 Catholic female academies and seminaries, leading to orders; the Hebrew Union College for educating rabbis, the chief one in the United States; the Art Museum and Art School founded by Cincinnati ladies on the model of South Kensington, with two large buildings and several hundred students, and a valuable collection of works of art. The Cincinnati Society of Natural History has a museum of valuable and interesting relics open to the public. Of the libraries, the chief is the free Public Library, handsomely housed on Vine Street (with over 300,000 volumes and pamphlets), and various suburban branches. There are 16 others, subscription and institutional, of which the chief are the Young Men's Mercantile, the Law Library, that of the Mechanics' Institute, the library of St. Xavier's College, Lloyd Library and Museum, the University Library, and the Historical and Philosophical Society has the finest collection in existence of original manuscripts, pamphlets, and bound volumes, pertaining to the history of Cincinnati and the State of Ohio, and ranks among the first institutions of the kind in the country. There are in 1904, 19 daily newspapers, 12 English, 6 German, and one Italian; 70 English and 13 German weeklies; 79 monthlies, 23 quarterlies, and 14 of various other kinds, 229 periodicals in all.

Churches and Charities.— Cincinnati in 1903 had 269 church bodies, 60 Roman Catholic (besides five convents), 180 Protestant of various denominations, 12 Jewish synagogues, and 17 unclassified, including Christian Science, Spiritualist, etc. The city is the seat of a Roman Catholic archbishop and a Protestant Episcopal bishop, with cathedrals of both. The finest church building in Cincinnati is the cathedral of the former (St. Peter's), in pure Grecian style, 180 feet by 60 and 90, with a spire 224 feet high. Other prominent churches are the First Presbyterian, with a tower and spire 285 feet high, the loftiest in the West, surmounted by a gilt hand pointing upward; the Second Presbyterian; St. Francis Xavier and the St. Francis de Sales (Roman Catholic) on Walnut Hills (with the largest swinging bell in the world); the Hebrew Synagogue and the Temple; Christ's and St. Paul's Protestant Episcopal, and St. Paul's Methodist Episcopal; the Ninth Street Baptist; the Unitarian; and the Church of the New Jerusalem (Swedenborgian).

There are 53 benevolent associations in the city, covering every class and grade of alleviable human misfortune; an infirmary; a house of refuge for irreclaimable children; and a workhouse, with workshops and work grounds. Prominent among the 17 hospitals, public and private, are the large city hospital, the Jewish Hospital, Good Samaritan, St. Mary's (both Catholic), Longview Asylum, United States Marine, Bethesda, the Ohio Hospital for Women and Children, the Presbyterian, the Elizabeth Gamble Deaconess Home and Christ Hospital, and the Laura McDonald Memorial. There are also numerous homes for the aged and infirm, for

orphans, for incurables, and the friendless, non-sectarian, and denominational, all splendidly equipped, and a fresh-air fund and farm.

Government, Finances, etc.— The government is "federal"; there is a two-years' mayor, who appoints non-partisan election, supervisory, and public safety boards (in control of the fire and police departments); a (legislative) council of one from each ward; other boards and officers elected by the people, including an administrative board of public service, and a board of education. The city debt is about $25,000,000, but $18,000,000 of this is for the Cincinnati Southern line, which returns $1,000,000 a year rental. The tax-rate is $22.70 per $1,000. The yearly disbursements are about $7,000,000, of which over $1,000,000 is for schools.

Population.— In 1800, 750; 1810, 2,540; 1820, 9,642; 1830, 24,831; 1840, 46,338; 1850, 115,435; 1860, 161,044; 1870, 216,239; 1880, 255,139; 1890, 296,908; 1900, 325,902. The census bureau estimate for 1904 is 332,934, which obviously does not include the territory annexed to the city in March 1904. This does not convey accurate information, however, without supplemental figures based on the position of the city with nearly a third of its business population resident across the river in another State, as well as several populous suburbs in other townships to the north. Newport, Bellevue, and Dayton, Ky., east of the Licking, contained in 1900 40,761; Covington and Ludlow, west of it, 49,989, or 90,750 in Kentucky; while Mill Creek and Columbia on the north had 34,629 — a grand total of 451,281.

History.— The site of Cincinnati at the time it first came under the eye of the white man was covered with "ancient works," monuments of a prehistoric race. Traces of many of these "works" still abound in the neighborhood, which is a centre of the so-called "Mound Builders'" remains. Here, too, ran the old Indian trail leading from the British trading post at Detroit to the Licking River, and into the section south of the Ohio. Numerous bands of savages swept through the valley of the Miamis, subsequently called the "Miami Slaughter House," on their marauding expeditions against the Kentucky pioneers. It was in pursuing one of these bands of "horse thieves" that Benjamin Stites first noticed the fertility of the section and its desirability for settlement. As a result of his efforts came the "Miami Purchase."

John Cleves Symmes, with other members of Congress who had been interested by Stites, in 1787 began negotiations with the government for the land lying between the Miamis, which resulted in a conditional purchase that on survey proved to be some 600,000 acres, of which he ultimately received about half. Early in 1788 he sold 740 acres opposite the mouth of the Licking to Matthias Denman and others, with whom he visited the spot later and selected it as the site for a city, to be called Losantiville — a combination of Latin and French, meaning "town opposite the mouth of the Licking." After some shiftings of ownership, a firm consisting of Israel Ludlow, a surveyor, and two others, took possession 28 Dec. 1788, and Ludlow laid out a village with the present Central Avenue and Broadway, about three quarters of a mile apart, for east and west boundaries, and Seventh Street, about as far from the river, for northern, blazing the street lines on the trees. Three or four log-cabins were built, and the flooding out of several Ohio River town sites about this time left Cincinnati the chief survivor. The building of Fort Washington by the government in the summer of 1789, just east of Broadway, still further confirmed its primacy, for the Indians were a terrible menace until long after. In January 1790, General Arthur St. Clair, newly appointed governor of Northwest Territory, arrived, laid out Hamilton County (named after Alexander Hamilton), and made its seat the new town, whose name he changed to Cincinnati (Symmes, who professes to have suggested the change, was tenacious for Cincinnata), after the famous society of Revolutionary officers, of which he was a member. By the end of 1790, it had some 40 log-houses. The defeats of Harmar (1790) and St. Clair (1791) nearly caused its abandonment in a panic, but the importance of the fort kept the settlement alive. In 1792 as many as 354 lots had been taken for building; and so important a centre of commerce had it become even then that 34 of its buildings were warehouses well stocked with goods. It had some 900 inhabitants, but many of them were floaters. A visiting missionary reported that the people resembled those of Sodom, and the town, like others on the north bank of the Ohio, was thronged with frontier idlers and lawless ruffians who took refuge in Kentucky when brought to book; but as the first church (Presbyterian) was built this year, and the first school (pay) opened with 30 scholars, perhaps some of this language was "common form." Also as settlers were compelled by law to take their loaded guns to church for protection against Indians, it was no place for the tamer sort. In 1793, the 'Centinel of the Northwest Territory,' the first newspaper published north of the Ohio, appeared, and a year later the first through mail to Pittsburg was started in a canoe, and a packet line of keel boats to Pittsburg was organized. Wayne's crushing defeat of the savages at Fallen Timbers, bringing peace to the frontier, was in one sense disastrous to Fort Washington, as settlers swarmed all over Ohio, and it ceased to be the one centre. This defeat, however, assured the permanency of Cincinnati, which increased slowly but surely until in 1800 its population was 750, a growth of 50 per cent since 1795. In December 1801 the seat of territorial government was removed to Chillicothe. But its 12 years' primacy, the army post making it a depot for supplies, and its frontier position, had given it a safe start. In 1802 Cincinnati was incorporated as a town. A well-known picture of the town also dates from this year, in which, too, a "Young Ladies' School" was started, indicating a superior grade of population; and from February to May 1802 over 4,400 barrels of flour were exported, showing its development as a distributing port. The first bank, that of the Miami Exporting Company, was started in 1803. In 1805 the town had 960 people and 172 buildings. But immigration set in much more strongly a year later, and the names show an extraordinary intellectual calibre in the settlers it was attracting. In 1810 it had 2,300 inhabitants, and was the largest town in the State, the centre of immigration to Ohio, and with a great commerce along the river, and was contemplating a university. The first book de-

scriptive of the place appeared this year written by the celebrated Dr. Drake. In October 1811 the New Orleans (steamboat) passed the town on her first trip from Pittsburg to Louisville. A stone steam mill 110 feet high of nine stories and with foundation walls 10 feet thick, dates from 1812. In 1814 Lancaster Academy, afterward Cincinnati College, was founded. In 1819 the town received a city charter, having according to the first directory, published this year, 9,873 inhabitants, mostly from the Northern and Middle States, but also many foreigners, so that it was "not uncommon to hear three or four languages spoken in the streets." Another little book descriptive of the city published in 1826 was republished in England and, translated into German, circulated on the continent and attracted a large number of immigrants, especially Germans, who by 1840 numbered one fourth of the population. But its great development came with the opening of the Miami Canal, the most important single influence in the history of the city, for which ground was broken in 1825 at Middletown, and which was completed to Cincinnati in 1827. This not only developed commerce, but furnished great waterpower for manufacturing. The first railroad, the Little Miami, was chartered in 1836, but was not opened till 1846, the first section not till 1843. Even before this the growth was very rapid, population nearly trebling 1820–30, and nearly doubling 1830–40; but the next decade showed the tremendous leap from 46,000 to 115,000. From 1840 the immense immigration of Germans increased so rapidly as to make it for years the typical German city, and this element still constitutes a large proportion of the population. The Germans took great interest in grape culture, and "the banks of the beautiful river" were festooned with vines and the city for some years was a great wine market. It was the great German population that caused the first Saengerfest of the North American Saengerbund to be held here in 1849, a great stimulus to the musical activity of a city since so famed in the musical world. Several times the city was fearfully ravaged by the cholera, beginning with 1832–4; in 1849 and 1850 over 9,000 souls, or nearly 8 per cent of the entire population, perished of it. Yellow fever came in 1878. Floods have also risen over its platform several times and laid the lower section under water; those of 1832 ("the year of flood, fire, pestilence, and famine"), 1883, 1884, having been especially high and destructive. In 1838 the new and beautiful steamer Moselle exploded in front of the landing with a loss of almost a hundred and forty lives, one of the most terrible river disasters of the country. Two years later the city was the centre of the "log-cabin" campaign, which sent a favorite son, William Henry Harrison, to the White House. At a later time Hayes, whose previous active life had been spent in this city, occupied the Presidential position, and Salmon P. Chase, another famous Cincinnatian, was Chief Justice of the United States. A continuous excitement of the city was its fury over the race question and later the abolition movement. The vast Northern interest in Southern trade was everywhere a powerful restraining influence on this; but Cincinnati, on the border, and with its daily bread dependent on this trade, besides having a considerable percentage of its people of Southern birth and detesting the movement on general principles, felt menaced with entire industrial ruin if the agitation were not put down by force. Lane Seminary was threatened with fire, and its faculty with lynching if the students were not prohibited from discussing slavery; and in 1836 and 1841 James G. Birney's Philanthropist press was wrecked by the mob. In fact anti-negro riots were frequent and arose upon the slightest provocation. The trouble was later aggravated by the fact that Cincinnati, being a border city, was a chief station on the "Underground Railroad"; one Quaker citizen boasted of aiding 3,000 fugitive slaves to escape, and in all several times that number must have been smuggled across. Here, too, were tried the celebrated "fugitive slave cases," the Rosetta and Margaret Garner cases. In 1856 Buchanan was nominated for the presidency in Cincinnati; later nominees of Cincinnati conventions were Greeley in 1872, Hayes in 1876, and Hancock in 1880. When the war broke out, however, it became a strong Union city, and its record is noble. In 1862 the fear of an assault by the Confederate, Kirby Smith, caused it to be put under martial law for awhile; a somewhat similar experience came in 1864 at the time of the John Morgan raid. Another war incident was the Vallandigham case. Cincinnati sent its citizen, George B. McClellan, to command the armies of the North. The decade prior to the war had not been one of great progress, but in spite of the decay of trade with the South, the city leaped forward with the resumption of peace. The desire to renew the relations with its old business associates induced it to enter upon the construction of the Cincinnati Southern Railway to Chattanooga, which was built by the city itself, an extreme instance of municipal ownership. The celebrated "Bible" case in 1869 resulted in the abolition of religious instruction from the public schools and gave national fame to the bar that included such lawyers as those who argued the case. In 1869 began a series of annexations, which in a few years increased the city area from 7 square miles (3 when incorporated in 1819) to 24 square miles. Annexations in 1895 and 1903–4 have brought the area to 42½ square miles. The most notorious event in its later history is the "Cincinnati Riot" of 28–31 March 1884. As usual in modern times, the law had protected the criminal against the community till the criminal law was felt to be a farce; some murderers had received absurdly light sentences, and the patience of the lower orders gave way; they attempted to break into the jail and lynch the prisoners; foiled in this, they assaulted the court-house, and burned it, as well as its records and other buildings adjoining; the State militia had to be called in, and in the fray that ensued 45 persons were killed and 145 wounded. In 1888 the centenary of the settlement of the State and city was celebrated by a Centennial Exposition of the Ohio Valley, the culmination of a series of industrial expositions that had attracted the attention of the country and given a director-general to the Centennial at Philadelphia in 1876.

cinnati' (1815); Drake and Mansfield, 'Cincinnati in 1826'; Cist, 'Cincinnati in 1841'; 'Cincinnati in 1851'; 'Cincinnati in 1859'; 'Cincinnati Miscellany' (1844-5); Stevens, 'Cincinnati' (1869); Burnet, 'Notes on Northwest Territory' (1845); Mansfield, 'Personal Memories, 1803-1843'; Directories of 1819, 1825, and 1829; and Mrs. Trollope, 'Domestic Manners of the Americans.'

JUDSON HARMON,
Ex-Attorney-General United States.

Cincinnati Anticline. In the period of disturbance which marked the close of Ordovician time in North America, the limestones deposited during the Trenton Epoch in the interior sea that covered most of what is now the Mississippi Valley were forced up, on a line running through southern Ohio, Kentucky, and Tennessee, in a low, broad arch. This arch is called the Cincinnati Anticline. It has been of much economic importance from its having contained great reservoirs of petroleum and natural gas, the latter now approaching exhaustion. See ORDOVICIAN SYSTEM; TRENTON EPOCH.

Cincinnati, Society of the (as having left the plow, like Cincinnatus, for their country's service, and returning to it when the need was over): a memorial society organized by the officers of the American Revolutionary army, 13 May 1783, just before their final dispersion, from the camp on the Hudson near Fishkill. The first meeting was in the Verplanck House, Steuben's headquarters. A society was organized for each State, besides the general society of which Washington was elected president. Membership was confined to officers of the Continental army who had served with honor three years, or been honorably discharged for disability, whether native or foreign, and to their direct male descendants in order of birth, through females in default of males, and then to collaterals if judged acceptable to the society. Partly as including several European nobles (Lafayette, Steuben, etc.), this was considered the beginning of an aristocratic order on European models, obnoxious to popular liberties. Of course it could only become such by government recognition, but the principle of heredity is *per se* un-American. With more show of reason, it was regarded as a military conspiracy to appropriate all the offices under the new government; a sign that the officers did not intend to be Cincinnatuses if they could help it. It was regarded by high and low as a grave public danger; and all the Revolutionary chiefs who had not been in the army, and were ineligible,— Franklin, Adams, Jefferson, etc.— distrusted its possibilities if not its motives. The legislatures of Massachusetts, Rhode Island, and Pennsylvania adopted resolutions censuring it as dangerous to the liberty and safety of the country; the governor of South Carolina denounced it in his message to the legislature; and the Irish chief justice of the same State, Ædanus Burke, wrote a pamphlet signed "Cassius," proving that it would subvert everything gained by the Revolution. This pamphlet was translated into French, and used by Mirabeau some years later. At the first general meeting, 7 May 1784, Washington persuaded them, in view of this public excitement, to abolish this hereditary feature. This, however, did not wholly conciliate popular feeling; and in 1789 the Tammany Society was founded in New York in avowed opposition, as a body where true equality should govern, and private advantage should not prevail over disinterested public spirit.

In 1787 Washington was elected president-general, and re-elected till his death; Alexander Hamilton succeeded him. Most of the State societies soon died, and the general society languished. When Lafayette visited this country in 1824, he was the only surviving major-general. The old hero's reappearance galvanized it into new life for a short time, but it sank out of sight again, and for many years was virtually dead, its chief function being an annual dinner in New York. Even a nominal organization was retained only in three or four States. The last survivor of the original association was Robert Burnet of New York, who died in 1854. In 1893 the general society began a successful effort to induce the States to revive or re-form their branches, and Connecticut first (1893) and Georgia last (1902) fill up the roll of the 13. Some of them issue publications.

The president-generals of the society have been: George Washington, Alexander Hamilton, Charles Cotesworth Pinckney, Thomas Pinckney, Aaron Ogden, Morgan Lewis, William Popham, H. A. S. Dearborn, Hamilton Fish, William Wayne, and Winslow Warren.

The emblem of the society, adopted at the outset, was a bald eagle suspended by a dark-blue ribbon with white borders, symbolizing the union of France and America. On the eagle's breast is Cincinnatus receiving a sword and other military insignia from the senate; in the background, his wife stands at the door of their cottage, with the plow and other agricultural implements near; round the whole are the words, *Omnia reliquit servare rempublicam* ("He left all to serve the commonwealth"). On the reverse, Fame is crowning Cincinnatus with a wreath, inscribed *Virtutis Præmium;* in the background, a seaport city with gates opened and vessels entering; below this are joined hands supporting a heart inscribed *Esto Perpetua* ("Be thou perpetual").

Cincinnati, University of. The University of Cincinnati owes its existence primarily to a bequest of Charles McMicken, who, in 1858, left $1,000,000 worth of property to the city of Cincinnati to found and maintain a college. One half of this property consisting of real estate in the State of Louisiana was lost in 1860 by a decree of the Supreme Court of the United States, annulling that section of McMicken's will giving this property to the university on the ground that the testator could not bequeath real estate in Louisiana to a foreign corporation. The university receives support from the city to the extent of $\frac{3}{10}$ of a mill on the total city tax. Other gifts have been utilized to contract buildings and to increase the endowment fund. The total value of the property and endowment was $2,260,761 in 1904. From 1858 to 1874 the income from McMicken's estate not being sufficient to support a college or university, the trustees decided to wait until a fund should accumulate or until additional support could be gained. Thus the present University of Cincinnati was not founded until 1874, although three departments of the university are much older, namely, the Astronomical Department, founded in 1842;

the Medical Department, founded in 1819; the Law Department, founded in 1819 (Cincinnati College). Until 1899 the University was composed of the following departments: Medical (founded 1819); Law (1819); Astronomical (1842); Academic (1874). Since 1899 the following departments have been added: the College of Engineering, offering courses in civil, electrical, chemical, architectural, and hydraulic engineering; the University Summer School; the University Library; the Teachers' College; the University Press; and the Technical School, which furnishes the shops to the Engineering Department, and is an integral part of the Teachers' College. The reorganization was effected under the presidency of Howard Ayers, LL.D. The Dental Department and the Clinical and Pathological School are only affiliated with the University of Cincinnati, having no financial or other connection with the University. The following scholarships are awarded to students of this university according to merit: the C. G. Comegys scholarship with an annual stipend of $50; five University scholarships with an annual stipend of $75; five McMicken honorary scholarships; twelve Thoms scholarships; the D. A. R. fellowship in American History established by the local chapter of D. A. R., with an annual stipend of $200. No tuition is charged to residents of the city of Cincinnati who enter the university as students. All others who enter the Academic Department are charged a tuition of $75 per year. The professional schools charge from $75 to $125 annual tuition. The University of Cincinnati possesses a beautiful location in Burnet Woods Park, away from the noise and dirt of the city. Its government is by a board of directors appointed for six years by the mayor of Cincinnati. The intellectual life of the University finds expression in the publication of many memoirs, and monographs on literary and scientific subjects through the very important department of the University that has been recently established, namely, the University Press. These contributions to knowledge in the form of an annual volume of university bulletins are distributed by exchange all over the world. The total number of laboratories in the University is 35 in 1904; the total number of volumes in the University Library, including pamphlets, is 143,463. The teaching corps numbers 156, and the students 1,360.

HOWARD AYERS, LL.D.,
President of the University of Cincinnati.

Cincinnatus, sĭn-sĭn-nā'tŭs, **Lucius Quinctius,** a patrician belonging to the earliest period of the Roman republic: b. about 519 B.C. The legend which makes him the beau-ideal of the virtuous Roman is as follows: The Romans of his day were weakened by dissensions between the patricians and plebeians; the warlike Æquians, after making harassing incursions into their territory, succeeded at last in surrounding the Roman army under the consul Minucius in the wooded grounds of Mount Algidus. In despair the Roman senators went to Cincinnatus, offering him the dictatorship. The messengers found him at the plow. Reluctantly he accepted the office. He succeeded in rescuing the army from its perilous position, and marched to Rome laden with the spoils of victory. He then returned to his farm, whence he was again called at the age of 80, to resume the dictatorship, to oppose the machinations of Spurius Mælius, and prevent a civil war between the upper and lower classes, which he succeeded in doing.

Cinematograph, sĭn-ę-măt'ō-grăf (Gr. *κίνημα*, "movement," from *κινεῖν*, "to move"), an ingenious instrument introduced about 1895 by two brothers Lumière of Lyons, and founded on the same principle as Edison's kinetoscope. The most important part of the instrument is a sensitive photographic film or band about an inch and a quarter broad and about 50 feet long. This band passes over a drum of moderate size, then down and round a small one, which deflects it upward toward another small drum, and after passing over this one it winds round another large drum in the centre of the instrument proper. Each portion of the film in the course of its motion passes vertically close behind an opening situated above the last three drums, but below the first one. This opening does not communicate directly with the outside, but is placed in the partition dividing the part of the apparatus containing the last three drums from an adjacent part situated below that containing the first drum. Facing this aperture, and fixed in the opposite wall of that box which does not contain the three drums, is an objective through which light passes into the interior. Thus, by means of a peculiar arrangement of eccentrics which secures that each portion of the film shall be stopped for an instant before the opening, about 15 photographs per second can be received on the film, each representing the photographed group at a different instant from the others. In order to transform these negatives into positives, the negative film is rolled back on to the first drum, and on a second similar drum below it in the same compartment of the apparatus another film is rolled. The two films are then unrolled simultaneously, and thus the light entering through the objective and the aperture imprints on the new film a positive impression of the scenes represented on the other one. The positive film is made to wrap itself round the drum in the lower part of the apparatus, while the negative one is made to pass off through the bottom. The positive film is now wound back onto the first drum, and the instrument is then ready to project the representations on a screen at some distance. To do this, lantern accessories are necessary, but beyond that all that is required is to unwind the positive film by means of the same mechanism as performed the previous operations. The screen receives enlarged representations of the successive film-photographs in the same order as that of taking, and separated by such small intervals of time as to cause the whole to blend and form apparently a continuous representation of a moving group during a fairly long period of time. The advantages of this mode of photographing and throwing pictures on a screen over the older methods are obvious. Movements too rapid to be analyzed by the eye can, by controlling the rate of working while they are being represented on the screen, be made slow enough to permit of their true nature being observed; and, similarly, movements too slow for comprehension or rapid observation may often be, as it were, quickened.

CINCINNATI.

2. University of Cincinnati Buildings.

Mqu

Cinerary (sĭn'ē-rā-rĭ) **Urns,** urns in which the ashes of the dead were deposited after the body was burned. Many Greek and Roman urns are in a high style of art, and are formed of bronze, marble, glass, or pottery ware. See BURIAL.

Cingalese. See SINGHALESE.

Cinna, sĭn'ạ, **Lucius Cornelius,** Roman patrician, associate of Marius, and leader of the popular party, during the absence of Sulla in the East. In 86 B.C. he was elected consul along with Octavius, and in violation of his oath to Sulla, he attempted to overpower the senate and to procure the recall of Marius and his party from banishment. In the contest which ensued, he was defeated by his colleague and driven from the city. His office thus became vacant, and the senate appointed another consul in his stead. He soon returned, however, along with Marius, and laid siege to Rome. The senate was forced to capitulate; but while the votes of the people were being taken for the repeal of the sentence against Marius, he broke into the city, massacred the friends of Sulla, and allowed his partisans to commit frightful excesses. He was consul for the next three years; but Sulla, having brought the Mithridatic war to a close, resolved (84 B.C.) to return to Italy to inflict condign punishment on his enemies. Cinna prepared to resist him by force of arms, but was prematurely slain by a mutiny among his own troops.

Cinnabar, sĭn'nạ-bär, red sulphide of mercury, HgS. The native cinnabar occurs in earthy, granular, and massive forms, and also in crystals belonging to the rhombohedral system. It is red, not infrequently with a brownish or leaden cast. Its hardness is from 2 to 2.5, and its specific gravity from 8.0 to 8.2. Artificial cinnabar, formed by subliming a mixture of sulphur and mercury, is brighter in color than the native mineral, probably on account of its greater purity, and is known in commerce as "vermilion." Cinnabar is the principal ore of mercury, and large deposits of it occur at Almaden, Spain, at Idria in Carniola, at New Almaden, Cal., and in certain parts of China and Japan. When it is roasted the sulphur burns away, and metallic mercury distils off and is condensed in earthenware vessels. (For a discussion of various ancient references to cinnabar, see 'Engineering and Mining Journal,' 16 May 1903, p. 747.)

Cinnamic (sĭn'ạ-mĭk) **Acid,** an acid which exists in the free state in the balsams of tolu and Peru, in liquid storax, and in gum benzoin. When oil of cinnamon is exposed to the air it absorbs oxygen and deposits crystals of cinnamic acid, which are colorless, and readily soluble in alcohol, ether, and boiling water, but sparingly soluble in cold water. It is not of any importance in the arts and is chiefly interesting as being the acid corresponding to oil of cinnamon. This oil is the aldehyde of cinnamic acid, and is represented by the formula $C_9H_8O_2$. Though isomeric with oil of cassia it has a slightly different flavor, and is much more expensive. Both of these oils are employed in medicine as aromatic stimulants, but chiefly as pleasant adjuncts to disguise the taste of nauseous drugs. From a chemical point of view, the cinnamic acid and oil of cinnamon are related to benzoic acid and oil of bitter almonds; and cinnamic acid may be converted into benzoic acid by oxidation.

Cinnamic acid is one of the active principles in many of the balsams and enjoys an excellent reputation in the treatment of tuberculosis and chronic ulcerative processes. It is a marked stimulant to the skin and mucous membranes, and has been very widely used in the form of an emulsion for the treatment of joint tuberculosis. Extravagant claims were made for it years ago, but these have been shown to be premature, although at the present time the drug is very widely used.

Cin'namon, the bark of the under branches of a species of laurel (*Cinnamomum zeylanicum*), which is chiefly found in Ceylon, but grows also in Malabar and other parts of the East Indies. The tree attains a height of 20 or 30 feet. Its leaves are oval, the flowers are of a pale yellow color, and the fruit is shaped somewhat like an acorn. There are two principal seasons of the year in which the Ceylonese bark the cinnamon-trees. The first of these commences in April, and the last in November; the former being that in which the great crop is obtained. In this operation the branches of three years' growth are cut down, and the outside pellicle of the bark is scraped away. The twigs are then ripped up lengthwise with a knife, and the bark is gradually loosened till it can be entirely taken off. It is then cut into slices, and on being exposed to the sun curls up in drying. The smaller pieces, or "quills," as they are called, are inserted into the larger ones, and these are afterward tied into bundles. Cinnamon is examined and arranged according to its quality by persons who, for this purpose, are obliged to taste and chew it. This is a very troublesome and disagreeable office, few persons being able to hold out more than two or three days successively. After this examination, the bundles are made up to a length of about four feet, and a weight of about 88 pounds each. From the roots of the trees numerous offsets shoot up. These, when they have attained the height of about 10 feet, are cut down and barked, being then about the thickness of a common walking-stick. The cinnamon which they yield is much finer than any other. In Ceylon the cinnamon-trees are said to be so common as to be used for fuel and other domestic purposes. The smell of cinnamon, particularly of the thinnest pieces, is delightfully fragrant, and its taste pungent and aromatic, with considerable sweetness and astringency. If infused in boiling water in a covered vessel it gives out much of its grateful flavor and forms an agreeable liquid. An oil is extracted from cinnamon, which is heavier than water. This is prepared in Ceylon, and almost wholly from the small and broken pieces. It is made, however, in such small quantity that the oil of cassia is generally substituted for it: indeed, the cassia bark is often substituted for cinnamon, to which it has some resemblance, although in its qualities it is much weaker. The leaves, the fruit and the root of the cinnamon plant all yield oil of considerable value. That from the fruit is highly fragrant, of thick consistence, and at Ceylon was formerly made into candles for the sole use of the king.

The oil of cinnamon consists mainly of cinnamic aldehyde, C_9H_8O, which, when pure, is

colorless. By exposure to air it absorbs oxygen and is converted into cinnamic acid (q.v.).

Various forms of cinnamon have been used for many years in medicine as flavoring agents and as carminatives. As cinnamon is rich in volatile oils, the action of the drug resembles the action of the oil of cinnamon, which is closely allied to other volatile oils (q.v.). The active principle in the oil is an aldehyde of cinnamic acid, and its antiseptic and antispasmodic action is due in large part to the cinnamic aldehyde.

Cinnamon Fern, a species (*O. cinnamomea*) of royal fern (*Osmunda*), so called from the cinnamon color of the sporanges. The plant has been known to reach the height of 11½ feet. It is frequent in boggy places during May and June in Florida and Mexico, and as far north as Minnesota and Nova Scotia. See OSMUNDA.

Cinnamon Oil, an essential oil distilled from cinnamon bark. It is of a bright yellow color, which gradually darkens. It consists chiefly of cinnamic aldehyde. When exposed to the air, it gradually absorbs oxygen and forms a resin and cinnamic acid.

Cinnamon-stone, or Essonite, a variety of grossularite garnet, usually of a beautiful cinnamon-brown, yellowish, or brownish-red color. It is a silicate of aluminum and calcium. Its name essonite is derived from the Greek *esson,* inferior, and refers to its hardness, 7, being inferior to that of hyacinth, which it often resembles. It occurs in isometric crystals, usually in rhombic dodecahedrons. Cinnamon-stone from Ceylon is the finest known, and has long been cut into gems. Beautiful specimens are also found at Piedmont, Ala., and Phippsburg, Me.

Cinnamomum, sĭn-ą-mō'mŭm, a tropical genus of plants of the laurel family, natives of Asia and the Pacific islands. The genus numbers upward of 50 species, all possessing aromatic volatile oils, that make them valuable articles of commerce. Cinnamon proper is the prepared bark of *C. zeylanicum;* Culiwan bark comes from the *C. culiwan,* and cassia bark from *C. cassiæ.* The best-known American relative, although not of the same genus, is sassafras. See CASSIA; CINNAMON; LAURACÆ.

Cino da Pistoia, chē'nō dą pēs-tō'yä, Italian jurisconsult and poet: b. Pistoia 1270; d. there 24 Dec. 1336. He ranks among the best of the early Italian poets, and resembles Petrarca more than any of the other predecessors of this poet. His poems were first published at Rome in 1558 by Pilli. They afterward appeared at Venice increased by a second volume, which, however, was not considered genuine. The most complete edition is that of Ciampi (1812). He published a commentary on the first nine books of the 'Codex Justinianus' in 1314.

Cinquefoil, sĭnk'foil. 1. In botany, a species of the genus *Potentilla* of the Rose family, closely allied to the strawberry. There are upward of 150 species, chiefly natives of the temperate regions of the northern hemisphere, 60 of them occurring in North America, being found in Greenland, south to New Jersey, to northern Mexico, and in all the territory of the western and northwestern part of America to Alaska. In northern New England the shrubby cinquefoil (*P. fruticosa*) is a troublesome weed. The name of the genus is from Latin *potens* (powerful), from the supposed powerful medicinal virtues of some of the species.

2. In architecture, an ornament in the Gothic style, consisting of five foliated divisions, often seen in circular windows. In heraldry, it means a five-petalled corolla borne without a stalk and full-faced.

Cinq-Mars, Henri Coiffier de Ruze, ŏñ-rē kwä-fē-yā dė rü-zā săñ-mär, MARQUIS DE, French courtier: b. 1620; d. Lyons 12 Sept. 1642. At the age of 18 he was presented at court by Cardinal de Richelieu, and soon obtained the favor of Louis XIII., to whom he became master of the horse. Chafing at the restraint under which Richelieu held him, and ambitious of political power, he framed a conspiracy to overthrow the cardinal, of which the king himself, and his brother Gaston, Duke d'Orleans, were members. But Louis was weak and fickle, Gaston perfidious, and Richelieu not the man to be put down by a youth just turned of 20. Cinq-Mars was delivered up to the cardinal, and beheaded at Lyons with his friend, the councilor De Thou.

Cinq-Mars, a historical romance by Alfred de Vigny, published 1826. The subject is the conspiracy of Cinq-Mars and De Thou against Richelieu, its detection, and the execution of the offenders at Lyons in 1642. The work is modeled after the Waverley novels.

Cinque Pace, sĭnk-pās, a kind of grave, stately dance, in which the steps were regulated by the number 5.

Cinque Ports, sĭnk-pōrts, seven ports of England, on the coasts of Kent and Sussex — Dover, Sandwich, Hastings, Hythe, Romney, Winchelsea, and Rye. They were originally only five, the two latter having been declared ports subsequent to the first institution; hence the name *cinque,* five. The precise designation of these seven localities is "The Cinque Ports and the Two Ancient Towns," the last named being Winchelsea and Rye. They were granted special privileges by the later Saxon and earlier Norman kings, on condition of providing a certain number of ships during war, there being no permanent English navy previous to the reign of Henry VII. The ports are, collectively, in the jurisdiction of a lord warden, whose office, though the salary is £3,000 a year, is little more than a sinecure. See Burrows, 'The Cinque Ports' in Historic Towns series.

Cinquecento, chĭng-kwē-chĕn'tō, in Italian, 500, an abbreviation for *mille cinquecento,* or 1,500. The term is used to designate the art styles of the 16th century, or such as were developed about, or after, 1500. In like manner the terms *trecento* and *quatrocento* denote art of the 14th and 15th centuries. The Cinquecento is the period of the highest perfection of the arts of the Revival or Renaissance.

Cintra, sēn'trä, Portugal, a town in the province Estremadura, 15 miles northwest of Lisbon, on the slope of the Sierra de Cintra. The country around is extremely beautiful, and the climate mild and agreeable. On these accounts it is much resorted to by the wealthier inhabitants of Lisbon, who have here their *quintas* or country houses. The kings of Portugal have a palace at Cintra, with fine gardens

ornamented with fountains. Cintra is celebrated for the convention entered into there in 1808, by which the French, after their defeat at Vimeira, were not only permitted to leave Portugal, but were conveyed to France with their arms, artillery, and property. Pop. 4,846.

Cinura, sī-nū'ra, a name proposed by Packard for a subdivision of the *Synaptera* under *Thysanura.* It includes the bristle-tails (q.v.) See Packard, 'Entomology for Beginners.'

Ciotat, sē-ō-tä, **La,** France, a seaport, department of Bouches-du-Rhône, on the Mediterranean, 15 miles southeast of Marseilles. It has a safe and commodious harbor, and carries on a considerable trade in the productions of the district. The yards and workshops of the Messageries Maritimes Company employ about 3,000 hands. The town, surrounded by its old ramparts, consists of well-built houses and spacious well-paved streets. The surrounding district yields wine, oil, oranges, etc. Pop. 11,300.

Cipher, a kind of monogram, in which the initials of a person or persons are intertwined with each other.

Cipher Despatches. On the meeting of Congress in December 1876, owing to the disputed presidential election returns, each chamber instituted an inquiry into the alleged frauds; the Senate (Republican) through its committee on privileges and elections; the House (Democratic) by a select committee on Louisiana affairs, popularly known as the Morrison Committee, from its chairman, William R. Morrison (q.v.). Each committee subpœnaed the Western Union Telegraph Company for the political despatches of that period in its possession; and portions of these, which the company had gathered from its various offices and forwarded to New York, were sent to each. A large number of these were in cipher; their political nature being inferred from the names and locations of senders and addressees. The Senate, though calling for telegrams from all portions of the country, devoted themselves mainly to Oregon where, it was alleged, from the translation of Democratic cipher telegrams, $8,000 had been devoted to securing the legislature's recognition of a Tilden elector. (These telegrams and translations were published in Senate Miscellaneous Document No. 44, 44th Congress, 2d session.) These despatches, after the investigation closed, were ostensibly returned to the Western Union; those from the Morrison Committee apparently were all returned. But the cipher despatches before the Senate committee were sorted over and the Republican ones nearly all destroyed (by Senator O. P. Morton, as said); while certain packages of the Democratic ones were preserved (by the same hands), and came into possession of Thomas J. Brady, the second assistant postmaster-general, William E. Chandler, afterward secretary of the navy, then lawyer and political manager, and Frank Hiscock, representative from New York. By these, in the summer of 1878, they were sent to Whitelaw Reid, editor of the New York *Tribune,* who published them serially, including the cipher despatches and professed translations. These were made by John R. G. Hassard and Col. William M. Grosvenor, of the *Tribune* staff, partly on suggestions of Prof. E. S. Holden of Washington; involved the use of several different ciphers, and different applications of the same cipher; and left some words illegible. As printed, they referred to offers of the disreputable "returning boards," then supreme in South Carolina and Florida, to sell their vote to Tilden for large sums in cash, $80,000 to $200,000; and negotiations of Democratic managers with them, closed by Tilden's refusal to make the bargain, and the transfer of the votes to Hayes. Tilden himself denied all knowledge of the telegrams or their subject matter, and the managers denied the accuracy of the translations. Their moral defense in the public mind was that they were submitting to blackmail to obtain what they believed legally and equitably theirs already, and that the Republican telegrams, if published, would have left that party in no better case. On 21 Jan. 1879 the new House appointed a "select committee on the alleged frauds in the election of 1876," avowedly to investigate the cipher despatches. It received from Benjamin F. Butler of Massachusetts another package of the telegrams, partly unpublished, given him by Mr. Chandler, and took a mass of testimony — published in House Miscellaneous Documents, 45th Congress, 3d session, Vol. V., with the telegrams and the translations, except those already published in the Senate document above cited.

Ciphers, signs for numbers (see NOTATION). They are either borrowed signs, as letters, with which the Greeks and several tribes of the north of Europe designated their numbers; or peculiar characters, as the modern or Arabic ones. The ciphers, such as they are at present, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, did not attain their present character till a pretty late period. We have them from the Arabians, who derived them from Hindustan. It seems probable that the Egyptians were acquainted with the present system of ciphers, at least in its principles. As early as the 9th century ciphers were used, though seldom, in France. Not until the 11th century did their use become common in Europe.

Cipher Writing, a method of sending important intelligence in a manner so effectually disguised that only those for whom the news is intended can understand the meaning of what is written. Till comparatively recent years diplomats, statesmen, and military or naval commanders were the principal persons compelled by circumstances to keep their affairs or their intended movements shrouded in secrecy. So long as there was not regular postal service important letters were sent by courier, and thus the weightiest secrets were often at the mercy of any one inclined to be dishonest. Before the spread of education, and at a time when few possessed a knowledge of any other language than their own, to indite a letter or despatch in a foreign tongue was usually ample protection against a surreptitious prying into its contents. But it is now many years since this safeguard was broken down, and it became necessary for all who did not want their correspondence known to interested parties to contrive some means of communicating with the pen that would defy scrutiny.

Hence there came into extensive use the art of writing in cipher, called also cryptography, from the Greek words *κρυπτός,* "secret," and *γράφειν,* "to write." Under this term are in-

cluded all private alphabets or systems of characters for the safe transmission of secrets. As fast as one device was discovered human ingenuity contrived another still more intricate. A cipher sufficiently perplexing for all ordinary purposes is found by using the alphabet in any language in an inverted order, taking Z for A, Y for B, X for C, and so on. When it is only desired to write a cryptogram, and not print it, such other characters may be used as are mutually agreed upon by correspondents, or the alphabet may be transposed in other ways. A figured cipher is one in which the letters of the alphabet are numbered, and these numbers compose the cryptogram. To insure secrecy it is, of course, necessary that the particular series of numbers chosen shall be known only to those who use the cipher. Another plan consists in choosing a certain book — a dictionary appears to have been the favorite — and by a simple citation of the number of the page, of the column, and of the line, sentences were constructed, the key to which was extremely difficult of discovery by one not in the secret.

As the number of different dictionaries was necessarily limited, however, the mystery could usually be solved by any one willing to devote time and patience to hunting up the particular one adopted. Various other books have been similarly used, such as spelling-books, and even the Bible; but these systems were cumbersome, and were all more or less open to detection. From a few rules, as for instance, that in English *e* is the letter which most frequently occurs, and *the* the most common word, the whole might generally be deduced. The task of detecting cipher methods is rendered much more difficult when false characters, which are not to be counted, have been interspersed throughout the cipher. A curious explanation of the process of unraveling a cipher is given in Poe's story of the 'Gold-Bug.' Still, with devices such as these, more or less ingenious, the world was fain to be content until about 40 years ago, when a scientific discovery was made that indirectly converted cryptography into a recognized calling, requiring thought, labor, and inventive ability.

The opening years of the second half of the 19th century found the world in amazement over the then recent invention of telegraphy. Immediately a new want made itself felt. Secrecy had been sacrificed at the shrine of speed. If the mail was slow, it afforded privacy, but the contents of a telegraphic message are of necessity known to others besides the sender and the receiver. So the minister, the banker, and the merchant soon began to send cipher despatches. It was quickly discovered, however, that existing methods of cipher writing were unadapted to telegraphy; the costliness of the new invention necessitated brevity; and thus it was not long before there went whirling over the wire messages of 10 words that, properly deciphered, included from 30 to 50.

A great proportion of commercial messages — orders to buy and sell and the like — are similar in their terms, and hence it is that a single word representing three or four words in frequent use is the plan on which our present cable ciphers are based, whereby there is annually a large saving in expense. Then, too, as trade increased and competition became fierce, every firm wanted its own cipher system, distinct from any used by other houses in the same business; and reflection will enable us to appreciate the vast number of separate ciphers in use in a great commercial centre like New York. Therefore, in course of time, the preparation of cipher systems for merchants and others using the telegraph largely came to be a regular calling, and in every large city the sign "Cable Codes" is to be seen.

At one of these offices a person may be accommodated with a code of from 50 to 5,000 words. Most of these codes are alphabetically arranged in parallel columns, like shipping signals — the English words and phrases in one column, and their cipher equivalents in another. To such magnitude has this business grown that all languages are ransacked for suitable cryptographic codes, and every day sees their preparation growing more complicated and costly. The modern telegraphic signals and our various systems of short-hand may be called examples of cipher writing, though in these cases, of course, speed and brevity are aimed at, not secrecy.

The cipher codes of the State Department at Washington are frequently changed. The special code is entrusted to the personal custody of diplomatic officials embarking on a mission, who retain possession of it and destroy it if their lives are endangered. The imprisonment of the United States Minister Conger, in Peking, in 1900, caused the cipher to figure conspicuously in international relations. China objected to the transmission of cipher despatches, but subsequently withdrew her objection. She was accused of having obtained surreptitious possession of a copy of the United States cipher code.

Cippus, sip'ŭs, a low column generally rectangular and sculptured, and often bearing an inscription, used by the Romans for various purposes. Cippi served as sepulchral monuments, as milestones and boundaries, and in some cases to receive the inscribed decrees of the senate. They were frequently or usually adorned with rams' heads supporting festoons of flowers, figures of sphinxes, and various mythological subjects. Those serving as tombstones regularly bore such inscriptions as D.M. for *Dis Manibus,* and S.T.T.L. for *Sit tibi terra levis.*

Cipriani, Giambattista, jäm-bät-tēs'tä chē-prē-ä'nē, Italian painter and engraver: b. Pistoia 1732; d. London 1785. He was one of the first Fellows of the Royal Academy. His drawing is correct, his heads have grace and loveliness, his coloring is harmonious, and the general impression of his composition good. Many fine engravings of Bartolozzi are from the designs of Cipriani.

Circars, sėr-kärz', **The Five Northern,** an ancient division of the Madras presidency, on the east coast of Hindustan. The northern Circars were formerly Chicacole, Rajahmundry, Ellore, Condapilly, and Guntur; but the districts that now correspond most nearly with them are those of Ganjam, Vizagapatam, Godavari, and part of Krishna. They were among the earliest of the territorial possessions of the East India Company, which acquired four of them in 1765, from Mogul Shah Allum, who bestowed them on the company as a free gift.

The fifth, Guntur, came into the possession of Great Britain in 1788.

Circassia, sĭr-kăsh'ĭ-ą, a region in the southeast of European Russia, lying chiefly on the north slope of the Caucasus, partly also on the south, and bounded on the west by the Black Sea. It forms part of the government of the Caucasus, including a great portion of the territory of the Kuban and the districts of Sukhum and Tchernomore, but is not itself an official division; and, indeed, the name is now much less seldom heard than formerly, since the country has been entirely incorporated with the rest of the Russian possessions in this quarter, and has no longer a separate political existence. The whole region is mountainous, and is composed of the northern masses or western offshoots of the great chain of the Caucasus, the culminating heights of which are those of Mount Elbruz. The mountains are intersected everywhere with precipitous ravines, in the deepest hollows of which flow rock-impeded streams that occasionally become raging torrents. The chief rivers are tributaries of the Kuban and the Terek, the first of which bounds the territory on the northeast and east sides, while the Terek skirts the Circassian limits on the southeast side. Circassia is a beautiful, though rugged, country. The sides of the mountains are often clothed with thick forests. Its climate is temperate, its inhabitants healthy and long-lived. There are few manufactures and little trade.

When Russia took possession of this region the exodus of the inhabitants left but comparatively few Circassians proper, and those who remained have now to a large extent lost their national peculiarities. The people call themselves Adighé; the Tartar word *Tchertkess* being a slanderous name applied to them as "robbers." The Circassians were divided into several tribes, having three distinct languages, or more. Each tribe included five ranks of men, namely, princes or chiefs (*pshat*); nobles (*vork*); middle class (*thlofokl* or *tokavs*); serfs, or retainers of the nobles; and slaves — the latter being prisoners taken in war, or the descendants of such. All classes except the slaves were united into fraternities, for mutual support; and this union formed the real groundwork of the government of the country, which was altogether peculiar, being patriarchal in nature, with a great amount of freedom. Hereditary feud, once prevalent, was latterly almost extirpated, and pecuniary compensation, including a mulct upon manslayers for the benefit of the deceased's fraternity, was substituted. Crimes of all degrees, and civil causes, were judged either in general or local councils; and petty offenses by district judges and assessors.

The religion of the country was chiefly Moslem; but in many cases it formed a jumble of Christian, Jewish, and heathen traditions and ceremonies. In no case was it very strict; although most of the chief Mohammedan feasts and fasts were pretty well observed. The morals of the people were nevertheless respectable. Great crimes were rare; and such as have their source in poverty with one class, and avarice in the other, were not common, for property was little coveted, and money was scarcely known. The commerce of presents was universal; few or none were very rich, and there were no miserably poor at all. There was no tenure of land in Circassia except what immediate possession, for the purposes of cultivation, gives.

Agriculture here is still in a rude state, but the produce of the tilled lands is considerable, and exceeds local wants. The forests yield great quantities of fine wood, including, oak, and all our own best species of timber trees, with (in the southern regions) boxwood, etc. The chief grain is millet; but barley, oats, and a little wheat are also raised. There are great numbers of goats, sheep, and oxen.

The Circassians, male and female, are a well-formed and handsome race. The males are highly prized as warriors by the Russians, and the females as mistresses by the Turks, a position generally envied by the women themselves. The men are among the finest equestrians in the world; and their horses, though small, are of good make, hardy, and intelligent.

The early history of the Circassians is obscure. They have no annals; but their minstrels, in their martial and genealogical strains, preserve traditional accounts of the deeds and lineage of their dead heroes and existing tribes. Between the 10th and 13th centuries this country formed a portion of the empire of Georgia, and it is said the Georgian queen Tamar subjected and for a time Christianized them. During the Middle Ages the Genoese had several trading stations on the coast, of which some memorials yet exist. In 1424 the Circassians were an independent people, and at war with the Tartars of the Crimea, etc., to whose khans, however, it is understood some were occasionally tributary. In 1555 the Muscovite czar, Ivan Vasilievitch, came to their aid against the Tartars, and married a Circassian princess. But the stay of the Russian forces was short, and after their withdrawal the belligerents kept up a struggle with varying results till 1705, when the Tartars were finally defeated in a decisive battle. Shortly after the territorial encroachments of Russia on the Caucasian regions began. From that time she advanced by steps slow and stealthy, and in 1781 obtained a frontier line on the right bank of the Kuban, the left banks of which formed the national limit of Circassia. In 1784 the Turks founded Anapa, near the northeast corner of the Black Sea, as a place of trade for their commerce and that of the Circassians; this was the only territorial settlement they as yet had in or near the country, and the place was a mere factory. In 1807 the Russians took Anapa from the Turks; but in terms of the Treaty of Bucharest, in 1812, it was restored. In 1829 it was once more taken by the Russians, and finally ceded to them by the Treaty of Adrianople, along with the whole of Circassia — as they interpreted the words of that cunningly ambiguous document; the fact being that not an inch of the territory of Circassia proper had ever been in the possession of either Turks or Russians. Many of the Circassians were, indeed, Mussulmans, and all such recognized the padisha (sultan) as their spiritual head, but nothing more. As the "hated Muscovites" (*fana Moscov*) immediately proceeded to act upon the pretended cession, a struggle commenced which was continued over a long series of years. The spirit of resistance to Russia became stronger than ever; and a bold leader, Schamyl, who united

in his person the imputed sanctity of the hierarch with the daring courage and prudent conduct of a great warrior, with his heroic band beat off or baffled the whole disciplined forces that Russia was able to send against him. But at length the protracted resistance of the people terminated in the triumph of the more powerful of the two foes, and the Circassians with their leader surrendered. Large numbers of them, as many it is said as 500,000, were deported into the Turkish provinces in 1864, and were settled both in Asia Minor and in Bulgaria and Servia. A considerable portion of their former country was thus almost denuded of inhabitants.

Circe, sêr'sē, in classical mythology, a sorceress on the island of Aeaea. Ulysses in his wanderings landed on her island, and sent out Eurylochus with a party to explore the country. They arrived at the palace of Circe, who gave them food and wine, and with her magic wand changed them into swine. Eurylochus only, by cautiously abstaining from the magical potion, escaped the transformation, and informed Ulysses of the event. He immediately proceeded himself into the country to free his companions. On the way Hermes (Mercury) met and advised him. Following the advice of Hermes he then ran upon her with his drawn sword, threatening her with death, and compelled her to bind herself by an oath to do him no injury, and deliver his companions. Ulysses then remained with her a whole year. Before his departure she told him that in order to secure a safe return to his country he must visit the infernal regions and ask advice of Tiresias. This he did, and again visited Circe on his way back.

Circinus, sêr'sĭ-nŭs ("the Pair of Compasses"), one of the 14 southern constellations added to the heavens by Lacaille in connection with his work at the Cape of Good Hope in 1751–2. It is surrounded by Apus, Musca, Centaurus, Lupus, Norma, and Triangulum Australe.

Circle, in geometry, a plane figure contained by one line, which is called the "circumference" and is such that all straight lines drawn from a certain point (the "centre") within the figure to the circumference are equal to one another. According to this definition of Euclid, which is remarkable for its perspicuity and precision, the circle is the space enclosed, while the circumference is the line that bounds it. The circumference is, however, frequently called the circle. Still no confusion ever arises from this usage.

The properties of the circle are investigated in books on geometry and trigonometry. Properly the curve belongs to the class of conic sections, and is a curve of the second order.

The celebrated problem of "squaring the circle" has given rise to extraordinary geometrical labors, and even now there are to be found, as in the case of the problem of perpetual motion, those who profess to have solved it. The question is to find a square whose area shall be equal to the area of a circle. It is not possible to do so. All that can be done is to express approximately the ratio of the length of the circumference of the circle to the diameter, and to deduce the area of the figure from this approximation. This ratio has, however, been determined to a degree of exactness more than sufficient for all practical purposes. If the diameter be called unity, the length of the circumference of the circle is 3.1415926535...; and the area of the circle is found by multiplying this number by the square of the radius. Thus the area of a circle of 2 feet radius is 3.14159×4, or 12.56636 square feet, approximately.

For trigonometrical calculations the whole circumference of the circle is divided into 360 equal parts or arcs, called degrees; each degree is divided into 60 minutes, and each minute into 60 seconds. The angles subtended at the centre by these arcs are called respectively degrees, minutes, and seconds of angle.

In practical astronomy a circle is an instrument for measuring angles by means of a metallic circle accurately divided. The general principle is to have a telescope movable accurately in one vertical plane, and an arm attached to it which moves over the graduated circle placed in a parallel plane. The arm carries microscopes and verniers for reading off minutely the angle it has traversed.

There are two great classes of these instruments, transit circles and mural circles (qq.v.); and there are other less important instruments of this kind.

In logic, a circle is the fault of an argument that assumes the principle it should prove, and afterward proves the principle by the thing which it seemed to have proved. The same fault takes place in definitions when an idea is defined by others which suppose the knowledge of the first. Arguing in a circle is a fault into which men are very liable to fall, particularly in theological discussions.

In astronomy, the heavens being considered as a spherical surface drawn round the earth as centre, an imaginary line drawn round the heavens so as to lie in one plane is a circle of the sphere. It is a "great circle" if the plane of it passes through the centre; thus the celestial equator and the ecliptic are great circles: if the plane of the circle does not pass through the centre it is called a "small circle"; all circles of declination except the equator are small circles.

Circle of Curvature. When a point in motion is tracing out any curved path, the direction of motion changes from point to point of the curve, and the path is said to be more or less curved according as the direction of the motion of the point changes more or less rapidly. The curvature at any point is measured by the rate of this change at the point per unit length of the curve.

In the case of the circle the curvature is the same at every point; and it is easy to show that the curvature measured as above is equal to the reciprocal of the radius of the circle.

If we consider any small portion of any curve whatever, it may be approximately taken as an arc of a circle, the approximation being closer and closer to the truth as the portion considered is smaller and smaller, and by taking it small enough we may make the approximation as close as we please. The curvature is then the reciprocal of the radius of this circle.

The circle which coincides more nearly than any other with an infinitely small arc at any point of any given curve is generally found by means of the methods of the differential calculus. Such a circle is called the circle of curva-

ture, and sometimes the osculating circle. The radius of it is called the radius of curvature of the curve at the point considered; and the centre of this circle is called the centre of curvature.

Circle, Magic, a space in which sorcerers were wont to protect themselves from the fury of the evil spirits they had raised. This circle was usually formed on a piece of ground about nine feet square (in the East seven feet appears to have been considered sufficient), in the midst of some dark forest, churchyard, vault, or other lonely and dismal spot. It was described at midnight in certain conditions of the moon and weather. Inside the outer circle was another somewhat less, in the centre of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which enclosed the larger one, were filled with all the holy names of God, and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this circle, the magician, it was believed, would have been carried off by spirits. Another figure which, described upon the ground, could bar the passage of a demon, was the pentagram.

Cir'cleville, Ohio, a city and county-seat of Pickaway County, on the Scioto River, the Ohio Canal, and the Cincinnati & M. V. and the Norfolk & W. R.R.'s, 28 miles south of Columbus. It derives its name from a circular earthwork built by some ancient people, and which is the site of the present city. It has numerous churches, several daily and weekly newspapers, three banks, and manufactures flour and meal; agricultural implements, furniture, canned goods, etc., and a large pork-packing industry. Pop. (1900) 6,991.

Circuit Court. See COURTS.

Circular Motion. A body in motion, which is continually impelled by some power toward a fixed point out of its original direction, is obliged to describe a curvilinear path round this point. A stone slung round by a string moves in a circle, because it is drawn toward the hand in every point of its path. The moon moves in a circle round the earth, because it gravitates toward the earth, and is thus drawn from the rectilinear direction which it would otherwise pursue. In such cases the point to which the body constantly tends is called the centre of the forces; the force itself, by which it is impelled, is called the centripetal force; that by which it strives to fly from the centre is called the centrifugal force; and the motion which is produced by these two forces, the circular motion. All the planets in the solar system are carried round the sun, and the satellites round their planets, by these forces. (See CENTRAL FORCES.) The theory of circular motion is a subject of celestial mechanics, on which Newton composed his 'Philosophiæ Naturalis Principia Mathematica'; and Laplace, his 'Mecanique Celeste,' etc.

Cir'cular Notes, in commerce, notes or letters of credit furnished by bankers to persons about to travel abroad. Along with the notes the traveler receives a "letter of indication" bearing the names of certain foreign bankers who will cash such notes on presentation, in which letter the traveler must write his name. On presentation the foreign banker can demand to see the letter of indication, and by causing the presenter to write his name, can compare the signature thus made with that in the letter, and so far satisfy himself as to the identity of the person presenting the note.

Circular Numbers, numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

Circular Parts, Napier's Rule for, a rule invented by Baron Napier of Merchiston, near Edinburgh, for the solution of all cases of right-angled spherical triangles, eminent for its comprehensiveness and utility in extensive surveys, navigation and practical astronomy. See TRIGONOMETRY.

Circular Polarization of Light. Plane-polarized light is altered into circularly polarized light by passing in a particular direction through a Fresnel's rhomb. This is a parallelopiped of glass with its faces set at certain angles depending on the refractive power of the glass. The light entering one base of the rhomb is twice internally reflected before it emerges at the opposite base; and while common unpolarized light passes through the rhomb without suffering alteration plane-polarized light has its properties in general completely altered. The final result depends on the inclination of the plane of polarization of the incident light to the plane of the internal reflections. In two cases, namely, when this angle is 0° or 90°, the emerging light is still plane polarized; when the angle is 45° the light is circularly polarized; in every other case it is elliptically polarized. In the first case, as will be understood from consulting the article on POLARIZATION OF LIGHT, the analyzer, on being applied to test the beam, shows in one position bright light, and on being turned round the principal axis through 90°, total darkness. In the last case — that of elliptic polarization — the analyzer shows, on being turned round, a beam of varying intensity, but never complete extinction. In the case of circularly polarized light the analyzer, on being turned round, shows a beam of the same intensity in every position of the analyzer, and, in fact, does not at first sight differ from ordinary unpolarized light. When, however, it is examined — not with a Nichol's prism direct, but after a second Fresnel's rhomb has been interposed — it is found to differ very remarkably from unpolarized light. The latter is, as we have remarked, unaffected by the rhomb; the circularly polarized light emerges from the second rhomb plane polarized. It is thus shown how to produce and how to recognize circularly polarized light. We now give a few of its most remarkable properties.

The light as we have said, that emerges from the second Fresnel's rhomb is again plane polarized, but it does not emerge precisely as it entered. For, except in one particular position of the two Fresnel's rhombs, the light that emerges from the second rhomb has its plane of polarization changed; the plane is turned round, in fact, through an angle depending on the positions of the two rhombs with regard to the original plane of polarization; and it may be turned round either in a right-handed direction, as it is called (see below), or in a left-handed direction. We might arrange a set of pairs of Fresnel's rhombs, it is evident, in such positions that each pair should give the plane of polariza-

tion of the ray passing through it a farther twist in the same direction, and we might turn it thus through any angle whatever. Such a power as we have imagined in a set of Fresnel's rhombs is possessed by quartz and by a considerable number of solutions of organic bodies, and it is known as a power of rotating the plane of polarization. When a beam of homogeneous light has passed through the polarizer, and the analyzer is placed in the position of total extinction of the ray (see POLARIZATION OF LIGHT), on introducing a plate of quartz the light reappears; but on turning the analyzer round, either in a right-handed direction or in a left-handed direction (whence the names), extinction is again obtained. Quartz is named right-handed quartz or left-handed quartz according to the direction in which the analyzer must be turned. The amount of the angle through which it must be turned depends on the thickness of the plate of quartz.

If, instead of using homogeneous light, as we have been supposing, plane-polarized white light is employed, it is found that the different rays are differently deviated. The effect on the more refrangible rays is greater than on the less refrangible, and the plane of polarization of the blue rays will thus be turned through a greater angle than that of the red rays. It will be perceived from this, that having arranged the polarizer and analyzer, and inserted a plate of quartz, as described above, on rotating the analyzer in the direction, right-handed or left-handed, that corresponds to the nature of the plate of quartz, we shall not arrive at a position of total extinction, but we shall see a most beautiful play of colors changing in order from red to yellow, then to orange, green, and blue. These phenomena are among the most beautiful and most striking of all the marvelous phenomena of light.

It has been remarked above that certain organic liquids and solutions have this rotatory power. Among these may be mentioned turpentine, some essential oils, solutions of sugar, and solutions of tartaric acid. This fact is taken advantage of in Soleil's saccharometer (q.v.), an instrument for determining the value of cane-sugar in a liquid.

We have spoken above of the right-handed and left-handed properties of quartz; a discovery of Haüy leads us here to the very threshold of the molecular structure of crystals. We may yet hope for discoveries in this direction. On comparing crystals of quartz that give us right-handed and left-handed polarization, it is found that a very remarkable property connects their forms. The crystals that give right-handed and left-handed polarization are of an unsymmetrical construction, such that either viewed in a looking-glass gives an image of the same form as the other. Pasteur, examining the crystals of the two varieties of tartaric acid whose solutions have opposite rotational powers, but whose chemical properties are very nearly the same, showed that the same law holds for them; and, having crystallized what is known as neutral tartaric acid, was able, by picking out the crystals by hand, to separate it into equal portions of lævo tartaric acid and dextro tartaric acid. But we must refer the reader to the special articles on the chemistry of this substance.

One of Faraday's most brilliant discoveries was the rotatory power of glass under the action of a powerful magnet. The reader is referred for an account of it to the article POLARIZED LIGHT.

Cir'culating Library. See LIBRARIES.

Circulation, in animals, the passage of blood in circuit through the body; in vegetables, a similar circuit of sap.

Circulation of the Blood.— This process is widely distributed throughout the animal kingdom, even the irregular movement of blood in the lowest animals being termed a circulation. Properly speaking, however, only fishes, birds, and mammals may be said to have a distinct circulation. In the lower animals, such as the lobster or crab, there is no continuous vascular system, the arteries ending in lymph spaces. In birds and mammals, however, a particle of blood starting at any given point in the system makes a complete circuit and repasses its point of starting.

History.— In the chapter on anatomy the point was reached where the important discoveries of Harvey had revealed the secret of the circulation and that the study of human physiology was set on a secure basis, but in the matter of the circulation all the credit of discovery is not due to Harvey alone. It will be recalled that the authority of Galen persisted for over 1,000 years, and that the opening of the 16th century found a number of enthusiastic anatomists who founded a school of their own, and the new Vesalian anatomy replaced the old Galenic anatomy, but unfortunately not Galen's physiology. The old doctrine of Galen as applied to the circulation may be summed up as follows (Foster, 'History of Physiology'):

"The parts of the food absorbed from the alimentary canal are carried by the portal vein to the liver, and by the influence of that great organ are converted into blood. The blood thus enriched by the food is by the same great organ endued with the nutritive properties summed up in the phrase 'natural spirits.' But blood thus endowed with natural spirits is still crude blood, unfitted for the higher purposes of the blood in the body. Carried from the liver by the vena cava to the right side of the heart, some of it passes from the right ventricle through innumerable invisible pores in the septum to the left ventricle. As the heart expands it draws from the lungs, through the vein-like artery (or, as we now call it, the pulmonary vein), air into the left ventricle. And in that left cavity the blood which has come through the septum is mixed with the air thus drawn in, and by the help of that heat which is innate in the heart, which was placed there as the source of the heat of the body by God in the beginning of life, and which remains there until death, is imbued with further qualities, is laden with vital spirits and so fitted for its higher duties. The air thus drawn into the left heart by the pulmonary vein, at the same time tempers the innate heat of the heart and prevents it from becoming excessive. Thus from the right side of the heart there is sent to the body generally along the great veins, and to the lungs along the artery-like vein (the pulmonary artery), a flow, followed by an ebb, of crude blood endued with natural spirits only, blood serving the lower stages of nutrition. Blood flows through the artery-like vein to the lungs for the nourishment of the lungs, just as it flows through the other veins for the nourishment of the rest of the body; in both cases there is an ebb as well as a flow along the same channel. From the left side, on the other hand, there takes place along the arteries to all parts of the body a flow, followed also by an ebb, of blood endued with vital spirits, and so capable of giving power to the several tissues to exercise their vital functions. As this blood passes from the left heart along the vein-like artery to the lungs, it carries with it the various fuliginous vapors which, in the fermenting activity giving rise to the vital spirits, have been extracted from the crude blood,

and discharges these vapors into the pulmonary passages. Arterial blood, that is, blood laden with vital spirits, reaching the brain, there generates the animal spirits, which, pure and unmixed with blood, existing apart from blood, are carried along the nerves to bring about movements and to carry on the higher functions of the body."

This is the outline of the crude Galenic doctrine, and Vesalius, brilliant anatomist that he was, was content to accept it, although there are evidences that he was very skeptical regarding much of Galen's physiological teaching. It was particularly from the anatomical side that he was most skeptical; namely, the lack of tangible holes between the two sides of the heart, which were so important to the Galenists. His skepticism was taken up by his pupils, and was also felt by others, one of them, Michael Servetus, who published a remarkable book, the 'Restitutio Christianismi,' in which a much truer conception of the circulation of the blood was taught. This was as early as 1553. He rejected entirely the ancient doctrines, and had grasped the true doctrine of the pulmonary circulation, the passage of the blood from the right side through the lungs to the left side. Servetus, however, was a theologian more than a physician, and his early death probably prevented his further studies. Realdus Columbus, of Cremona, must be regarded as another link in the chain that led up to the final solution. He is thought to have been a tricky man, however, and one who would not hesitate to poach on another's preserves, and there are indications of his copying much from Vesalius' works and claiming them as his own. He was vain and ignorant, but in his book, 'De Re Anatomica' (1559), he described correctly the pulmonary circulation, but he was unable to draw from it the lessons that it implied. This, by many historians, is taken as evidence that he was only a copier, and that probably the work of Servetus had been seen by him and he had claimed the discovery as his own. Cæsalpinus, a noted botanist, was the first to appreciate the fact that at the contraction of the ventricles (systole) the blood was thrown into the aorta and into the pulmonary artery, and at its diastole it received the blood from the vena cava and the pulmonary vein. He also seemed to have grasped the fact of the flow of the blood from the arteries to the veins, and of the flow along the veins to the heart. This was in 1571 and 1593. Thus Cæsalpinus had a true suggestion of the idea both of the pulmonary and systemic circulations. But Cæsalpinus' work seems to have been lost sight of, and another, Hieronymus Fabricius, had the honor to open the next door that led to Harvey's triumph. Fabricius called renewed attention to the valves in the veins, but missed their real function, and, although he was Harvey's teacher, he was more of a Galenist than a modern.

It is to William Harvey's credit, not so much that he was the discoverer of the physiology of circulation,— this, it can be seen from this brief recital, was of gradual accretion,— but that he was the first demonstrator of the process. He was the first physiological experimenter, and his work on the living animal has opened up to the world most of its priceless gifts in the field of medicine. It was by the faithful and prolonged study of many hearts of many animals that showed him that —

"the motion of the heart consists in a certain universal tension, both of contraction in the line of its fibres, and constriction in every sense, that when the heart contracts it is emptied, that the motion which is in general regarded as the diastole of the heart is in truth its systole";

— that the true work of the heart is not that it sucked blood in, but that it drove blood out. Cæsalpinus guessed at this, or may be knew it, but Harvey proved it, and, what is more, read the consequences. He saw clearly, then, the real function of the auricles and the ventricles and of their valves, and he applied the lessons of the lesser, or pulmonary circulation, to the greater, or systemic circulation, and thus rounded out the true natural history of the process. In his own words:

"I frequently and seriously bethought me, and long revolved in my mind, what might be the quantity of blood which was transmitted, in how short a time its passage might be effected, and the like; and, not finding it possible that this could be supplied by the juices of the ingested aliment without the veins on the one hand becoming drained, and the arteries on the other hand becoming ruptured through the excessive charge of blood, unless the blood should somehow find its way from the arteries into the veins, and so return to the right side of the heart, I began to think might there not be *a motion, as it were in a circle.* Now this I afterward found to be true; and I finally saw that the blood, forced by the action of the left ventricle into the arteries, was distributed to the body at large, and its several parts, in the same manner as it is sent to the lungs, impelled by the right ventricle into the pulmonary artery, and that it then passed through the veins and along the vena cava, and so round to the left ventricle in the manner already indicated, which motion we may be allowed to call circular."

Thus clearly and forcefully he set forth in 1616 — although his work did not appear until 1628 — the true doctrine, and it is of interest to record that he lived to see it adopted practically by all scientists. Malphigi, in 1661, demonstrated, by means of the microscope, the capillaries, thus filling out the last link in the chain of evidence.

Mechanics of Circulation.— Harvey's work established the mechanical character of the heart's action, and, as it is now regarded, the heart is the pump which beats about 72 times a minute, thus forcing the blood with considerable velocity and force through the arteries. It is a double pump, as it were, both sides working simultaneously, the pulse-beat being the wave of the systolic contraction of the left ventricle. Each half of the heart consists of a smaller, less muscular portion, the auricles, and a larger, stronger portion, the ventricles, the left ventricle being much more powerful than the right. Leading into the heart and away from it are the aorta, pulmonary vessels, artery, and vein, and the vena cava. Between the auricles and ventricles are valves,— the mitral between the left auricle and left ventricle; the tricuspid corresponding on the right side; and the pulmonary and aortic valves. Starting with the spent blood that is collected from the entire body in the veins, this is carried, by pressure of the walls of the veins, through the vena cava, and emptied into the right auricle; this contracts, the valve at the orifice of the vena cava closes, the tricuspid valve opens, and the blood is forced into the right ventricle. It remains here a small fraction of a second, and this ventricle contracts, the tricuspid valve closes, and the blood is forced through the pulmonary artery into the lungs. Here it is spread out, mesh-like, in millions of capillaries, is oxygenated, and brought back to the left auricle by the pulmonary vein. The contraction of the left auricle forces the blood into the left ven-

tricle through the mitral orifice, the valves behind closing, and finally the great throb of the heart is caused by the ventricular systole, the mitral valve closes tight, preventing regurgitation, and the blood bounds out into the arteries, the aortic semilunar valves closing as soon as the ventricle commences to expand to get its next supply. Thus this cycle goes on 72 times a minute on the average, night and day, until death quiets the heart's action. In actual operation the right and left sides are working simultaneously, and when one listens to the heart-beat one hears only the "lub-dup," "lub-dup," of the closing auriculo-ventricular valves, and the closing aortic and pulmonary tricuspids. From the arteries the blood goes to every structure in the body in the capillaries, and returns in the veins, whose valves prevent venous congestion, and once more into the vena cava. The whole cycle is complete in about 22 seconds, one thirteenth of the entire weight of the body in blood has been thus sent round the circuit, with an initial force of the ventricular contractions of about 4.5 foot pounds at an initial velocity of about 20 inches a second. In 24 hours thus the heart's energy would lift 124 tons in weight one foot. The vital or nervous mechanism that keeps the heart in motion consists in the main of three factors, the irritability of the heart muscle itself, the action of the cardiac nervous ganglia of the sympathetic, and the cardiac regulator nerve, the pneumogastric. If a salt solution of 0.6 per-centage composition is passed through the fresh heart of many of the lower animals, the heart will commence to beat, thus showing that if the heart muscle is supplied with proper liquid it must beat, hence the irritability of the heart muscle is the first and most important factor in the phenomenon of circulation. The blood salts, notably calcium and potassium, supply the irritant, and muscular contraction results, but if the heart muscle alone is beating it does so rhythmically, but the different parts do not work in efficient unison, hence the need of a regulating mechanism other than the auricle "pace-maker." This is supplied by the cardiac ganglia, their irritation causes the heart to beat more rapidly, but not in unison. The chief regulator and steadier of the heart-beat, as well as the great trophic nerve, is the tenth nerve, the pneumogastric or vagus, coming from the medulla. This nerve brings complete order and system into the heart mechanism as adjusted to other conditions in the body. Its stimulation slows the action of the heart; its paralysis causes the heart to run away, given over to the ganglia and the muscle. Another important feature in the circulation is the elasticity of the blood vessels, or vessel tone. This is maintained by the sympathetic nervous system, which raises or lowers vessel tone in accordance with the needs of the cells of the body. A regular condition of blood-vessel tonus is essential to the life of the cells of the body, muscular as well as nervous.

Circulation in the Lower Animal Forms.— The motion of a limpid fluid can be rendered perceptible only by the presence of the corpuscles which it carries. In the blood it is rendered apparent in the capillary vessels by means of its globules. In infusorial animalcules the movement of the fluids of the body is maintained by that of the animal itself and by the disturbing influence of nutritive absorption. In the *Polypi* the movement receives aid besides from the action of cilia on the inner walls of the body. The *annelids*, as the earth-worm, possess contractile vessels traversing the length of the body. The insects, crustaceans, myriapods, and spiders have a dorsal tube which in the common crab and the spider is much shortened and broadened, but in the others remains tubular, the blood regaining its cavity through slits in the sides as well as by the openings of the trunks which the heart gives off. In these animals the circulation is incomplete, that is, the blood does not flow through canals with definite walls, but in the interstices of the tissues. The *Mollusca* have the heart provided with an auricle and a ventricle, as in the snail and whelk; two auricles, one on either side of the ventricle, as in the fresh-water mussel, or two auricles and two ventricles as in the ark shells. Among the ascidians, which stand low in that division of animals to which the mollusks belong, the remarkable phenomenon is encountered of an alternating current, which is rhythmically propelled for equal periods in opposite directions. All vertebrated animals (except *Amphioxus*) have a heart which in most fishes consists of an auricle and ventricle, but in the mud-fishes (*Lepidosiren*) there are two auricles and one ventricle; and this trilocular heart is found in the amphibians, and in most reptiles except the crocodiles, which, like birds and mammals, have a four-chambered organ consisting of two auricles and two ventricles. In these two last-named classes the venous and arterial blood are kept apart; in the trilocular hearts the two currents are mixed in the ventricle.

Circulation in Plants. See SAP.

Circumcellions, sĕr-kŭm-sĕl'ĭ-ŏnz, **Circumcellio'nes,** or **Circelliones,** members of bands probably of fanatic monks, partisans of Donatus (q.v.) and the Donatists in Numidia and Mauretania who, avenging the condemnation of Donatus by the Synod of Arles (314) and the Council of Nicæa (325) and the condemnation of Donatus and his followers by Constantine and Constantius, roamed throughout those provinces pillaging and wrecking the churches and other religious establishments of the Roman Catholics and proclaiming the downfall of the empire itself. Their name probably is formed from *circum,* round about, and *cella,* cell, a monk's cell: if the derivation is correct these Circumcellions are of the same class of vagabond monks complained of by the father of western monachism, St. Benedict as *gyrovagi,* circulating vagabonds.

Circumcision, an amputation of a portion of the human organs of generation; principally performed on males, but sometimes on females. It has been practised in all ages, and by both civilized and savage races, as Arabs, certain African tribes, Christian Abyssinians, Australian "blacks," Malays, some North American Indians, Aztecs, Mayas, Caribs, South American Indians, Jews, Mohammedans, Fijians, and Samoans.

In the male, the operation consists in removing a section of the prepuce. Doubtless the original object was cleanliness, a safeguard against venereal infection, or the moderation of the sexual passion, which are said to be results of the operation, but among the Jews it has always been a religious rite, for they regard it as the sign of the covenant made by Jahwé with Abraham and his posterity. The institution of the rite is recorded in Gen. xvii. Here it is stated that Abraham, then 99 years old, was himself circumcised, with his son Ishmael, 13 years old, "and all that were born in his house, and all that were bought with his money, every male among the men of Abraham's house." But by the terms of the covenant every man-child among the Hebrews was to be circumcised on the eighth day after birth, and this rule, peculiar to the race, is adhered to with such rigor that even the Sabbath observances are not allowed to interfere with the ceremony. Other Eastern nations have practised circumcision on various days,—the Arabs 7, 14, 21, or 28 days after birth, though Josephus states that in his day the Arabs circumcised after the age of 13 on account of the circumcision of Ishmael, their progenitor, taking place at that age; the Mohammedans of Persia circumcise in the third or fourth year; Fijians and Samoans in the seventh year; the Christian Abyssinians in the sixth, seventh, or eighth year; while some of the African tribes that practise the rite follow the Jewish rule; others, again, performing the ceremony between 30 and 60 days after birth.

Circumcision is universally practised by Mohammedans, not on the authority of the Koran, which does not enjoin it, but as following the example of Mohammed. It seems to be doubtful whether Mohammed's omission to prescribe the rite was due to his deeming such a rule valueless where custom already decreed it, or because he attached only a physiological and not a religious importance to the ceremony. It is, however, now recognized as a religious obligation just as strongly as if it had been ordained by the founder of Islam. Circumcision among Mohammedans may be practised seven days after birth, but it is customary to postpone the ceremony to some time between the 7th and 12th year.

Christianity recognizes no religious significance in the rite, substituting for it, according to St. Paul (Rom. ii. 25–29) "circumcision of the heart." The Church, however, celebrates as a festival the first of January, as being the day of the circumcision of its founder.

Circumcision of proselytes to the Jewish or Mohammedan faith is insisted on by the orthodox, and previous circumcision for surgical reasons is not accepted as sufficient compliance with the requirements of religion. Among some "reformed" Jews, however, the circumcision of adults has lately been abandoned. Among many savage tribes the rite is undergone at the age of puberty, and is perhaps in such instances more of a sociological than a religious ceremony, being akin to other mystic rites which mark the entrance of the young into full tribal fellowship.

The circumcision of women is effected by the removal of a portion or the whole of the clitoris. It is perhaps practised more in Arabia than elsewhere, but has never prevailed among Jews.

Circumcision is much favored by physicians and surgeons of the present day as a hygienic measure irrespective of any religious associations.

ELFORD E. TREFFRY.

Circum'ference, or **Periphery,** the curve which encloses a circle, ellipse, or other plane figure. In figures bounded by straight lines, as the triangle, square, and polygon, the term perimeter is employed to designate the sum of all the bounding lines taken together. The length of the circumference depends partly on the nature of the curve; thus, that of the circle $= 2\pi r = \pi d$ and that of the ellipse

$$= 2\pi a \left\{ 1 - \left(\frac{1}{2}\right)^2 \frac{e^2}{1} - \left(\frac{1.3}{2.4}\right)^2 \frac{e^4}{3} - \left(\frac{1.3.5}{2.4.6}\right)^2 \frac{e^6}{5} \right\} \text{ etc.}$$

where a is the semi-axis major, and e the eccentricity.

Cir'cumflex, in grammar, one of the three accents, formed by the union of the other two, thus, ^, ~. It originally denoted a rising and falling of the tone in the pronunciation of the syllable. It is not used in English, and in French is usually a sign of the elision of a letter, and therefore indicates a prolonged sound.

Cir"cumlocu'tion Office, a name used by Dickens, in 'Little Dorrit'; he applies it to the delay and slowness of British officialism and especially when dealing with poor and friendless persons, imprisoned for petty offenses.

Cir"cumnuta'tion, the continuous motion of every growing part of a plant, in which it describes irregular elliptical or oval figures. The apex of the stem, for instance, after pointing in one direction, moves round till it points in the opposite direction, and so on continuously. The term circumnutation was first used by Darwin.

Circumpo'lar Stars, stars near the Pole that appear to move around it, and perform their circles without setting. A star whose polar distance is less than the latitude of a place will never set at that place. They are constantly used by astronomers in connection with meridian work for determining the correction to be applied to transit observations to free them from the errors due to the slight departure of the line of collimation of the instrument from the plane of the meridian as it revolves on its axis. The pole-star Polaris or Alpha Ursæ Minoris, usually known as the North Star, is the most used for that purpose.

Circumstantial Evidence, evidence which tends to prove a particular fact by the proof of other facts, from which it is concluded that the particular fact must have happened. It is the natural and reasonable inference resulting from facts which have been established.

If A is on trial for the murder of B, and a witness testifies that he saw A shoot B, and a few minutes later B died, that would be direct evidence; whereas if the witness testified that B had been shot, and the bullet found in the body of B was of a particular make only used by A, and that A was in the neighborhood at the time of the shooting, the jury might infer that A was guilty; but if A could

prove that his pistol had been stolen from him shortly before the shooting, and he had not recovered it at the time of the shooting, it would be a complete defense, and the verdict would depend on the credibility of the witnesses.

Circumstantial evidence is of two kinds: that from which a certain conclusion necessarily follows, and that from which a certain conclusion is only probable or likely. If the body of a man is found with a bloody right hand impression on a part of his body where it is impossible for him to put his right hand, the presumption is that some one was present at or since the time the person was hurt; but if that is all of the evidence, it is impossible to tell whether the bloody impression was made by the person at the time of the assault, or by some one after the assault had been committed. In civil cases the jury may decide according to the weight of the evidence; but to convict a person of a crime the evidence must be such as to leave no reasonable doubt as to his innocence. See LAW, CRIMINAL.

Cir"cumvalla'tion, a fortification consisting of a parapet of earth and a trench, constructed by a besieging army around its camp, to guard against attempts to relieve the place besieged.

Circus, a word which has come down to us from the Latin without change, meaning "circle," and used by the Romans to indicate the place in each city where chariot races, gladiatorial contests, and feats of skill were held. The circus building in Roman times was without a roof, rectangular in shape, except that one short side formed a half-circle; on both sides, and on the semicircular end, were the seats of the spectators, rising gradually one above another, like steps. The largest of these buildings in Rome was the Circus Maximus, 1,875 feet long and 625 feet wide, and capable, according to Pliny, of containing 260,000 spectators. At present, however, but few vestiges of it remain, and the circus of Caracalla is in the best preservation. Grown great through conquest of other peoples, the Romans of 2,500 years ago (and for 10 centuries later) encouraged all forms of pleasure which would develop to its highest pitch the fighting instinct in their soldiery. Among the circus games were chariot races, a favorite sport of the Romans; athletic contests; the Trojan games, contests on horseback; and combats with wild beasts in which beasts fought beasts, or beasts with men (either criminals or volunteers). The prizes given to the victors were often valuable, and the honors great. In the decadence of Rome came a decline of the circus, and it was frequently debased by revolting spectacles, in which Christians or others temporarily hated by the government were given over to wild beasts, or crucified. Julius Cæsar dug ditches around the circus and filled them with water. This served the double purpose of protecting the spectators from the sudden swerving of a chariot or spring of a tiger, and of making possible the novelty of feats of skill on the water. Most of the vessels then were propelled entirely by banks of oars, and Cæsar held rowing-races, swimming-races, etc. Most of our grotesque picnic-games, like swimming in a barrel or running in a sack, are relics of his fertile inventions to please his restless, turbulent people. There was no charge to see these entertainments, as a rule, the circus being used as a pacifier by the emperor.

America has taken the lead in the reproduction of the Circus Maximus. This is probably because the American people are of a similar strenuous, contest-loving, restless disposition. It was his acute perception of this disposition in his countrymen that led Phineas Taylor Barnum (q.v.) a Connecticut Yankee, to devote his life to entertaining his countrymen by giving them a real circus. He first started the American Museum at the corner of Broadway and Ann street, New York, a site now occupied by the 20-story St. Paul Building. Soon he began to exploit all kinds of freaks and curious human beings, "Tom Thumb" and other dwarfs being among his features. He saw the greed of the public for odd, grotesque things. "The public loves to be humbugged," was one of his frequent declarations. Yet Barnum always gave the people what he promised, and soon had on the road the beginning of what has since become perhaps the largest "show" on earth. Since Barnum's death, the circus has been directed by Mr. Bailey, his partner for some years previous to that event. The magnitude of the Barnum & Bailey circus and menagerie can scarcely be described. It is usually formed by making three immense rings, three different performances being given simultaneously. With 1,000 performing horses, 2,000 horses to haul the tents and equipment from town to town, hundreds of wild beasts in a menagerie, 500 performers, bare-back riders (both sexes), clowns, aërialists, tumblers, etc.— 1,200 other employees to care for the animals and erect the tents (seating 25,000), put up show-bills, etc., advance agents, cashiers, managers, and other attachés, bringing up the total to about 3,000 people employed during the season, the conducting of such a circus requires consummate ability and great pecuniary resources. A dozen trains of cars are necessary to carry this exhibition, and a whole ship is used when it visits Europe, as it often does, successfully. The capital invested in this and other circuses in America is enormous, being not under $100,000,000. There are 8 or 10 of the very large circuses, and 20 more smaller ones at work in America at present (1903). The admission price to the common seats was primarily fixed by Barnum at 50 cents, and this has never been varied from since. The better seats, near the centre, are $1.00. These seats correspond to those of the Roman emperor and his court in the old Circus Maximus. Vast crowds attend these exhibitions, particularly in the rural districts, where "circus day" is as much of a holiday as 4th July. Unless a continuous season of rainy weather is encountered, the profits accruing to the proprietors of these circuses at the end of the season (about October) are usually 100 per cent or more.

Since about 1890 there has developed a peculiar American form of circus which is worthy of mention. This is a reproduction in the ring of the habits and customs of the "cowboy" and pioneer of our own western plains. The exhibition is termed a "Wild West" show. It was originated, practically, by William F. Cody (q.v.), known on the plains as "Buffalo Bill."

Circus, a word which has come down to ... from the Latin without change, meaning "circle" and used by the Romans to indicate the place in each city where chariot races, gladiatorial contests and feats of skill were held. The circus building in Roman times was without a roof, rectangular in shape, except that one short side formed a half-circle; on both sides, and on the semicircular end, were the seats of the spectators, rising gradually one above another, like steps. The largest of these buildings in Rome was the Circus Maximus, 1875 feet long and 625 feet wide, and capable, according to Pliny, of containing 260,000 spectators. At present, however, but few vestiges of it remain, and the circus of Caracalla is in the best preservation. Grown great through conquest of other peoples, the Romans of 2,500 years ago (and for 10 centuries later) encouraged all forms of pleasure which would develop to its highest pitch the fighting instinct ... Among the circus games ... races, a favorite sport of the ... contests; the Trojan games, ... horseback; and combats with wild ... beasts fought beasts, or beasts ... other criminals or volunteers). ... given to the victors were often ... the honors great. Mqu

He was a former government scout, and thus became familiar with many Indian tribes. With the aid of "Nate" Salisbury he organized an exhibition of frontier and Indian life which rivals Barnum & Bailey's in point of interest and profit. He has a hundred western cattle-herders, who give marvelous illustrations of the perfect horsemanship of the plains; he has many American Indians from a score of tribes, who give their war-dances and weird chants; he has Mexican lariat-throwers, who perform wonderful feats with a swirling rope; he has "rough riders" from many lands. Altogether, this makes a "show" which appeals powerfully to both the young and the old American. Several less important "Wild Wests" have also been organized.

Some American college youth have recently endeavored to revive interest in the ancient Grecian Olympic games. A delegation of them went to Athens in 1902 to compete with the modern Greeks and other national champions. These efforts may eventually rehabilitate the hippodrome and Circus Maximus in the lands which gave them birth.

Cirencester, sĭs'ĕ-tẽr, England, a town in the county of Gloucester, on the river Churn, 18 miles southeast of the city of Gloucester. The chief industries are malting, brewing, and cutlery manufacture; it also has a large wool trade. The town contains the remains of the gateway of an abbey founded in 1177; and several churches of interest. In the environs is the well-known Royal Agricultural College, with a large number of students coming from all parts of the world. Cirencester was founded by the ancient Britons, and later, under the name of Corinium, became a Roman station. Various Roman remains, including those of an amphitheatre, have been discovered in it, and numerous relics belonging to this period of its history have from time to time been found and placed in the local museum. It was the scene of engagements during the civil war of the 17th century. Pop. (1901) 7,530.

Cirillo, Domenico, dō-mā-nē'ko chē-rēl'lo, Italian republican and naturalist: b. Grugno, Naples, 1734; d. Naples August 1799. He officiated in early life as professor of botany, afterward accompanied Lady Walpole to France and England, became a Fellow of the royal society of London, a friend of Buffon, D'Alembert, and Diderot, and on his return to Naples was appointed physician of the court. After the proclamation of the republic by the French, he was chosen representative of the Neapolitan people, and member of the legislative commission (1799); and on the re-establishment of royalty suffered death on the scaffold, rather than take the oath of allegiance or ask a pardon from King Ferdinand. His principal writings are: 'Fundamenta Botanica' (1787); and 'Entomologiæ Neapolitanæ Specimen' (1787); folio.

Cirl-Bunting, sêrl'bun'tĭng, a small and very handsome European bunting (*Emberiza cirlus*), rare and local in England, often kept as a cage-bird, though its song is slight.

Cirpan, cher'pàn, a town of eastern Rumelia, Bulgaria, on the tributary of the Maritza, 30 miles east of Philippopolis. It is situated in a fertile, fruit-producing region and is noted for its mineral springs. Pop. 11,069.

Cirque, sêrk, the name applied to basins occurring in mountainous regions at the head of narrow stream valleys and gorges. They are characterized by precipitous walls, which curve around in a semicircle, forming a natural amphitheatre. Their origin may be traced to the erosive action of converging glaciers and streamlets.

Cirrhosis, sĭ-rō'sĭs, a process of chronic, inflammatory reaction in an organ, due to some form of constant irritation. It is characterized by the excessive production of connective tissue in the part, which increase of connective tissue gradually encroaches upon the blood-vessels of the organ and slowly invades its essential portions. Cirrhosis may occur in almost any portion of the body, but it is characteristically present in only those organs which are rich in functionating parenchyma, such as the kidney, liver, spleen, pancreas, and brain. In each of these organs it produces a very definite form of lesion, with a clearly defined clinical course and history. Thus, in the kidneys, cirrhosis constitutes one of the forms of Bright's disease or chronic nephritis (q.v.). Cirrhosis of the liver results in a well-defined form of liver-disease, or chronic cirrhotic hepatitis (q.v.). Cirrhosis of the spleen, and cirrhosis of the pancreas also occur, and there is a well-known form of cirrhosis of the brain associated with degeneration. (See GENERAL PARESIS.) These different forms of cirrhosis will be discussed under their separate headings.

Cirripe'dia, an order of entomostracous *Crustacea* (barnacles), sometimes ranked as a sub-class, always fixed in the adult stage, but with free-swimming larvæ having three pairs of appendages (*nauplius*) like other *Crustacea*. The typical barnacles have the body enclosed in a reduplication of the skin which secretes a calcareous shell, on which account they were classed with the *Mollusca* until the discovery of their free-swimming larvæ led to a closer investigation of their structure. Owing to adaptation to a sedentary life segmentation of the body has become obscure, and the six pairs of jointed biramous appendages are mere fringed scoops for creating currents in the water. The eyes and other sense organs have likewise degenerated, and most species are hermaphroditic. The barnacles are exclusively marine, and a great many are parasitic.

Four sub-orders are distinguished: (1) *Thoracica*, including the typical, free-living, shelled barnacles of which the sessile forms (*Balanidæ, Coronulidæ*, etc., are well known as rock and ship barnacles in which the animal is protected by a conical shell formed of several pieces, with a multivalve conical movable lid, having an opening through which several pairs of long, many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The young have oval bodies, with a single eye, a pair of antennæ, with three pairs of legs. After swimming about for some time it attaches itself by its antennæ to some object, and now a strange backward metamorphosis begins. The body becomes enclosed by two valves, the stalk by which it is anchored grows larger, the feet become more numerous, and eventually the barnacle shape is attained. The goose-barnacle (*Lepas*) is not sessile, but is flat and triangular, and attached to floating bits

of wood or seaweed by a long, large, soft stalk. (2) *Abdominalia,* parasitic barnacles, in which the sexes are separate and very unequal in size. In this group is presented the remarkable phenomenon of dwarfed complemental males discovered by Darwin. The females live in burrows in the shells of mollusks and other barnacles, while the males are minute, lack mouth, digestive canal, and appendages, and live, often several together, permanently attached to the female. (3) The *Apoda,* whose body is maggot-shaped, are hermaphrodite and parasitic in other barnacles. (4) *Rhizocephala:* This group presents perhaps the most extreme cases of degeneration, through parasitism, known among animals. *Sacculina,* which attaches itself to the abdomen of the crab, is little more than a bag of genital organs which draws its nourishment from the tissues of its host by means of branching root-like processes which penetrate to every part of its body. Consult Darwin, 'Monograph of Cirripedia.'

Cirrus. See CLOUD.

Cir'rus, in botany, the tendril by means of which certain plants climb, usually a modified leaf or the prolongation of a midrib.

Cirta, sĭr'tȧ, a city of northern Africa, the capital of the Numidian prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony. It was much injured by the troops of Masentius in 310 A.D., but was restored by Constantine and named Constantina. The modern Constantine occupies its site.

Cisal'pine Republic, Italy, a former State in the northern part. After the battle of Lodi, May 1796, Gen. Bonaparte proceeded to organize two states — one on the south of the Po, the Cispadane Republic, and one on the north, the Transpadane. These two were on 9 July 1797, united into one under the title of the Cisalpine Republic, which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the duchy of Modena, the principalities of Massa and Cararra, and the three legations of Bologna, Ferrara, and the Romagna. The republic had an area of more than 16,000 square miles, and a population of 3,500,000. The seat of the government or Directory was Milan. The army consisted of 20,000 French troops, paid by the republic. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte after the victory of Marengo, and some modifications of constitution were made and the area was increased. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its president. In 1805 the republic sent a deputation to Napoleon, with authority to give him the title of King of Italy. The territory was known as the kingdom of Italy until 1814. In 1815 it became a part of Austria. It is now a part of the Italian kingdom.

Cisco, sĭs kō, a local name, probably from the Indian language, applied to several species of fresh-water fishes of the family *Salmonidæ* (q.v.) and closely allied to the white-fishes (q.v.), with which they are sometimes placed in the genus *Coregonus,* or separated under the name *Argyrosomus.* They are distinguished from the true white-fishes by having the lower margin of the premaxillary bone horizontal instead of vertical, and by the larger mouth. Nine or ten species have been described from North America, most of them belonging to the waters of particular lakes or lake systems. The most important is *A. artedi,* which is found in the Great Lakes and adjoining regions, being represented in the small lakes of Indiana and Wisconsin by a slightly modified race. Under the name of lake herring it is the object of an extensive fishery on the lakes, second in value only to that of the true white-fish. It is a voracious fish, swimming in large schools, frequenting deep waters during most of the year, but spawning in the shallows during the winter. The other species inhabit various lakes and the river systems of Alaska, etc. Similar species also occur in Europe and Asia.

Cisleithan (sĭs-lī'thān) **Provinces,** Austria proper or Austria west of the river Leitha, which partly forms the boundary between it and Hungary. This portion of the Austro-Hungarian monarchy contains about 115,850 square miles. Pop. (1900) 26,107,304.

Cisleithania, a river on the boundary line between Austria and Hungary.

Cisneros-Betancourt, thēs-nā'rōs bĕ-tŏn-koor', **Salvador,** Cuban patriot: b. Puerto Principe 1832. He was a descendant of one of the best families of Spanish nobility, and possessed the hereditary title of Marquis of Santa Lucia. During the revolution of 1868–78, he was president of the Cuban House of Representatives, and during a part of the time president of the Cuban republic. In 1895 he was re-elected president of the new Cuban republic. His niece, Evangelina Cosio Cisneros, was imprisoned by the Spaniards for aiding the insurgents during the insurrection in 1896–7, and made a sensational escape, coming to the United States, where she became a protegé of Mrs. Gen. John A. Logan. His daughter tendered her services to the United States as an army nurse during the war with Spain in 1898.

Cispadane (sĭs-pā'dān) **Republic,** Italy, a republican state established by Napoleon in 1796, after the battle of Lodi. It comprised Bologna, Modena, Ferrara, and Reggio. In 1797 it was united with the Cisalpine Republic (q.v.).

Cisplatine (sĭs plā'tīn) **Republic** (Lat. *cis,* on this side, and Sp. *Plata,* name of the river on the boundary between Uruguay and Argentina). The Republic of Uruguay was called by this name from 1828 to 1831. Previous to becoming an independent state it had belonged to Brazil, and was called Cisplatine Province.

Cisrhenish Republic, or **Cisrhenam Republic,** several towns on the Rhine, particularly Cologne, Aix-la-Chapelle, and Bonn, at the time when so many republics were created, declared themselves independent, under French protection, and took the title of *Cisrhenish Republic* in September 1797. But at the Peace of Campo-Formio (17 Oct. 1797), the left bank of the Rhine, including the Cisrhenish Republic, was ceded to France by a secret article, and the confederation bearing this name is in consequence hardly known.

Cissampelos, a tropical genus of climbing shrubs of the natural order *Menispermaceæ,*

whose growth is similar to that of an ivy vine. The plant is of great commercial value because of its medicinal qualities, especially the velvet-leaf of Brazil, (*Cissampelos pareira*), the root of which supplies the spurious pariera brava, abuta root, used in medicine as a tonic. Other species growing in nearly all tropical countries are used for emetics and cathartics, and an East Indian species (*C. obtecta*) yields an intoxicating spirit.

Cissey, sē'sā, **Ernest Louis Octave Courtet,** French general: b. Paris 1811; d. there 1882. He was educated at the military school of St. Cyr and having served with distinction in Algeria and the Crimea, he was promoted in 1863 to be general of a division. He fought in the Franco-Prussian war, and in the contest against the Commune of 1871. He was elected to the National Assembly in February 1871, and was minister of war from 1871 to 1873, and in 1874–6. He was elected life senator in 1875.

Cis'soid, a curve in geometry, the locus of the vortex of a parabola rolling upon equal parabola. If pairs of equal ordinates be drawn to the diameter of a circle, and through one extremity of this diameter and the point in the circumference through which one of the ordinates is let fall, a line be drawn, the locus of the intersection of this line and the equal ordinate is known as the cissoid. This curve was discovered by Diocles while he was seeking the solution of the celebrated problem of the duplication of the cube.

Cist, Henry Martyn, American soldier: b. Cincinnati, Ohio, 20 Feb. 1839; d. Rome, Italy, 17 Dec. 1902. He graduated at Belmont College 1858, and began the study of law, but enlisted as a private in the Sixth Ohio Regiment 21 April 1861, attaining, before his resignation 4 Jan. 1864, the brevet rank of brigadier-general. He was post-adjutant of Camp Chase during the imprisonment of the Confederates captured at Fort Donelson, assistant adjutant-general of the Army of the Cumberland, and later, on the staff of Gens. Rosecrans and Thomas. After the war he practised law in Cincinnati, was twice mayor of College Hill, originated the project that resulted in the conversion of the Chickamauga battlefield into a national park, and was a contributor of military articles to the magazines. He wrote 'The Army of the Cumberland' (1882); and collaborated with Donn Piatt in a 'Life of General George H. Thomas.'

Cist, a place of interment of an early or prehistoric period, consisting of a rectangular stone chest or inclosure formed of rows of stones set upright, and covered by similar flat stones. Such cists are found in barrows or mounds, enclosing bones. In rocky districts cists were sometimes hewn in the rock itself. See Burial; Burying Places.

Cistaceæ, sĭs-tā'sẹ-ē. See Cistus.

Cistercians, sĭs-tẽr'shē-ăns, a monastic order in the Roman Catholic Church founded in 1098 by St. Robert of Molesme, a Benedictine monk of Cluny (q.v.) at Cistercium, near Dijon in France. After a year Robert of Molesme was succeeded as abbot by the monk Alberic and he in turn by St. Stephen Harding, an Englishman, who ruled the order during 25 years with great wisdom and who is regarded as its second founder and lawgiver: his day in the Church calendar is 17 April. The Cistercian order in his time grew to be the most considerable monastic order in the Church, and to him in great part is due the founding of the four greatest Cistercian monasteries of France, next after Citeaux, namely, La Ferté, Pontigny, Clairvaux, and Morimond. By the middle of the 12th century Citeaux had affiliated to it 500 abbeys and priories, and early in the 13th their number was 1,500, of which very many were convents or priories of Cistercian nuns. For 200 years the austere rule of St. Benedict as reinforced by St. Stephen Harding was maintained throughout the order: there was the chanting of matins and lauds at midnight throughout the year in the abbey or priory church; there was a strict fast on one slender meal from 14 September to Easter; there was abstinence at all times (cases of sickness excepted) from all animal food, save that very rarely milk was allowed. The austerity of the Cistercian rule extended even to the churches of the order: simplicity was sought in everything; there was no fatuous display of ornamentation, either of the edifice or of the vestments, or of the sacred vessels; the copes and chasubles employed in the church services were of white linen instead of silk or cloth of gold; the chalices and the pyxes, instead of being of gold incrusted with precious stones, were of plain silver. But the church schisms and the wars and civil commotions of the 14th century led to the plundering of the abbeys and priories, and the monastic discipline was greatly relaxed, so that on the one hand it became necessary for the see of Rome to sanction in some respects this relaxation, while on the other hand there arose zealous upholders of the ancient rules who brought back the primitive observance in all its rigor. Among the most notable of these revivers of the ancient rule was the abbot De Rancé of the monastery of La Trappe (q.v.) in the 17th century. At the dissolution of the English monasteries by Henry VIII. there were in England and Wales 115 Cistercian houses, of which 25 were for nuns. In the period of the French Revolution most of the Cistercian Cenobia, not only in France, but throughout the continent of Europe, were suppressed. In the United States there are two Cistercian abbeys, namely, that of La Trappe at Gethsemane in Kentucky, and that of New Melleray, near Dubuque, in Iowa. The most noted English Cistercian's houses were the abbeys of Furness, Fountains Rievaulx, Tintern, Kirkstall, and Woburn. A modern English Cistercian abbey is situated at Mount Saint Bernard, not far from Leicester. See Janauschek, 'Origines Cistercienses' (1877); Guignard, 'Monuments primitifs de la règle Cistercienne' (1877); Sharpe, 'Architecture of the Cistercians' (1874); Lefroy, 'Ruined Abbeys of Yorkshire' (1889); Eulart, 'Origines de l'architecture Gothique en Italie' (1893).

Cistern, a tank for holding water. Cisterns differ from wells in that they do not get their water from natural sources, such as springs, but through channels made by the hand of man. In hot countries, where the supply of water is not regular, or where rain water is used, cisterns are necessary for storing up water for future use. They are also largely used for the

supply of locomotive boilers at railroad stations. Cistern water used for drinking is usually filtered.

Cistus, the typical genus of the rock rose family (*Cistaceæ*), a family having four genera, and about 160 species, of which two at most are found outside the northern hemisphere. The American representatives of the family belong to the genera *Helianthemum, Hudsonia,* and *Lechea,* most of the species being pestiferous plants, such as the frost-weed or Canadian rock rose (*H. canadense*), poverty-grass (*Hudsonia ericoides*), and the pin-weeds (*Lechea*). Cistus does not grow wild in America, but some species are cultivated in greenhouses and the warmer regions for the beauty of their large wild roselike flowers, which are often of two colors. This genus, which is a native of the countries of Europe, is generally a beautiful evergreen flowering shrub, ornamental in gardens or shrubberies. Gum ladanum is obtained from *C. creticus,* and *C. ladaniferus.* This gum was formerly used as an external stimulant in plasters, but is now almost obsolete in medical practice.

Cit'adel (from the Italian *cittadella,* a diminutive of *città,* city; signifying little city), in fortification, a kind of fort, consisting of four, five, or six sides, with bastions, commonly joined to towns, and sometimes erected on commanding eminences within them. It is distinguished from a castle by having bastions.

Citation, a summons or official notice given to a person to appear in a court as a party to a cause. A writ issued out of a court of competent jurisdiction, commanding a person therein named to appear on a day named and do something therein mentioned, or show cause why he should not. Proctor, Prac.

In cases in which a citation issues it is generally the writ commencing the action, the same as a summons in trespass or a bill in equity. The citation is used by courts having control over the estates of the dead.

Cithæron, sĭ-thē'rŏn, or **Elatea,** a mountain, Greece, which stretches northwest, separating Bœotia from Megaris and Attica. Its loftiest summit rises 4,620 feet above the sea, and is the subject of numerous fables and classical allusions. On its northern slope stood the ancient city of Platæa, the circuit of whose walls may still be traced. Its modern name Elatea, from *elatē,* a fir, is derived from the pine forests which are abundant on its sides and summit.

Cithara, sĭth'ạ-rạ, a guitar-like musical instrument, said to have been invented by Apollo. The strings, usually five or six in number, were struck with a plectrum, or picked with the fingers, sometimes both methods being used at the same time. It was the forerunner of the banjo, guitar, zither, and all similar instruments. See LYRE.

Cities of the Plain, Sodom and Gomorrah, chief of the five cities which, according to the commonly received account, were destroyed by fire from heaven, and their sites overwhelmed by the waters of the Dead Sea.

Cities of Refuge, according to the law of Moses six out of the 48 cities which the Israelites were directed to give to the tribe of Levi, in the division of the land of Canaan among their tribes, were to be set apart as cities of refuge for the manslayer or accidental homicide. The right of avenging murder belonged to the next-of-kin of the murdered man; but the slayer fleeing to one of these cities, three of which were to be on either side of Jordan, the avenger of blood was forbidden to touch him till he stood before the congregation in judgment, when, if he were found to have acted without premeditation or malice, he had a residence appointed him in the city of refuge until the death of the high priest, and was then permitted to return to his inheritance. If the slayer violated this regulation by leaving the city of refuge before the death of the high priest, the avenger of blood might kill him with impunity. The six cities of refuge appointed in accordance with this law were Kedesh, Shechem, and Hebron on the west side of Jordan; and Bezer, Ramoth-Gilead, and Golan on the east. This law of refuge seems to have been favored by the Levites, to whom it gave a measure of political influence, much in the same way as the privilege of sanctuary did to the monks, abbots, and other dignitaries of the Roman Catholic Church; it was consequently interpreted by them in the most liberal way. Maimonides says that all the 48 cities of the Levites had the right of refuge, although only the six were obliged to receive and lodge the slayer gratuitously.

Citizen, originally, a member of the body of freemen entitled to share in the government of a *civitas,* or city-state of the ancient type; as the Roman state gradually broadened into the entire ancient world, the citizenship was extended piecemeal for political reasons, till Justinian made it coextensive with personal freedom, and the attribute of all residents of the empire except slaves. With the rise of the miscellaneous modern community, where flux of population permanent and temporary is going on, and the mass of people share in the government to a varying extent, the question of its limitations and the privileges it confers have become acute, and that of its legal definition has furnished one of the grounds of a civil war. The definition varies in different countries. In monarchies it is commonly used only of a resident's relation to his municipality, the term "subject" expressing the relation to the state; in republics generally it means a regular member of the community, subject to its ordinances, obligated to its support and defense, and entitled to its protection. In the United States, a complication is introduced by the federal structure of the government, there being a citizenship of each distinguished from that of the other. The questions arising in this country are therefore: (1) What constitutes citizenship; (2) What rights it confers; (3) How it is acquired; (4) How it can be lost; (5) What are the respective obligations to State and nation.

1. A citizen has been legally defined as "one who owes to the government allegiance, service, and money by way of taxation, to whom the government in turn grants and guarantees liberty of person and of conscience, right of acquiring and possessing property, . . . suit and defense, security in person, estate, and reputation." In a word, the citizen is one whose lot is cast in with his society, for all social purposes according to his status and means, to fight or pay unless he is a dependent member of a group which fights, pays, etc. This includes

women, children, defectives, and criminals; and excludes alien residents (see, however, section 3), and Indians living in tribal relations, who are «dependent subjects.» It should be added, however, that for jurisdictional purposes resident aliens are regarded as citizens, and in commercial and business legislation «citizen» is equivalent to «resident.»

2. Citizenship implies civil but not necessarily political rights. The former are one for all, and are the primary obligation of a government to secure to its members; political rights are endlessly varied and within the discretion of the government. The right of direct share in government is everywhere withheld from minors, convicts, and the insane or idiotic, nearly always from paupers, and most generally from women; but these do not cease to be citizens. On the other hand, voting has occasionally been permitted in this as in foreign countries to persons not citizens of a State or municipality, for holdings of property, and could be so again. It was on this distinction that the minority in the Dred Scott case based their dissenting opinion that a slave's lack of political rights did not prevent his being a citizen with a right to sue in the courts; and the government by the Fourteenth Amendment ratified this view, and definitely dissociated civil from political rights.

3. Citizenship may be acquired by birth, every child born on the soil or within the jurisdiction of the United States,— even of resident aliens, except of foreign official representatives, whose residences are assumed to be part of their country's territory,— or of citizen parents traveling abroad, or of its officials resident abroad, being a citizen; or by naturalization; or by succession to a parent's or husband's rights,— the wife of an alien becomes a citizen by his naturalization, or after his death before naturalization if he had previously declared his intention of becoming so; and the children inherit similar rights.

4. It may be lost by formal renunciation, but the abandonment will not be presumed without it, even from a lifetime of residence abroad; but the government, with most civilized governments at present, recognizes full right to change allegiance at will. This was one of the issues in the War of 1812, Great Britain firmly refusing to recognize it; and it was not till 1870 that that country formally admitted that right.

5. Dual allegiance. The nature of the obligations is different: any one may be a citizen of the United States, yet not of any particular State, but not *vice versa;* and as the citizenship of the nation is the more universal, so it is of the higher sanction. The two could not in fact come into conflict except through an act of secession, which must be fought out, so that the question is academic, as short of that the whole matter would involve a case in the supreme court, pending which the question would be in abeyance; but in case of forcible resistance of a State to a decree of the nation, the citizen's first allegiance is to the latter. Further than this, however, the national government cannot go beyond the scope of its reserved powers; and a State can go very far in the direction of abolishing even the civil rights of its citizens under the shelter of this flexible permission. It should be noted that the right of citizenship is totally unconnected in essence with the right of suffrage or the elective franchise. The former is an elemental right of all born among, or who have cast in their lot with, a civil society; the right to the protection of its laws and its strength, to a share in its benefits and its charities. The latter, a right to share in the governmental management of a society, is a mere question of the best machinery of management, and dependent on the fitness or power of individuals or classes to help guide that machinery. The unfit or weak are just as much citizens as the fit or the strong, by natural right; women and minors, defectives and criminals, have the fullest right to claim the protection of the laws, by themselves or their natural or appointed guardians. The suffrage is only a substitute for a battle, assuming that the larger body could outfight the smaller; and admission to it lies in the discretion of the fighting body.

Citizen King, The, a title applied to Louis Philippe, king of the French, 1830–48.

Citizen of the World, the signature of Oliver Goldsmith's 'Letters from a Chinese Philosopher residing in London, to his friends in the East.' The work was published in 1762.

Citizens' Industrial Association of America, The, a national federation of local employers' associations, citizens' alliances, and State and national organizations representative of business interests, organized as the culminating step in the movement for the organization of employers in 1903. Nearly all the large cities, and scores of the smaller ones, during the months following the anthracite strike of 1902, became the centres of considerable agitation on the labor question, and from 400 to 500 local associations sprung into existence for the purpose of combating what was termed the lawless aggressions of organized labor. The membership of some of these associations was confined to employers, while others, which adopted the general name of alliances, admitted professional men, and even employees, into their ranks. In cities like Chicago, Saint Paul, Omaha, Kansas City, Saint Louis, Detroit, Cincinnati, Louisville, and New York employers' associations were formed, while in Denver and all over Colorado and many other parts of the West, as well, also, in the smaller towns of the Central States, the alliance was the most popular form of organization. In response to a call issued by a number of the prominent leaders in the employers' movement, a convention was held in Chicago, 29–30 Oct. 1903, which was attended by nearly 300 delegates, who came from all parts of the United States and Canada, cities as far apart as San Francisco, New Orleans, Montreal, and Minneapolis being represented. The name of the Citizens' Industrial Association was considered as being inclusive in meaning of both employers' associations and citizens' alliances, and was selected by the convention for the new organization. The purposes, as set forth in the constitution adopted, were those of law enforcement, the maintenance of individual liberty, the securing of industrial peace, and the perpetuation of free competitive conditions in industry. The organization stands for the open shop, and no restriction of output. Its work is largely confined to that of educational propaganda, and it maintains a publication bureau for this purpose,

It does not interfere in any respect with the internal government of its constituent associations, and the action of its convention or executive committee is advisory and not obligatory upon its members. The association forms a central source of information for its members and a directing agency in matters of national legislation in which the associations generally are interested. In the contest in the present Congress over the eight-hour and anti-injunction bills, which are fathered by organized labor, the Citizens' Industrial Association is taking an active part. The National Association of Manufacturers is a member and one of the principal elements of support in the new organization. Its president in 1904, David M. Parry, was chosen by the Chicago convention as the first president of the association. The secretary, chosen by the executive committee, was A. C. Marshall, of the Dayton Employers' Association, Dayton, Ohio. Vice-presidents were J. C. Craig, of the Denver Citizens' Alliance, and J. T. Hoile, of the New York Manufacturers' Association, with offices in Brooklyn. The treasurer in 1904 was Major A. C. Rosencranz, of the Evansville Alliance.

DAVID M. PARRY,
President Citizens' Industrial Association.

Citizen, The a comedy by Arthur Murphy, performed 2 July 1761, at the Drury Lane Theatre, and printed in 1763. It is founded in part on Destouche's 'Fausse Agnès.'

Cit'ric Acid ($C_6H_8O_7,H_2O$), a very widely distributed acid, present in most common fruits, such as gooseberries, currants, lemons, citrons, cherries, and many others. It was first separated and distinguished by Scheele in 1784. It is generally prepared from lemon juice, the dark treacle-like fluid imported from Sicily, by fermenting it, filtering, and neutralizing with chalk and quicklime, by which citrate of calcium is precipitated. This, by decomposition with sulphuric acid, gives the acid, which is then purified by repeated crystallization. Several improvements have of late been introduced, both in preparing the crude lemon juice for exportation and in the subsequent purification and crystallization of the acid. Citric acid is white when pure; it crystallizes in two forms, one belonging to the trimetric system is the common form, and in it the acid contains one molecule of water, as indicated in the formula given above. The other form contains half the quantity of water. The ordinary crystals effloresce in the air in a warm room. Citric acid has a pleasant sour taste. It dissolves very readily in water, and is soluble in alcohol, but insoluble in ether. When heated it undergoes decomposition, and yields aconite, itaconic, and citraconic acids, along with other products. It is acted on by nitric and sulphuric acids, and by other reagents, yielding a variety of decompositions and derivatives.

Citric acid combines with the metals, forming citrates. They are crystalline salts, and many of them are soluble in water. Crude citric acid is largely employed by the calico-printer as a resist and as a discharge.

Citric acid and the citrates are used in medicine as cooling drinks, as antidotes to alkalies, and for the purpose of rendering the urine alkaline, thus overcoming too great an acidity. Citrates of magnesium are used as laxatives and cathartics, and are among the most efficient and pleasant of this class, being particularly adapted to children.

Citron (*Citrus Medica*, var. *genuina*), a bush or small tree of the natural order *Rutaceæ*. It bears reddish or purplish slender branches; smooth, oblong leaves; externally reddish flowers; and large, warted or furrowed, oblong or ovate fruits with a very thick, tender, aromatic rind, which is candied or preserved and used in cakes or confectionery. The mildly acid juice of the pulp is used to some extent with sugar and water as a drink like lemonade, or for mixing with and flavoring various liquors. From India, where the tree is native, the citron has been introduced into many warm climates throughout the world. It is sparingly cultivated in California and southern Florida, but more generally in the West Indies more as a home than an orchard fruit. Most of the candied citron on the American market comes from the Mediterranean region of Europe, where the trees are extensively cultivated. All the varieties, which vary considerably, probably on account of hybridizing with other species, are very susceptible to injuries by frost. They may be propagated by layerage, graftage, or cuttage, the first producing trees inferior in form to those derived by the other two methods. The orchards should be located on well-drained land well exposed to sun and air, which aid in preventing the attacks of insects and fungi. Clean cultivation, liberal fertilization, and the use of cover crops during the hot months, are the three leading factors in the cultivation of this crop in Florida. In the United States, the name is also popularly applied to a variety of watermelon with an edible flesh and generally red seeds. This citron is frequently grown in northern private gardens and to a small extent commercially for its rind, which is used for preserving in various ways. See CITRUS; LEMON; LIME; WATERMELON.

Citron-melon. See WATERMELON.

Citronel'la Oil, an oil obtained from a kind of grass (*Andropogon nardus*), cultivated at Singapore and in Ceylon. It is used for scenting soaps. Other species of the same genus and some other allied genera also yield essential oils.

Citronelle, sĭt-rō-nĕl', Ala., a village in Mobile County, where on 4 May 1865 the last Confederate army east of the Mississippi surrendered to the Federal troops under Gen. Canby.

Citronwood, or **Citrus-wood,** the most costly furniture wood of Roman antiquity, usually regarded as derived from *Biota* (*Thuja*) *orientalis*, or possibly from *Callitris quadrivalvis*, allied coniferous trees, both popularly known as *Arbor vitæ* (Oriental and African). Cicero is said to have paid an enormous sum for a table of this wood.

Città Vecchia, vĕk'kē-ā, or **Civita Vecchia,** a fortified city of Malta, near the centre, and almost on the highest point of the island, seven miles southwest of Valetta. Pop. 7,000.

Cittadella, chēt-tā-dĕl'lā, Italy, city in province of Padua, compartimento of Venetia; 30 miles northwest of Venice. Portions of its ancient walls still remain. It contains beautiful churches and botanical gardens. Its mod-

ern industries are the manufacture of paper and linen. Pop. 9,850.

City (Latin *civitas*). The Greeks and Romans distinguished a city from a town, or mere assemblage of people living together under municipal laws, as an independent community or state possessing sovereign authority, and including any portion of the surrounding territory the inhabitants of which possessed the rights of citizenship, but excluding conquered or dependent territories. Thus, Athens, Rome, and Carthage were all both towns and cities in different senses. In Europe the word city came to have two meanings, the one civil, the other ecclesiastical. The civil meaning corresponded with the Roman sense, in which the great Italian republics and the German free cities during the period of their independence corresponded with it. The fluctuations in the fate of such cities must necessarily have caused the word to lose the sense of territorial independence, and this change would be promoted by the rise of rivals to them in other respects having no such claim, so that in modern times a city has come to signify merely a town holding from extent of population, favorable situation, or other causes, a leading place in the community in which it is situated. The ecclesiastical sense of the term city is a town which is the see of a bishop. This seems to be the historical use of the term in England, and still possesses some authority there, but in general use it has been superseded by the wider one. In our historical retrospect we take the term in its least restricted sense. The origin of cities belongs to the earliest period of history. According to Moses Cain was the first founder of a city, and Nimrod built three, among which Babylon was the most important. The Jews imagine that Shem erected the first city after the deluge. At the commencement of society the form of government was patriarchal. The ruler was the head of the family or clan. Relationship, the innate wish of men to live in society, and more, perhaps, than both these causes, the necessity of providing means of defense against more powerful clans, brought together separate families into one spot. The fertility of the East also afforded facilities for men to give up the rambling life of nomads and to form permanent settlements. These settlers began to barter with those tribes who continued to wander with their herds from place to place. Thus cities sprung up. These were soon surrounded with walls to prevent the inroads of the wandering tribes. The bond of connection between their inhabitants thus became closer, and their organization more complete. As by degrees the chiefs of these family-states died away, the citizens began to elect the most able or most popular men for magistrates, without respect to birth or descent. Thus political institutions began to assume a systematic character. The earliest forms of government succeeding the patriarchal state was probably monarchical. In this the religious, paternal, and political authority remained rudely mingled. When conquest extended the limits of these early kingdoms the authority of the king was weakened, his connection with the different parts of his dominions became imperfect, and the progress of civilization was promoted almost solely by the growth of the cities. These gave rise to the division of labor, the refinements of social intercourse, the development of laws caused by the conflicting interests of many people living close together, the idea of equality of rights, the diminution of awe for a distant monarch, the growth of patriotism, springing from the sense of advantages enjoyed and the exertions necessary to maintain them. These were the salutary consequences of the establishment of cities. Under the mild sky of Asia, Africa, Greece, and Italy cities were built first, and in the greatest number. The Phœnicians and Egyptians particularly distinguished themselves by the erection of cities, which soon attained a high degree of wealth, and consequently of civilization. The Egyptians considered their city of Thebes older than any of the Greek cities; and Pliny says that Cecropia, said to have been erected in Attica by Cecrops, 1582 B.C., and afterward called "Athens," was the oldest city of Greece. Heeren justly remarks that the rise of cities was the most important source of the republicanism of antiquity. This is particularly true of Greece. In fact cities are, by their very nature, of a democratic tendency. Several confederations of cities existed in the ancient world; for instance, the Phœnician, consisting of the cities of Tyre, Sidon, etc., and the Achæan league, formed by the most important cities of Greece, in order to strengthen themselves against the power of Macedon. Under Augustus and his successors the Romans began to establish colonial cities in Germany, having done the same long before in Gaul, Spain, Africa, etc. In Switzerland they first erected cities about 70 A.D., which, however, were mostly laid waste by the Alemanni, and subsequently rebuilt under the government of the Franks (496 A.D.). The Germans, accustomed to a wild, rambling life, did not show any disposition to live in cities until Charlemagne labored to collect them together in settled abodes from his desire to civilize them. Henry I. distinguished himself particularly in this way, and on this account has been called by some "Henry the City-builder" (*der Stadterbauer*). He gave the cities great privileges, in order to induce his subjects to live in them, and thus laid the foundation of that power which at a future period contributed most to break down the feudal system. In many cities imperial castles were erected to protect the inhabitants, and the insupportable oppressions and even cruelties exercised by the feudal lords upon their peasants, or by the wandering knights and robbers, drove many people into the cities. The attacks of the neighboring lords gave firmness to their union, and compelled them to cultivate their resources. Commerce and the various arts and trades were soon cultivated within their walls, and their wealth and respectability increased. They soon became sensible of the want of a better system of laws and political administration than prevailed around them, and the principle of equal rights and laws was quickly developed.

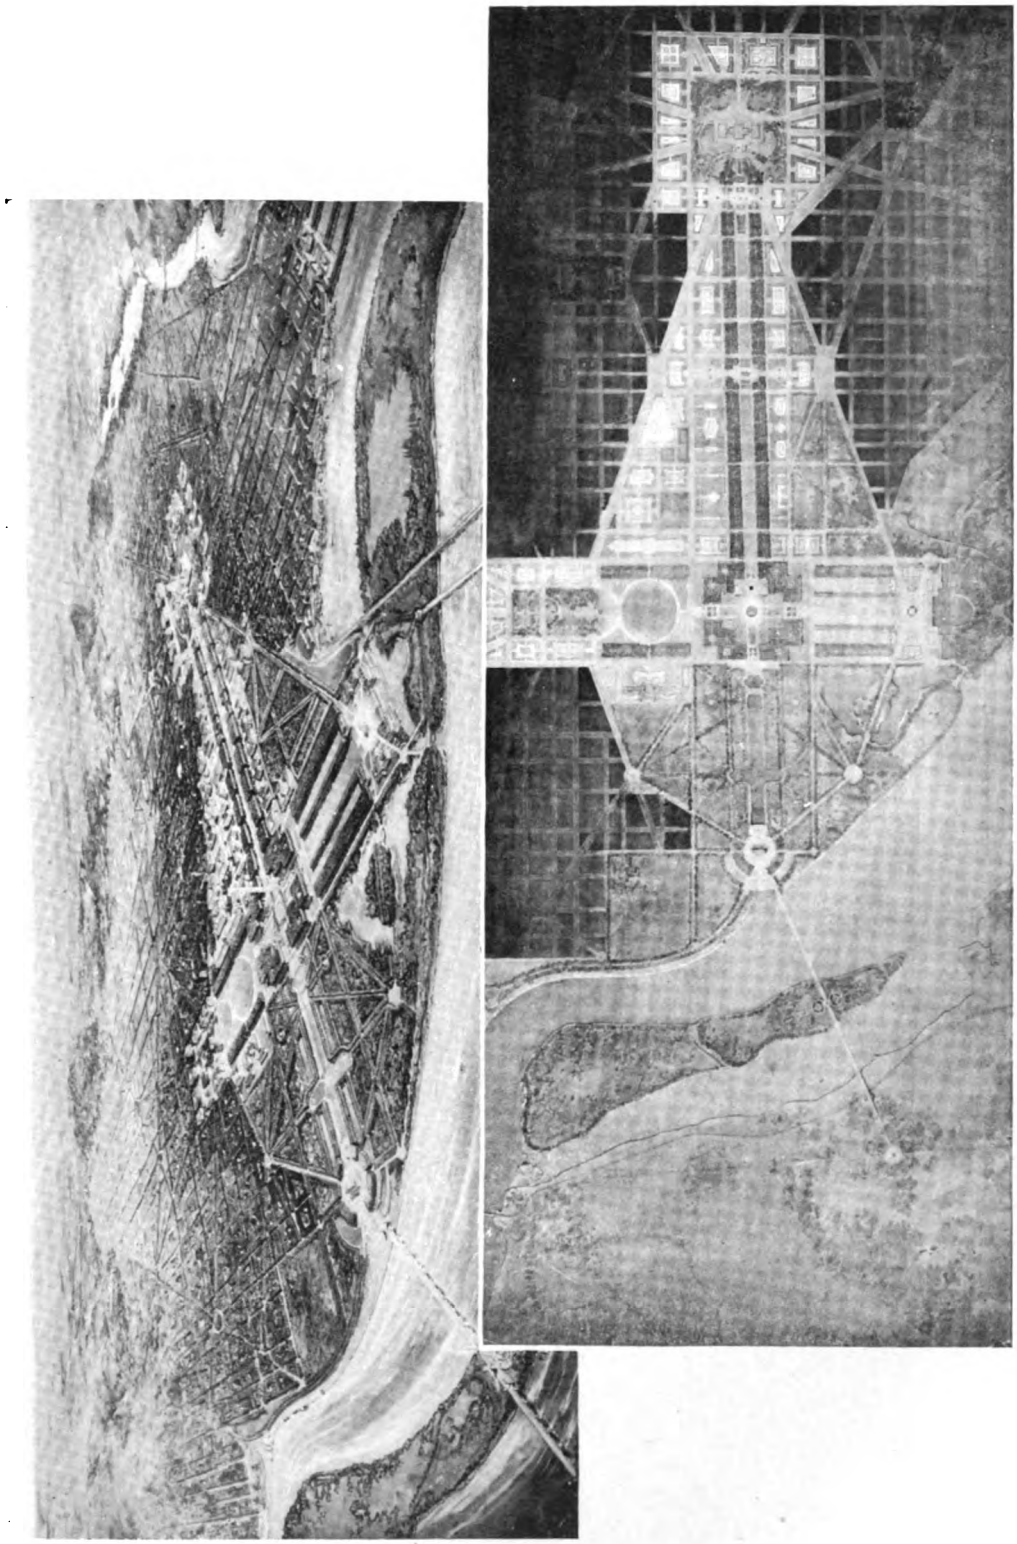
One of the most important remnants, if not the most important, of the great fabric of ancient civilization, was the cities of Italy. In spite of their bloody contests with each other, and the vices of an oligarchical government, Europe is mainly indebted to them for the cultivation of the commercial spirit, together with the toleration and love of liberty, which, under

the most unfavorable circumstances, it tends to foster, and for that ardor in the cultivation of arts, science, and literature, which has always distinguished the best periods of Italian history, and from which the general revival of learning in Europe, called the Renaissance, took its rise. Under the reign of Conrad III. (1138–52) the cities of Lombardy, and particularly Milan, which stood at their head, had acquired a high degree of wealth and power, and had formed themselves into a confederation. The struggles between the emperors and these cities form one of the most important portions of the history of the German empire and of Italy. Frederick I. in vain demolished the powerful city of Milan. It was soon rebuilt, and the cities of Lombardy, in alliance with the Pope, obliged the emperor to conclude with them a very disadvantageous peace at Constance. Two other confederations of cities, highly important, were formed during the interregnum of the German empire, between 1256 and 1272. One of them was the powerful Hansa, or Hanseatic League (q.v.), the other the confederacy of the High German and Rhenish cities, from the foot of the Alps to the mouth of the Main, established by Walpode of Mentz in 1255. A similar confederacy, and a very important one, was that of the Suabian cities, instituted in 1488 to repel the outrages of the feudal lords and knights. The cities of the Netherlands, from their central position between France and Germany, exercised a powerful influence on the growth of civilization and political liberty in Europe. Their favorable situation and the enterprise of their inhabitants early gave them great wealth and power. The democratic spirit, ultimately carried to the greatest height in Holland, was earliest manifested in the towns of Belgium, which began in the 12th century to manifest a turbulent disposition, and by frequently leaguing themselves with the enemies of their feudal superiors extended their political privileges, and acquired at times a premature independence, which, though ultimately extinguished in the spirit of nationality, contributed not a little to the breaking up of the feudal system (q.v.). In Spain municipalities were established at an early date. Leon received a charter in 1020, Sepulveda, Lograno, Sahagun, and Salamanca followed soon after. The constitution of the Spanish towns approached more nearly to the ancient idea of a city than was common in other large states of Europe, in this resembling the Italian cities. Their constitution was extremely democratic, and they ruled over a large extent of surrounding territory, which they were bound to defend. Deputies from the towns were admitted to the cortes in the 12th century (1167 and 1188). The love of liberty rose high in these ancient Spanish cities, but from the isolation of the Iberian Peninsula they exercised little influence in Europe, and they soon lost their power and importance, most of them by the end of the 15th century having ceased to send their representatives to the cortes. By degrees the cities acquired in the different countries of Europe the right of representation in the legislative bodies; and wealth, industry, knowledge, and equal laws spread from them through Europe. But the cities of Lombardy, though still flourishing and wealthy, had fallen, for the most part, under the rule of single families; their republican governments vanished, and their confederation was dissolved. The associations of German cities experienced a similar fate. By the Peace of Westphalia the princes of the German empire were declared sovereign powers, and the more their authority increased the more did the relative weight of the cities diminish. These had formerly suffered from the oppressions of the feudal lords. They were now the victims of the policy of the neighboring princes, whom envy often led to adopt the most unwarrantable measures against the cities, many of which had lost their independence before Napoleon dissolved the German empire. He took away the privileges of those which remained free; and the Congress of Vienna restored freedom to Lübeck, Hamburg, Bremen, and Frankfort, only because the different powers could not agree to whom they should be assigned. At the same time Cracow was declared an independent city, with a republican form of government.

Cities, as we have seen, naturally develop the democratic principle, and on this and several other accounts are to be considered among the firmest supports of liberty. Well-organized municipal institutions, in which the government is in the hands of the citizens, afford continual nourishment to the spirit of freedom throughout a country.

In the United States a city is an incorporated municipality, usually governed by a mayor, alderman, and common council. In many of the States, especially the eastern, the number of inhabitants required for legal municipal incorporation is 10,000. In several of the western States a much fewer number is required. A village or town of 10,000 or more inhabitants is not obliged to become a city, and in several cases places of 20,000 and 30,000 have preferred, for local reasons, to remain under village government. In the United States cities are generally the outgrowth of villages, one village expands into a town with population sufficient to assume the duties of a city; but in several instances, villages near each other have united to form a city, and sometimes cities nearby have united in one municipality.

Much has been said and written upon the immorality of large cities, and it cannot be denied that they have vices peculiar to themselves; but it must be considered, on the other hand, that they are free from many of those of petty towns, and even of rural districts. The association of men in masses, when due surveillance is exercised, has an influence distinctly favorable to the maintenance of social order, the impartial administration of justice, and, above all, the suppression of all petty and local tyrannies, and the maintenance of individual liberties. It is by the influence of cities alone that a sufficient organization for the support of education and the means of enlightenment is obtained, even though that organization often fails to penetrate the entire mass of the cities themselves. It is to them that many of the facilities for progress in art and science are due. It is in them that public opinion is formed, and so organized as to act upon the administration, and, even independently of direct representation, upon the legislation of a country; and although the individual freedom enjoyed in great cities may often tend to license, its general influence in an otherwise healthy community is highly beneficial to the moral tone of the whole. It must, however, be



PLAN AND BIRDSEYE VIEW OF A PROPOSED ARRANGEMENT FOR WASHINGTON, D. C.

admitted that the democratic spirit in cities is liable to be carried too far, and that an excessive growth of large towns might thus prove dangerous to the State.

As regards mortality, New York compares favorably with most of the larger European cities, of which St. Petersburg and Moscow have the highest death-rate (29 or 30). Cities in Great Britain and Canada seem to be much on a par with those of the United States. Asiatic cities stand much higher. See MORTALITY.

City-making.—Although in the history of the world, cities have occasionally sprung up by fiat and have thus been deliberately planned, giving scattered examples of practical city-making on a large scale and more or less satisfactory in character, the rule remains that most have usually grown by extension and accretion from smaller communities, and their growth has had no other law than the requirements of the moment and the unorganized practical and æsthetic impulses of individuals and corporations. The units of a community have always, indeed, united for common ends, but rarely with a conscious regard for a civic ensemble, and still more rarely with regard to the necessity of preserving to the community the means of further extension on lines foreseen toward a larger whole, of which the existing city should be a concrete and vitally related part. The surge of the population toward the great centres which has marked the rise of the industrial spirit and the enormous growth of the cities in the United States and Germany has brought the subject into clear prominence, and for the first time in history science has seized on this field and endeavored to trace the natural laws and phenomena of civic life and civic growth, and to point out to the practical worker the condition of his problem.

The modern science of city-making, then, has sprung up in answer to a manifold need in the cities of to-day. From the reorganization of the entire plan of a city like that being undertaken by the city of Washington, D. C., to matters of the discipline of the street in one form or another, its principles are becoming more and more clearly recognized in the minds of the people, and in the laws and regulations that are its outcome.

In the extension and widening of streets which, as originally planned, were too narrow for the traffic that has surpassed the hopes of the early founders, and in the parking treatments by which we try to counterbalance the aridity of the unbroken stone and brick, we have one of its fields which is most obvious. Another is seen in the growing sentiment that the fixtures on our streets must not be merely functionally suitable, but should also be at least neat in design and quiet in color, if they cannot have positive ornamental value. Along this line may also be mentioned the desire, on æsthetic, as well as practical grounds, for the burying of wires and the clearing of our streets of the forest of poles so destructive to the architectural beauty of a city. In the improved disposal of garbage and in street cleaning, a somewhat stronger position has been early assumed from the direct practical necessities of the case. It is in spacing and the insuring of breathing spots in our cities that a haphazard and unscientific method, one, indeed, almost of accident, is to be clearly observed. No city of any importance is without its parks, but few have a park system, and in few cases is there evidence of anything but chance in their location. The science of city-making touches on questions of the control of private action at a number of important points. For instance, in Massachusetts, the trees along the sidewalk are considered so far a public benefit that the public interest in them is held to exceed that of the owner, and he may not remove or injure them except by official permission. In the attempt to restrain the voiding of immense clouds of bituminous smoke into the atmosphere, we have another example in point. The municipal oversight of architectural designs in this country, chiefly restricted to constructional features, is in foreign countries extended to a municipal oversight of designs from the architectural standpoint, and this which might, in certain cases, prove a source of tyranny, has, like all similar regulations, a counterbalancing advantage to the community. In the municipal control of posters and signs we again see the same readiness to defend the citizen on grounds of morality or from the danger of falling signs, but we must still look abroad, except in a few isolated cases, for an official expression of the growing conviction that on artistic grounds, as well as for the good of the general neatness and dignity of the city, there should be restraint on artistic grounds also. In functional matters, in the disposal of sewage, in all matters of construction, there is little need for other than a more exact and logical application of principles already well thought out, but in the employment to advantage of the city's physical opportunities, and in the expression of a municipal pride at all commensurate with the pride which every citizen feels in his own personal domain, we are yet in the early stages of development. How far we have still to go can best be judged by the advance that has already been made at isolated points. Governmental and municipal buildings are being more monumentally handled. They are being protected in some measure from private encroachment. Water supply systems have in more than one instance given handsome buildings, and in at least one case ornamental reservoir lakes.

In municipal pageantry our cities have taken a great step forward in the last 10 years. The various local celebrations that took place at the close of the Spanish war are an example in point, and while we have not yet the extensive paraphernalia such as belongs to almost every considerable city on the other side of the ocean, our cities at least own the nucleus of a collection of civic ornaments for use on occasions of public festivity. Hygiene, on the other hand, has been a powerful appeal. Our regard for it has opened up breathing spots like that at Mulberry Bend in New York, and it is natural that moral and ethical grounds should have taken precedence over the æsthetic.

The history of the modern movement as a conscious scientific effort begins with the work of Louis Napoleon and George Eugene Haussmann in Paris, who, a year after the proclamation of the second empire, decided on the first great and comprehensive scheme of modern city-making. In the following years a scheme of urban development was carried out in Paris which still remains an unsurpassed object les-

son. Under Haussmann's administration the movement achieved remarkable results, and being in a position to assume title to the improved areas, the increase in values was in large measure preserved to the community and a clear demonstration was made of the fact that such gigantic civic improvements, far from being costly luxuries, could be made paying investments. As prefect of the Seine he transformed a congested and unorganized centre into the most splendid capital of modern times and created a new profession in which his name yet remains the most eminently distinguished.

It was not until many years after that the Germans began to consider the symmetrical development of cities along equally broad lines, though once their attention was turned to the subject, with customary thoroughness they developed a system entirely their own, so that now nearly every German city of over 25,000 inhabitants has a department in its municipal government devoted to city expansion where all problems of extension and improvement are regulated.

George E. Hooker writes on this subject as follows: "Indeed, the great widening of municipal action in the cities of the fatherland respecting education, recreation, charity, hygiene, and 'municipal trading' is less significant than the attempt to give proper shape, both for economic and æsthetic ends, to the entire physical organization of those cities. The authorities have set up the ideal of a city which, in arrangement and structure, should be a rational unity; and while the results achieved have naturally been limited, they are in many respects surprising.

"Hamburg, for example, could displace 30,000 people in order to obtain a proper location for new docks. Nuremburg, while developing into a modern industrial town, has studiously perpetuated its delightful architectural spirit, and any German city which should to-day lay out or permit to be laid out, a new quarter on the easy and wearisome checkerboard plan would be laughed at. There have actually developed in Germany — and in Austria, too — especially during the last dozen years, the rudiments of a real science of city-building, with a limited but distinctive literature of its own."

The appearance of Dr. Albert Shaw's books on municipal government in 1895 gave a distinct impetus to the municipal improvement movement in this country. His painstaking accounts of organic development in many foreign cities and the methods by which they were brought about, created widespread interest, starting a wave of popular enthusiasm and activity, which is evinced by the numerous associations with large and influential membership to be found in almost all progressive centres in the United States.

Among the pioneers in the work was the elder Olmsted, who did much to reclaim numbers of bare spots in American cities and might be considered the father of American parks, although he never carried his work so far as did one of his disciples, the late Charles Eliot. It was Mr. Eliot who blazed the way toward metropolitan development by utilizing the barren and squalid outer zones about Boston for a regular chain of parks, and actually, before his untimely death, establishing in and about Boston the most comprehensive system of public reservations that any city can boast of, including the redeeming of nearly all water fronts both inland and along the sea. Indeed, the extent of the advantages of these reservations to future generations is not to be estimated, as they ensure a certain amount of openness and verdure for all time, notwithstanding the greatest possible increase in population. Boston, thanks to his foresight, is far ahead of any other municipality in the United States in matters of public recreation and health, and has that which no foreign city can rival. Her water supply, including that of over a score of contiguous communities, is protected from pollution by including the entire eastern watershed of Massachusetts, and for the first time reservoirs have been made to do double duty by becoming ornamental lakes, and as such, spots of much interest in the metropolitan system.

The Boston metropolitan park system was not brought about without much agitation, and to Mr. Sylvester Baxter must be attributed much of the success of the undertaking. His far-sighted articles appeared with great regularity and did much to mold public opinion in favor of the undertaking, and as secretary of the first metropolitan park board, he was able to still further assist in the work.

Since that awakening other writers have come to the front, and prominent among them are the names of Mr. Charles Mulford Robinson and Prof. Charles Zueblin. The former's book, 'The Improvement of Towns and Cities,' is a hand-book which has been endorsed by many improvement societies and which, owing to its concise and business-like presentation, is just what is needed by those interested in the development of backward communities. 'American Municipal Progress' by Prof. Zueblin, goes rather into the sociological side and outlines with surprising interest what an awakening has taken place in the United States during recent years, and what unexpected results this awakening has brought forth along lines of physical development.

Among other of the forces that must be recognized as responsible for the force of the movement are the American League for Civic Improvement and the American Park and Out-Door Art Association. The latter is the older, and through the indefatigable efforts of Mr. Warren H. Manning, the landscape architect, it is well established, and by bringing park superintendents together from many cities it has become a real force and has extended its work beyond the province suggested by its title.

The American League for Civic Improvement, not being restricted either in name or endeavor to a group of professional workers, has carried on a broader campaign and through many local organizations all over the country is doing good work.

The first great object lesson of symmetrical development was exemplified by the Chicago Exhibition, where a comprehensive plan was prepared and adhered to. The height of all main cornices was established at an equal level and certain uniform rules applied to the development of the grounds, the buildings and all architectural accessories. Since then more or less successful efforts along similar lines have helped to educate the public at Omaha, Charlestown, Buffalo, and St. Louis.

bitions, and particularly the Louisiana Purchase Exposition at St. Louis, with its Municipal Improvement Section, popularly known as the "Model City," the first of its sort to be held in America, have swelled the current. This latter exhibit, under the direction of the writer, brought together results that had proven the nucleus of interest in municipal subjects at the Paris Exposition of 1900 and the Exposition by Municipalities at Dresden in 1903, as well as the exhibits from the United States.

Nevertheless, the recognition of the need for immediate and radical work toward civic betterment finds the nation better provided with

true-hearted soldiers, anxious to work in the ranks, than with enough good leaders to point the way toward the much-coveted ideal, or even any steps toward it. In a recent article in one of the leading magazines, Mr. J. Horace McFarland gives extracts from letters all over the country, the tenor of which was,—"there is much to do and many who stand ready to do the work, but we need leaders."

The primitive character of some of the needs proclaimed by the organizers of societies for municipal reform would be amusing, if it did not mirror a state of affairs almost incredible. From several towns we learn that the hogs are permitted to run the streets at large, and this fact alone hints at others which are not creditable to the sense of civic pride in these communities. It is interesting to note, however, that almost every educational institution has recognized the importance of the movement, and that municipal governments have also been forced to take note of its growth by the extension of those bureaus of administration, the work of which relates to the care and development of the civic domain, and by the appointment of additional officers, such as city architects, foresters, etc., in addition to the engineering force. Moreover, Boston has added a municipal nursery to its civic departments, and thus its verdure has become a matter of as much public concern as the water supply. New York has an architect on bridges, and many park boards now properly insist on having all designs for contemplated improvements prepared by an expert commission, including a landscape architect, an architect, and an engineer.

The plan for the embellishment of the city of Washington, prepared by the Park Board Commission, of which Daniel H. Burnham was chairman and Charles F. McKim, Frederick Law Olmsted, Jr., and Augustus St. Gaudens the other members, is at the present writing the

best illustration of organic city-making actually under way in the country, though other cities, notably Cleveland with its group plan, are following suit.

Two of our illustrations show this plan for the regeneration of Washington, in which, by means of a number of monumental avenues, a series of vistas will be opened up, each with notable foci, such as large public buildings or monuments, by which the city will be given unity of plan and will outrank most cities in ease of access from part to part, and in the magnificence of its public ways. The chief of these avenues will be the new Mall, and it is only proper to add that this is a return to the ideal of the original designer of the city plan, developed on a more magnificent scale and glorified by memorials and architectural masterpieces that have come as the expression of national growth and history.

Another illustration, Figure 3, shows the work that has been done in the neighborhood of Boston, and may be taken as the type of the highest accomplished result in the development of an extended park system in and about a large municipality. The feature of this plan which distinguishes it from all others is the attention given to the future. By acquiring all water fronts, inland and seashore, Boston is gradually extending its park system and improving its waterways for all time. The city as a unit a hundred years hence is being arranged for. In the meantime a metropolitan system of scattered units is rapidly crystallizing.

Other illustrations exhibit in diagrammatic form the possibility which has at more than one point become an accomplished reality, of governing the character of the natural waterways. A river or any water front, whether now given up exclusively to commerce or whether it shows a broad, unhealthy mud-flat on either side, can be easily redeemed. According to the exigencies of the occasion the treatment must vary, but taking the most demanding conditions, it will be seen that the requirements of traffic by rail and water may be much better met if the problem is comprehensively studied, that the logical arrangement of the various structures is economical in every sense, and gives the opportunity to bring the beauty of shaded drives where formerly the conflict of the various enterprises made only confusion and barrenness. Moreover, the river being now confined within vertical banks, the current scours its own bed and the railway and canal are, moreover, protected from inundation. Thus, natural force and inventive planning combine to improve the salubrity, beauty, and revenue yielding power of an area in which private and public interests being at conflict have lost all trace of the beauty that once belonged to them, and which could again be theirs by conciliation of purposes and the expressed sense of interdependence between the various needs of society.

Figs. 5 and 6 are a project for the grouping together of public conveniences, a problem of the utmost importance in the congested portions of cities. In this drawing an attempt has been made to show how, instead of a number of scattered and unsightly units which have no excuse but their utility, the same ends may be efficiently served, while adding to the city a focal point of beauty.

Moreover, such centres, no matter what form their superstructure may take, should be points from which to thread pipes and wires radiating in all directions, and thus making unnecessary the greater part of the outrageous tearing up of streets, now of so frequent occurrence. Here again can be laid stress on the principal aim of municipal science, which is to replace the haphazard and accidental arrangement of cities with its incalculable waste of time, money, comfort, and beauty by a logical system and arrangement by which the needs can be at least as well met for a city as they now are for even the most complex of single buildings, and in which the various public and semi-public buildings can be so grouped with mutual economy. The transportation facilities of our cities are inadequate and yet wasteful of space, and without due regard to the convenience of the public; yet at no greater cost, by well considered arrangement at the outset, a system of stations and subways could lead to terminal facilities of sufficient capacity and in more direct relation to the requirements of business.

In this connection are to be mentioned the terminal warehouses in St. Louis, where a private company has united the depots of many independent railroads, thus forming a great freight centre, which has proven an isolated but striking lesson in economy. At Algiers, in North Africa, a similar combination exists between the steamship companies and the railroads. The dryness of the climate has here made it possible to use for this purpose huge vaults, above which passes the magnificent Boulevard de la Republic, a combination of utility, economy, and beauty, which should prove a spur to nations which pride themselves on their superiority in other matters.

Mankind has been so long accustomed to the economy gained by uniting for common ends that it seems more remarkable that the question of location, in its relation to the functions assumed by society, has not been more carefully studied. We have municipal hospitals, theatres, libraries, school houses, public baths, and gymnasia, and recreation grounds, from the sand-courts for the smallest children to the ball parks for men, but instead of being made centres of improvement which, as functional centres they should normally be, they are too often ill placed and inadequately arranged.

With regard to school houses this is especially true. There these buildings, so essential to our democratic system, have been erected with regard to an outward appearance befitting their functional character, and have been given that amount of yard space per child which should be made an invariable requirement, as it now is in some places; they have become the centres of local pride and local improvement, and have raised the value of neighboring properties and gone far to reduce local jealousies caused by the placing of those large public works which, unlike school houses, are not the necessity of every ward.

Resolved to its final analysis, the science of city-making appears under the heads of circulation, hygiene, and beauty, and concerns itself with the uniting of these three problems in a scheme of urban life and development in which they shall be fused in a perfection of interdependent and co-related response to the universal needs of man. The conditions of the age, the

climate and the location, if rightly interpreted, will give it the expression of a perfect and model city in the terms of the given land and people.

ALBERT KELSEY,
Civic Architect.

City Government. See MUNICIPAL GOVERNMENT.

City Point, a village in Prince George County, Va., 10 miles northeast of Petersburg; on the James River and on the Norfolk & W. R.R. It has a trade in brick, lumber, and phosphates, and is of considerable historical interest. Here, in 1864, Gen. Grant made his headquarters, and in his subsequent operations the city was used by the Federal army as its principal landing-place and depot for supplies. Pop. about 1,000.

City Politiques, pŏl'ĭ-tēks', a satirical comedy, probably printed for the first time in 1683, and produced at the King's Theatre, London, the same year. It was a sharp attack on the contemporary Whig faction, especially on Oates. Only the king's protection kept it from being suppressed by the victims of the satire.

City of Brotherly Love (Gr. *φίλαδλφίο, philadelphia, φίλος philos,* dear, and *ἀδελφός, adelphos,* brother). William Penn gave the English rendering of the two words as the name, Philadelphia, to the city in Pennsylvania. The common rendering into English of the name of the city is "City of Brotherly Love."

City of Churches, a name given to Brooklyn, N. Y., because of the large number of churches in proportion to the population.

City of David, Bethlehem (modern Beit-Lahm, house of bread), supposed to be the birthplace of David, the place where his descendants had to go for the enrollment, when the census was taken by order of the Roman emperor. Jerusalem is sometimes called the "City of David" because he captured it from the Jebusites and made it the capital of his kingdom.

City of Destruction, The. In Bunyan's 'Pilgrim's Progress' Christian begins his journey at this city and journeys to the Celestial City. The place of beginning represents the world with its temptations, and the place of ending, Heaven with its joys.

City of Dreadful Night, The, a poem by James Thompson. In this poem one is supposed to have gone to a city whose inhabitants are gloomy, hopeless, despairing. The hopeless darkness is as the night — oppressive and dreadful.

City of Elms. The large and ancient elm trees which adorn the Green and many of the older streets of New Haven, Conn., have caused this city to be called "City of the Elms."

City of God, The, a noted work by St. Augustine. This, the most important of all the saint's writings, was begun in 413, three years after the capture and pillage of Rome by the Visigoths under Alaric. The pagans had endeavored to show that this calamity was the natural consequence of the spread of the Christian religion, and the main purpose of Augustine is to refute them. The work was finished about 426.

City of Homes, a name bestowed on Philadelphia, from the large number of dwellings inhabited by the owners.

City of a Hundred Towers, a name given to Pavia, Italy, from the many towers and steeples which first greet the traveler.

City of Magnificent Distances, The, a name given to Washington, D. C. When the city was planned, the last of the 18th century, the long and broad streets, with here and there small parks, almost all of which was out long distances in broad fields, caused this name to be given to it in derision. Now its citizens are proud of the title.

City of Oaks, a name given to Raleigh, N. C., from the size and beauty of some of the oak trees which adorn its streets.

City of Palaces, a name applied to Calcutta, India, from the numerous palace-like edifices.

City of the Plague, The, the name of a poem written by John Wilson (Christopher North), published in 1816. It is said to have been founded on the 'Journal of the Plague in London,' by Defoe.

City of the Prophet, a name given to Medina, in Hedjaz, Arabia; the second holy city of the Mohammedans; the place where Mohammed took refuge, in 622, when he fled from Mecca, and the city where he died.

City of the Straits, often applied to Detroit, Mich., from its position. It is situated on that part of Detroit River between Lake St. Clair and Lake Erie.

City of the Sun, a name given to Baalbec, an ancient city of Syria, built on the ruins of the Greek city, Heliopolis, "The Sun City."

City of the Violet Crown, The, a name applied to Athens.

City of Victory, a translation of the Arabic name for Cairo, the capital of Egypt.

City Water Supply. See WATER SUPPLY OF CITIES.

Ciudad, thē-oo-dăd' or sē-oo-dăd', in geography, the Spanish word for city, from the Latin *civitas,* appears in many names of Spanish places, as Ciudad-Rodrigo, Ciudad-Real, etc.

Ciudad, thē-oo-dăd' or sē-oo-dăd', in Venezuela, capital of the state of Bolivar, on the Orinoco. Although about 245 miles from the mouth of the Orinoco, it is one of the chief ports of Venezuela. The handsome dwellings, beautiful cathedral, theatre, monuments, and plazas make it a pleasant city. Its chief exports are sugar, coffee, rubber, cattle, hides, asphalt, and cabinet woods. The city was founded in 1764 and was called Angostura. The name was changed in 1819 to its present one in honor of Simon Bolivar. Pop. 12,000.

Ciudad De Cura, dā koo'rā, or **Cura,** Venezuela, in the state of Guzman Blanco, southwest of the city of Caracas, about 20 miles east of Lake Valencia. It is a 17th century city, but many of its new buildings are modern in style and beautiful in architecture. The streets are broad, many small parks adorn the city, and the inhabitants are justly proud of their library. Pop. 12,200.

Ciudad Juarez, hoo-ä'reth (formerly EL PASO DEL NORTE), Mexico, state of Chihuahua. It is on the Rio Grande River, opposite El Paso,

Texas, on the Mexican Central R.R., about 210 miles north of Chihuahua, the capital of the state. Altitude about 3,800 feet, country around fertile and producing fruit, grains, and vegetables. Cattle are shipped to various parts of the United States. It has a Mexican custom-house and an army post. A United States consul is stationed here. Pop. 7,200.

Ciudad Porfirio Diaz, pôr-fē'rē ō dē'äth, Mexico, town in the state of Coahuila, on the Rio Grande, opposite Eagle Pass, Texas, on the Mexican International R.R., and is the Mexican terminal of the international bridge across the Rio Grande. It has a custom-house, army post, large cattle markets, and but poor buildings for the storage of fruits or grains. It is situated in an agricultural region, and its trade with the United States consists chiefly in exporting grains, fruit and cattle, and in importing manufactured articles. Coal beds near are of value and may cause the establishing of manufactories. It was founded in 1849. Pop. 5,200.

Ciudad Real, thē-oo-däd' rā-äl', the name of a province of Spain, occupying the south extremity of New Castile, and of its capital. The area of the province is 7,620 square miles. The surface in general is bare-looking, immense plains stretching from the mountains of Toledo to the Sierra Morena. The mountains of Ciudad Real abound in minerals: iron, silver, copper, lead, antimony, cinnabar, and coal; also in quarries of marble, jasper, quartzite, granite, etc. Medicinal and mineral springs, both hot and cold, are abundant. The climate is dry, and in the heat of summer very oppressive. The plains and valleys are productive in the vicinity of the rivers; in favorable seasons good crops of cereals are obtained. Cattle, sheep, mules, etc., are reared. Woolen, linen, and other fabrics, hardware, earthenware, esparto, etc., are manufactured; brandy, wine, and oil of good quality are made. Metals, manufactured goods, brandy, wine, and oil, horses, mules, and cattle are exported. The city of Ciudad Real is situated on a low plain near the Guadiana, 100 miles south of Madrid. The walls are in many parts ruinous. The principal edifices are the Church of Santa Maria del Prado, consisting only of a single nave, but so grand and lofty that no other in Spain, except the cathedral of Coria, equals it; the hospital; the institute, with a good laboratory and botanic garden. The manufactures and the trade are of little importance — the former in woolen and linen cloths, the latter in grain, wheat, wine, etc. Pop. about 15,000. Pop. of the province (1900) 321,580.

Ciudad Rodrigo, rōd-rē'gō, Spain, a fortified town in Leon, on the river Agueda, about 55 miles south-southwest of Salamanca. There is a castle dating from the 13th century. The cathedral was begun in 1190 and contains many interesting features. Ciudad Rodrigo was a place of considerable importance in early Spanish history as a frontier fortress. It was taken by the English in 1706 during the war of the Spanish Succession, and recovered by the Spaniards in 1707. The fort was surrendered to the French under Masséna, 10 July 1810, having been bombarded 25 days; and 19 Jan. 1812, it was taken by storm by the British under Wellington, after a siege of 11 days. The Cortes bestowed upon Wellington the title of Duke of Ciudad Rodrigo. Pop. 8,000.

Ciudad Victoria, sē-oo-däd' vīk-tō'rē-ä, Mexico, capital of the state of Tamaulipas, on the main line of railroad which runs from Tampico to Monterey, about 100 miles from the Gulf coast. It is in a sugar and fruit-growing region, but the sugar only is exported. It is an episcopal see and the residence of a consular agent of the United States. The city was founded in about 1750. Pop. 14,800.

Ciudadela, thē-oo-dā-dā'la, Spain, a city and seaport on the island of Minorca, at the west side. It is surrounded by walls and a ditch, and has a cathedral, municipal buildings, hospital, cemetery, and several convents. The inhabitants are engaged in weaving woolen fabrics, expressing oil and wine, and in husbandry. Pop. 8,447.

Civets, a family of small carnivorous mammals, the *Viverridæ,* related to both the hyenas and the cats. Their alliance to the former appears when the fossil history of the family is traced back to the early Tertiary, where the ancestry of both converges. The comparatively coarse hair, erectile mane, possessed by some species, and dentition, are still hyena-like; while the slender, elongated form, long tail, and especially the fact that the claws are semi-retractile, exhibit the inborn likeness to the cats. The civets vary from two to three feet in length, and most of the species are strongly marked in black and white stripes and spots, sometimes prettily disposed. They are distributed throughout the warmer parts of the Old World, abounding in Africa and the Malayan Islands, but are absent from the Australian region. The family is divisible into two groups, one of which includes the typical civets; the African genets (q.v.), one species of which also inhabits Spain and Italy; the linsangs and other Oriental spotted forms, and the paradoxures. The second group includes the mungoos and other ichneumons, suricates, and the like. These various forms will be found described elsewhere under their separate names.

Civets feed upon smaller mammals, birds' eggs, lizards, and snakes, and are considered beneficial because of their appetite for crocodile eggs, which they devour in great quantities along the Nile. They are characterized by, and chiefly valued for, an odorous, fatty substance, contained in a pouch connected with the sexual organs, in both sexes. This substance is used for compounding perfumes, and is ready for use after it has been drained, washed and dried. It is called "civet." A dram is obtained at a time from each animal, from which it is taken at intervals of a few days. Many thousand ounces are annually imported into London. Pure civet is valued at about $10 an ounce. The American "civet-cat" is the cacomistle (q.v.), which is not a true civet, but nearly related to the raccoons.

Civic Crown, among the Romans, the highest military reward assigned to him who had preserved the life of a citizen in battle. It bore the inscription *Ob civem servatum,* that is, "for saving a citizen," and was made of oak leaves. He who was rescued offered it, at the command of his leader, to his preserver, whom he was bound to honor afterward as a father. Under the emperors it was bestowed only by them. The person who received the crown wore it in the theatre, and sat next the senators.

When he came in all the assembly rose up as a mark of respect. The senate granted to Augustus, as a particular mark of honor, that a civic crown should be placed on the pediment of his house, between two wreaths of laurel, as a sign that he was the constant preserver of his fellow-citizens and the conqueror of his enemies. Similar honors were also granted to the Emperor Claudius.

Civics, the science which deals with the theoretical and practical aspects of citizenship; the duties of citizens to each other as fellow members of a body politic, and to the government. In its broadest aspects it includes civil law, political economy, and finance, as well as social ethics, governmental methods, and the history of social and political development; but the first three are counted as separate sciences from their extent and specialty, and civics proper is concerned with the last three. This is becoming a recognized study in the schools and colleges of the United States.

Cividale, chē-vẹ-dä'lā, Italy (the ancient FORUM JULII), a town of Venetia, in a basin of the Julian Alps, eight miles east-northeast of Udine. It consists of the town proper, surrounded by walls and ditches, and of fine suburbs; and has among its edifices a large cathedral of the 15th century, with three Gothic portals, a curious baptismal font, and several fine paintings; a museum of antiquities, and a record office with some very ancient charters. The neighborhood abounds in interesting antiquities. Pop. about 9,000.

Civil Action, an action brought in the civil courts for the recovery or protection of private or civil rights, or damages for their breach. The two great classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.

Civil Damage Acts, legislative acts passed in several of the States, giving to husbands, wives, children, parents, guardians, employers, and others who have sustained injury in person or property or means of support, by an intoxicated person in consequence of such intoxication, the right of action against the person who sold or gave away the liquor which caused such intoxication. Such acts have been held to be constitutional. In some cases the right of action has been extended to the owner of the premises where such intoxicating liquor has been obtained.

Civil Death is where a person, although possessing natural life, is on account of some crime for which he has been convicted, sentenced to life imprisonment, and thereby lost all his civil right, is considered in law, dead. In some jurisdictions a person convicted of murder and sentenced to life imprisonment is considered in law as dead.

Civil Engineering. See ENGINEERING, CIVIL.

Civil Law, The. 1. *Introduction.*— The term Civil Law (*Jus Civile*) is commonly and popularly used in several distinct senses. Thus we distinguish it on the one hand from the *Jus Gentium* and on the other hand from the *Jus Naturale.* Again our municipal law is called the civil law, and further we distinguish between civil and criminal law on the one hand and civil and canon law on the other. But it is here used as referring to the whole body of Roman law (the *Corpus Juris Civilis*), having its proper origin contemporaneously with the genesis of the Roman state, and coming down in ordinary generation, from century to century, through the regal period, the republic, and the empire to the codification of Justinian and Napoleon.

When we speak thus of the Civil Law we mean the whole system of usages and rules of private law adopted by the Roman people; their *jus privatum* as opposed to their *jus publicum* (including criminal and sacred law). The *Corpus Juris Civilis* as left by Justinian was the result of a gradual modification and enlargement of the code of the XII Tables under three great influences— the Jurisconsults, the Prætors, and Legislation. The institutional definition of the *jus civile* as the peculiar law of Rome, in contrast with the *jus naturale* and the *jus gentium* is a mere philosophical flourish; by late writers *jus civile* was confined to the *responsa prudentium* alone; what the Roman jurists had chiefly before their mind when they used the expression was the old law of the XII Tables, as contrasted generally with the newer development of the *jus honorarium* (Hunter, Roman Law, 24).

Thus the Roman law presents two aspects, each perhaps equally deserving the attention of the student of jurisprudence. From one point of view it furnishes the sound and scientific basis of the greater part of the modern law of all civilized mankind, and has long proved an inexhaustible storehouse of legal principles. On the other hand, it forms a connecting link between the institutions of our Aryan ancestors and the complex organizations of modern society. In its ancient records it takes us back to the very inception of civil jurisdiction, and tracing it down for more than 2,500 years from the Rome of Romulus and Servius Tullius, we see it constitute a legal development not matched in the history of the law of any other people. The oldest fragments of the Roman law that have come down to us are ascribed to the period of the kings, but these are essentially traditional and practically insignificant, and we take the XII Tables as the first solid ground in the history of the Civil Law.

2. *The Law of the XII Tables.*— About the year 450 B.C. a commission from Rome visited Greece for the purpose of collecting information necessary to draw up a written code of laws. This fact suggests a foreign or Greek extraction for at least a part of the oldest body of Roman law, although it must of course be conceded that the XII Tables undoubtedly contained much law of indigenous growth. Three centuries had intervened between the founding of the city and the promulgation of the law of the XII Tables. During this period a certain body of local, customary law had inevitably developed, some part of which must have been incorporated into this first written code. Until the time of Diocletian (245–313 A.D.) professional lawyers, strictly so called, were not known in Rome. The business of practising law, so to speak, had been up to that time regarded as a public office, which each citizen might be called upon to undertake; but about that time there began to grow up in Rome a class of men among the patricians who made it their busi-

ness to know the law. Pomponius in his history of the Roman law, written about the middle of the 2d century A.D., informs us that the custody of the XII Tables, the exclusive knowledge of the forms of procedure and the right of interpreting the law belonged originally to the College of Pontiffs, a patrician order, at the head of which was an officer known as the Pontifex Maximus, from which office it may be remarked in passing, indirectly and by a strange and circuitous devolution has come down to our day the office of the Pope in the Roman Catholic Church. Only a small part of the language of the substantive law of the XII Tables has been transmitted to our time. Some learned attempts have been made to patch out the substance of each table, but it is by no means certain that the exact fragments of any part of the XII Tables have come down to us in their precise original form and expression. The language has probably been essentially modified by the subsequent Latin usage and by repeated transcription; and the fragments have had to be picked out and pieced together from numerous references in the later literature, as for example from Cicero, Dionysius and Gaius; so that, as matter of fact, what passes for the substance of the XII Tables is probably largely a speculative patch-work, and in its content and significance certainly more or less misleading.

3. *The Jurisconsults and the Prætors.*— The Jurisconsults, a professional class of jurists or legal writers dating from the century before Christ, were given by Augustus an authority and standing which they had not theretofore possessed, and from his time much weight is to be attached to the opinions and writings of the more eminent of them. In 426 A.D. Valentinian enacted a law, commonly called "the Law of Citation," providing that the writings of only five jurists,— Papinian, Paul, Gaius, Ulpian, and Modestinus, should be quoted as authorities. If a majority of these held one opinion, that was to bind the judge; if they were equally divided, the opinion of Papinian was to be adopted. The great bulk of Roman law as it has come down to us, and all that is most valuable in it, is due to the jurisconsults. The Prætor stood in Roman law midway between the jurisconsults and the legislature. At first there was but a single Prætor, but later a Prætor-Urbanus and a Prætor-Peregrinus (when the empire extended beyond Italy, the number being increased to 18), dividing the jurisdiction among them generally either along the line suggested by their names, or territorially. The Prætor exercised a qualified or limited legislative power. His right to alter the law was conceded, but it was not unlimited. He was in some sort the Chancellor, the keeper of the conscience of the Roman people, or the person who was to determine in what cases the strict law was to give way to natural justice (*naturalis æquitas*).

4. *Legislation.* — To give an adequate account of Roman legislation would be to write the constitutional history of Rome, something quite beside the purpose of this article. It is important, however, to state that during the republic the popular assembly was the foundation of legislation. During the earlier part of the empire the function of the popular assembly was gradually usurped by the Senate, acting more and more as the mere mouth-piece of the emperor. Finally even this form was dropped, and all enactments were made directly by the emperor. During the republic three assemblies of the Roman people existed,— the *Comitia Curiata*, a patrician body, the *Comitia Centuriata*, composed both of plebeians and patricians — the franchise being on the basis of a property qualification — and the *Comitia Tributa*, which was based on a local division of the people of the city — the vote being given territorially, as if by arrondissements, cantons, or wards. The sovereign power was exercised by the emperors in three ways,—(1) by direct legislation (*edicta, constitutiones*); (2) by judgments in their capacity as supreme judge (*decreta*); and (3) by *epistolæ* or *rescripta*, giving instruction on questions of law in answer to applications from the judges.

5. *Codification.*— The earliest collection of law in Rome was the *Jus Papirianum* of the regal period (*temp.* Tarquinius Superbus), and it was not until 304 B.C. that the full knowledge of the law was wrested from the patricians. The constitutions of the emperors were collected at different times and constituted the first codes. The oldest collection in the form of a code is the *Codex Gregorianus et Hermogenianus*, which covers a period of 200 years from Hadrian to Constantine. Only fragments of it remain. Next we have the *Codex Theodosianus*, made about the year 435 A.D. The Theodosian Code has small pretensions to scientific classification, but it runs to 16 books and has come down to us almost complete. The reign of Justinian (527–565 A.D.) marks the culminating period of Roman law. In collaboration with Tribonian, he prepared, or caused to be prepared, a complete codification of the whole body of the law, first appointing a commission of 10 members to draw up a Code along the general lines of the Theodosian Code. This is called the *Codex Vetus*, which was speedily superseded by a later edition and has been entirely lost. Next, about the year 530 A.D., Justinian created a commission of 16 members to collaborate with Tribonian in a codification of the vast accumulation of law that had grown up under the hands of the Jurisconsults and the Prætors. The commission had to deal with the works of 39 jurists, consisting of 2,000 books and 3,000,000 verses. This matter was finally sifted and reduced to 50 divisions or books, and constitutes what we know as the Digest and the Pandects. For the purpose of providing an elementary or preparatory text-book of the law, a commission was further constituted by Justinian, which prepared the Institutes of Justinian, which are in some sort a little more than a revision or a new edition of the Institutes of Gaius. After publishing the Pandects and the Institutes in 534 A.D., a commission was appointed to revise the old code and to incorporate the new constitutions and decisions. This revision was completed in the same year, and promulgated on 16 Nov. 534 A.D. Laws of a permanent character, subsequent to Justinian's codification, were collected from time to time and called Novels.

6. *The Justinian Law in the West.*— Upon the fall of the Western Empire and the subsequent local disorder and social disintegration throughout western Europe, the civil law fell into disuse in the West, and during the Middle Age was largely lost sight of; but in the 12th century the study of the Civil Law was revived at Bologna and spread thence throughout Italy

and into France. In 1453, about nine centuries after Justinian, Constantinople was taken by the Turks and the Eastern Empire was overthrown. During some five centuries, or more than half of the existence of the Eastern Empire after Justinian, the law nominally remained as settled by Justinian's legislation, modified indeed by subsequent novels of the emperors; but about the end of the 11th century the Justinian Code fell into abeyance without special abrogation. The great causes of its decay were the change of language from Latin to Greek, the accumulation of fresh law and of commentaries, the authorized readjusting of the whole by several of the later emperors, and the overpowering influence of the ecclesiastical or the canon law. The revival of the study of Roman law and the rise of the Bologna school, were formerly erroneously attributed to the alleged discovery of a manuscript of the Pandects at the sack of Amalfi by the Pisans in 1137; but it has recently transpired that the study of the Roman law had begun to be pursued with ardor at Bologna and elsewhere in Italy long before that time. However, the manuscript in question, now called the *Pandectæ Florentinæ*, taken to Florence on the conquest of Pisa in 1406, is well known; it is a very ancient and valuable copy of the entire Pandects, being also the only one in existence that dates before the age of the Glossators. The fame of the school at Bologna spread throughout Europe, attracting crowds of students from all quarters and reviving a vivid interest in the Civil Law.

About 1135, or a little earlier, the code of Justinian was translated into French, and by the 13th century many French translations had been made of the Digest, the Institutes, and the Code. By the 12th century ecclesiastical councils had begun to forbid ecclesiastics to study the secular law (Rheims, 1131; the Lateran, 1139; Tours, 1162). This ecclesiastical inhibition served somewhat to check the study of the Civil Law at Paris — then as now the chief university town of Europe — and was favorable to the continued predominance of Bologna as the seat and centre of civil law study, to the growth of the Montpellier School, and to the establishment of new schools, the chief of which were at Toulouse and at Orleans. All these great schools in France — except Paris — and the numerous schools that sprung up in the succeeding centuries, taught the Civil Law on the basis of the Justinian text. After the spread of the scientific study of Justinian's works from Bologna to Montpellier and other parts of France, the Justinian law in the 12th and 13th centuries gradually replaced the ante-Justinian, as being the more perfect form of the Roman law. In 1250 France was still divided under two laws; in the south (*pays de droit écrit*) the Roman law obtained, modified by local customs; in the north (*pays de coutume*) local customs prevailed, slightly modified by Roman law, which, however, was taught in the northern schools and left numerous traces in the legal works of the period. A Dutch school of jurists arose toward the end of the 16th century at the University of Leyden. So, too, in Germany some progress was made in the study of the Justinian law. Like the jurists of other countries, those of Germany were impressed by the superiority of the Roman law to their native law, both in form and substance, and their admiration induced them by degrees to put it forward in practice. The influence of the Bologna revival extended into Spain, where a crude codification was effected as early as 1263, called *Siete Partidas*, but not generally adopted throughout the kingdom until about the reign of Alonzo XI. in 1348. The Roman law worked its way into Scotland by way of France. From the close alliance that so long subsisted with France, Scotland, besides borrowing many of its institutions from that country, also "imported a large portion of Roman jurisprudence to make up the deficiencies of a municipal law, long crude and imperfect, and which had made little progress as a national system till some time after the establishment of the Court of Session in 1532 by James V., after the model of the Parliament of Paris. . . . Properly speaking, the teaching of the civil law commenced in Scotland at the Reformation in 1560"; after which date, as well as before it, the more ambitious students of the civil law also availed themselves of the best professional teaching of the continental universities. "In Scotland a knowledge of the Roman law has always been regarded as the best introduction to the study of the municipal law. . . . All the best writers on the law of Scotland, such as Stair, Bankton, Erskine, and Bell, were able civilians; and though they have not produced separate treatises on the subject, their works abound with admirable illustrations of the Roman law, evincing great learning and research, and a familiar acquaintance with the writings of the continental jurists." (Mackenzie, Studies in Roman Law, 40–1).

The influence of Roman law on the English common law has been very differently estimated by different writers. Mr. Stubbs stands at one pole of the controversy with his eyes shut, saying, "England has inherited no portion of the Roman legislation except in the form of scientific or professional axioms, introduced at a late period, and through the ecclesiastical or scholastic or international university studies. Her common law is, to a far greater extent than is commonly recognized, based on usages anterior to the influx of frudality,— that is on strictly primitive custom." (Stubbs Const. Hist. of England, I., 10 § 8.) This is perfectly insular and manifestly untrue. The other and sounder view as here taken is presented in Reeves' 'History of the English Law,' following Guizot and Mackintosh, and more recently an equally enlightened view has been taken by Pollock & Maitland in their 'History of English Law.' The definite traces of Roman law surviving the Roman domination of the island are exceedingly slight. Selden states that the Roman law wholly disappeared in England until it was re-introduced from Bologna in the 12th century. A little before the middle of the 12th century, Vacarius, a Lombard, went over to England with Archbishop Theobald and lectured on the Civil Law at Oxford with success. Even Stubbs admits that before the end of the reign of Henry II. the procedure of the Roman civil law had become well known by the English Canonists. Henry of Bracton was the first · really scientific commentator on the law of England, and the greater and more important part of his work is little more than a transcript of the Roman law. He shows everywhere close familiarity with the *Corpus*

Juris. The Novels are not quoted, but the Institutes are referred to, and there are many quotations from the Digest and the Code, while a very large number of passages are incorporated bodily into the text itself and into the tissue of the author's commentary without any statement as to their source. From Bracton and Glanvill to Pollock & Maitland, the predominating influence of the Roman law in English jurisprudence is everywhere traceable and evident. "The English system of equity and the ecclesiastical law have been formed more or less extensively on the Roman law or on the Roman through the Canon law." (Mackenzie, 'Studies in Roman Law,' 40.)

Both in England and in Germany the influence of the Roman law was resisted and its predominance looked upon with disfavor, but it nevertheless made its way *pari passu* with advancing civilization in each country, becoming in fact and effect the substantial *corpus juris* of the one country directly and of the other indirectly. Many causes combined to open the way both in Germany and in England for the practical application of Roman law. Among them, especially in England, were the impulse given by the universities and the Oxford School of Civil Law, the recognition of the Roman law in the clerical courts, whose jurisdiction extended over a class of civil matters, and the personal influence of the higher judges, who mostly belonged to the clergy, and were therefore versed in the Roman law. Above all, however, was the necessity of supplying the defects of the common law, which had become manifest from the growth of trade, the increase of intercourse, and the greater importance of movable property; for the common law had expended its best energies in the completion of the legal constitution of the feudal system, and had showed no tendency toward creating an original commercial law. To these causes must also be added the scientific superiority of the foreign law with its completeness, over the domestic law with its want of theoretical development. Even at an earlier period it is not improbable that the Roman law had been used as an assistant and complementary authority in the Curia Regis, upon which court it was incumbent to instruct the inferior judges in regard to the law in doubtful and omitted cases. A legal principle enunciated by that court had authority beyond the particular case in which it was laid down, and became, by means of its actual use, part of the *jus non scriptum, consuetudinarium.* As Roman legal matter obtained reception, although the written sources of the Roman law were not at all received as having a legislative authority, Bracton properly included the former among the *leges et consuetudines Angliæ.* (Prof. Dr. Güterbock, *Henricus de Bracton,* etc., translated by Brinton Coxe, 60–2).

7. *Code Napoleon.*— Some steps were taken during the reign of Louis XIV. looking to a codification of the French law. Little, however, was accomplished, and the French people owe to the constructive genius of Napoleon the present scheme of codification, which was undertaken during the consulate at his dictation, and finally completed, one code at a time, shortly after the end of his reign. The Civil Code, which was the first, was enacted and became the law of the land 21 March 1804. It was prepared by a council of jurists assigned by the First Consul to the work; but he himself took great personal interest in it, attending many of the sessions of the Commission and contributing much by his acute suggestions to the form and content of the law. With some fitness he is reported to have said, "I shall go down to posterity with the Code in my hand." This code, called at first the Code Napoleon, but now the Code Civil, has to do with the law of obligations, of persons, of personal status, and of property. It contains 2,281 sections, many of them of only a line or two in length, and is comprised in a volume of less than 350 pages. The whole body of law in France at present, substantive and adjective, civil and criminal, is comprised in eight codes, as follows: *Le Code Civil; Le Code de Procédure Civile; Le Code de Commerce, Le Code Pénal; Le Code d'Instruction Criminelle; Le Code Forestier; Les Codes de Justice Militaire.* The scope and purpose of each of these codes is generally and sufficiently disclosed by its title. This codification is supplemented by the *Lois Usuelles.* The sources of the codified law of France are: (*a*) the ancient laws of the realm theretofore in force, consisting of local customs (custom of Normandy, custom of Paris, custom of Brittany, etc.); (*b*) the written or Roman law; (*c*) such legislative enactments of the National Assembly, the Legislative Assembly, and the Convention, and such of the Decrees of the Consuls and of the Directory, between 17 June 1789 and 15 March 1803, as were thought by the codifiers to be of permanent value; and (*d*) such general laws as have been enacted since 21 March 1804. The Roman law constitutes the foundation and groundwork of the structure, the other constituent elements indicated being merely subordinate or ancillary.

8. *The Extent of the Civil Law Throughout the World.*— The civil law in its modernized form and substantially as enacted in the Code Napoleon has, within a century past, become the law of more than three quarters of civilized mankind. To be more exact, it is thus the law not only of France and of all her colonies, but also of Italy, Greece, Switzerland, and all the minor countries of southeastern Europe, of Spain and Portugal, Belgium, Holland, and her colonies, of Austria-Hungary, Germany, Norway and Sweden, Denmark, Russia, Mexico, together with all the countries of Central and South America — all of the Western Hemisphere from the Texas border to Cape Horn — of Scotland and the Philippine Islands, the West Indies, and Louisiana, of Egypt, of all the other civilized parts of Africa, and of a majority of the more important British colonies, to-wit: Quebec, Ceylon, British Guinea and other English possessions in Africa, and Australasia. It is also working its way into Turkey and her dependencies. The German empire in 1900 adopted for the empire the Prussian Code, which is a Germanized version of the Code Napoleon; and Japan, as part and parcel of her scheme of civilization, has within recent years enacted a code of law on French lines, following closely even its minor details, thus writing the law of Rome — the Codes of Justinian and of Napoleon — into the jurisprudence of the remote islands of the sea.

9. *Resemblance Between the Civil Law and American Law.*— Aside from matters of procedure and minor detail, the actual differences be-

tween the living Civil Law as it exists throughout the world and the English common law, as refined and modified in this country and now administered here, are not great, certainly not greater than we should reasonably expect, having regard to the controlling influence,—conscious and unconscious—of the Civil Law, upon the growth and development of the common law in England, and having in mind the fact that many English judges, notably Mansfield and Holt, and several of the chancellors for the past 200 years at least, have professedly drawn copiously from the great reservoir of Roman jurisprudence, whenever occasions have arisen for modifying or extending common law principles or for applying them to new conditions of fact and circumstance. The so-called Common Law of England, certainly from the 11th century, is, in reality, largely the Custom of Normandy and the Custom of Paris, as imported at the Conquest in 1066 A.D. Its scientific terminology and its exact legal language even in its present form are essentially French. Chief Justice Holt nearly 200 years ago said: "Inasmuch as the laws of all nations are doubtless raised out of the ruins of the civil law, as all governments are sprung out of the Roman empire, it must be owned that the principles of our law are borrowed from the civil law, and, therefore, grounded upon the same reason in many things." (12 Mod. Rep. 482.) Sir William Jones, writing during the Revolutionary War, said: "With all of its imperfections, the Digest is a most valuable mine of judicial knowledge; it gives law at this hour to the greatest part of Europe, and though few English lawyers dare make such an acknowledgment, it is the source of nearly all our English laws that are not of feudal origin." And Mr. Hornblower, addressing the New York State Bar Association (1902), has just said: "It is also well for us votaries of the common law to remember that there is another jurisprudence founded upon the Roman or the Civil Law, and prevailing throughout the greater part of continental Europe, from which we have ourselves borrowed many of the most important legal principles." If we eliminate from the law of England as it obtains in this country, our technical rules of evidence, which have grown up about our system of trial by jury, our pleading and the peculiarities connected with the tenure, transmission, and devolution of real estate (which are each of them, for the most part, little more than an antiquated mass of ignorance and rubbish, of which it is the modern tendency of our American jurisprudence to relieve us), the rest of our system is not very different, at least in its elements, from modern Civil Law. The following subjects in American law may be mentioned, which have been largely influenced by the Civil Law, and resemble that system in many important elementary principles, namely, the subject of probate, of succession to personal property and testamentary capacity; the law of admiralty; the law merchant, largely of continental origin; the law of equity and trusts; the law of corporations as juridical persons distinct from the corporators; the law of *res judicata*, fully expounded in the Digest of Justinian; the theory and practice of *habeas corpus*, the leading principles of which are found in the same compilation; the law of alluvion, of accession, and of wild animals; and finally the great subject of obligations in general as arising from contract, *quasi* contract, tort, neglect, and the operation of law, the logical arrangement of which by the civilians becomes more and more useful in legal analysis and discussion. To these we may add the general doctrines of public and private international law which are mainly of continental origin. (Howe, Roman and Civil Law in America, 16 Harv. Law Rev. 342.)

10. *The Importance of the Civil Law in America.*—The present practical importance of the Civil Law to us consists in the fact that about one sixth part of the present population of the United States and its dependencies—or, to put it in figures, more than 12,000,000 of our population—live under the civil law, and are governed in their personal and property rights by some form of it. Thus Louisiana, with a population of 1,400,000, Porto Rico, with a population of 1,000,000, the Hawaiian Islands, with a population of 150,000, the Philippine Islands, with a population of 8,000,000, and Cuba (if indeed it may be included), with a population of 1,600,000, are governed by the civil law. Not only, therefore, must our judges and lawyers acquire familiarity with it and facility in working in it, but our commercial and trading classes are finding it constantly of more and more consequence to them in their business. Not only is much of our law derived from it, but many millions of our people live and must continue to live under it. It is a curious fact that the Custom of Paris was in force in Michigan and Wisconsin down to the year 1810, when it was formally abolished, in Michigan at least, by the legislature of that State. (18 Wis. 158; 8 Mich. 25.) All the French colonies established in the 17th and early part of the 18th century in North America were governed by the Custom of Paris, which still remains in Quebec the basis of the codified law of that province. By a royal ordinance the laws, edicts, and ordinances of France and the Custom of Paris were extended to Louisiana, and that system of law thus introduced prevailed there until 1763, when France ceded the country to Spain. That introduced the Spanish law into Louisiana, which was, however, only another form of the Civil Law. In 1808 a Civil Code was adopted by the Territory of Orleans based to a considerable extent on the Code Napoleon, and, as revised in 1825 and subsequently, constitutes the present Louisiana Code. We probably owe to the study of Blackstone's Commentaries much of the unreasoning prejudice which has hitherto existed to some extent in this country against the study of the Civil Law. Blackstone began to be read by law students in America about 140 years ago, and from then to now has been for the most part the initial text-book for all lawyers and law schools. He writes bitterly in his first lecture about the civil law. But it is manifest that he wrote without knowledge and under the influence of a set of political prejudices, and with a bias and prepossession with which we in the United States may well have little sympathy. Abstractly, there is no more reason why Americans should entertain a prejudice against the Civil Law than against the law of gravitation, and there are cogent reasons, practical as well as scientific, why we should—now at least when it has become a matter of real personal

concern to so considerable a part of our people — give serious attention to modern Civil Law.

CHARLES F. BEACH, JR.,
Lecturer on Equity Jurisprudence in the St. Paul College of Law.

Civil List, a term signifying in the United States, (1) a list of the entire expenses of the civil government, (2) the revenue appropriated to support the civil government, (3) the officers of the civil government who are paid from the public treasury.

In England the meaning of the term formerly represented the whole expenses of the government with the exception of those of the army, navy, and other military departments. It is now limited to the expenses proper to the maintenance of the household of the sovereign. It was once a principle in England, as in other Teutonic nations, that the monarch was to pay all the expenses of government, even including those of the army, from the possessions of the crown, the domains, and that the subjects were not obliged to contribute anything more than they voluntarily engaged to. From this principle, which is proved by the history of the origin of the domains, it appears that the crown lands in general cannot be considered the private property of the ruling family. On the contrary, they are, in general, the property of the state, and have been given to the prince to defray the expenses of government. Until the Restoration the whole expenses of the government continued to be defrayed out of the royal revenue. The first Parliament of Charles II. fixed on £1,200,000 ($6,000,000) as the ordinary revenue of the crown in time of peace. For this they provided by taxation, which ultimately produced more than the amount of the grant. The same taxes were continued during the reign of James, and produced on average £1,500,000 ($7,500,000), besides which he received extraordinary grants. At the commencement of the reign of William, the Commons made still further restriction on the royal control of the revenue. They voted £1,200,000 ($6,000,000), as the revenue of the crown in time of peace, one half of which was appropriated to the maintenance of the king's government and the royal family, the other to public and contingent expenditure. The outbreak of war prevented this arrangement from being exactly carried out, but the Commons maintained the principle of separating the regular and domestic expenses of the king from the public expenditure, and establishing a systematic and periodical control over the latter. The amount actually voted to the king for life in 1697 was £700,000 ($3,500,000) and the same vote was made at the commencement of the reign of Queen Anne and George I. On the accession of George II. £830,000 ($4,150,000) was voted. Besides the regular vote, grants had been frequently made to defray debts incurred in the expenditure of the sovereign. On the accession of George III. the civil list was fixed at £800,000 ($4,000,000), but instead of being paid out of appropriated revenues in which the crown lands were included, these were surrendered, and it was charged on the ordinary taxation. Large extra grants had to be made during this reign. At the commencement of the reign of Victoria a civil list of £385,000 ($1,925,000) per annum was settled on her majesty for life for the support of the royal household, and the maintenance of the dignity of the crown, £60,000 ($300,000) being allotted to the privy purse. In 1901 the civil list of King Edward VII. was raised to £470,000, ($2,350,000); £110,000 of this being for the privy purse. Many continental states have a fixed civil list; that of Russia is equivalent to $7,050,000; of Turkey, $4,600,000; of Austria, $3,650,000; of Prussia, $4,500,000.

Civil Procedure. See COURT.

Civil Rights Bills. 1. An act to carry out the intention of the Thirteenth Amendment, prohibiting slavery — which it was alleged the Southern States were attempting to nullify by public and private action — and secure the political equality of the ex-slaves with the whites. It provided that all persons born in the United States and not subject to any foreign power, excluding Indians not taxed, were citizens of the United States, and entitled to the same immunities, irrespective of race or color, or previous condition of servitude, except as punishment for crime; punished as a misdemeanor any deprival of such right under color of State law; transferred cognizance of such cases from the State to the Federal courts; intrusted the execution of the act to national officers only, and fined them for refusal; punished resistance to the officers; provided for fees; empowered the President to send officers to any district where the act was likely to be violated, and to call out the national forces to execute it; but permitted an appeal to the supreme court. Significantly, it employed somewhat the same means to emancipate the negro which the Fugitive Slave Law did to re-enslave him, especially in over-riding or supplanting State officers; and for the same reason — they could not be trusted in the sections where it was to be enforced. The bill was passed in the Senate 2 Feb. 1866, 33 to 12; in the House 13 March 111 to 38. Andrew Johnson vetoed it 27 March, and it was passed by the requisite two thirds over his veto, in the Senate 6 April and in the House 9 April. Even so, the debate had brought out two grave doubts of its constitutionality; that the protection of civil rights under the Constitution belonged not to Congress but to the States, and that under the Dred Scott decision (which stood as a precedent for the supreme court until reversed), negroes could not become citizens even by emancipation. This led to the proposal of the Fourteenth

Amendment (see CONSTITUTION, *Amendments*), which passed both Houses in June.

2. An act extending the foregoing to the exclusion of negroes from juries, and from equal privileges in schools, public conveyances, hotels, theatres, etc. This had been persistently urged by Charles Sumner, for some years before his death; was offered as an amendment to the Amnesty Bill of 1872, and lost by only one vote; again introduced into the House in December, and referred to a committee; on 30 April 1874, a few weeks after Sumner's death, it passed the Senate, but the House rejected it; it finally passed both Houses in February 1875 and was signed 1 March. For an account of its partial invalidation, see next article.

Civil Rights Cases. These were five test cases in the United States supreme court of the constitutionality of sections 1 and 2 of the second Civil Rights Bill, described above; decided in one group, October term, 1893, and reported and cited under the title above. All came up from circuit courts; three on certificates of division of opinion, two on appeal for error; and while the decision on the act was adverse to all, and the first three were found for defendant, the error was admitted and the decision given for plaintiff in the last two. Two of them were for hotel discrimination, two for theatre discrimination, one for railroad discrimination; the first four submitted 7 Nov. 1882, the last one 29 March 1883. The cases were: U. S. *v.* Murray Stanley, from the Kansas district: hotel case. U. S. *v.* Michael Ryan, California district; refusing a negro a seat in the dress circle of Maguire's Theatre, San Francisco. U. S. *v.* Samuel Nichols, Western Missouri district: hotel case. U. S. *v.* Samuel D. Singleton, southern New York district; refusing a negro a seat in the Grand Opera House, New York. Richard A. Robinson, and Sallie A. Robinson his wife, against the Memphis & Charleston R.R. Co.: refusal to allow the wife a seat in the ladies' car from Grand Junction, Tenn., to Lynchburg, Va. The decision of the court was given by Justice Bradley, Harlan dissenting. The terms of the first section of the act are that "All persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, etc., of inns, public conveyances by land or water, theatres, and other places of public amusement," and that laws must be "applicable alike to citizens of every race and color, regardless of previous condition of servitude." The second section affixes penalties. The court held that these two sections are unconstitutional as applied to the States, not being founded on either the Thirteenth or Fourteenth Amendment (see CONSTITUTION, *Amendments*): the former merely prohibits slavery, which is not constituted by a denial of civil equality; the latter is prohibitory merely on the States, not on individuals, and it was not alleged that the discrimination was made under State laws. Congressional legislation for enforcing the latter amendment is not direct legislation, but corrective, counteracting or redressing State legislation of a sort forbidden by the amendment. For private injury from discriminations, the remedy must be sought in State laws — to withdraw it from which was the precise object of the act.

Civil Service, that branch of the public service which includes all executive offices not connected with the army or navy. The term is not applied to the direct representatives of the people, as the President of the United States or the governor of a State. Owing to the complexity of modern government and the variety of its functions, the civil service has become very complex, and the problem of its effective administration a difficult one.

In Great Britain the service comprises various departments, such as the home office, the foreign office, the war office, admiralty, post-office, customs, excise, etc. Formerly, appointments to the civil service in Great Britain were the gift of the executive government, and were obtained by influence, while the bestowal of them was used as a means of gaining parliamentary support on behalf of the government. Those appointed were not generally called upon to show whether they were competent or not. In 1855 examinations were instituted to test the efficiency of all candidates for subordinate posts; but for some time candidates were specially nominated for those posts. As more than one might be nominated for a post, competition was gradually introduced, and in 1870, it was directed that appointments in the civil service should (with certain exceptions) be filled by open competition, as was already the case with appointments in the Indian civil service. The appointments to what are known as clerkships in the civil service are divided into two classes or divisions, with different age limits and salaries. In the higher division, while the examinations are more severe, the salaries are much better; the two divisions are kept quite distinct; and it is rare for a person to be promoted from the lower to the higher. For a number of appointments open to competition special qualifications, scientific or technical, are necessary, while there is also a special limit of age. A large number of subordinate appointments in the postal and telegraph service, the excise, etc., are on a different footing from the clerkships just mentioned, and are not so well paid. All persons who have served in an established capacity in the permanent civil service are given a pension, varying with the length of service, at the time of retirement. The total expenditure of the civil service of Great Britain is about $90,000,000.

In the United States the Federal civil service numbers over 100,000 officials in the various administrative departments. The Constitution provides that the President, "with the advice and consent of the Senate," shall appoint all officers of the United States whose appointments are not otherwise provided for by the Constitution. This gives the chief executive power to choose the heads of departments, as well as their subordinates. In the separate States the appointive power of the chief executive is much more limited. The heads of the State departments such as the attorney-general and comptroller, etc., are elected by the people, and usually have the constitutional right to select most of their own subordinates. The governor therefore appoints only his own secretaries, etc., members of commissions, heads of bureaus, and the like. With the development of party government in the United States, the patronage placed in the hands of elected officers through their power of appointment, has led to

the giving of offices as a reward for party service (the spoils system), and to considerable inefficiency and unnecessary expense in public administration. A reform is being brought about by the appointment of officials according to merit in public examinations. See CIVIL SERVICE REFORM.

Civil Service Reform, the improvement of the civil service in methods of appointment, rules of conduct, etc.; in the United States, the movement for the appointment of public servants according to their fitness for their work, rather than their services to the party in power.

In the year 1835 a debate took place in the Senate of the United States on the condition of the civil service, and especially on the abuse of the power of appointment and removal to serve party ends instead of public ends. Among the senators who took part in the debate were the three whom history has judged the strongest in that famous body, Daniel Webster of Massachusetts, Henry Clay of Kentucky, and John C. Calhoun, of South Carolina. Differing widely in their views of party policy and rivals in ambition, they were of one mind as to the true nature of the public service, and as to the errors and evils that had crept into it. Mr. Webster, then in the prime of his young manhood, had already won the title of the "Great Expounder of the Constitution." He thus stated the idea in which the others heartily joined: "The theory of our institutions is plain; it is that government is an agency created for the good of the people, and that every person in office is the agent and servant of the people. Offices are created, not for the benefit of those who are to fill them, but for the public convenience."

There is no doubt that this is indeed the true theory of our institutions. It is to be found in all the early writings of the men who formed the government. It is the basis of the Declaration of Independence, that "governments are instituted among men" to secure the rights of "the governed" from whose consent "they derive their just powers." When our national government was founded it was the only one in which offices were not a privilege, but a trust, imposed by the choice of the people and for their sole interest. Neither birth nor rank, nor wealth gave any title to them. Each of the men who held them was intended to be, in the words of Webster, "the agent and the servant of the people."

This theory had grown out of the needs of the American people, and fitted them closely. As colonists they had had to work and fight hard for the right to live and the means to live as free men in a wild land, far from the homes of their fathers, amid many perils and hardships. There was no ruling class among them. To attend to the common business of each little settlement, they were led to choose among their own number the agents best fitted for the task. These in the early days were, as in the towns of New England they still are, "select-men," "trustees." The name shows what was expected of them, and what was their title to employment. As the towns were grouped in counties and the counties in States, the public business grew, became more complex, and required a larger number of agents with different duties and powers, but the idea held. They were still agents, selected men, trustees. From the most modest unpaid village or town officer to the President of the United States, the Commander-in-Chief of the army and navy of the nation and its representative in the eyes of the world, no man in the public service in this country is anything but the agent, the trustee of the people.

One result of the growth of the public business has been that only a small part of the agents for doing this business, are chosen directly by the people. Those thus chosen are entrusted with the employment or appointment of a very large number of others. The chief difference between the two classes is that those elected are expected to carry on the public business in a way that the majority of the voters are in general agreed upon. They are the choice of the majority party and, so far as the rights of all permit, they are the agents of that party. When the views and wishes of the majority change, these agents are usually changed also. But the far greater number of agents for doing the public business are appointed or employed. The duties of nearly all these are the same no matter what may be the policy of the majority party. In the national government, for instance, the main work for those in office, except the highest, is the collection and expenditure of the taxes. The taxes are collected on goods brought into this country for sale or on goods made here for sale; in other words, customs, duties, and internal revenue taxes. Parties differ widely as to which class of taxes should be the higher, and as to how high the custom duties should be. But all parties agree that the taxes of all sorts should be collected according to law, honestly and fairly, that the money should be carefully accounted for, and none of it stolen or wasted. Agents for this purpose need to be good business men of character and ability; they do not need to be of one party or another. Again, the Post-office Department does a great part of the business of the government. It collects mail matter of all kinds, transports it, delivers it at home or abroad, makes large payments on money orders, and sells the stamps by which the cost of its work is paid. As to this work, there is no difference at all between parties, and there has never been. The agents engaged in it need only to be honest and efficient. They do not need to be of one party or another. In all offices where the duties are of this sort, it is plain that those engaged in them should be selected for merit only, promoted as the service requires, and removed only for failure or incapacity to do their work in the best manner.

Such a policy would answer to Webster's statement of the theory of our institutions, and to the practice of the early Presidents. Washington declared: "In every nomination to office I have endeavored, so far as my own knowledge extended or information could be obtained, to make fitness of character my primary object." In the first 39 years of the history of the government the six Presidents made only 112 removals. A few years later, when Webster had to define anew the true theory of the public service, a very different practice had grown up. It was frankly described in that same debate by Mr. Marcy, a senator from New York. He said: "The politicians of the United States are not so fastidious as some gentlemen are as to disclosing the principles on which they act. They see nothing wrong in the rule that to the victor belongs

the spoils of the enemy." This theory is plainly the opposite of the true one. Under it elections do not merely settle the policy of the country, as to which parties may unselfishly differ. They become contests for spoils as well, and tend to become more and more contests for spoils and less disputes as to principle. The spoils are the offices, the places of trust, and these tend to be given not to those best fitted to perform their duties, but to those who have claims on the party. The service is hurt by putting out tried men and putting in untried men, and since the untried men are chosen for other reasons than fitness, they are apt to be poorer officers. Since they owe their employment to party favor, and do not get it on their merits, they are likely to be less faithful and less honest. They are liable to be turned out at the next election, and they are tempted to make all they can from their places. The offices tend to be regarded as created not "for the public convenience" but "for the benefit of those who fill them." The service tends to become poorer, less honest, more costly. Any large private business conducted in this way would surely come to disaster. So would the business of the government if it had not the pockets of the taxpayers to draw on.

The Spoils System.—The spoils system prevailed in the service of the United States government for about a half-century after 1830. It also prevailed in greater or less degree in the service of the several States and of the larger cities. It was not confined to any one party. All were more or less corrupted by it. The effect on the politics of the country was very bad. The pressure for public employment, always strong, became extreme. Probably the election of 1860 was as largely decided by moral conviction as any in the history of the country. Yet, one month after he took office, President Lincoln groaned under the burden of this pressure. "I wish," he wrote, in his simple phrase, "I could get time to attend to the Southern question. I think I know what is wanted, and believe I could do something toward quieting the rising discontent, but the office-seekers demand all my time. I am like a man so busy letting rooms in one end of his house that he cannot stop to put out the fire that is burning in the other." In the crisis of the war for the Union he was visited by a committee of New York politicians, intent on patronage. The chairman opened his address with a reference to the "awful burden of the nation's fate weighing on the president." "Gentlemen," interrupted Mr. Lincoln, "it is not the fate of the nation that worries me most just now; it is your pesky post-office." These incidents throw a strong light on the waste of time, of money and of strength imposed by the spoils system. The degradation and pollution of politics were even worse effects. The office-holders, living on the spoils of the place, and greedy for more, seized the organization of their party, whichever it happened to be, and made the free exercise of honest preference among the voters difficult and often impossible. The scramble between factions in the party in possession became as intense as between opposing parties. In the Custom House in New York, five collectors of the same party made 1,878 removals in a period of 1,565 business days, and the service grew steadily worse. In 1881, Guiteau, an office-seeker from New York, where a bitter factional fight had long been raging, half-crazed with disappointed greed, assassinated President Garfield, to whom he charged his failure.

The Merit System.—This proved the turning point. At the next session of Congress bills were introduced for the establishment of the merit system, and a law was passed in January 1883. It was entitled "An Act to Regulate and Improve the Civil Service of the United States." The object of the law was to secure appointment and promotion in the service for fitness. For this purpose appointments were to be made from those graded highest as the results of open competitive examinations, the appointments being made final only after a period of probation or trial. This system was to be extended throughout the service as fast and as far as the President should direct. When any part of the service was to be brought under the system, it was to be arranged in classes by order of the President; hence the term "classified service" means, under the law, the part of the service in which the merit system is applied. Within the classified service, the examinations for appointment and for promotion are chiefly competitive; that is to say a list, called an "eligible list," is made of all applicants passing a fixed grade, in the order of their standing, and a selection is made by the appointing officer from the three highest on this list. This selection is for the period of probation or trial, six months, at the end of which term, if his conduct and capacity are satisfactory, the probationer is absolutely appointed; if not, he is discharged. Non-competitive examinations are held according to the rules laid down by the President. In these all applicants passing a fixed grade are eligible to appointment without regard to their relative standing. The rule as to probation is the same as in the other cases. The law requires that all "examinations shall be practical in their character, and as far as may be shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service into which they seek to be appointed." Close attention is paid to this requirement. In the first place, weight is given to the experience of the candidates in the kind of work they seek, when such experience can definitely be known. Then each class is tested as to the knowledge and skill particularly needed. For clerks and accountants, weight is given to accuracy and quickness in figures, to clearness and rapidity in writing, and to familiarity with the principles and methods of bookkeeping. Examinations are generally for entrance to the lower grades of the service, and actual excellence in the performance of work counts in promotion. For places requiring special knowledge, trained examiners are employed. For instance, the examiners who set the questions and rated the answers in the case of the supervising architect were prominent architects from various parts of the country. They were able, from the records of the candidates, to test not only professional knowledge, but business capacity. In all cases the examiners are selected from those who are well informed as to the work to be done. The application of this law is to be carried out and watched by a commission, known as the United States Civil Service Commission, made up of three members,

appointed by the President with the advice and consent of the Senate. This commission aids the President in the formation of the rules under the law, and, with the aid of examiners, sets and conducts the examinations. All appointing officers are required to report to it all changes in the classified service, of which the commission keeps a full record, as well as of its own examinations and other proceedings. All officers of the service are required to aid in the performance of the duties of the commission.

One of the worst evils of the spoils system was the fact that public employees were made to pay a large fraction of their salaries to party funds, and another was that these employees were forced to work for the party in power in order to keep their places. Both these practices are now forbidden by law in the service of the United States. No one in the service is allowed to use his official authority or influence to coerce the political action of others. All persons in the service are forbidden to ask or receive political contributions from others in the service. Such contributions cannot be solicited in any place or building used by the government. By the rules, which have the force of law, no question can be asked of candidates for appointment as to their political or religious opinions; no disclosures of such opinions can be considered; no change of rank or pay can be made because of such opinions. Under the spoils system, the office-holder got his place from his party and was taxed heavily by his party managers. The law intends to put a stop to that; it holds the officer bound only to earn his pay by honest work, and free to spend it as he chooses. The law further holds him without fear of harm or hope of aid from outside, to do his duty to his employers, the whole people of the United States. It aims to put the people and those who work for them on the same footing that is maintained in honorable private business between employers and employed.

The merit system has been greatly extended since the passage of the law. Under President Arthur, who signed the law in 1883, some 16,000 places were brought within its provisions. The number is now over 80,000. This is nearly a half of all the places in the executive service, while the salaries paid in these places are nearly three fourths of all paid in the service. While this advance has been made there have been more frequent changes of party in the government of the country than in any like period in our history. In the five elections since 1883, four have resulted in a change of party. Each succeeding President until the present has, in the discretion which the law confides to the President only, added to the number of places removed from the spoils system. President McKinley withdrew a considerable number of places from the merit system for reasons urged upon him by the heads of some departments. The effect has been unfortunate. On the other hand, the merit system has been extended to the service in the Philippine Islands in a way that promises to make the work of governing there clean, efficient, and fair to a degree that could hardly have been looked for. In this region the bond of trusteeship rests upon our government with a peculiar and solemn obligation. The United States have taken control of the affairs of the people of these islands as the result of a war with Spain, without the assent of the people in the first instance, and against resistance by a portion of them which was overcome by arms. It would be a sore disgrace, if their affairs were not managed honestly and purely and for the interest of the governed. The merit system on the lines of the Civil Service Law has been established there, under the general guidance of an experienced and skilled examiner from Washington. As many natives as practicable are being employed. It is still too early to judge of the final outcome, but the beginning is promising.

The chief aim of the merit system is, on the one hand, to get the best service for the government — that is, for the people — and, on the other hand, to remove from the party contests of the country the corrupting influence of the vast number of business places offered as spoils to the victors. The methods of competition and probation are not perfect, and, like all other human methods, are liable to mismanagement. But they are the best that have ever been tried, and they are very effective. The test of competitive examination is shown to be thorough and practical by the fact that only a very small number of those who pass that test are dropped after probation or trial. Another proof is the much larger amount of work done by persons so selected. During 10 years before the adoption of the merit system in the departments at Washington the number of clerks increased from 3,300 to 5,523, or more than two thirds. In the 13 years after the system was adopted the number actually fell off 211, or three per cent, while the work of the departments had largely increased. Another proof of the efficiency of the system is the small number of changes that take place in it compared with those that take place in the branches of the service where the system is not yet applied.

Two facts are noteworthy with regard to the effect of the use of the merit system on partisan contests in politics. The total cost of the executive service is over $100,000,000. Of this nearly $75,000,000, or three fourths, is now paid to those employees who are under the merit system. This very large sum is no longer held out as prizes for partisan activity, or treated as the "spoils of the enemy." The other fact is that the feeling of the people that the government is theirs, and does not belong to the party in power for the time being, is greatly strengthened. The entrance examinations are held in all parts of the land, and men and women are selected for the departments at Washington with no regard whatever for their party views or the influence of politicians. This has been of great effect in laying to rest the passions bred by the Civil War, and giving to the dwellers in the South a sense of their common rights and duties as citizens of the nation. It is a great and lasting gain.

In 1884, laws for the introduction of the merit system were enacted in New York and Massachusetts, and later laws authorize the system in the service of cities in Wisconsin and Illinois. In Massachusetts and in New York the system has made much progress and the results have been good in proportion as the system has been extended and honestly and faithfully applied. But the evils of the spoils system still prevail almost without check in the service of the cities and the States throughout the country. The enormous number of

places involved are still almost wholly the prizes of party contests. The place-holders, many times more numerous than the present army of the United States, are in greater part enlisted for party rather than for public service. Efficiency, industry, and economy in the public work are hard to secure. The suppression of vice and the decent administration of the affairs of cities and States are made more difficult.

Clearly it is best that the merit system should be applied to all that portion of the civil service in which the duties are of a business nature and in which the office-holders are not called on to fix the policy of the government. There is no Democratic or Republican or Populist way of being honest and industrious and intelligent which all Americans may not use. To these qualities in their service the people have a right, and no party can claim a monopoly of them. Much remains to be done to complete the work so well begun. The men in all parties who look on public employment, not as a trust, but as the spoils of party victory, resist all advance and seek to undo what has been done. They cannot succeed if the true nature of the merit system is understood, its honesty and fairness, its high utility, and its fidelity to the fundamental principle of the free institutions of the American republic.

EDWARD CARY,
Associate Editor New York Times.

Civil War in America. The number of engagements entered in the government's 'Chronological List of Battles' exceeds 2,200. An alphabetical list of battles compiled at the bureau of pensions, including such minor actions and skirmishes as seemed worthy of incorporation, contains over 6,800 separate affairs. It is therefore clear that, even in a comprehensive narrative of the War, a large number of the lesser engagements must be ignored. Merely to state strength and losses for the battles mentioned would form a lengthy statistical article. For these figures the student is referred to the separate accounts in this work of the various battles herein treated.

The Civil War of 1861–5 was inaugurated by the determination of seven Southern States to withdraw from the Union. South Carolina led by passing an ordinance of secession 20 Dec. 1860, followed by Mississippi, 9 Jan. 1861; Florida, 10 January; Alabama, 11 January; Georgia, 19 January; Louisiana, 26 January; and Texas, 1 February. On 7 February the Choctaw Nation declared its adherence to the Confederacy.

During the autumn of 1860 and the early spring of 1861 the forts, arsenals, custom-houses, and other government property in those States, with few exceptions, had been seized by State troops, and large sums were voted for arming the States, Georgia leading in November 1861, by appropriating $1,000,000. Major Robert Anderson, a Federal officer, who held Fort Moultrie on the inner line of Charleston harbor, becoming aware of active preparations for capturing that work, withdrew, on the night of 26 December to Fort Sumter in the centre of the harbor. This move hastened results. Immediate preparations were made for bombarding the fort. The first firing upon the flag was 9 January by the batteries erected against Fort Sumter, the inciting cause being the appearance of the Star of the West off the harbor. This vessel had been sent from New York with provisions for Sumter, and with the accompanying fleet withdrew without replying to the fire.

Delegates from the seceded States met at Montgomery, Ala., 4 February, and 8 February adopted a provisional government, "The Confederate States of America," and the next day elected Jefferson Davis of Mississippi President, and Alexander H. Stephens of Georgia Vice-President of the Confederacy.

On 1 March Gen. P. G. T. Beauregard, appointed by the Confederate government, was sent to Charleston and took charge of the preparations for reducing Fort Sumter. On 4 March Abraham Lincoln was inaugurated as President of the United States. On 10 April Beauregard was instructed to demand the surrender of the fort, and, in case of refusal, to reduce it. The next day Anderson received and promptly declined a demand to evacuate, and at daylight 12 April, the Confederate batteries opened upon Fort Sumter, compelling its surrender on the 14th. The expectation of a relieving fleet probably hastened this attack.

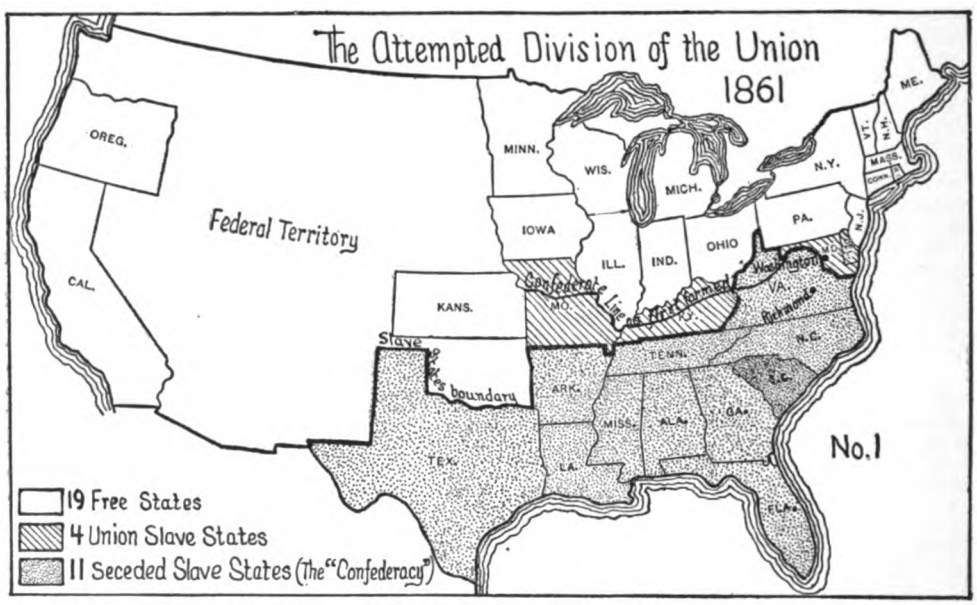
With the news of the attack and surrender the country received President Lincoln's proclamation calling for 75,000 volunteers, and summoning Congress to meet on 4 July. In an instant discussions over the power to coerce States, the discussions of peace conventions and movements, and all similar perplexing questions were brushed aside, and the North responded with intense enthusiasm, the predominating sentiment being the preservation of the Union. The South was equally aflame, rallying under the banner of State rights.

On 8 April President Davis had called for 20,000 volunteers, and the day following President Lincoln's proclamation he asked for 34,000. Two days later the Confederate Congress authorized the raising of 100,000 men. Three days after the surrender of Sumter Virginia seceded, followed 6 May by Arkansas and Tennessee, and 20 May by North Carolina, the belief being then general that a policy of coercion had been decided upon. The border States of Kentucky and Missouri were held to the Union by their loyal element, and Maryland was held at first by the direct power of the national government, and later by its own loyalty. The first two were represented in the Confederate Congress throughout the War. The movement to take Missouri into the Confederacy was thwarted by Gen. Nathaniel Lyon, who captured Camp Jackson near St. Louis 10 May, and on 17 June, having already taken the State capital, in a brief engagement dispersed a force which Governor Jackson had gathered at Booneville. This resulted in relieving the capital from those plotting secession. Kentucky at first declared for neutrality, but at the election for members of Congress, 20 June, it was made clear that the State was lost to the Confederacy. In May the Confederate capital was moved from Montgomery, Ala., to Richmond, Va., where troops from all parts of the Confederacy were rapidly assembling. In like manner, the Northern States were pouring troops into the national capital, and Washington soon became a vast military camp. The Union forces crossed into Virginia 24 May and encamped opposite Washington.

For a brief time Baltimore resisted the passage of troops to the capital. Four hundred Pennsylvanians reached Washington 18 April,

but the 6th Massachusetts regiment was attacked in Baltimore 19 April. The 7th New York reached Washington 25 April from Annapolis. Brig.-Gen. B. F. Butler, with the 8th Massachusetts, had reached Annapolis on the 20th, and on the 22d had proceeded to the Relay House. On the night of 13 May he occupied Baltimore, and thereafter the route to Washington was unobstructed. Harper's Ferry, with its arsenal and machinery for manufacturing small arms partially destroyed, was seized by the Confederates 19 April, and Gosport Navy-Yard, near Norfolk, 20 April, with guns, stores, ships, and machinery of immense value.

On 20 May Gen. Butler, having been made a major-general of United States volunteers, was assigned to the command of the Department of Virginia and North Carolina, with headquarters at Fort Monroe. On 10 June he moved against a force under Gen. J. B. Magruder at Big Bethel and was defeated. While it was comparatively a small affair, like another about



the same time at Vienna in front of Washington, both caused widespread dissatisfaction and mortification at the North.

Under President Lincoln's call Ohio promptly organized 13 regiments, and 23 April Capt. George B. McClellan was appointed major-general of Ohio militia. On 14 May he was commissioned major-general in the regular army and assigned to the Department of the Ohio, embracing that State, Indiana, Illinois, and, later, West Virginia. In May the Confederate government had despatched a small force to Grafton, W. Va., under Col. Porterfield, with the purpose of breaking the Baltimore & Ohio R.R. On 26 May Gen. McClellan threw troops from Ohio and Indiana into the State, defeating Porterfield at Philippi, 3 June. West Virginia seceded from Confederate Virginia 17 June, and set up a State government which was recognized by President Lincoln on the 26th. On 9 July United States senators were elected, and on the 13th they took their seats at Washington. Congress met in special session 4 July. It legalized all President Lincoln's acts with respect to the army and navy, and authorized a further call for 500,000 men, a national loan of $250,000,000, and an increase of the navy to render effective the blockade of the Southern ports which had been declared 19 April by President Lincoln.

Following the Philippi defeat, the Confederates sent Gen. Henry A. Wise to the Kanawha Valley, and Gen. Robert S. Garnett to Beverly. Gen. William S. Rosecrans, who was commissioned brigadier-general in the regular army 16 May, joined Gen. McClellan from Ohio, and 11 July defeated the Confederate forces under Col. Pegram at Rich Mountain. On 13 July Gen. Garnett, during the retreat of his column, was killed at Carrick's Ford. His command escaped, leaving Gen. McClellan in control of northwestern Virginia.

The latter part of July, upon hearing of the arrival of Gen. J. D. Cox of Ohio in the Kanawha Valley, Gen. Robert E. Lee was ordered to the command of West Virginia. The campaign for regaining the State failed, and by November the Confederate authorities decided to abandon the plan of occupying it. Gen. Lee was ordered to the command of the Department of South Carolina, Georgia, and Florida.

Early in July the army in front of Washington under Gen. Irwin McDowell prepared to move against the main Confederate army under Gen. Beauregard in front of Manassas. The flanks of each army toward the Shenandoah were protected by strong forces, Gen. Robert Patterson commanding on the Union side, and confronting Gen. Joseph E. Johnston.

The Union advance was hastened by an almost universal cry in the North of "On to Richmond!" Gen. McDowell left his camps on the Virginia side of the Potomac on the afternoon of 16 July with five divisions, encountering an advance brigade of Beauregard's army at Fairfax Court-House. This, with two other

brigades, withdrew with light skirmishing to the main lines, which had been established behind Bull Run, its right at the crossing of the railroad from Manassas to Alexandria, and its left at the crossing of the Warrenton turnpike from Alexandria. McDowell's forces were concentrated about Centreville on the 18th, and one brigade had quite an affair on that date at Blackburn's Ford. On the 20th Gen. Johnston arrived with all except one brigade of his army and assumed command. On the 21st McDowell, feinting in front, turned the Confederate left, and maintained a successful battle until near four o'clock, when the last brigade (three regiments) of Johnston's army arrived with a battery on the Union right and checked its advance. A brigade of Gen. Beauregard's troops moving farther to the left and more directly on the Union flank, changed this check into a retreat, which soon became a panic, and the entire Union army left the field in disordered haste. There was slight pursuit, but the panic increased, and only ended when the army was inside the fortifications of Washington. The North was astounded at the result, and the South correspondingly elated. Both sections immediately redoubled their efforts to prepare for vigorous war. Gen. McClellan was summoned from West Virginia and given command of the Department of the Potomac, and began to organize the troops pouring in from all parts of the North. On 20 August he took command of the Army of the Potomac, then for the first time organized under that title, and 1 November he was made commander-in-chief of the armies of the United States in place of Gen. Winfield Scott, who had asked to be retired on account of failing health. In the rapid organization going forward in both sections, the South had the advantage of the services of the majority of regular officers from that section who resigned their commissions and went with their States.

After Bull Run there was little heavy fighting during the remainder of 1861, both sides devoting their chief attention to establishing their lines. On 15 August Jefferson Davis ordered all Northern men to leave the South within 40 days; and the next day President Lincoln proclaimed the seceded States in insurrection and prohibited all intercourse. On the Union side, Gen. Butler in command of a joint expedition of land and naval forces, sailed from Fort Monroe, and 29 August captured the forts guarding Hatteras Inlet, opening the way to Pamlico Sound. On the lines of the Army of the Potomac the Union forces under Col. E. D. Baker, senator from California, were defeated at Ball's Bluff, 21 October, Col. Baker being killed. On 7 November a joint expedition from Annapolis, under Gen. Thomas West Sherman and Admiral S. F. Dupont, captured Port Royal, thus securing one of the most important harbors on the Southern coast. Gen. E. O. C. Ord, with a Union brigade, defeated a brigade under J. E. B. Stuart at Dranesville, 20 December. Gen. N. P. Banks succeeded Gen. Patterson in the Shenandoah; Gen. Rosecrans commanded in West Virginia.

On 29 Nov. 1861 Gen. Quincy A. Gillmore was ordered to reconnoiter Fort Pulaski, at the mouth of the Savannah River. On 1 December he reported that it could be reduced with batteries at 1,700 yards' distance, a third greater than foreign authorities laid down as practicable against permanent works. His batteries opened 10 April 1862, breached the walls within 24 hours, and the fort surrendered 11 April.

Gen. Robert Anderson was assigned to the Department of Kentucky 28 May. His headquarters were fixed at Cincinnati on account of the position of Kentucky in regard to neutrality, but on 1 September his headquarters were moved to Louisville. On 8 October Gen. Anderson's health failing, Gen. W. T. Sherman succeeded to the command of the Department of the Cumberland. On 9 November this Department was discontinued, and under the title of the Department of the Ohio, embracing the States of Ohio, Michigan, Indiana, and most of Kentucky and Tennessee, Gen. D. C. Buell was assigned to the command, which he assumed 15 November. Gen Ulysses S. Grant was ordered to the District of Southeastern Missouri with headquarters at Cairo, Ill., which he reached 4 September. On the 6th he seized Paducah at the mouth of the Tennessee, and 7 November was defeated in an expedition to Belmont. Gen. J. C. Frémont was ordered to Missouri, and assumed command 25 July. Before his arrival Gen. Lyon had moved against forces under Gen. Sterling Price with which ex-Governor Jackson was seeking to regain the State, and in the battle of Wilson Creek, 10 August, where Gen. Ben McCulloch commanded, Lyon was killed and Price occupied southern Missouri. Frémont, upon assuming command, advanced against Price, and occupied Springfield. Gen. H. W. Halleck succeeded Frémont, assuming command 19 November. Gen. David Hunter then in command at Springfield withdrew under orders, leaving the Confederates in possession of southern Missouri for the rest of the year.

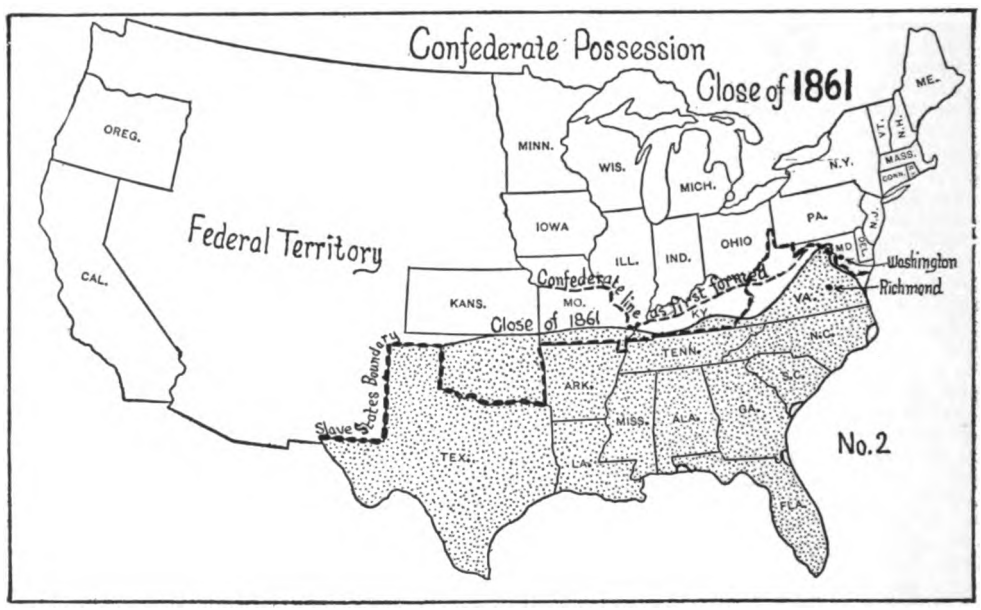
On the Confederate side, Gen. Joseph E. Johnston commanded the Army of Northern Virginia, «Stonewall» Jackson was in the Shenandoah, Gen. Robert E. Lee in West Virginia until November, Gen. Humphrey Marshall and Gen. G. B. Crittenden in eastern Kentucky, Gen. A. Sidney Johnston at Bowling Green, Gens. G. J. Pillow, J. B. Floyd, Simon B. Buckner, and N. B. Forrest at Fort Donelson, Gen. Leonidas Polk at Columbus, Ky., and Gen. Price in Missouri. Thus stood the opposing lines at the close of 1861. Half the year had been spent in establishing them. The campaigns of 1862 began early and were prosecuted with the greatest vigor on both sides.

From January to April Gen. H. H. Sibley, with Texas forces, was engaged in attempting to secure New Mexico to the Confederacy. He inflicted much loss on Union posts and commands under Gen. E. R. S. Canby, but abandoned his purpose the middle of April and retired to Fort Bliss.

On 6-8 March a severe battle occured at Pea Ridge, or Elkhorn Tavern, Ark., between the forces of Generals S. R. Curtis and Earl Van Dorn, resulting in the retreat of the latter.

As Gen. George H. Thomas was concentrating to attack Gen. Crittenden at Beech Grove, Ky., opposite Mill Springs on the Cumberland River, the latter marched at night from his entrenchments and attacked Thomas at Logan's cross roads the morning of 19 January. The Confederates were defeated, pursued to the river, and dispersed. This, with Gen. J. A. Garfield's movement up the Big Sandy, and his defeat of

Humphrey Marshall at Prestonburgh, 10 January, broke the right of the Confederate line through Kentucky. On 6 February Admiral Foote's fleet, supported by Grant's forces, captured Fort Henry on the Tennessee, and Grant's army, moving at once to Fort Donelson on the Cumberland, forced its surrender on the 16th, with about 15,000 men. Gen. A. Sidney Johnston then evacuated Bowling Green 15 February, and Gen. Leonidas Polk withdrew from Columbus 3 March, the movements of the latter being hastened by Gen. John Pope's advance on New Madrid and Island No. 10. This latter was captured 7 April. The Confederate forces in Kentucky and Tennessee then withdrew to the line of the Memphis & Charleston R.R., Gen. Johnston establishing his headquarters at Corinth. Gen. Buell, moving rapidly from Kentucky, occupied Nashville, 25 November. Gen. Johnston, learning that Buell was to join Grant, whose army had been brought from Fort Donelson to Pittsburg Landing, and was found that the Confederates had already evacuated the place. After a short pursuit, under Pope and Buell, as far as Blackland, the Union army was concentrated at Corinth, and extensive fortifications were erected. The army was soon divided, and Buell with the Army of the Ohio was sent toward Chattanooga, with orders to repair the railroad as he advanced. Gen. Braxton Bragg, who had succeeded Beauregard, proceeding to Chattanooga by way of Mobile and moving rapidly north behind the Cumberlands, compelled Buell to withdraw to the Ohio River to protect his department, which included Indiana, Ohio, and Michigan. Gen. E. Kirby Smith, at the same time, invaded Kentucky by way of Cumberland Gap, defeated Union forces at Richmond, 30 August, and threatened Cincinnati. Buell, upon reaching Louisville, advanced upon Bragg. On 8 October resulted the battle of Perryville, by which Bragg was compelled to abandon Kentucky. Passing through Cumberland Gap, he retired to Chattanooga,



camped there awaiting Buell, marched from Corinth to attack Grant before the junction could take place. The Union army was unexpectedly attacked 6 April at Shiloh Church, two miles and a half in front of Pittsburg Landing and forced back to the immediate vicinity of the landing. The advance of Buell arrived about sundown, and during the night four divisions, three of Buell's army and Lew Wallace's of Grant's, reached the field. The next day the Confederates under Gen. Beauregard, being largely outnumbered, were defeated and returned to Corinth. Gen. A. Sidney Johnston was killed near the close of the first day's fight.

Gen. Halleck arrived from St. Louis 11 April and took command. Gen Pope's army was brought from Island No. 10. On 30 April an advance began on Corinth by slow approaches. The Confederates brought Price and Van Dorn from west of the Mississippi. On 30 May Gen. Halleck's lines were close to the city, and an attack was meditated, when it was whence he advanced to Murfreesboro in central Tennessee, and went into winter quarters.

During the operations at Pittsburg Landing and Corinth Gen. O. M. Mitchell advanced with a division from Murfreesboro 5 April, reached Huntsville 11 April, and seized the Memphis & Charleston R.R. from Decatur to Bridgeport. Gen. J. S. Negley's brigade crossed the mountains and bombarded Chattanooga 7 June. Mitchell's operations drew Gen. E. Kirby Smith from east Tennessee, and left the way open for Gen. G. W. Morgan at Cumberland Ford, Ky., to seize Cumberland Gap.

In September Price and Van Dorn, who had previously joined Beauregard from beyond the Mississippi, moved against Grant and Rosecrans in the region of Corinth. Price was defeated by Rosecrans 19 September, at Iuka, and Van Dorn, supported by Price, 4 October, at Corinth. From this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, then styled the Fourteenth

corps. On 30 October Gen. Rosecrans relieved Gen. Buell, and concentrated his army at Nashville. On 26 December he moved toward Murfreesboro to attack Bragg. The battle began on the last day of the year, and continued during the days of 1–2 Jan. 1863. Gen. Bragg retreated the night of 3 January, eventually taking up positions at Shelbyville, Tullahoma and Wartrace. Gen. Rosecrans occupied Murfreesboro. The respective armies remained on these lines until Rosecrans' advance in June 1863.

While Rosecrans was succeeding at Murfreesboro, there was a noted Confederate victory at Galveston. Gen. Magruder, with a fleet of ordinary river boats, protected with hay and cotton bales, captured the Harriet Lane 1 January, sunk the gunboat Westfield, and received the surrender of the forces holding the city. The Confederate Alabama, arriving shortly after, captured the gunboat Hatteras.

Both river fleets of armored and unarmored gunboats, mortar-boats, and rams were actively engaged on the western rivers. The Union fleet, Commodore A. H. Foote, was composed of 45 vessels of various classes, and 38 mortar-boats. The Confederate fleet, Commodore Montgomery, was somewhat less, but contained several formidable vessels. Commodore Foote's gunboats captured Fort Henry on the Tennessee, and played an important part at Fort Donelson, Pittsburg Landing, and New Madrid. Commodore Montgomery awaited Foote's fleet, now under the command of Commodore C. H. Davis, before Memphis. The Union fleet was made up of 5 gunboats with 68 guns, and 4 rams; the Confederates of 8 gunboats with 28 guns. After a desperate battle, 6 June, against great odds, the Confederate flotilla was destroyed, and Memphis surrendered to the fleet. Davis left Memphis 29 June, and 1 July reached Young's Point, where he joined Admiral David G. Farragut's fleet from New Orleans, which had run the Vicksburg batteries.

The year 1862 opened at the east with very general dissatisfaction over the long inaction of Gen. McClellan. Gen. Joseph E. Johnston was at Manassas and Centreville with some 50,000 men, but Gen. McClellan, misled by his secret service, continually insisted that there were three times that number. The Army of the Potomac numbered fully 150,000 present for duty. The Potomac was blockaded, and the Confederate flag floated on Munson's Hill in sight of Washington. On 31 January President Lincoln gave McClellan a peremptory order to move on Manassas not later than 22 February. McClellan asked leave to present a plan of his own for a movement down the Potomac, up the Rappahannock, across to York, and thence to Richmond. While he was discussing it, Johnston, placing "Quaker guns" in his embrasures at Centreville, withdrew unmolested behind the Rappahannock to a line of works and field depot already prepared.

Just as his movement began occurred the ominous attack, 8 March, of the Confederate ironclad Merrimac, Flag Officer Franklin Buchanan, which suddenly moved out from Norfolk and attacked the Union fleet in Hampton Roads, sinking the frigate Cumberland, capturing and destroying the frigate Congress, doing much other damage, and startling the entire eastern coast. On resuming operations the next day the Merrimac was met and foiled by the Monitor, Lieut. John L. Worden, which had just arrived. The Merrimac then retired to Norfolk, being blown up when the Confederates evacuated that city, 9 May.

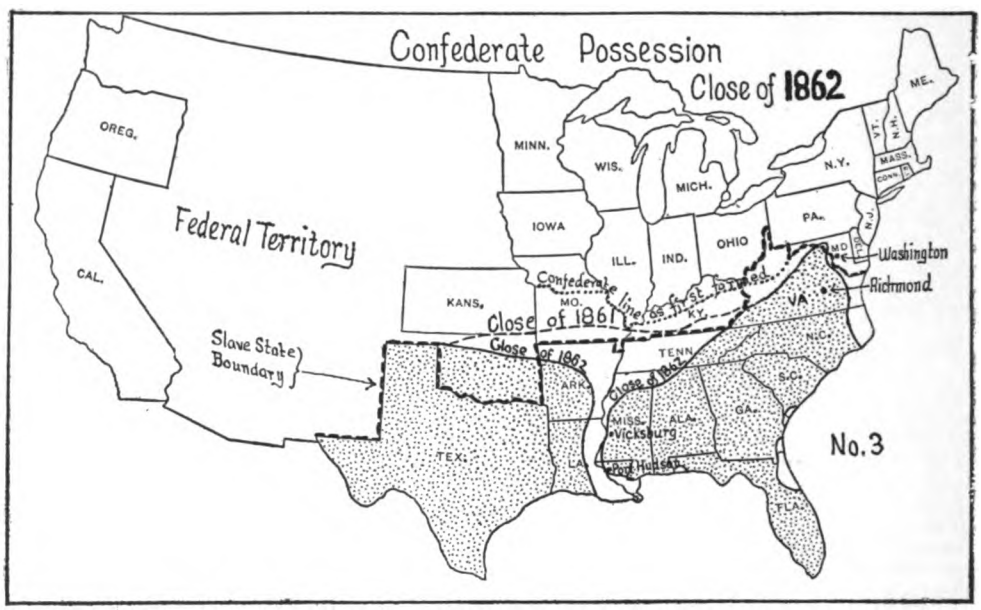
McClellan was allowed to undertake his Peninsula campaign. On 11 March he was relieved from the general command of the armies. The Army of the Potomac was transported to Fort Monroe, and the movement up the peninsula toward Yorktown began 4 April. Heavy rains caused delays from the start. It was found at Washington that the designated number of men had not been left for the proper defense of the capital. McDowell's corps was therefore retained. Arriving before Yorktown with about three times the strength of the enemy, he concluded to lay regular siege to the position. Parallels were therefore opened, nearly 100 heavy siege guns were brought up, and at the end of a month, as his batteries were about to open, Gen. J. E. Johnston evacuated the place 3 May and withdrew toward Richmond. He halted at Williamsburg, where on the 5th an unsupported attack was made upon his lines, and at night he withdrew toward Richmond. McClellan followed to the Chickahominy. On 15 May the Union fleet in the James made an unsuccessful attack on Drewry's Bluff, eight miles below Richmond. On 20 May the right of his army crossed the Chickahominy and advanced to Seven Pines, or Fair Oaks, about five miles from Richmond, where he was attacked by Gen. Johnston 31 May. The prompt advance of Sumner's corps from the other side of the Chickahominy prevented serious disaster. At the close of the day Gen. Johnston was badly wounded and carried from the field. Gen. Gustavus W. Smith commanded temporarily, and was succeeded 2 June by Gen. Robert E. Lee, who continued in command of the Army of Northern Virginia until Appomattox. On 1 June the battle was renewed by the Confederates, the troops regained their lost ground, and Lee withdrew to the fortifications of Richmond.

On 16 June the Union forces on James Island in Charleston harbor, under Gen. Benham, met with a severe repulse at Secessionville. Gen. "Stonewall" Jackson, by a brilliant campaign in the Valley, had prevented the most of McDowell's corps, then in the vicinity of Fredericksburg, from reinforcing McClellan. By moving rapidly down the Valley he defeated Banks at Winchester and forced him across the Potomac, 26 May. Returning, he defeated Gen. J. C. Frémont at Cross Keys, 8 June, on one flank, and Gen. James Shields at Port Republic, 9 June, on the other, and after a week spent in deceiving Gen. Frémont into the belief that he was about to advance down the valley, by a rapid and unsuspected movement he appeared 25 June at Ashland on the flank of McClellan's army in front of Richmond. Then followed the Seven Days' battles, beginning with Mechanicsville 26 June, and ending at Malvern Hill 2 July, whence the Army of the Potomac withdrew to Harrison's Landing on the James. The only victories of the series were the first and last battles. The Peninsula campaign had ended as a disastrous failure. Gen. McClellan had been relieved from the command of all the armies 11 March, retaining that of the Army of

the Potomac, and Halleck assumed the chief command 23 July.

Against McClellan's protest, it was decided to withdraw his army from the Peninsula to the vicinity of Washington. To cover this movement, and protect Washington, Gen. John Pope was given command of the Army of Virginia, organized with the corps of McDowell, Banks, and Frémont. Pope concentrated his army north of Culpeper, and began with his cavalry to operate toward Lee's railroad communications at Gordonsville. Lee, though McClellan's army was still within striking distance of Richmond, at once sent a portion of Jackson's and Gen. James Longstreet's corps to Gordonsville. Pope took the field 29 July, and threatened Gordonsville again. «Stonewall» Jackson advanced on the 7th, reaching Cedar Mountain on the 9th. Here Banks attacked and was defeated. Jackson retired beyond the Rapidan, and upon Lee, with Longstreet, coming up, Pope retired behind the Rappahannock. By a long battle of Chantilly. Pope then, under orders, 2 September, withdrew his army to the fortifications of Washington.

Pope was then relieved; his forces were added to the Army of the Potomac, and McClellan took command of the combined army. The first Confederate invasion of the North followed. On 3 September Lee put his army in motion from Chantilly toward the Potomac. The crossing was accomplished in the vicinity of Leesburg on the 5th, the army moving forward to Frederick, where, on the 7th, Lee issued a proclamation setting forth that his army had come to help them regain the rights of which they had been despoiled. This was coldly received. Upon learning that the garrison of Harper's Ferry had not withdrawn, he detached forces which invested and captured that place with its garrison of 11,000 men and over 70 guns. Lee, who, with Longstreet's command, had marched to Hagerstown, turned back to hold Turner's Gap in South Mountain, but was



detour, by way of Salem and Thoroughfare Gap, Jackson moved rapidly around Pope's right and 26 July destroyed his stores at Bristoe Station and Manassas in his rear, retiring to the former battlefield of Bull Run. On the 23d Reynolds' division from the Army of the Potomac joined McDowell, and on the 25th Gen. S. P. Heintzelman's corps, two divisions, arrived, and the next day Fitz-John Porter's corps of two divisions reached Pope. The battle of Gainesville followed on the 28th, resulting in the retirement of two of McDowell's divisions. At Groveton on the 29th the head of Longstreet's forces reached the field and took part in the closing fight. All the battles of the campaign had been desperately fought by both sides. On the 30th occurred the second battle of Bull Run. Pope was defeated, but withdrew unmolested to Centreville beyond Bull Run. Here he was joined by the strong corps of Sumner and Franklin from McClellan's army. A flank movement by Jackson led to the defeated on the 14th and fell back to Sharpsburg, where he was subsequently joined by the forces detached against Harper's Ferry.

McClellan advanced from Washington 5 September toward Frederick, Md., the right wing and centre passing through that place on the 13th, the right moving to Turner's and the left to Crampton's Gap. Both these positions were carried on the 14th after sharp fighting. On the 15th Lee took position on the high ground beyond Antietam Creek, and in front of Sharpsburg. Gen. Joseph Hooker's corps attacked his left toward evening of the 16th, the fighting continuing until after dark. The general engagement began at daylight on the 17th, lasting for 14 hours, the losses being greater than for any one day's fighting of the War. The advantages were with the Union army, though Lee maintained his lines during the 18th, but at night withdrew and crossed the Potomac, ending the first invasion of the North. Lee remained a month about Winches-

ter, and upon the Union Army's crossing into Virginia and moving toward Winchester he took position behind the Rappahannock.

Near Warrenton, 7 November, McClellan was superseded by Gen. Ambrose E. Burnside, under an order dated 5 November. The latter took position opposite Fredericksburg 19 November, and, 13 December, forced a crossing into the city and below it. After great slaughter, largely incurred in assaults on Marye's Heights, he was repulsed and obliged to recross the river. The next month he attempted to cross above Fredericksburg and turn Lee's left. An unusual storm made advance impossible, the army finding itself actually stalled, the movement becoming known as the great Mud March. After this failure Burnside was relieved by Hooker 26 Jan. 1863.

The navy was active and effective throughout 1862. The blockade became exceedingly stringent for the Confederacy; warlike and commercial supplies alike were very difficult to obtain. On 11 January Gen. Burnside and Commodore L. M. Goldsborough sailed from Fort Monroe, capturing Roanoke Island 5 February, Newbern, 14 March, and taking Fort Macon with its garrison 26 April.

Gen. Butler and Admiral Farragut sailed from Fort Monroe 25 February for a move against New Orleans. After a terrific engagement, participated in by Commander D. D. Porter with his mortar-boats, and in which the Confederates exhibited great endurance, the chain across the river below forts St. Philip and Jackson was cut, and 24 April Farragut forced his fleet past the forts, and after terrific fighting, during which the Varuna was sunk by the fire of the forts, appeared before New Orleans on the 25th, Gen. Lovell, who held the city with a small force, some 3,000, retiring. Gen. Butler arrived with his troops 1 May, and took full possession, taking Baton Rouge 9 May, and Natchez on the 13th, neither being fortified. Farragut's fleet then ascended the Mississippi. He ran past the batteries at Vicksburg and joined Commodore Foote's (Davis') fleet from Memphis at Young's Point. Retiring to New Orleans, thus running the Vicksburg batteries a second time, he found letters from Washington urging him to clear the Mississippi. On 25 June his fleet, with Porter's mortar fleet, was assembled at Vicksburg, and on the 28th, after a short engagement, two ships and five gunboats ran the batteries and again joined Davis' fleet above the city. On 15 July the Confederate ironclad Arkansas came out of the Yazoo, ran directly through the Union fleet, none of its vessels having steam up, and gained the shelter of the Vicksburg batteries. Farragut ran the batteries that night, and attempted to destroy the Arkansas while passing the city wharves, but failed. On 20 July his fleet was ordered to New Orleans, where it arrived on the 29th.

Grant, from Corinth, 1 November, began his first move against Vicksburg, by ordering his troops forward to Grand Junction, purposing to move along the railroad by way of Holly Springs and Grenada to the rear of the city, while Sherman should co-operate from Memphis. A raid by Forrest destroyed long reaches of railroad above Jackson, and the destruction of the depot of supplies with its immense stores at Holly Springs, 20 December, by Van Dorn, effectually paralyzed Grant's advance toward Vicksburg.

During Forrest's and Van Dorn's operations east of the Mississippi Gen. T. C. Hindman, in Arkansas, attacked Gens. F. J. Herron and J. G. Blunt at Prairie Grove, but retreated after a severe engagement. On 16 December Gen. N. P. Banks relieved Gen. Butler at New Orleans.

Sherman was then sent, 20 December, from Memphis down the Mississippi to ascend the Yazoo and attempt the capture of the left flank of the defenses of the city at Haines' Bluff. He assaulted at Chickasaw Bayou, 29 December, with disastrous results, and returned to the mouth of the Yazoo, where he was met by Gen. J. A. McClernand with orders to assume general command. This officer at once moved up the Arkansas River with Porter's gunboat fleet and Sherman's and G. W. Morgan's corps, captured Fort Hindman 11 January, and returned to Young's Point. From this position the Vicksburg campaign of 1863 began, which opened the Union operations of that year.

The first attempt was to cut a canal across the peninsula opposite Vicksburg, which would allow the army to move below Vicksburg. After working on this from 22 January to 7 March, a flood destroyed it. Efforts were next made to open a way through Lake Providence to the Red River, making a circuit of 350 miles to a point below the city. Both this plan and one for the east side through the Yazoo pass leading to the rear of the city, being actively opposed by the Confederates, and found otherwise exceedingly difficult, were abandoned.

A way was finally found from Milliken's Bend by way of New Carthage to a point on the river opposite Bruinsburg. On the night of 16 April the memorable running of the Vicksburg batteries by the fleet of Admiral Porter, convoying transports, was successfully accomplished. The means of ferrying his forces over the Mississippi being thus secured, the advance of the army crossed 30 April. Port Gibson was captured 1 May, after a stubborn and most gallant defense against a greatly superior force by Gens. Bowen, Baldwin, and Cockrell. Grant was then on solid ground in rear of Vicksburg.

He moved at once to intervene between Pemberton at Vicksburg and Johnston, who was seeking a junction with Pemberton. Johnston was forced out of Jackson by Sherman's and Gen. James B. McPherson's troops 14 May. Grant then turned toward Pemberton, advancing from Vicksburg, defeated him at Champion's Hill on the 16th, again at Big Black Bridge on the 18th, whence Pemberton withdrew into Vicksburg, followed by Grant. On the 19th Grant ordered an assault, which was repulsed, and again on the 22d, with the same result. A regular siege was then undertaken, and Pemberton's army was starved out and surrendered 4 July.

On 24 May 1863, Gen. J. M. Schofield, who had been active and prominent in Missouri from the first, relieved Gen. Curtis in command of the Department of the Missouri. During the Vicksburg campaign he sent all troops that could be spared to Grant. Upon their return he was able to advance Gen. Steele to the line of the Arkansas and hold it thereafter. During 8–14 June Grant received a division from Gen. S. A. Hurlbut's command, under Gen. Sooy

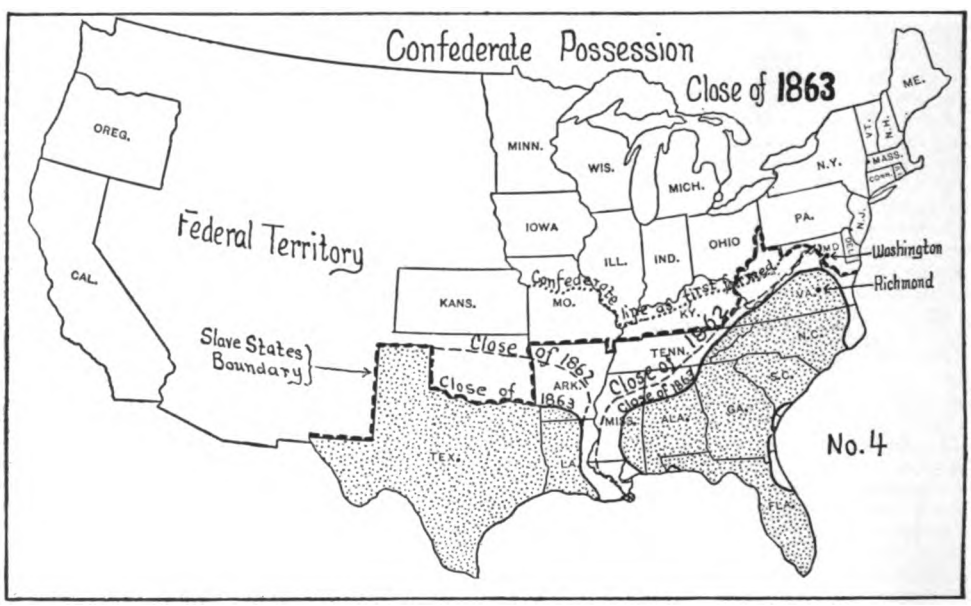
Smith, one from the Department of the Missouri, under Gen. Herron, and two divisions of the Ninth corps under Gen. J. G. Parke. During the operations of Gen. Grant about Vicksburg Gen. Banks was active in Louisiana. After three unsuccessful attempts against Port Hudson, which he twice assaulted, it finally surrendered, 8 July, upon hearing of the capture of Vicksburg.

In January, February, and March 1863, the Union ironclads under Admiral Dupont made unsuccessful attacks upon Fort McAllister in the Ogeechee River, but in one of them destroyed the noted blockade-runner Nashville. The Confederates were active on the North Carolina coast early in 1863, Gen. Hoke capturing Plymouth 20 April.

The campaign of the year in the Army of the Potomac was opened by Hooker. On 28 April Gen. John Sedgwick's corps was thrown across the Rappahannock at Fredericksburg, the rest of his army crossing above at Kelly's ford, and thence advancing across the Rapidan at Germanna and Ely's fords, to and beyond Chancellorsville. His force was fully twice that of Lee. On 1 May Hooker's advance fell back to Chancellorsville. On 2 May "Stonewall" Jackson's corps of three divisions was descried at different times during the day from several points of the Union line moving toward its right. No preparations were made to guard against a flank attack, though orders to that effect were early given. At 6 P.M., while the troops of the Eleventh corps holding the right were at supper, Jackson's solid columns burst upon them and disastrously routed the Union right. On the 3d Sedgwick's corps advanced from Fredericksburg to Salem Church, was defeated that afternoon, and recrossed the river on the night of the 4th. The night of the 2d Jackson, reconnoitering in front of his pickets, was mistakenly fired on by them and mortally wounded. On the 3d, by hot fighting, Hooker's lines were forced further to the rear. The 4th passed without an engagement, as Lee, with the greater part of his army, was at Salem Church. The night of the 5th Hooker, thoroughly defeated, recrossed the river, and his army was reassembled at Falmouth.

On 3 June Lee, from Fredericksburg, began his second invasion of the North, Longstreet's troops leading. After minor engagements in the Valley, Gen. R. S. Ewell's advance crossed the Potomac at Williamsport 15–16 June, moved forward to Chambersburg, and had reached the vicinity of Harrisburg and Columbia on the Susquehanna, and captured York 28 June, when recalled to Gettysburg, where Lee's army was concentrating.

Meantime, the Army of the Potomac under Hooker reached the vicinity of Frederick, when Hooker, not being allowed to order the garrison of Harper's Ferry, over 10,000 strong, to join him, asked to be relieved, and Gen. George G. Meade succeeded him. The two armies met



forced out of his lines and retreated over the Cumberlands and across the Tennessee to Chattanooga. It was chiefly a strategic campaign, carried on in continuous rains of most unusual severity, occupying nine days, and involving a total loss of only 560 killed, wounded and missing. The Union line advanced to the western base of the Cumberland Mountains.

The succeeding campaign, having Chattanooga for its objective, required extensive repairs to the railroad and an accumulation of supplies sufficient for leaving a base for a month, and moving in a mountainous region largely barren. The movement began 16 August. Bragg was at Chattanooga. Rosecrans' army lay along the western base of the Cumberlands from Winchester to McMinnville. Rosecrans feinted with his left corps, Gen. T. L. Crittenden's, by throwing it from McMinnville over the mountains, its advance being into the valley of the Tennessee above Chattanooga. This led to the belief that a junction was to be formed with Burnside from Knoxville, or an attack made upon the city from that quarter. Bragg, as a result, fixed his attention upon this move. Meantime the centre corps, Thomas', and the right, Gen. A. McD. McCook's, crossed the Cumberlands and the Tennessee River some 30 miles below Chattanooga, continued over the Sand Mountains, and ascended the Lookout range — all bold mountains with palisaded summits crossed only by very difficult and widely separated mountain trails. When Rosecrans' columns were ascertained to be on Lookout, Bragg, 7 and 8 September, withdrew from Chattanooga, the heads of the Union columns having in the meantime descended into McLemore's Cove, south of Chattanooga. Upon Bragg's reaching Lafayette, 26 miles south of Chattanooga, he awaited Longstreet's arrival from Virginia, meantime unsuccessfully demonstrating against Rosecrans' centre and left east of Lookout in the valley of the Chickamauga. Crittenden's corps, after having accomplished its diversion, had crossed the Tennessee, left one brigade in Chattanooga, 9 September, and moved south through Rossville to a position on Rosecrans' left at Lee and Gordon's Mill on the Chickamauga. Bragg, strengthened by Longstreet, started back 17 September toward Chattanooga, seeking to interpose between Rosecrans and that city. Rosecrans, by a night march, 18 September, proceeded toward Chattanooga, formed his lines between Bragg and the city, nine miles south of it, at Chickamauga. A two days' battle, 19 and 20 September, ensued for the possession of the roads to Chattanooga. At noon of the second day Longstreet broke through a gap at the centre of the Union lines, cut off two divisions of the right wing, and forced them with fragments of other divisions from the field, Rosecrans, McCook, and Crittenden being caught in the break. Gen. Thomas, with the greater part of seven divisions, held the field, and at night withdrew to Rossville and there reformed the army between Bragg and the city, thus securing its possession without further fighting. Bragg advanced on the 22d, and formed his lines in front of the city, which Rosecrans soon rendered impregnable by heavy earthworks. Bragg's lines embraced Lookout Mountain and Missionary Ridge, heights overlooking the city, the mountain position closing the river line of supplies. The situation of the Union army soon became precarious for want of food and forage. Hooker, with the Eleventh and Twelfth corps was ordered from the Army of the Potomac, reaching Bridgeport 30 September; and Sherman, with four divisions from the vicinity of Vicksburg. Grant was assigned to general command, arriving 23 October. Rosecrans was replaced by Gen. George H. Thomas 19 October. The river line of supplies was opened 28 October upon a plan devised by Gen. Rosecrans and executed by Gen. W. F. Smith, Hooker being brought forward to Lookout Valley, and troops from Chattanooga forming a junction with him. The battle of Chattanooga occupied three days. On 23 November Thomas, in the centre, threw forward one division, supported by four, and captured the advanced line of Bragg. The night of the 23d Sherman crossed the river six miles above the city and seized an unoccupied range overlooking the north end of Missionary Ridge. On 24 November Hooker carried the western and northern slopes of Lookout Mountain, and the next day moved against the south end of Missionary Ridge. The afternoon of 25 November Thomas, at the centre, assaulted Missionary Ridge, his storming line being two and a half miles front, carried the earthworks at the foot of the ridge, and next the ridge itself, capturing 37 guns on the summit, and forcing a general retreat. From this time Chattanooga remained in Union control to the close of the war. (See CHATTANOOGA, BATTLE OF; CHICKAMAUGA, BATTLE OF.)

The same day that Rosecrans started from Winchester, Tenn., for Chattanooga, Burnside with the Army of the Ohio (Twenty-third corps) left Lexington, Ky., for Knoxville, Tenn., his Ninth corps being still with Grant near Vicksburg. He reached Knoxville 2 September. Being ordered to assist Rosecrans at Chattanooga, he was held by demonstrations of a small force from making the junction. On 4 November Bragg despatched Longstreet's corps from Chattanooga to besiege Knoxville. On the 29th he assaulted Fort Saunders and was repulsed with serious loss. Sherman, who was sent by Grant from Chattanooga after the success there, now approaching, Longstreet retreated to Virginia. On 16 December Burnside was relieved and ordered to recruit the Ninth corps, which was assembled at Annapolis.

Throughout these operations both Union and Confederate forces in Charleston harbor had been engaged in formidable attack and most stubborn and brillant defense. Gen. Gillmore, who had reached Charleston 12 June, immediately undertook engineering and siege work of unprecedented character as to success at long ranges; and finally, after several severe repulses, forced the evacuation of Fort Wagner 7 September, and soon shells reached the city from his long-range guns. While some of these fell in Charleston 31 August, the regular bombardment began 16 November.

On 28 Jan. 1864, Gen. Rosecrans was ordered to relieve Gen. John M. Schofield in Missouri, the latter being assigned a little later to the command of the Department and Army of the Ohio at Knoxville. Gen. Rosecrans repulsed the invasion of Gen. Price, and then sent troops not needed to Gen. Thomas at Nashville. On 20 February an expedition sent from Charleston to Florida by Gen. Gillmore under

Gen. Seymour, was disastrously defeated by Gen. Finegan at Olustee. From February to December 1864, Gen. Forrest was active throughout west Tennessee and northern Mississippi and Alabama, performing much brilliant cavalry service, to the continued disturbance of all Union commands in those regions.

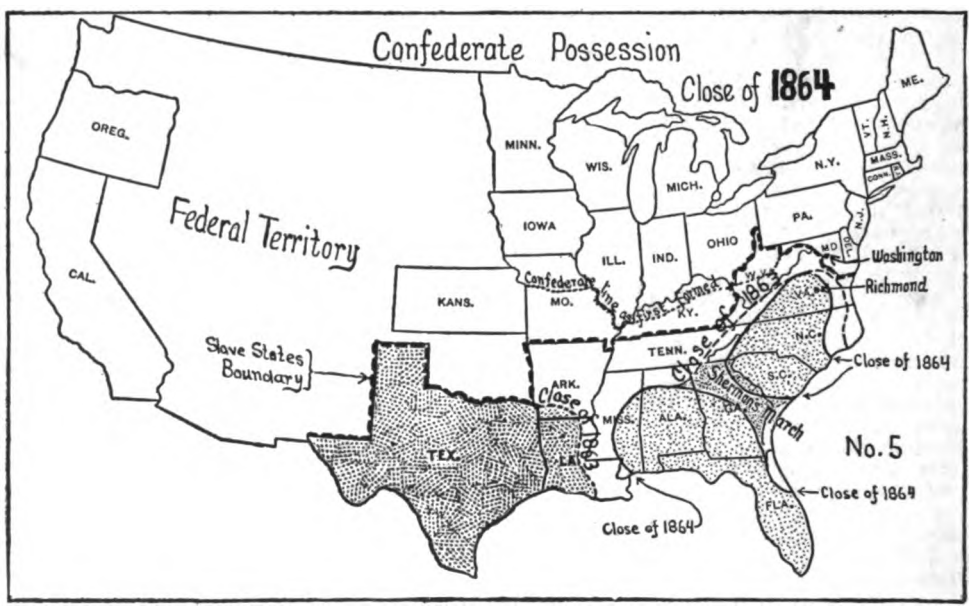
Early in the spring of 1864 Banks, supported by Admiral Porter's fleet, was ordered to advance up the Red River. At Sabine Crossroads 8 April, he was defeated and driven back to Pleasant Grove, and thence to Pleasant Hill 13 April, where A. J. Smith, from Sherman's army, re-enforced him. The fleet narrowly escaped capture by the falling of the river, and altogether the campaign was a decided failure. The defeat of Banks enabled the Confederate general, J. F. Fagan, to force Gen. Frederick Steele, who was advancing to co-operate with Banks, back to Little Rock. Banks was relieved 12 May by Gen. E. R. S. Canby.

On 12 March 1864, Gen. Grant, who had been commissioned lieutenant-general, that grade having been revived by Congress, was placed in command of all the armies. Early in April he had formed a plan for a combined movement of the armies to begin toward the last of the month, and had communicated the same to Meade with the Army of the Potomac, Butler at Fort Monroe, Sherman at Chattanooga, and Banks at New Orleans. The main Confederate armies were those of Lee, at Orange, with Longstreet at Gordonsville, confronting Meade in the vicinity of Culpeper, and Johnston at Dalton, Ga., facing Sherman in the vicinity of Chattanooga.

Grant's general plan was for Gillmore, from South Carolina, with 10,000 men, to join Butler at Fort Monroe, giving him 23,000 troops for a move up the James to capture City Point, threatening Petersburg and the rear of Richmond. Burnside, with 25,000 men assembling at Annapolis, was to join Meade, and the Army of the Potomac was to advance toward Richmond by Lee's right. Sherman, with three armies, the Cumberland, under George H. Thomas, the Tennessee, under McPherson, and the Ohio, under Schofield, aggregating nearly 100,000 men, was to move against Johnston's army at Dalton and follow it. Banks was to leave the Red River country to Steele and the navy, abandon Texas, and move against Mobile with his 25,000 men, re-enforced by 5,000 from Missouri.

Grant established his headquarters with the Army of the Potomac, Meade having the full direction of the army under Grant's general orders. The Army of the Potomac moved toward the Rapidan in the early morning of 4 May, and by night all the troops had crossed.

Grant's force was about 119,000, and Lee's about 62,000. Lee pushed rapidly to his right and struck Grant's advance in the Wilderness 5 May. Terrific fighting followed till the night of the 6th. Lee pushed on to Spottsylvania, reaching it in advance of Grant and interposing on the



line to Richmond. Both armies entrenched, and from the 8th there was bitter fighting until the night of the 20th, when Grant started for North Anna. From Spottsylvania 8 May, Sheridan, commanding Grant's cavalry, made a raid around Lee's army, encountering and defeating J. E. B. Stuart at Yellow Tavern 11 May, where Stuart was killed. Sheridan spent a day within the outer defenses of Richmond, and joined Butler on the James. Grant proceeded to move to his left, everywhere opposed by Lee, fighting heavily at North Anna and Bethesda Church, reaching Cold Harbor 2 June. On the 3d Grant assaulted along his whole line, to meet in an hour with terrible slaughter and repulse, so serious that an order for a second assault was not carried out. Grant had failed to interpose between Lee and Richmond. From Cold Harbor he sent Sheridan with his cavalry to occupy the attention of Fitzhugh Lee's and Hampton's cavalry while he withdrew to the James. Sheridan defeated both at Trevilian's Station. Grant

then moved without interruption to the James, reaching it 13 June, and crossing it in the vicinity of City Point and Bermuda Hundred. Gen. Butler had occupied these points 5 May. On the 14th Butler carried the outer defenses of Drewry's Bluff, but was thence driven back by Beauregard's troops, who had arrived from the south, and his contemplated movement toward Petersburg and the rear of Richmond was defeated. Lee occupied the Petersburg lines. Grant attacked the works several times unsuccessfully from 15 to 18 June. On 30 July an attempt on the works was made by exploding a mine. The explosion was a great success, but the assault to follow it was a failure. This was the battle of The Crater.

From the establishment of Grant's lines before Petersburg frequent and heavy fighting continued until about 1 November, but with little permanent impression on Gen. Lee's lines. The Union left, however, was extended across the Weldon R.R. On 28 September Gen. Butler, with two corps, crossed to the north side of the James and captured Fort Harrison, a position from which Richmond was seriously threatened. On 16 November Butler, supported by Porter's fleet, was sent to capture Fort Fisher, but failed. During the winter the lines of each army were greatly strengthened. On 7 December Grant had extended his left 20 miles to Hicksford on the Weldon R.R. On 22 June Gen. James H. Wilson, with two divisions of cavalry, moved against the railroads south of Richmond, destroying nearly 50 miles of track, and inflicting much other serious damage. His return route was blocked, but he brought his forces in with some loss of both artillery and trains. He had severed all railroad connections with Richmond, and they were not fully restored for several weeks. Gen. Franz Sigel's campaign began 1 May. On the 15th he moved up the Shenandoah to New Market, and was defeated, cadets from the Virginia Military Institute taking prominent part. At Grant's request Sigel was suspended and Gen. David Hunter assigned. The latter pushed on to Lynchburg, but was compelled by Gen. Jubal A. Early to retreat from that point by way of the Kanawha and Ohio rivers to Parkersburg, and thence by rail to the east. Gen. George Crook's wing of Sigel's column from the Kanawha penetrated to the Tennessee and Virginia R.R. at Wytheville.

On 6 May Gen. Sherman moved from the vicinity of Chattanooga against Gen. Johnston at Dalton. The Union army had in round numbers 100,000, the Confederates being about half as strong. After vainly attacking the gaps and ranges in front of Dalton for several days, Sherman passed his army through Snake Creek Gap leading to the rear of Dalton. This compelled Gen. Johnston to retire from his camps, and he was defeated at Resaca. Johnston resisted stubbornly at every step, but he was successively flanked out of every new position until he reached Atlanta. Fighting had been in progress at some points of the line from May till September. Johnston was succeeded by Hood 18 July, and on the 20th Hood attacked at Peach Tree Creek, and was repulsed with great loss. He then moved out of Atlanta and attacked, and was again defeated. Gen. McPherson, commanding the Army of the Tennessee, was killed. The next attack was at Ezra Church 28 July, upon the Army of the Tennessee, this also being repulsed after three hours' severe fighting, with much loss.

On 2 September Sherman occupied Atlanta, which was evacuated as a result of his moving to the rear of the city on Jonesborough. Hood first raided Sherman's railroad communications, fighting heavily at Allatoona 5 October, and soon after moved northward. Gen. Thomas was sent to resist his movement if he invaded Tennessee, and Sherman started 15 November on his March to the Sea. While it was originally intended by Gen. Grant that he should move from Atlanta to Mobile, the harbor there having been captured 5–23 August by Farragut and Canby, he decided upon the alternative which Grant had suggested before the campaign opened, and started for Savannah.

The fight of Farragut's fleet in the harbor of Mobile, which decided Sherman's march to Savannah, was one of the most brilliant in naval warfare. The Confederate fleet was destroyed, including the far-famed ironclad ram Tennessee. Sherman reached Savannah with slight opposition. On 17 December he summoned Hardee to surrender. The latter refused, and on the night of the 20th retired with his force of 10,000 without molestation. The next morning the Union army entered.

Meantime Hood had invaded Tennessee with the entire army with which Sherman's three armies had been confronted from May till September. Gen. Thomas left with two small but excellent corps, by great exertion organized an army to oppose Hood. On 30 November Gen. Schofield, commanding in the field in front of Hood, inflicted a nearly fatal blow upon him at Franklin. After Gen. Thomas' forces were united at Nashville 15–16 December, he attacked Hood's entrenchments in front of the city and dispersed and practically annihilated his army.

The forced retreat of Hunter from Lynchburg over the mountains of West Virginia left the Shenandoah unprotected. Gen. Early entered it, drove Sigel across the Potomac, then on 9 July defeated Wallace, who was in small force at Monocacy, Md., threatened Baltimore and appeared before Washington 11 July. Here he was met by veterans of the Sixth and Nineteenth corps, Army of the Potomac, hurried to Washington by Grant, and forced into rapid retreat. Upon the withdrawal of the troops from the Army of the Potomac Early again sent a force under Gen. John McCausland, into Pennsylvania, and these invaders burned Chambersburg 30 July. Sheridan, being assigned to command, forced Early beyond Staunton; and devastating the Valley, he withdrew to Cedar Creek. While Sheridan was absent Early attacked and drove the army out of its camps. Gen. H. G. Wright, however, rallied the troops near Middletown and restored the battle. Sheridan arriving, the army advanced, and Early was so seriously defeated as to close the campaign in the Valley.

The first movement of the final campaigns of 1865 began 2 January in Tennessee, when Gen. Schofield with the Twenty-third corps left Columbia, Tenn., for Clifton on the river bound for the east. The corps left Alexandria on transports soon after 1 February, and landed at the mouth of Cape Fear River 9 February,

where the Tenth corps was established, which, under Gen. Alfred H. Terry, had captured Fort Fisher, that had been most stubbornly and gallantly defended against the army and the fleet by Gen. W. H. C. Whiting. Fort Anderson was attacked by army and fleet, and abandoned 19 February; the position of Town Creek was carried 20 February, and Wilmington was taken 22 February. Operating next by way of Newbern, Gen. R. F. Hoke was defeated at Kingston 10 March. Goldsboro was occupied by Gen. Schofield on the 21st. Sherman's army joined Schofield here on the 23d. On 26 January Gen. Terry had been despatched to co-operate with Admiral Porter in reducing Fort Fisher at the mouth of Cape Fear River. A previous expedition under Gen. Butler, 13–16 December, had failed, but the fleet had remained, and Porter had appealed to Grant to send another force. Terry's troops effected a landing above the fort 13 January. The next morning he was entrenched across the peninsula. Early on the 15th the fleet opened a terrific bombardment, which was continued until a force of marines was landed in the afternoon to co-operate in the assault of the army. This was delivered at 3.30 in the afternoon, the flank of the work next the river being carried. Then followed severe fighting for each succeeding traverse. It was not until 10 o'clock at night that the fort was finally carried. Sherman started northward from Savannah 1 February. Marching through swamps, and crossing all streams at flood, he was before Columbia on the 16th. It was surrendered without fighting the next day. Charleston, being cut off from interior communications, was evacuated by Gen. W. J. Hardee 18 February. Fayetteville, N. C., was reached 11 March. The first opposition stronger than skirmishing was at Averasboro 16 March, where Gen. Hardee made a brief stand. On 19 March Johnston's army, which had been collected on Sherman's front at Bentonville, checked his advance and nearly overwhelmed his left wing before the right wing, which was widely separated from the left, could reach it. On the 21st Johnston was defeated after sharp fighting, and Sherman marched for Goldsboro, which he reached 23 March.

On 2 March Sheridan advanced up the Valley, defeated Early at Waynesboro, and proceeded through Charlottesville and along the Richmond & L. R.R., destroying roads and stores, and joined Grant at Petersburg. Gen. James H. Wilson, operating under Gen. George H. Thomas, crossed the Tennessee 22 March with a thoroughly equipped mounted force of 12,500, and 1,500 dismounted to follow until horses could be captured. His first objective was Selma, Ala. A portion of Forrest's cavalry was encountered and defeated at Montevallo 30 March. The fortifications of Selma were carried against Forrest 2 April, and immense war supplies and plants for the manufacture of war materials destroyed. Montgomery surrendered 12 April; West Point was captured 15 April,

after sharp fighting; Columbus was carried by a night assault 16 April; Macon surrendered 20 April. Here Wilson received notice of the Sherman–Johnston truce. An expedition, sent out 7 May by Wilson from Macon, under Col. Pritchard, Fourth Michigan, captured Jefferson Davis, 10 May, at Irwinsville, Ga. On 6 February the Confederates made a heavy attack at Hatcher's Run on Grant's left, but were finally repulsed with a Union loss of about 1,500. The night of 24 March Gen. J. B. Gordon made a daring and most successful assault upon the right of Grant's lines at Petersburg, capturing Fort Stedman and three strong works. These were recaptured the next day.

The Army of the Potomac was the last to move in the opening campaigns of 1865. It had occupied its lines before Petersburg without general movement from November till the last of March. The general movement, which was to the left, began on the 29th, and brought on

the battle of Dinwiddie Court House and White Oak Road on the 31st, and the battle of Five Forks on April 1st, in which latter engagement the Confederates were defeated. On 2 April the Confederate entrenchments were carried, and Gen. Lee abandoned his lines during the night, having notified President Davis during the forenoon that he would begin a retreat on Amelia Court House that night. Jefferson Davis received this dispatch in church. He and his Cabinet immediately collected personal effects and Confederate archives, and left Richmond on a special train. Gen. Godfrey Weitzel received the surrender of the city on 3 April.

Gen. Lee's army was assembled at Amelia Court House 5 April, and continued its retreat at night. On the 6th Gen. Meade advanced on Amelia Court House, but, finding that Gen. Lee had left, he moved toward Deatonsville (Sailor's Creek), where the most of Ewell's corps, the rear of Lee's army, was captured 6 April. About the same time some 10,000 men of the divisions of Anderson, Pickett, and Bushrod Johnson, were captured. Lee continued his retreat and reached Farmville on the morning of the 7th. Here his troops received their first rations since the retreat began. At 11 o'clock, Union troops appearing, the march was renewed, his men being greatly exhausted with loss of sleep, hunger, and hard marching. On this day the correspondence began between Gens. Grant and Lee, which, on the 9th, resulted in the surrender of Lee's remaining forces at Appomattox. The number paroled was 28,231 officers and men, extra duty men, and detailed men of every description, this remnant being all that was left within the control of Gen. Lee of his magnificent fighting machine, the Army of Northern Virginia.

In North Carolina Sherman and Schofield moved against Johnston, occupying Raleigh 13 April. On the 14th Johnston asked for a conference, and on the 18th terms of surrender were agreed upon, subject to the approval of the President of the United States. These, being deemed in part political, were disapproved, and Gen. Grant was sent to Raleigh to insist upon the same terms made with Lee. These Gen. Sherman demanded of and received from Gen. Johnston 26 April, and the War was over, though small independent forces were in the field for a short time thereafter, Gen. Dick Taylor, in Alabama, not surrendering to Gen. Canby till 4 May.

President Lincoln made nine calls for troops during the War. Under these about 2,800,000 men of all classes were enlisted, including emergency men of a few weeks, three, six, and nine months' men, two and three years' men, conscripts and substitutes. There were 52,000 drafted men held to service; 75,000 conscripts who sent substitutes; and 42,000 men who sent substitutes, although not themselves drafted.

The Confederate records are very deficient, having been largely destroyed. The best estimate from the data in the possession of the war department places the Confederate strength at something over 1,000,000. After Mr. Davis' calls of the first year a general conscription act was passed 16 April 1862, including all white men between the ages of 18 and 35 for the term of 3 years. On 27 Sept. 1862, this act was extended to include those of 45 years. On 17 Feb. 1864, the law was extended to those between 17 and 50, the term to be for the war.

According to the latest compilation of the record and pension office of the War Department, the total number of deaths from all causes in the Union army during the War was 359,528. As many records are incomplete, the actual number must be somewhat larger. On the basis of the figures given, there were killed in action, 67,058; died of wounds received in action, 43,012; died of disease, 224,586. The Confederate losses were quite as severe in proportion to strength, but the records are wanting to such an extent as to make definite estimates of little value.

H. V. Boynton.

Civil Wars of Rome, The, in their widest extent began with Tiberius Gracchus, and terminated with the election of Octavius Augustus to the empire, 133–131 B.C. In a more limited sense they mean the contest between Caius Marius and Cornelius Sylla, or Sulla (88–78 B.C.). The original cause of the civil war was the struggle between the oligarchy and the democracy of Rome. This struggle lasted till Sylla restored the senate to sovereignty; but this sovereignty was soon disturbed by Julius Cæsar (q.v.).

Civilian, in common speech a word denoting a person whose employments are wholly of a civil character as distinguished from one who belongs to the army or navy, while in legal acceptation it designates one who is learned in civil or Roman law.

Civi'lis, Germanic leader of the Batavi in their revolt against the Romans, 69–70 A.D. At one time he held a command in the Roman army, but being more than once charged with treason he escaped and roused the Batavians, his countrymen, to rebellion. Pretending to espouse the cause of Vespasian against Vitellius, he raised a powerful army, and inflicted severe defeats on the Romans. An imposing force sent against him he routed and shut up in the military station, Vetera Castra, which after a long siege capitulated, on which all its defenders were slaughtered. Fortune at last for-

sook him, and he had to negotiate with the Romans, the Batavians returning to their allegiance. His fate is unknown.

Civiliza'tion (from the Latin *civilis*, "like a citizen" (*civis*), that is, having the virtues or qualities of a citizen), a term that may mean many things, but is commonly applied to the upward movements of peoples toward higher intellectual, moral, social, and industrial altitudes. "Whatever," says John Stuart Mill, "be the characteristics of savage life, the contrary of these, or the qualities which society puts on as it throws off these, constitutes civilization." The word means, therefore, social progress, the improvement or perfecting of the laws, both written and unwritten, which make for security and peace, and the harmonious development of individual life. The word is often used relatively, meaning the dominant influences of the present period, as when we speak of "our civilization." The most eminent writers who have dealt with this subject have chosen to treat it in different ways. Guizot in his history writes of political or institutional progress, and thus his definition of civilization differs from that of Buckle, who, minimizing institutions as resultant forces, treats the individual as paramount. Many are the influences that determine the character of civilization. Among these Buckle places climate, soil, food, and what he terms the "General Aspect of Nature." To these influences he attaches, perhaps, undue importance, inclining to the minimizing of those innate or inherited qualities in the different races of mankind. His history is written from the view-point of a necessitarian. His theory that moral truths are stationary, intellectual truths alone progressive, and that religion has done more harm by its persecutions than good by its moral and spiritual ministrations, must be taken as showing the bias of an otherwise valuable work, the chief merit of which is its assertion of the claims of the individual against interference in the name of authority. Not all writers hold to the view that our present civilization is a development from primitive rude conditions, but, on the contrary, contend that it was the original state of mankind from which the savage races have in reality descended, and that our present civilization is therefore an artificial approximation to conditions prevailing before the descent. But the other view — namely, that civilization is a development out of barbarous beginnings — is the one commonly held.

A kind of civilization may exist based upon laws and customs which constitute a survival of barbarism, and which are working for the overthrow of institutional civilization which other forces are laboriously building up. Thus ancient civilizations, the democracies of Sparta and Athens, were based upon slavery — the civilization of much of Europe, upon a burdensome militarism that saps its strength. It is hard to say what constitutes a true civilization judged by its fruits, but it may be said to be based primarily upon respect for human rights. Wherever a society exists in which classes are deprived of the fullest participation in its opportunities, there, it may be said, true civilization cannot flourish, however brilliant may seem its achievements, however pleasing its outward countenance, however gracious its aristocracy. Civilization is progress (Guizot's definition) only as society moves forward as a whole. Nor is it in its arms and powers of conquest, but in its domestic virtues that its greatness consists. Augustus did more to make lasting the greatness of imperial Rome when he strove to promote her domestic life and her civic virtues than did the long line of emperors who sought the destruction of her rival cities. Civilization is not a chain in which every link is apparent, though doubtless such links there are. With the age of Charlemagne, the old civilization receded, and the new was born. But this was so only in appearance, since the race is forever in process of development; it is at no one minute what it was the minute before. Every period marks as stupendous if invisible a change from the old to the new. The ancient bonds are not broken; they loosen and fall off. The spectacle of nations rising to greatness from small beginnings, and then slowly sinking, the prey to conquerors from without and internal forces from within, has constituted the perpetual enigma to those who have written histories of civilizations. Yet some later science of history will make the secrets of their decay and death as obvious as the methods by which in their beginnings they rose to greatness and power. The reasons will be found in the denial of natural justice and natural equality among men. From the past it may be predicted with tolerable safety that there will be progress on the whole; that the progress will be intermitted and interrupted; and that it will never, perhaps at the best, be quite as satisfactory as it might be.

Bibliography.— Buckle, 'History of Civilization'; Guizot, 'History of Civilization'; Mackinnon, 'History of Civilization'; Kidd, 'Principles of Western Civilization'; Draper, 'Intellectual Development of Europe'; Maine, 'Village Communities in the East and West'; Tylor, 'Researches into the Early History of Mankind'; Tylor, 'Primitive Culture'; Wachsmuth, 'Allegemeine Kulburgeschichte.'

Civiliza'tion, An Introduction to the History of, a noted work by Henry Thomas Buckle, published 1857–61. Although the progress of science has uncovered facts that prove the weakness of an occasional principle in the 'History of Civilization,' the work remains one of the greatest popular contributions of modern times to the new aspect of history, as a human document, to be read by the light of scientific discovery. No book of its time was more influential in turning the direction of men's thoughts to the phenomena of social and political science.

Civilization in Europe, a history, by François Guizot. In this work Guizot begins with the fall of the Roman empire, and ends with the opening of the French Revolution. Although he analyzes all the important facts of history between the great landmark of 476 and the convocation of the States-General in 1789, he is far more anxious to grasp their import than to give a vivid relation of them; and therefore, facts in themselves play but a small part in his exposition. They are simply a help in his effort to discover the great laws that direct the evolution of humanity, and to show its development in the individual and in society. His investigations are limited to purely social development, and he does not touch upon the intellectual side of the question.

Civita-di-Penne, chē-vē'tä dē pĕn'nä, Italy (the ancient PINNA-VESTINA), a small town in the province of Teramo, Naples, built on two hills, 29 miles east by north of Aquila. It was formerly a place of importance. The Normans, under Roger I., made it the capital of their kingdom.

Civita-Vecchia, chē'vẹ-tä vĕk'kē-ä. See CITTA VICCHIA.

Civitali, Matteo, mät-tā'ō chē-vē-tä'lē, Italian sculptor and architect: b. Lucca 1435; d. 1501. He followed the occupation of a barber until about 1470, when he suddenly rose to the highest rank among the sculptors of his time. His first important work was the mausoleum erected in the cathedral at Lucca to Pietro de Noceto, secretary to Pope Nicholas V. His greatest works are six statues of white marble in the same church, representing personages of the Old Testament. Among his architectural works is the Bernardini palace at Lucca, of simple style, and also the little temple which contains the miraculous crucifix in the church of St. Martino. The Uffizi Gallery at Florence contains Civitali's statue of 'Faith.'

Civoli, chē'vō lē, **Ludovico.** See CIGOLI LUDOVICO CARDIDA.

Clackmannanshire, klăk-măn'ạn shēr, Scotland, the smallest county, being only about nine miles long, seven wide, and comprising an area of about 35,160 acres or 55 square miles. By the recent readjustment of county and parish boundaries the parish of Alva, formerly a detached portion of Stirlingshire, was added to the county, increasing its area by over 5,000 acres. It lies on the north side of the Forth, by which it is bounded southwest. On all the other sides it is enclosed by the counties of Perth, Fife, and Stirling. The north part of the county is occupied by the Ochil Hills, but the other portions are comparatively level, and in general are exceedingly fertile, yielding large crops of oats, barley, wheat, and beans, turnips, and other green crops. The minerals are valuable, especially coal, which abounds. There are ironworks, breweries, and distilleries, woolen manufactures, tanning, glass-works, etc. The principal towns are Alloa (the largest), Alva, Tillicoultry, Dollar, and Clackmannan; the last is nominally the county town. It is rather poorly built, but has an interesting old tower and an old market-cross. Pop. (1901) 32,019.

Clacton-on-Sea, England, a popular watering-place on the coast of Essex, 15 miles southeast of Colchester, with admirable facilities for sea-bathing, and of easy access from London both by railway and steamboat. It stands on cliffs over 40 feet high, and has a town-hall, a church in the early English style; a long ocean pier, etc. Pop. (1901) 7,453.

Cladel, Léon, lā-ôn klä-dĕl, French romancist: b. Montauban 1855; d. 1902. He rose suddenly into prominence with his story, 'The Ridiculous Martyrs' (1862), a satirical description of the lower walks of literature in Paris. This first success was repeated with the later novels: 'Eral the Tamer'; 'One Qouael'; the 'My Peasants' series; 'Barefoot'; 'A Woman Under Ban,' for which he suffered four weeks' imprisonment; and many others.

Cladium, klā'dĭ-ŭm, a genus of plants of the sedge family (*Cyperaceæ*), with about 30 species natives of tropical or temperate climes. There are only three species found in America, of which the most common is the twig-rush (*C. mariscoides*), found in marshes from Minnesota eastward to Nova Scotia, and southward to Florida. This plant is very common in certain of the fenny districts of England, where it is used for thatching.

Cladocera, klạ-dŏs'ẹ-rạ, a group of *Crustacea* forming a sub-order of the order *Branchiopoda,* and by some authors regarded as an independent order. It is represented by the little water-flea, *Daphnia,* in which the body, consisting of few segments, is protected by a bivalvular shell, though the head, with its antennæ, is uncovered. The legs are short and leaf-like. It lays summer and winter eggs, the latter enveloped in a peculiar shell, the "ephippium," and the young develop in a space between the shell and the back of the animal, which forms a brood-pouch.

Cladrastis, klă-drăs'tĭs, a genus of the pea family, with two species, one in Manchuria, the other (*C. lutea*) in eastern United States. The American or Kentucky yellow-wood is a species with smooth bark, and sometimes grows above 50 feet in the rich soils of Kentucky and Tennessee. The wood, which weighs about 40 pounds to the cubic foot, is strong and hard, and of a bright yellow color. It produces a dye of considerable commercial value.

Claflin, Horace Brigham, American merchant: b. Milford, Mass., 18 Dec. 1811; d. Fordham, N. Y., 14 Nov. 1885. He received a common school education, worked in his father's store until he was of age, when he went to Worcester, Mass., and in partnership with his brother-in-law, engaged in the dry goods business on a large scale. In 1843 he established in New York the firm of Bulkley & Claflin, importers and jobbers of dry goods; in 1851 it became Claflin, Mellin & Company, and in 1864 H. B. Claflin & Company, by which it is best known. Mr. Claflin conducted an enormous business extending all over the country, and since 1864 it has been the largest mercantile business in the United States, its sales in a single year having reached $72,000,000. Its financial strength, and the money markets' firm confidence in Mr. Claflin's methods and integrity, enabled the firm to pass safely through most of the financial crises of the last 40 years. In 1861 and in 1873 it had to ask for slight extensions of time in which to settle accounts, but all were paid with interest before maturity. Mr. Claflin was a man of domestic tastes, fond of books and horses, a regular attendant of Plymouth Church, Brooklyn, and an intimate friend of his pastor, Henry Ward Beecher.

Claflin, Mary Bucklin, American prose writer: b. Hopkinton, Mass., July 1825; d. Whitinsville, Mass., 13 June 1896. She was the second wife of William Claflin (q.v.). For 18 years she was a trustee of Boston University; and of Wellesley College from its foundation till her death. Among her publications are: 'Brampton Sketches'; 'Recollections of Whittier'; and 'Under the Elms.'

Claflin, William, American governor: b. Milford, Mass., 6 March 1818. He was educated in the public schools and at Brown University. For many years he was engaged in

the shoe and leather business in St. Louis, Mo., but later settled in Boston, Mass. He was elected to the State House of Representatives 1849–52; to the Senate 1860 and 1861; was a member of the Republican National Committee 1864–75; lieutenant-governor of Massachusetts 1866–9; and governor 1870–2. From 1877 to 1881 he was a Republican member of Congress. The degree of LL.D. was conferred on him by Harvard and Wesleyan universities.

Claflin University, a co-educational institution in Orangeburg, S. C.; organized in 1869, under the auspices of the Methodist Episcopal Church, exclusively for the colored race. Professors and instructors, 31; students, 713; volumes in the library, 5,600; grounds and buildings valued at $150,000; income, $14,000; president, L. M. Dunton, A.M., D.D.

Claghorn, Kate Holladay, American writer: b. Aurora, Ill., 12 Dec. 1863. She was educated at Bryn Mawr College, and has been engaged in research work for the United States Industrial Commission. Besides contributions to periodicals, she has published 'College Training for Women' (1897).

Claiborne, klā'bôrn, or **Clayborne, William,** American colonial adventurer: b. Westmoreland, England, about 1589; d. about 1676. He was of good family and became surveyor of the Virginia plantations for the London Company in 1621; settled at James City, and acquired 45,000 acres of land. In 1625 he was commissioned by Charles I. a member of the colony's council, and its secretary of state. In 1628–31 he received commissions, and in 1631 a royal patent, for discoveries and trade with the Indians; and about 1631 discovered and partially planted Kent Island in Chesapeake Bay, which settlement was accorded a burgess in the Virginia Assembly. In 1632 Lord Baltimore was given his Maryland charter, saving the rights of previous settlement; and his first colony arrived in March 1634. Finding Claiborne's island within his limits, he at once claimed title to and sovereignty over it, alleging that Claiborne's patent was only a trading right, giving neither title to soil nor political rights. Claiborne, however, claimed both ownership and independence, in which Virginia sustained him. He was at this time carrying on an extensive Indian trade in partnership with a London house in armed vessels, and he endeavored to prejudice the Indians against the new colony. Capt. Cornwallis of the latter retaliated in 1635 by assailing and capturing one of his vessels, in a fight in which several lives were lost. This misfortune, and the burning of his warehouse, aroused the suspicions of his partners, who sent out an investigating agent, to whom he turned over the Kent Island property and went to England. There he was sued for account, and indicted for rebellion; but this seems not to have been pressed. Meantime the agent seized all Claiborne's Virginia property, and acknowledged Baltimore's title and sovereignty in Kent Island. Claiborne then bought Palmer's Island at the head of Chesapeake Bay, supposing it beyond Baltimore's grant, and asked the king for an injunction to restrain Baltimore from interfering with him, and for a grant of lands along the Susquehanna. The king referred it to the commissioners of plantations, who ignored the purchase, refused the grant, and sent him to the courts for the injunction. Claiborne's party in Kent Island continuing insubordinate, Gov. Calvert reduced it and seized Palmer's Island also. Ousted from all his settlements, Claiborne petitioned for a grant of some island he might discover *within* the company's patent. This, too, was refused, but Charles made him treasurer of Virginia for life. He at once became a leading political director. During the English civil war that followed, Virginia clung to the royal cause, while Baltimore trimmed sail, and in 1644 Claiborne attempted to raise Kent Island against the proprietary government, as Roman Catholics and hostile to the king. He failed, but in 1645 an English captain, professing a parliamentary commission, overturned the Baltimore government altogether for a time. On the execution of Charles I., Virginia and Maryland, through its royalist deputy, proclaimed Charles II. Claiborne now joined the party of Parliament and was accordingly commissioned to reduce Virginia and Maryland to obedience. In 1652, accordingly, his expedition deposed Gov. Berkeley of Virginia, appointed a new governor, with Claiborne secretary of State, and forced Gov. Stone of Maryland to swear allegiance to Parliament. When Parliament was turned out by Cromwell, Stone repudiated the oath, whereupon Claiborne marched on Maryland with an armed force, deposed Stone, and appointed a Puritan administration, which at once disfranchised all the Roman Catholics. Cromwell intervened in their favor in 1654, and Stone undertook to recover his position by force, but was defeated and captured. Claiborne held his advantage till 1658, when Baltimore had his province restored to him. On the Restoration, in 1660, Claiborne was dismissed from the council and secretaryship of State. In 1675, on Cecilius Calvert's death, he petitioned the king for redress of his wrongs from the Baltimores, but no attention was paid to his request. His descendants in the South numbered many able and distinguished men, and are commemorated in town and county nomenclature. He was a man of enormous energy, resource, and pertinacity, a true type of the English adventurers who have overrun the world; but too inconsiderate and personal in policy for the largest success.

Claiborne, William Charles Cole, American senator: b. Sussex County, Va., 1775; d. New Orleans, La., 23 Nov. 1817. He received a good education, studied law, and engaged in its practice in Nashville, Tenn. He assisted in forming the constitution of Tennessee, and represented that State in Congress 1797–1801. In 1801 he was appointed governor of Mississippi Territory, and in 1804 of Louisiana. When the latter became a State and adopted its constitution, he was elected governor 1812–16. He was later elected United States senator, but died before taking his seat in that body.

Claiborne Stage, in American geology, the rocks, principally shales and limestones laid down in Middle Eocene time along the Carolinas and the Gulf States and around an arm of the sea that reached northward to the present mouth of the Ohio River. See EOCENE SERIES; TERTIARY SYSTEM.

Claim, a challenge of ownership of a thing which is wrongfully withheld from the possession of the claimant. The assertion of

liability of some one, to the party making it, to do some service or pay a sum of money. The possession of a settler upon lands owned by a government which is not used for any particular purpose, and from which no benefit is derived. When a new section of country is opened up, the government gives to each settler a certain amount of land on condition that he will live there, and improve and cultivate the soil for a definite time. The land taken is called a claim, and the settler receives an absolute title to the property when the conditions have been complied with. The ground must be staked out so that the particular claim may be identified. Mining claims are of this nature. Generally it is required that they be staked out, that a description of the claim be filed, and that a certain amount of work be done within a specified time. These claims are considered personal property until the conditions are complied with, and are subject to sale and transfer, it being necessary for all but the original settler to be able to show how and through whom he acquired title, in order to get a complete and absolute title from the government, as it is necessary to show that the land has been used, and in what manner, for a definite length of time, before the settler acquires his title from the government.

There are claims for labor and wages by mechanics for work done, by material-men for material furnished, or by pilots for pilotage. When filed of record these claims become liens against the property which has been benefited by the work, material, or care bestowed upon it.

Claims, when filed in the name of a municipal corporation for improvements, such as opening or widening a street, laying sewers, or any municipal improvement, are liens against the property benefited.

Claims, Court of. See COURTS.

Clairac, klā-răk, France, a town in department Lot-et-Garonne, on the Lot. It was the first town in the south of France to declare in favor of the Reformation. Pop. 2,388.

Clairaut, klā-rō, **Alexis Claude,** klōd, French mathematician: b. Paris 7 May 1713; d. there 17 May 1765. In his 11th year he composed a treatise on the four curves of the third order, which, with his subsequent 'Researches on Curves of Double Curvature' (1731), procured him a seat in the Academy at the age of 18. He accompanied Maupertuis to Lapland, to assist in measuring an arc of the meridian, and obtained the materials for his work 'On the Shape of the Earth.' In 1752 he published his 'Theory of the Moon,' and in 1759 calculated the perihelion of Halley's comet. A brother, who died at the age of 12, published in his ninth year a treatise entitled 'Divers Quadratures of Circular Elliptics.'

Clairin, George Jules Victor, zhŏrzh zhül vēk-tōr klā-răń, French portrait painter: b. Paris 11 Sept. 1843. He studied in Paris under Picot and Pils, and obtained a second class medal at the Paris Exposition in 1889, and the Legion of Honor medal in 1888. Beside portraits he has painted several brilliant scenes from Spanish history.

Clairvaux, klār-vō' (*clara vallis,* lightsome vale), a village of France on the river Aube, 10 miles southeast of Bar Sur-Aube, noted as the site of the celebrated abbey of Cistercian monks, founded in 1115 by Saint Bernard, who was its abbot till his death in 1153. It was a vast establishment, comprising within its enclosure a large population both of monks professed, lay brothers, laborers and artisans employed in various industries. There was a large and magnificent church; four cloisters surrounded by buildings for housing the monks, *conversi* or lay brothers, the novices and the superannuated members of the order; the abbots' hall with the guest house adjoining it, the kitchen, refectory, infirmary, scriptorium, etc.; all these were grouped in one portion of the monastic domain. In another portion were the fish tanks, the wine press, slaughter house, barns and stables, sawmill, grist-mill, oil-mill, tannery, tile works, etc., producing all necessary supplies for the use of the inmates. At the Revolution the monks were turned out, and the lands and buildings, except the church which was destroyed by fire, were occupied for public uses: the buildings are now used as a penitentiary and workhouse.

Clairville, Louis François, loo-ē frăń-swā klār-vēl, French writer of light comedy: b. Lyons 1811; d. 1879. He was the author of more than 220 comedies, farces, and comic-opera libretti. Among his most successful operettas are: 'Daphnis and Chloe' (1849); 'Mme. Angot's Daughter' (1873); among his vaudevilles: 'Property Is Robbery' (1848); 'Antoinette's Temptations' (1850); 'Cinderella' (1866).

Clairvoy'ance, defined as the power of perceiving without the use of the organ of vision or under conditions in which the organ of vision with its natural powers alone would be useless. It comprises the sight of things past, present, or future. Various methods of clairvoyance are recounted; by direct vision of things at a distance (opaque substances being no hindrance); by looking into a black surface; by looking into water, into a crystal, etc.; or by laying the object to be described on the forehead or chest of the clairvoyant; but clairvoyants now usually represent the cerebral region as the seat of illumination. From remote antiquity the possession of such powers by favored individuals has been believed. In the Old Testament (2 Kings vi. 15–17) is an account of the opening of the inner vision in the case of the servant of Elisha in answer to the prayer of the prophet.

Clairvoyant powers were claimed for the Pythia at Delphi. Apollonius of Tyana and Diodorus Siculus testify to the clairvoyance of the Indian sages. Macrobius gives an instance of clairvoyance on the part of the oracle of the Heliopolitan god when consulted by the Emperor Trajan. Tertullian speaks of a seeress who could prophesy and prescribe for the sick. Clairvoyance was known among the nations of antiquity, and is still generally accepted as an undoubted fact among Eastern nations. As instances of clairvoyants in later times may be mentioned Jacob Böhme (1575–1624) and Emanuel Swedenborg (1688–1772), the Swedish scientist and founder of the religious body called "The Church of the New Jerusalem."

The phenomena of clairvoyance have been carefully observed. The clairvoyant state seems to be intimately connected with the mesmeric, the somnambulistic, and the so-called "biological." Mesmeric somnambulism and clairvoyance were first brought to notice by Puysegur in 1784. The clairvoyant is usually in a state of trance, which may be induced by mesmeric

passes. In this state he is sometimes conscious only of his mesmerizer; in others, his clairvoyance is unrestricted; but the clairvoyant may enter the trance state spontaneously, or he may even be in possession of his ordinary faculties, both of which characteristics are to be found in Zschokke, the German novelist. In "second-sight," as found in Denmark, parts of Germany, and especially in the Highlands of Scotland, the seer is not in a state of trance similar to that in other forms of clairvoyance. Some modern scientists claim that the discovery of the X-rays, by Röntgen, in 1895, has solved a number of the questions raised by clairvoyance.

Clam. While the vernacular name clam is indiscriminately applied to any large edible bivalve, it is generally given to the northern "long" or soft-shelled clam (*Mya arenaria*), in distinction from the round clam, hard-shell clam, or quahog (*Venus mercenaria*), which extends from Cape Cod southward, though occasionally found as far north as the Maine coast (Casco Bay) and the Gulf of St. Lawrence at Shediac.

The long or soft-shelled clam occurs throughout the north Atlantic coast from New York to Greenland, and on the British shores, and is everywhere on the American coast a valuable article of food. The so-called black "head" is the siphon, which is very extensible and divided by a fleshy partition into two passages, opening out by two orifices surrounded by a circle of delicate sensitive tentacles; into the lower opening passes the sea-water, carrying minute animals, young and old, and diatoms, around to the mouth, which is in the larger end of the body; through the other or upper opening of the siphon the excrementitious matter is expelled. The clam has a tongue-shaped "foot," by which it burrows into the mud or sand to a depth of several inches.

The clam may be of either sex, male or female; it is very prolific, extruding an inconceivable number of eggs into the sea, where they are fertilized. The young larvæ (veligers) swim at the surface, where they are borne in all directions, until in a few days, the shells becoming heavier, they sink to the bottom, and, resting on the seaweed or stones at the bottom, the "spat" become attached by a few byssus threads. Clams begin to spawn by the end of the first year of their life, and in Narragansett Bay are sexually mature and the eggs become ripe when the animal is only an inch long. The breeding season begins in May, reaches it height in June, ending in July. Of course clams cannot feed when the tide is out, hence they grow more slowly when living near high-tide line. When the young begin to burrow, and they dig very rapidly during the first two months of their life, when one quarter to one half inch in length, they are attacked by crabs, eels, and starfish (q.v.). In Rhode Island attempts at restocking clam beds and raising clams artificially have met with success and promise valuable results in clam-culture. Clams have been taken five and three quarters inches long, and weighing 15 ounces. Attempts have been made to plant the clam on the Pacific coast.

The round, or little-necked clam, or quahog, as it is called in New England, lives in the sand from Cape Cod to Texas, just below low-water mark, and abounds at the mouth of estuaries. The shell is heart-shaped, the valves very thick and heavy. This bivalve is fished by means of long rakes and tongs, or is dredged like oysters. It has a very large "foot," and plows through the sand, but does not burrow deeply.

The beach, surf, or hen clam is *Spisula* (formerly *Mactra*) *solidissima*. The large edible species of the southern coast is the painted clam (*Callista gigantea*). Several large Pacific coast bivalves are edible and known as clams, being species of Taper, Laxidomus, and Glycimens. Very unlike any edible clam is the "giant clam" (*Tridacna gigas*) of the coral reefs of the Pacific Ocean, whose shell often weighs upward of 400 pounds. Consult: Mead, '30–33d Annual Reports of the Commissioners of Inland Fisheries of Rhode Island.'

Clamecy, klä-mē-sē, France, a town in the department Nièvre, 38 miles northeast of Nevers, left bank Yonne, at the mouth of the Beuvron. It was formerly surrounded by enormous walls, and defended by a castle, which commanded the town and environs. One of its suburbs, situated on the opposite side of the Yonne, was the seat of a bishopric *in partibus*, known as the bishopric of Bethlehem, founded in 1180 for the bishop of that place, who had been expelled by the Saracens. Wood-rafts for the supply of Paris with fire-wood are made up here, and floated down the Yonne and Seine. The parish church, founded in 1497, is remarkable for its tower and for some fine sculptures. Clamecy carries on several industries, the chief being that of tanning. Pop. 4,800.

Clan, a tribe or number of families, bearing the same surname, claiming to be descended from the same ancestor and united under a chieftain representing that ancestor. The clan system is essentially the same as that existing among the Arabs, the Tartars, and tribes similarly situated. From ancient times the "clans" existed in Ireland. The system is said to have sprung up in Scotland about 1008, while Malcolm II. was reigning, but it may have been of greater antiquity. In 1747 the legal authority of the chiefs over their followers was abolished as a punishment for the part which the former had taken in the insurrection which ended in 1745 at Culloden. While the clans flourished they were divided into two, the clans of the borders and those of the highlands.

Clan-Na-Gael, klăn-na-gāl, Irish secret society, founded in the United States for the purpose of aiding in securing "Home Rule" for Ireland. The society has been charged with some grave crimes, said to have been perpetrated for the purpose of intimidating the British government; but so little is really known about the workings of the organization, nothing positive can be asserted.

Claosaurus, klā-ō-sôr'us, **Trachadon,** trăk'-a-dŏn, or **Trachodon,** a genus of duck-billed dinosaurs (see DINOSAURIA) of the Cretaceous Period. This dinosaur was bipedal, herbivorous, resembling the hadrosaurus (q.v.), but the bill was not so broad. Its remains are found in the Upper Cretaceous formations of North America. A mounted skeleton possessed by Yale University is 30 feet long and stands 14 feet high.

Clap, Roger, American pioneer: b. Salcomb, Devonshire, England, 6 April 1609; d. Boston, Mass., 2 Feb. 1691. He came to America in 1630, and with other colonists settled the present Dorchester, Mass. In the course of his life he held several military and civil offices, being captain of Castle William 1665–86, and representative in the general court 1652–6. His 'Memoirs,' written for the instruction and benefit of his children, were originally published by Rev. Thos. Prince (1731). Other editions are: 'Memoirs of Roger Clap; Relating Some of God's Remarkable Providences to Him in Bringing Him Into New England' (Boston 1807; Pittsfield 1824; and an edition with preface, etc., printed by the Dorchester Antiquarian and Historical Society, Boston 1844).

Clap, Thomas, American clergyman: b. Scituate, Mass., 26 June 1703; d. New Haven 7 Jan. 1767. He was settled as a minister at Windham, Conn., in 1727, and in 1739 was elected president of Yale College. He contributed much to improve that institution, and was the means of building a college edifice and chapel. He was a man of extensive erudition, gave great attention to mathematics and astronomy, and constructed the first orrery made in this country. He published a 'History of Yale College' (1766); 'Nature and Foundation of Moral Virtue and Obligation' (1765); 'Nature and Motion of Meteors' (1781); etc.; and had made collections for a history of Connecticut; but most of his manuscripts were plundered in the expedition against New Haven, under Gen. Tryon. He had a controversy with President Edwards respecting Whitefield, and opposed the latter, not so much upon religious grounds as from a misapprehension of Whitefield's designs.

Clapboard, klăp'bōrd, colloq. klăb'ôrd, a thin, narrow board commonly used for covering the sides of wooden buildings. Clapboards are usually of white pine, and are made much thinner on one edge than on the other, so that when nailed on to each other one can lap a little over the one next below it. This makes the covering of the building much tighter than if the boards were only set together one above the other, and keeps the rain from driving in. Clapboards are sawn out of solid logs, not by sawing them clear through, as in making common boards, but by sawing from the outside to the middle or heart of the log. They are thus made thicker on the outside than on the inside. They are afterward smoothed in a planing machine.

Clapham, klăp'ạm, a southwest suburb of London, lying a mile south of the Thames. Clapham Common is still an open common of 200 acres. Clapham Junction, in Battersea parish, is one of the busiest and most perplexing railway junctions in the world.

Clapham Sect, a name given by Sydney Smith to the Evangelical Party in the Church of England; the Rev. Henry Venn was the vicar of Clapham, and some of the most eminent Evangelicals — Zachary Macaulay, Wilberforce, and the Rev. W. Romaine — lived there. Thackeray's 'Newcomes' has made the phrase familiar to a later generation.

Clapnet, a ground net used by bird catchers, consisting of two equal parts about 12 yards long by 2½ wide, and each having a slight frame. They are placed about four yards apart, and are pulled over by a string so as to enclose any birds on the intervening space.

Clapp, Henry Austin, American dramatic critic: b. Dorchester, Mass., 17 July 1841. He has been for many years clerk of the supreme judicial court of Massachusetts, and a well-known dramatic critic on the Boston press. He has also lectured extensively on Shakespeare. He has published 'Reminiscences of a Dramatic Critic' (1902).

Clap'perton, Hugh, Scottish explorer: b. Annan, Dumfriesshire, Scotland, 1788; d. near Soccatoo, central Africa, 13 April 1827. He entered the merchant service, but was impressed into the navy, in which he became a lieutenant in 1816. He then went to Africa, where he remained till 1825, returning with valuable information, though the disputed question of the course of the Niger was left undecided. On his return to England Clapperton received the rank of captain, and immediately engaged in a second expedition, to start from the Bight of Benin. Leaving Badagry in December 1825, he penetrated to Katunga, within 30 miles of the Quorra or Niger, but was not permitted to visit it. At Soccatoo the Sultan Bello refused to allow him to proceed to Bornu, and detained him a long time in his capital. He was the first European who traversed the whole of central Africa from the Bight of Benin to the Mediterranean. See Landor, 'Records of Captain Clapperton's Last Expedition' (1830).

Claque, klăk, a body of paid applauders at a public performance, according to tradition, an invention of Nero's. At the present time the claque is a recognized feature of theatrical management in Paris, and although said to be employed in London and New York, the use of such artifices is not recognized as legitimate outside of the French capital.

Clare, Saint, or **Saint Clara,** Italian nun: b. Assisi 11 July 1194; d. 12 Aug. 1253. When very young she was attracted by the accounts of the work being done by Saint Francis (q.v.), a young man of her native place. At an early age she decided to give her life wholly to God and to work for him in poverty. She sought and received the advice of Saint Francis, and when only 18 years of age, gave up the world, and began to devote herself wholly to charity. Other pious young women soon joined her and in time a recognized religious order was founded. For some years they had no special rule, but in 1218 they adopted the rule of Saint Benedict. Later (1224) Saint Francis gave them a rule, mitigating the rigors of the fast, but recognizing holy poverty in the extreme. Two years after her death she was canonized by Alexander IV. The order which she founded is known throughout the world as "Poor Clares"; but several branches of the order have been established as "Order of Saint Clara," "Capuchin Poor Clares," and the name by which first known, "Order of Poor Ladies." Another and a correct title is "Second Order of Saint Francis." The differences in the branches are the rules of poverty. Saint Clare allowed none of her nuns nor herself to hold property individually nor as a body. She followed the practice of Jesus Christ. They did not own the houses in which they lived. Some of the branches, as a body, have corporate rights of

property. Saint Clare is known by the name, "Princess of Poverty."

Clare, Saint, Order of. See CLARE, SAINT.

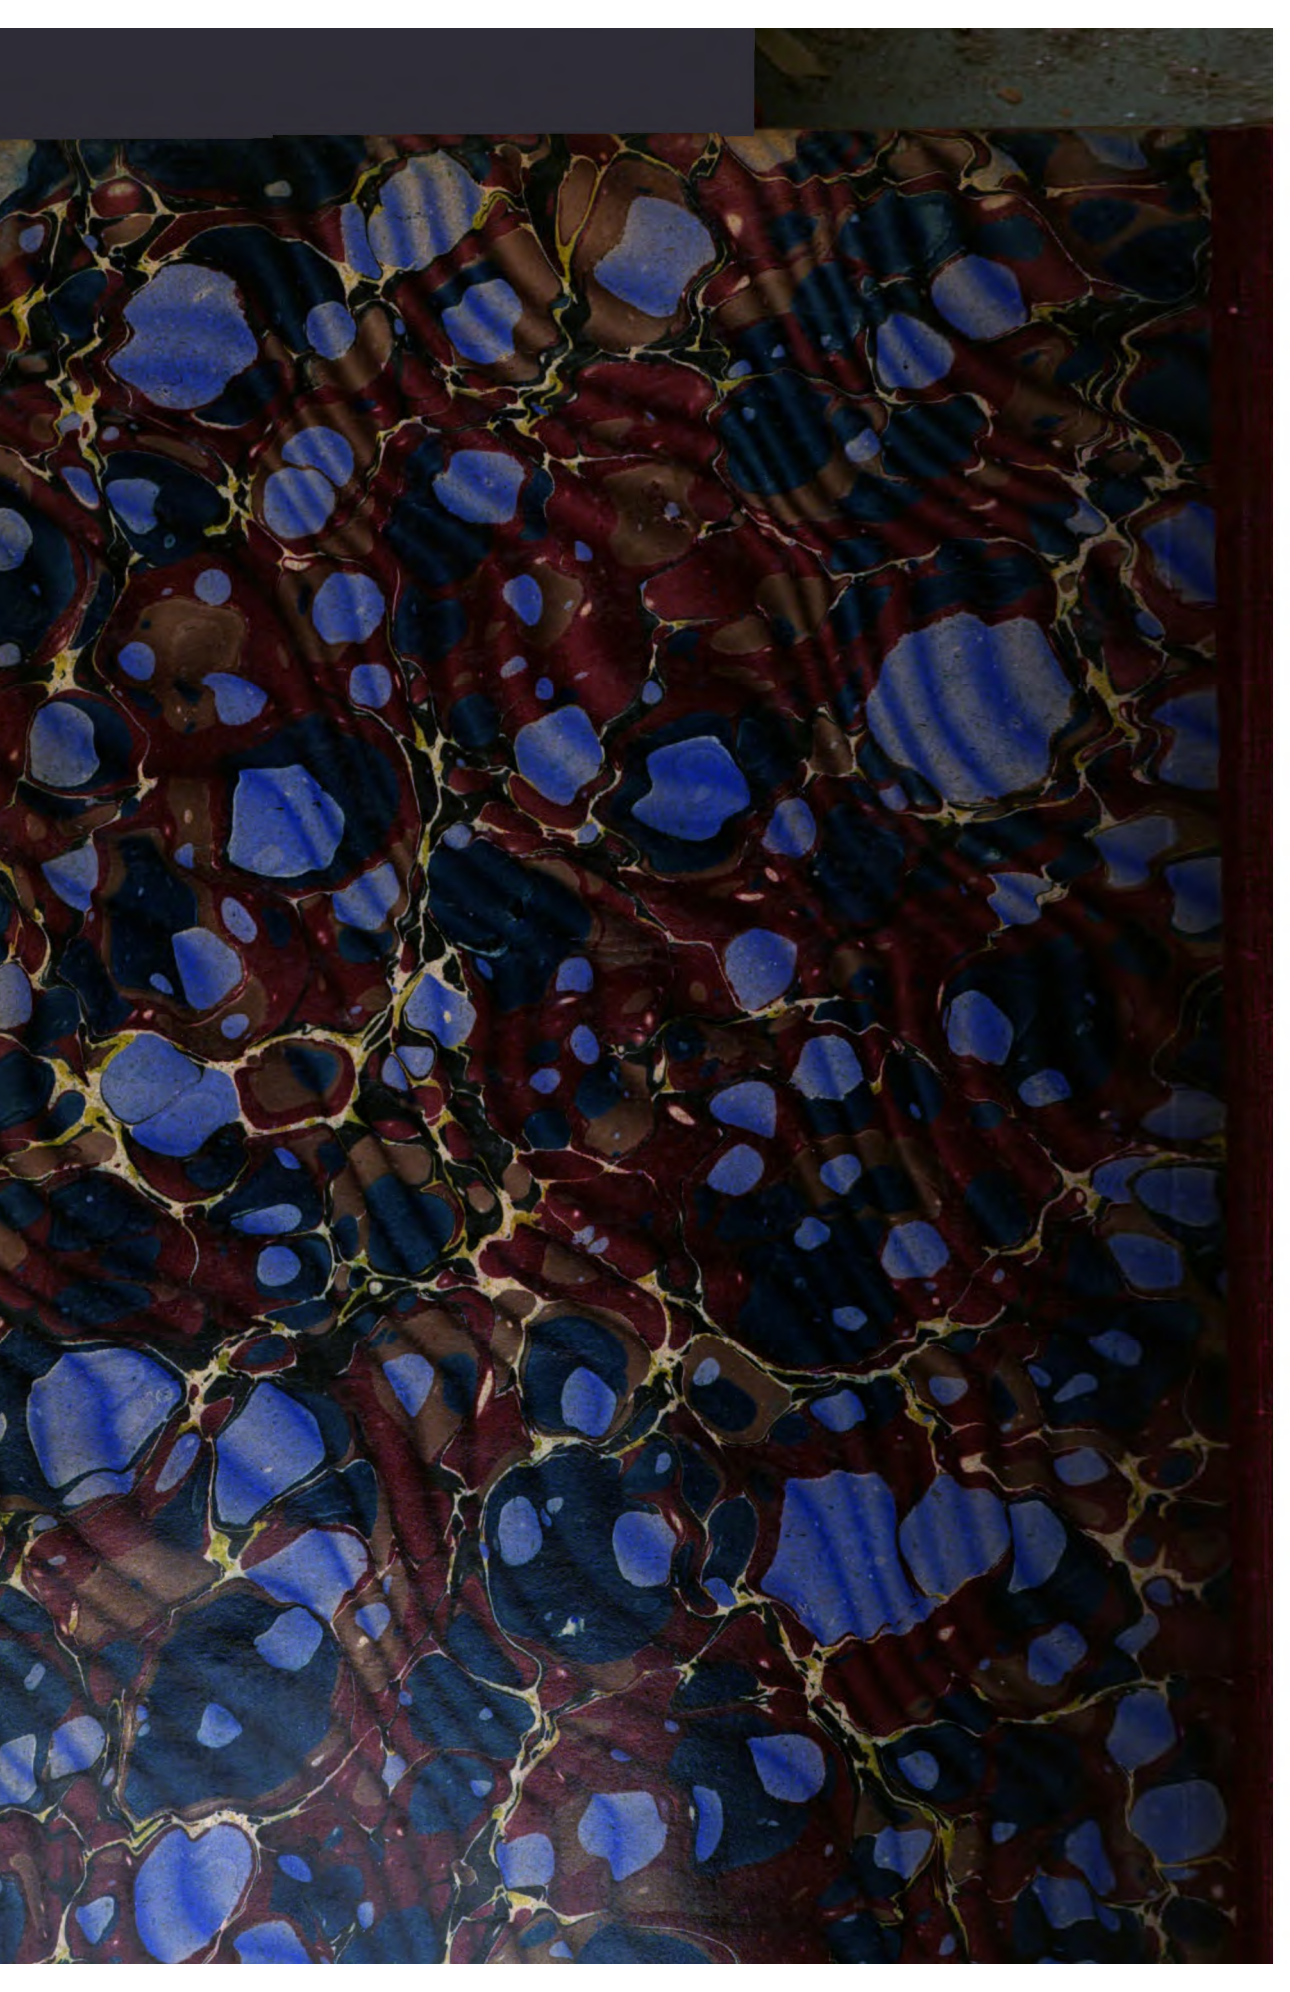
Clare, Israel Smith, American historical writer: b. Lancaster County, Pa., 24 Nov. 1847. He has published: 'Illustrated Universal History' (1876); 'Complete Historical Compendium' (1884); 'Library of Universal History' (1890); 'History of British Boer War' (1900).

Clare, John, English peasant poet: b. Helpstone, Northamptonshire, 13 July 1793; d. Northampton 20 May 1864. He led a rambling, unsteady life until 1818, when he was obliged to accept parish relief. In 1821 his 'Poems Descriptive of Rural Life and Scenery,' met with a favorable reception, and the issue of his 'Village Minstrel' later in the same year won him many friends. A subscription furnishing him with £45 annually was, however, dissipated by 1823, and his 'Shepherd's Calendar' (1827), which he hawked himself, was not a success. He brought out a new work, the 'Rural Muse,' in 1835, but became insane shortly afterward, and the remainder of his life, from 1837 to 1864, was passed in the Northampton Lunatic Asylum. Clare was a genuine poet, and his pictures of rural life are eminently truthful and pleasing.

Clare, Ireland, a county in the province of Munster; boundaries north and east, Galway Bay and county; east and south, the Shannon separating it from Tipperary, Limerick, and Kerry; west, the Atlantic. Area, 827,994 acres, nearly three fourths of which is under cultivation or in use as pasturage, and the remaining portion is in bog, mountain, or under water. The surface is irregular, rising in many places into mountains of considerable elevation, particularly in the east and west and northwest districts. The grazing lands are excellent; the chief minerals are limestone, lead, and slate, and in the southwest coal; but owing to the laws regarding mining, the mineral deposits remain almost undeveloped. The chief crops are oats and potatoes. Sheep and cattle on the hillsides, salmon in Clonderlaw Bay, the rivers Shannon and Fergus and at Dunbeg are sources of income. There are oyster beds near Ballyvaughan and along the shores of Burren. Frieze and hosiery are manufactured. The chief town is Ennis. Pop. (1901) 112,100.

Clare College, University of Cambridge, founded in 1326, and first called "University Hall." In 1336 its patronage was given, by Richard de Baden, then chancellor of the university, to Elizabeth de Burgh, sister of the Earl of Clare. Her object in giving of her riches to this college was to educate young men who would become priests, in order to replace the many clergymen who died from the plague. The college has not continued to educate men for the purpose intended by its first patron. Many noted men have been educated in this school. At first there were a master, eight senior, and seven junior fellows, besides scholars and students. Now the 15 fellowships are open to B.A.'s or persons of a higher degree, without restriction as to marriage. A fellowship becomes vacant in five years and 11 months from the time of election, unless the holder occupies at the same time the post of professor, public orator, etc., in the university, or the post of tutor, dean, bursar, or lecturer in the college. The master and fellows elect to the vacant fellowships, and the master is elected by the fellows. The foundation scholarships are eight of not less than £60, eight of not less than £40, eight of £20, four of £50 per annum each; three of about £60 per annum, tenable for three years, with preference to clergymen's sons; with several minor scholarships. At present there are 18 fellows, 24 residents, and two non-resident scholars, and several undergraduates.

Claremont, Cal., village in Los Angeles County, on the Atchison, T. & S. Fé R.R., 38 miles east of Los Angeles. This is the centre of a large fruit growing and raisin making region, and large crops of oranges and lemons are raised here. It is the seat of Pomona College, a Congregational institution, founded in 1888. Pop. (1902) 1,200.

Claremont, N. H., town in Sullivan County, on the Boston & Maine R.R., 50 miles north of Concord. Water power from Sugar River is furnished here to cotton and woolen mills, paper mills; and there are lumber, granite, and marble yards, shoe factories and brick yards. The Fiske Free Library, founded in 1873, is located here. Pop. (1890) 5,565; (1900) 5,498.


Clarence, George, DUKE OF, English prince: d. London, 18 Feb. 1478. He is chiefly celebrated for his tragical end, and for the use made of his name and history by Shakespeare. He was the son of Richard, Duke of York, and brother of Edward IV., king of England, and on his brother's accession to the crown in 1461 he was, as the reward of his assistance, created Duke of Clarence, and in 1462, lord-lieutenant of Ireland. When the Earl of Warwick deserted the cause of Edward, Clarence entered into alliance with him, married his daughter in 1469, retired with him to France, and afterward landed with him at Dartmouth in September 1470, and in a parliament held at Westminster by the Lancastrians had the crown settled on him, failing the issue of Henry VI. From a story told by Commines, it would appear likely, however, that Clarence had already meditated a double treachery before leaving France, and at Coventry, on 30 March 1471 he left the party he had espoused on the field of an imminent battle, and joined his brother Edward. Clarence's wife having died in 1476, he offered himself, on the death of Charles the Bold, to Mary, heiress of the estates of Burgundy, but the king opposed his suit, which hardly needed his opposition to cause it to miscarry. Some of his servants were about the same time hurriedly put to death on an accusation of magic. Clarence, who had for some time engaged in a rash opposition to the court, now appeared in the council to complain of the injustice of their sentence. For this interference with justice, he was committed to the Tower. A parliament was summoned, which condemned him to death; and on 18 Feb. 1478, he was found dead in the Tower. Of the manner of his death, or by whom it was perpetrated, nothing is known. Suspicion fell on his brother Richard, Duke of Gloucester, on account of their old enmity.
